Editorial

Dear Scientific and Academic Colleagues,

The 21st International Congress of Nutrition (ICN) is organized under the auspices of the International Union of Nutritional Sciences (IUNS) to be celebrated in Buenos Aires, October 15th-20th 2017. The IUNS-ICN is a four-yearly meeting that has been held since 1946. The 2017 IUNS-ICN edition has been conjointly organized by the Argentinian Society of Nutrition (Sociedad Argentina de Nutrición, SAN) and the IUNS Council with the integrative collaboration of the Organizing, Scientific and Executive Committees under the motto "From Sciences to Nutrition Security". The aim of this IUNS 21st ICN is to promote the global exchange of knowledge in Nutritional Sciences. The scientific program comprises 6 Plenary Lectures, 40 keynote Lectures, 108 parallel symposia, 22 sponsored symposia, and 18 satellite symposia.

The congress focuses on every aspect of nutrition issues, going through a wide variety of topics, which will be dealt with from different perspectives in order to enrich our attendees' points of view. Let us mention the tracks of the devised program:
1: Advances in Nutrition Research
2:Nutrition Through Life Course
3: Public Health Nutrition and Environment
4: Nutrition and Management of Diseases
5: Nutrients and Nutritional Assessment
6: Functional Foods and Bioactive Compounds
7: Food culture practices and Nutritional Education
8: Agriculture, Food Science, and Safety

The main goal is to offer a high-level scientific meeting focused on addressing the key aspects of nutrition in a multicultural environment, from state-of-the-art reviews to cutting edge nutritional science information. Sessions are planned to deliver latest investigations and outcomes concerning the impact of nutrition on homeostasis and body metabolism, on dietary intake and nutritional status of the population and the individual for precision nutrition as well on the role of dietary prescriptions in disease management and prevention. Translational research orientated to design and implement strategies and approaches to change dietary behaviors and to develop policies, as well as aspects related to public health issues, Nutrition Education and Climate Change, or Food and Agriculture for Health Maintenance, are included in the program. Six plenary sessions framed the program with eminent speakers covering all health aspects in the life cycle with integrative views on food security. The present supplement accounts for 2029 abstracts from 97 countries, and additional 297 abstracts selected for oral communications. Including the summaries of more than 500 selected guest speakers participating in the scientific symposia.

The distribution of abstracts for the different selected tracks appears below:

TRACK	ORAL	POSTER	TOTAL
Track 1: Advances in Nutrition Research	33	110	143
Track 2: Nutrition Through Life Course	39	276	315
Track 3: Public Health Nutrition and Environment	62	499	561
Track 4: Nutrition and Management of Diseases	33	280	313
Track 5: Nutrients and Nutritional Assessment	32	239	271
Track 6: Functional Foods and Bioactive Compounds	36	129	165
Track 7: Food Culture Practices and Nutritional Education	33	111	144
Track 8: Agriculture, Food Science and Safety	29	88	117
TOTAL	297	1732	2029

In these times of worldwide economic burdens and financial crisis, it has been a challenge to build a solid Nutrition Congress; for that reason, we counted on the advice of the Ethics Committee in order to avoid potential conflicts of interest. Notwithstanding, in parallel, it opens the exceptional occasion to link the multidisciplinary spaces of nutritional sciences, chiefly basic and applied research activities relating Nutrition and Food with Health. Also, food safety, food production, and environmental sustainability are approached in the program.

The 21st ICN organizers wish to recognize and thank the important involvement of young investigators and nutrition professionals from transition countries. A special fee rate for students and participants from low- and middle-income countries was offered to encourage their participation. Travel grants, registration fee discounts, and accommodation reductions for selected young investigators and other awardees were made possible by the contribution from international agencies and the private sector. In this context, IUNS granted 70 scholarships to its Adhering Bodies' affiliates and early career scientists from universities and research institutes from all over the world. We wish to express our genuine appreciation to all attendants, also to invited speakers and international experts and delegates whose participation and interest will undoubtedly produce a successful IUNS 21st ICN for sharing and exchanging knowledge in nutritional sciences for the benefit of the human being.

