A corrigendum on

Heat stress during seed filling interferes with sulfur restriction on grain composition and seed germination in oilseed rape (*Brassica napus* L.)

by Brunel-Muguet, S., D'Hooghe, P., Bataillé, M. P., Larré, C., Kim, T. H., Trouverie, J., et al. (2015). *Front. Plant Sci.* 6:213. doi: 10.3389/fpls.2015.00213

Reason for Corrigendum:

After our article was published online, it was brought to our attention that the values of the ratio ω_6/ω_3 in **Table 2** were inverted between the four treatments i.e., Ctrl T-HS, HT-HS, Ctrl T-LS, and HT-LS. All of the other data related to the total FAs and the *F*-values for the FAs (in the Supplemental data, Table 2) are correct.

Corrections for the values of the ratio $\omega_6:\omega_3$ follow:

	Ctrl T-HS		HT-HS		Ctrl T-LS		HT-LS		T effect	S effect	T × S effect
	mean	se	mean	se	mean	se	mean	se			
C18:2/C18:3 (ω_6/ω_3)	1.82	0.32	2.47	0.12	1.70	0.03	3.11	0.32	17.2***	1.09 ns	2.24 ns

Therefore, high temperature increased the ratio for both S supplies condition.

The authors apologize for the mistake that changes the conclusion with regards to the effect of temperature on this ratio.

In the text and in **Figure 3**, we want to make the following modifications:

In the abstract:

Instead of “While LS had negative effects on seed composition by reducing the FA contents and increasing the ratio S-poor SSPs (12S globulins)/S-rich SSPs (2S albumins) ratio, HT

had positive effects by increasing S and FA contents and decreasing the C18:2/C18:3 ratio and the 12S/2S protein ratio,” we want to write: “While LS had negative effects on seed composition by reducing the FA contents and increasing the ratio S-poor SSPs (12S globulins)/S-rich SSPs (2S albumins) ratio, HT had positive effects by increasing S and FA contents and decreasing the 12S/2S protein **but it negatively affected the C18:2/C18:3 ratio by increasing it.**”

In the result section:

Page 5 line 500: Instead of “The C18:2/C18:3 (also denoted ω_6/ω_3 , **Table 2**) ratio, which is used as an indicator of nutritional quality of oil (the lower the ratio, the higher the nutritional

value), decreased significantly under heat stress under both S treatments, while no significant effect of S was observed (**Table 2**),” we want to write “The C18:2/C18:3 (also denoted ω_6/ω_3 , **Table 2**) ratio, which is used as an indicator of nutritional quality of oil (the lower the ratio, the higher the nutritional value), **increased** significantly under heat stress under both S treatments, while no significant effect of S was observed (**Table 2**).”

In the discussion section:

Page 8 lines 846–849: Instead of “Our results also showed that heat stress was rather beneficial because it allowed the C18:2/C18:3 ratio to be lowered, which is usually targeted to satisfy dietary requirements (Simopoulos, 2002),” we want to

