HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

An operational monitoring system for cyanobacterial blooms

Application to water bodies in the South-Western France

² Communauté de Communes des Grands Lacs (CCGL), 136 rue Jules Ferry B.P. 64, F-40161 Parentis-en-Born Cedex, France.

Context

Large lakes of South-Western France are largely concerned by recreational activities and constitute an important touristic place during summer. These lakes have bathing areas regularly monitored for public health. In France, regulation impose biological monitoring, especially for cyanobacteria that could be potentially toxic. However, current survey induces long time delay detrimental to health security and resulting in high financial costs.

Objectives

The present work, carried out between scientists and managers, proposed to modify the reglementary alert decision tree in :

- reducing the time delay
- limiting the financial costs
- conserving the safety level

	REGLEMENTARY	PROPOSED
TOOLS	Laboratory ► Microscopy	In situ ► Fluorimetric field probe
METHODS	Counted cells ► CC.ml ⁻¹	[cyanobacteria chlorophyll-a] ► µg/l
TIME DELAY	36 hours	Immediately
HEALTHCARE THRESHOLDS	≥ 20 000 CC.ml ⁻¹ ≥ 100 000 CC.ml ⁻¹	≥ ? µg/l ≥ ? µg/l

Sites and methods

3 lakes – 6 stations

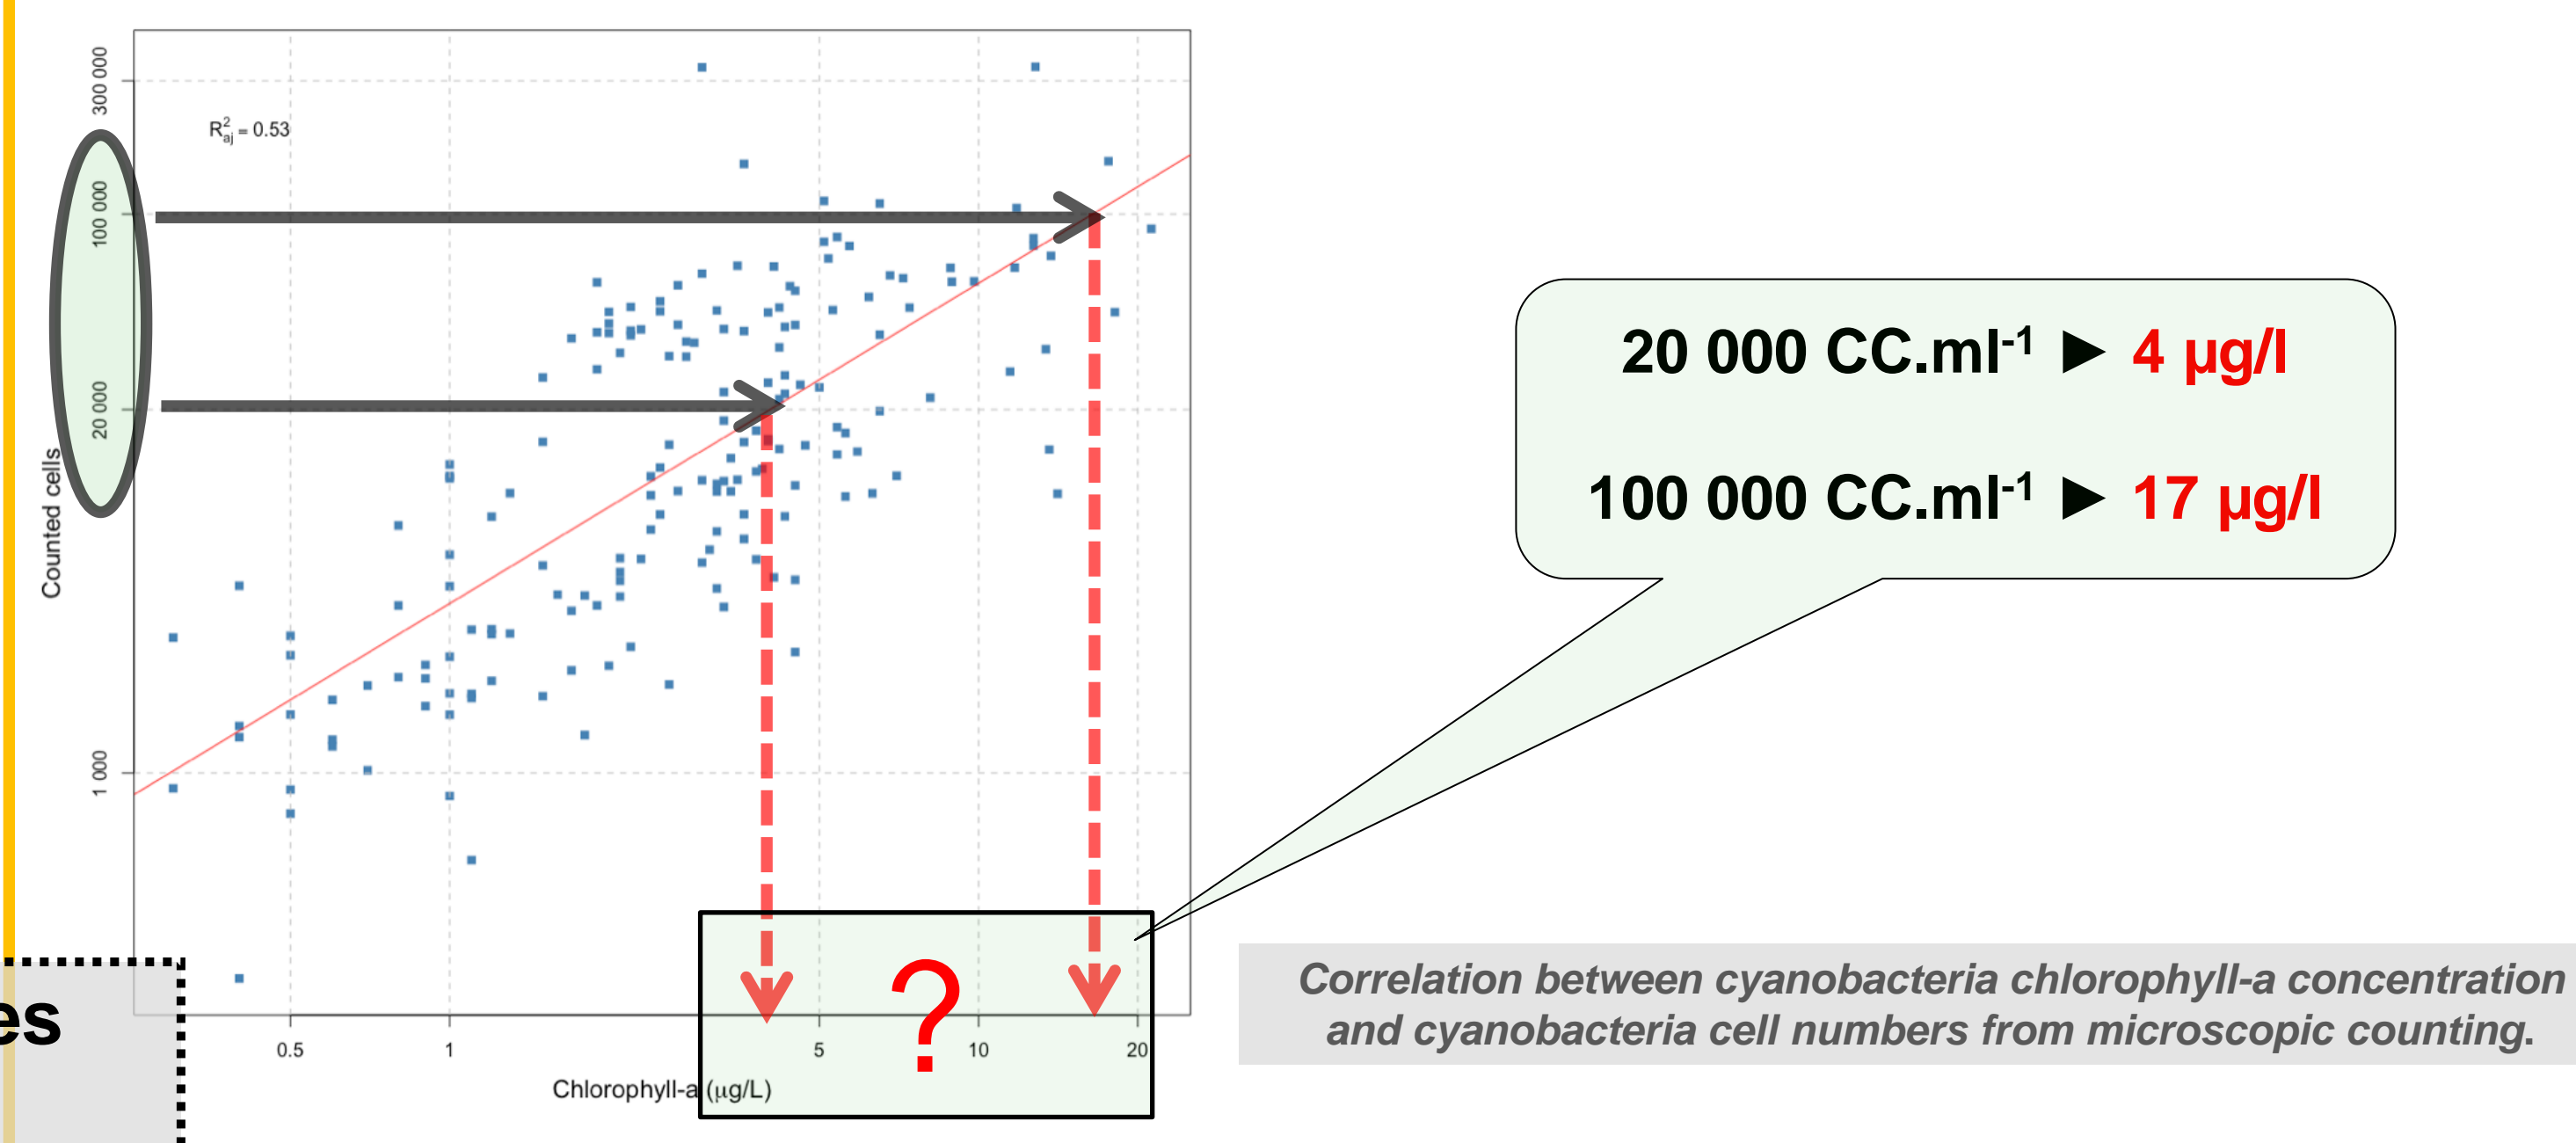

AlgaeTorch bbe
Fluorimetric field probe

174 water samples
(2012-2013)

Thresholds definition

THE NEW ALERT DECISION TREE

Results

Validation

		PROPOSED Warning level			
		0	1	2	3
REGLEMENTARY Warning level	0	85	19	0	0
	1	27	34	2	0
	2	2	4	1	0
	3	0	0	0	0

70 % IDENTICAL

20 % UNDER EVALUATED
Small species non toxic
Better assessment

10 % OVER EVALUATED
Bigger species potentially toxic
More precautionary

Conclusions and perspectives

This new decision tree provides at least the same safety level and is, sometimes, more precautionary than the regulatory method. This new method need however to be tested on other lakes with different cyanobacteria taxa and biomass, but provide encouraging results for bathing areas management and is already used for management of lake beaches of the large lakes of South-Western France.