Prof. Mabel Carrera
President of the Organizing Committee

FIT FOR THE FUTURE: ALIGNING NUTRITIONAL SCIENCES FOR THE SERVICE OF HUMANITY

Prentice, Andrew M.

PhD, FMedSci, MRC Unit The Gambia & MRC International Nutrition Group. London School of Hygiene & Tropical Medicine. London. United Kingdom.

Nutrients, water and oxygen are the fundamental needs of human existence. This simple statement emphasises the salience of nutritional sciences and the contribution that we can make to optimising human health and combatting disease. But our discipline is beset by challenges that we must address if we are to be fit to serve the best interests of our fellow beings into the future. I will focus on five of these challenges working upwards from basic science to population health. Knowledge gaps: Nutrition text books catalogue the properties and functions of the essential and non-essential nutrients but there are still vast gaps in our knowledge especially in relation to the complexities of nutrient-nutrient and nutrient-genome-epigenome interactions. We cannot shy away from these complexities; we must address them head on and this will require an infusion of mathematical and modelling sciences. In this regard the much vaunted 'omics' sciences have failed to make a substantial impact so far, but their day will come. Nutrition needs an infusion of bright young computational scientists. Funding gaps: Scientists complain that there is never enough money to do vital research; funders complain that there is a paucity of novel ideas and that we do not deliver effective solutions to their target diseases. The truth lies somewhere in between. Two challenges stand out. First, such is the desire of funders to find the magic bullet, that they prematurely invest tens of millions in very large 'definitive' trials that usually end in failure. Second, that every scientist believes they can 'do' nutrition and hence our funding options are encroached upon by other disciplines. We must reassert our ownership of nutrition; but this can only be achieved by delivering excellence. Solution gaps: We have had our successes. Observations of low folate status in the mothers of babies born with Neglected tropical diseases (NTDs) was confirmed by randomised controlled trials and has translated into very effective public health interventions. But we have far more failures in which, seemingly strong diet-disease associations fail the test of a randomized controlled trial (RCT). We must develop stronger epidemiological methods that can robustly establish causality before we waste funds on ill-advised trials. Gaps in trust: Many in our field treat the food industry with a level of antagonism that blocks constructive dialogue. If global multinationals are part of the problem they must surely be part of the solution. Gaps in credibility and authority: A substantial segment of the population ignores nutritional advice because they read constantly conflicting messages in the print and electronic media; many others follow highly dubious nutritional fads. Re-establishing public trust in evidence-based advice represents one of the key challenges in our field.

Plenary Lectures:

ZINC TRANSPORTER FUNCTIONS IN HEALTH AND DISEASE

Cousins, Robert J.

Boston Family Professor of Nutrition. Director. Center for Nutritional Sciences. University of Florida. USA.

The supply of zinc needed for cellular functions is influenced by multiple variables. These include dietary composition and genetics. For zinc to carry out its biochemical roles in protein and nucleic acid structure, catalysis and cell regulation, a high degree of coordination is essential. That coordination is provided through the activity of about 24 transporter proteins derived from two gene families: ZIP and ZnT. Some of these genes are regulated via signals from the dietary zinc supply. Other transporter genes are regulated physiologically via hormones and immune mediators. Convincing evidence is accumulating from genetics that mutations in some human transporter genes lead to disease. In addition, molecular studies with gene knockout models with rodents are leading to identification of specific transporter-requiring, zinc signaling pathways that also can contribute to metabolic disorders in humans. These conditions include neurodegenerative diseases, arthritis, cancer, endotoxemia, diabetes and metabolic syndrome. One hallmark of zinc transporter activity is the cell-specificity of expression of the Zip and ZnT genes. ZnT2, highly expressed in secretory cells of the exocrine pancreas and mammary gland and ZnT8, in pancreatic β cells, are but two examples. Cellular localization and transporter trafficking to specific sites is a second hallmark of zinc transporter activity. This provides the opportunity for the targeting of zinc ions sites necessary for activation or inhibition of specific pathways. In this presentation, I will give examples of targeted zinc transporter activity by summarizing research on ZIP14, a zinc transporter that is regulated by proinflammatory conditions including IL6. I will describe roles for ZIP14 in diverse processes including hepatic ER stress, impaired intestinal barrier function and defense, adipocyte NF-κB activity control, endosomal insulin receptor activity in hepatocytes, bone homeostasis with aging and prevention of neurodegeneration. Research discussed was supported by the National Institutes of Health.