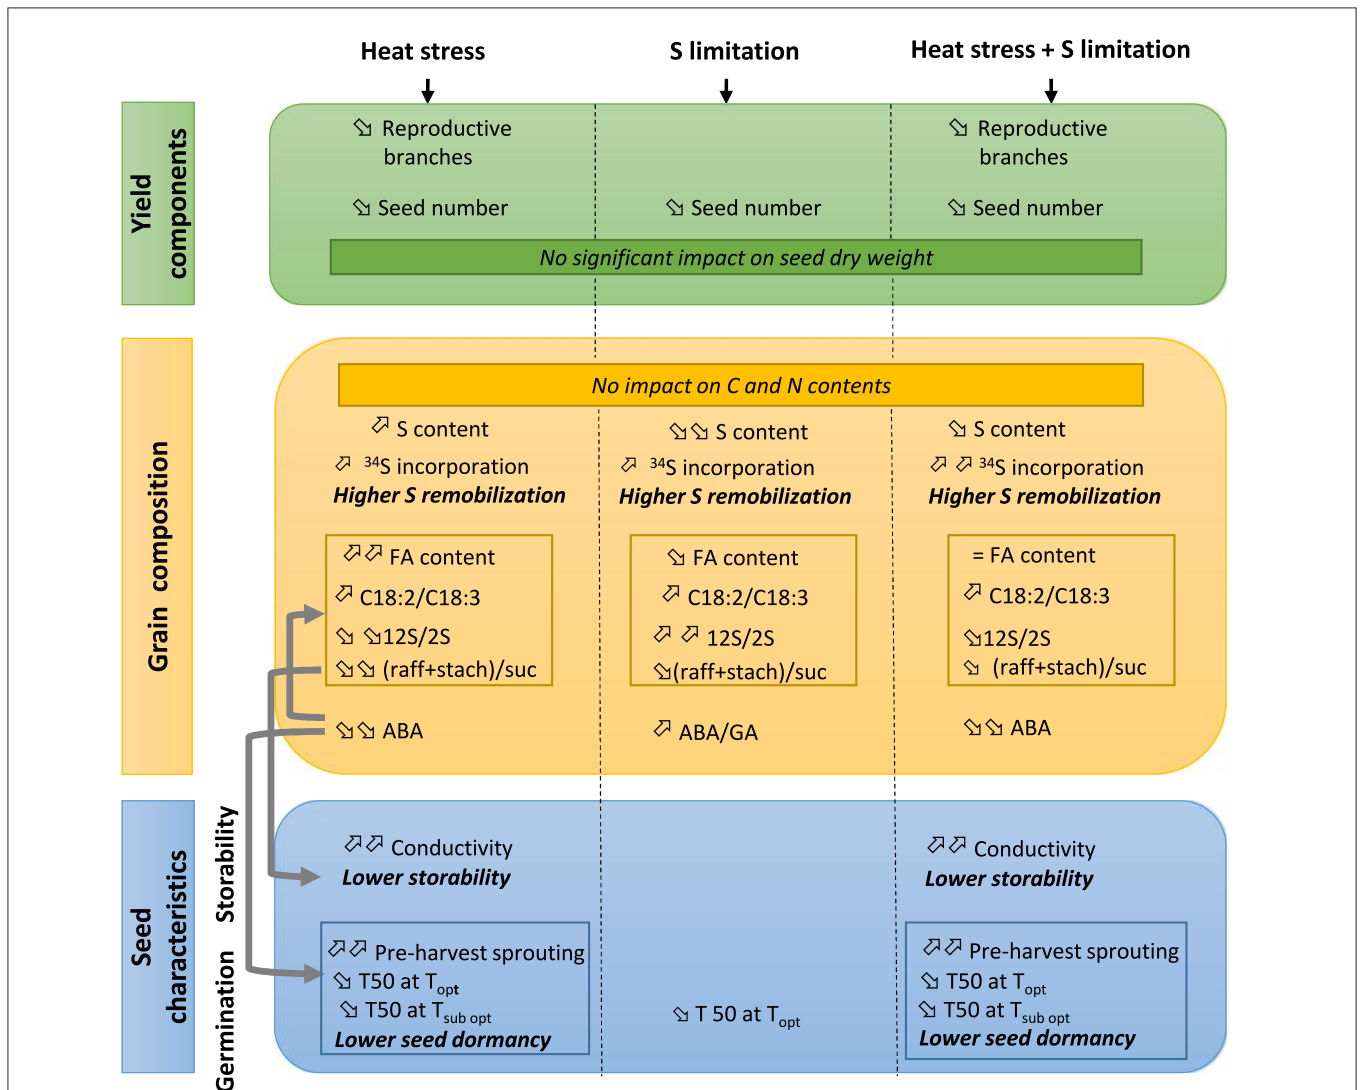

FIGURE 3 | Summary of the effects of heat stress and/or S limitation on yield components, seed composition, storability, and germination in oilseed rape. When a single effect (heat stress or S limitation) was observed, the trends (increase or decrease) are given in reference to the ANOVA in **Tables 1, 2**. When a double effect (heat stress + S limitation) is observed, the trends (increase or decrease) are given in reference to control plants (Ctrl T-HS). Grey arrows indicate relations between variable levels. FA: fatty acids; raff: raffinose; stach: stachyose; suc: sucrose; ABA: abscisic acid; GA: gibberelic acid; T50: time to reach 50% of germination; T_{opt}: optimum temperature for germination (20°C); T_{subopt}: sub-optimum temperature for germination (5°C)

write “Our results also showed that heat stress was **rather negative because it increased the C18:2/C18:3 ratio, which is usually not targeted with regards to dietary requirements** (Simopoulos, 2002).” Therefore, the following sentence is wrong “it should be noted that heat stress mitigated the negative effect of S restriction on the C18:2/C18:3 ratio, as double stress (HT-LS) had ~~lower~~ C18:2/C18:3 ratios than single stressed seed.

Page 9 line 920: Instead of “Like the C18:2/C18:3 ratio, heat stress mitigated the negative effects of S restriction (...),” we want to write “Heat stress mitigated the negative effects of S restriction...”

Page 10 line 1030: instead of “Overall, heat stress decreased yield, but improved important ratios that determine the quality of the oil and meal (lipids and proteins),” we want to write: “Overall, heat stress decreased yield, but improved an important ratio that determine the quality meal (proteins).”

In Figure 3

The changes deal with the arrows for the C18:2/C18:3 ratios that increased with Heat Stress (first column) and with Heat Stress+ S limitation (third column).

In addition to these points above, the authors want to correct the followings sentences:

- Page 2 line 148 (at the end of the first paragraph of the introduction): “S limitation may lead to a loss of 40% of seed yield in oilseed rape” instead of “S limitation may lead to 40% seed yield in oilseed rape.”

AUTHOR CONTRIBUTIONS

SB, PD, JT, JA, and PE contributed to the experimental design, to plant growth and tissue sampling and have been involved in revising the article for important intellectual content. CD supervised the choice of relevant measurements on seeds. MB made the spectrometry analysis. CA was involved in the SSP analyses, interpretation of protein data, and revising the manuscript. TK was involved in the hormone measurements. SB performed the whole raw data analysis (including statistical analyses). SB and CD made interpretation of data and writing of the article.

ACKNOWLEDGMENTS

This work is part of the CAQ40 (CAQ40: Climate chAnge and Quality of fruit grain and seeds in the next 40 years) project, which was funded by the metaprogram ACCAF “Adaptation to Climate Change in Agriculture and Forest” by INRA.

Conflict of Interest Statement: The authors declare that the research was conducted in the absence of any commercial or financial relationships that could be construed as a potential conflict of interest.
