HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Context

Studying the structure and understanding processes acting in the Earth system at various temporal and spatial scales in order also to predict its evolution and extreme events demand an easy and interoperable access to the numerous observation data acquired on ground, in oceans, from space,... regardless their nature and mode of collection. Indeed, to study the Earth System today requires to take into account processes acting in each terrestrial component but also to understand how they interact. In the meantime, the fantastic evolution of the observation techniques results in an unprecedented increase of the rate and volume of data acquisition. This requires innovative plan easing analysis, dissemination and smart use of data and models from national and international observing systems on the entire Earth System and their access by the scientific community, public policy actors and citizens.

Scientific and technical objectives

Our project federates for the time being four data and services poles dedicated to the four physical compartments of the Earth System: Aeris for the atmosphere, Odatis for the oceans, Theia for continental surfaces and ForM@Ter for the solid Earth. Our goal is to give an easy access to data (mainly satellite and in situ) and to generate derived products (including modeling) usable by all scientific communities studying our globe as well as by public policy actors.

Prototype of HPC (High Performance Computing)/ Data Infrastructure for On-demand Services

3 years

This project aims to develop and implement prototypes for the exploitation of Earth Sciences spatial and environmental data of by relying on intensive computing capabilities (HPC).

It will start in November 2019 until 2022.

Data Terra manages the WorkPackage 3 for technical coordination of the whole project.

The project will develop datasets which will be added into the EOSC catalogues.

European Open Science Cloud

3 years

The EOSC Pillar project is based on the Open Science concept and FAIR data services and practices to promote them in all communities using scientific data. The kick-off meeting held in early July 2019.

Data Terra is particularly involved in WP6 EOSC in action: Use cases and community-driven pilots

This Work Package collects use cases based on the requirements of scientific communities. Each use case "demonstrator" will analyze different tools and services for data FAIRisation and the type of governance according to the needs of the user community.