HUMANS VS OBESITY: WHO WILL WIN?

Caballero, Benjamin.

Bloomberg School of Public Health. Johns Hopkins University. Maryland. USA.

Efforts to stop the global obesity epidemic have been ongoing for at least 3 decades. While there is no single global coordinated program, many programs are based on similar premises, e.g., reducing dietary energy intake with low nutritional value, promoting physical activity, etc. The WHO and other organizations have defined frameworks to assist in the development of obesity prevention programs in different geographic and cultural contexts.

And yet, the rise in obesity prevalence continues almost in all countries. The situation calls for a pause and reflection on a few conceptual issues related to our understanding of the epidemic. First, there are well recognized questions about our key indicators, particularly BMI. This parameter evolved from a screeening tool to a diagnostic/predictive indicator for NCD, diabetes, early mortality, etc. Second, we have never really defined our endpoint. What would constitute a "victory" over the obesity epidemic? To have no more than 5% of the population with a BMI above 25? If so, the gap with the current situation in many countries would be enormous, and that goal is unlikely to be reached in many generations, if ever. Another question is whether the continuing increase in BMI in the world is a combination of an epidemic and a historic secular trend in body size, since human body size has been increasing continuously for at least 300 years. If there is a fraction of the continuing rise in obesity prevalence that is due to a "natural" secular trend, that fraction might be less responsive to prevention programs having BMI as an outcome indicator.

IUNS LIFETIME AWARD LECTURE: FROM TREATING CHILDHOOD MALNUTRITION TO PUBLIC HEALTH NUTRITION

T. James, W. Philip.

CBE, FRSE, MD, DSc Hon. Prof. Nutrition. London School of Hygiene and Tropical Medicine. London. United Kingdom.

My first understanding of nutritional issues started on landing in the Tropical Metabolism Research Unit in Jamaica as a young doctor with some paediatric experience. The task was to understand and effectively treat children with marasmus and kwashiorkor. Albumin levels were a key marker but we soon found its limited utility because of albumin's unrecognised extra-cellular adaptations. Mortality rates, however, were high with diarrhoea a major problem. So a new biopsy and 5 lumen perfusion techniques for assessing gut morphology, motility, digestive and absorptive capacity were developed. There was a marked inability to digest and therefore absorb disaccharides, especially lactose, and compensatory dietary fluid composition was critical. Whereas the gut digestive capacity recovered we found that insulin secretory capacity seemed permanently impaired. Only recently have we linked this to our more recent findings of excess diabetes on adult weight gain in Asians, Mexicans, Africans e.g.in the Caribbean and now Middle East nationals. Jamaican children with gastroenteritis also had marked jejunal secretion only overcome by careful repeated small glucose/saline feeding. The NIH Bangladesh cholera group then linked these data with their own research findings and then introduced glucose/saline treatment solutions for childhood diarrhoea and cholera thereby saving annually millions of lives. Shortly thereafter, when assessing schoolchildren's nutritional state in Montserrat, it was shown that stunting rather than crude "weight for age" was the key, dominant issue when assessing global childhood malnutrition.

Returning to the UK I established the criteria for the normal mortality related BMI and for obesity and later for adult underweight or "chronic energy deficiency". Assessing energy balance with new whole body calorimeters, however, led to the re-evaluation for WHO/FAO/UNU of individual, national and global basic food needs with new criteria for FAO analyses based on our predicted basal metabolic rates and physical activity levels (PALs). The emphasis on low BMIs and height transformed policy analyses and showed that dietary surveys supposedly showing very low "adaptive" energy intakes in poor countries were misleading.

This led to new dietary validation analyses with biomarkers and the lithium tracking of dietary salt sources thereby revealing striking differences between dietary salt sources in pre and post industrialised societies, essential for understanding the approach to salt reduction to prevent strokes in lower income countries.

I was privileged to chair many WHO consultations and the SCN's Millennium report where we discovered that stunting also related to the prevalence of low birth weight so maternal nutritional health was crucial and we needed a new life – course approach to nutrition while recognising the potential importance of epigenetic programming of children's future well-being and the trans-generational amplification of nutritional risk. We then showed that lower income countries now have epidemic obesity and probably nutritionally programmed exaggerated diabetes rates. Our International Obesity Task Force focused on poorer societies and income groups for WHO with our new analyses highlighting the need for integrated multi-sector policies. Recently our revised analyses on sugar intakes and dental caries helped WHO to emphasise the importance of very low (max 5%) sugar intakes for overall public health nutritional prevention.

BUILDING AND IMPLEMENTING EVIDENCE – BASED NUTRITION POLICY

Rivera Dommarco, Juan Ángel.

Managing Director. National Institute of Public Health. Mexico.

Malnutrition and poor diets are the largest risk factors responsible for the global burden of disease. Therefore, ending all forms of malnutrition by 2030 is an international priority.

Essential to achieving this goal is to design and implement nutrition policy based on the best available scientific evidence. The demand for evidence-based nutrition policy may originate directly from policy makers or through social actors. In both cases, the role of research institutions is to generate relevant evidence for public policy. The design of sound policy to tackle malnutrition

in all its forms requires that research institutions develop strategic research agendas.

The two key objects of analysis for the design of effective policy are the magnitude, distribution and trends of malnutrition in all its forms in the population (nutrition conditions) and the policies and programs available, including the identification of platforms and competences required by human resources, for the provision of products and services (social response).

In addition, systematic literature reviews about the risk factors of malnutrition as well as the efficacy and effectiveness of an array of promising policy actions lead to evidence based policy recommendations. For some topics, international evidence based recommendations developed by expert panels with clear criteria for identifying and classifying the evidence are already available (WHO/PAHO, WCRF, Lancet Series and commissions, etc.). Given the multifactorial nature of malnutrition, the drivers and risk factors operate in several systems (food, health, education, and social) and may be immediate, underlying or basic causes. This multilevel complexity should be considered when developing recommendations.

Evidence-based recommendations should be then adapted to the local conditions in the country, using the locally generated evidence about the nutrition conditions and the known risk factors in the population. This exercise will produce locally adapted evidence based recommendations, which ideally should be tested in small-scale interventions for feasibility and efficacy before implementing at scale. In some instances, when immediate action is required, locally adapted recommendations are implemented without small-scale testing. In those cases policies or large-scale programs should be evaluated, so that the body of evidence about effective policy actions is produced.

The last exercise required is the evaluation to provide feedback to policy makers. This exercise should include assessing the design, implementation, results and effectiveness. Design evaluation is inexpensive and not time demanding, making it a cost-effective tool to avoid implementation of flawed policy or programs. For a policy or program to be effective, correct implementation is critical; thus, implementation evaluation is essential for the success of a well-designed policy and provides timely feedback for improvement. Effectiveness evaluation assess the results of programs and policy on behaviors (i.e. food purchases, healthy eating, physical activity) and nutrition outcomes (i.e. nutritional status). The results of the evaluation often guide decisions about keeping or modifying policies or lead to recommendations for improving their design or implementation. They may also generate new research questions that feed the research-to-policy cycle. Finally, the whole process for the generation and evaluation of policies should include provisions for avoiding conflicts of interests.

Keywords: evidence-based nutrition policy

Closing Lecture:

OUR QUEST FOR HEALTHY DIETS: THE ROLE OF NUTRITION SCIENTISTS

Lartey, Anna.

President of the International Union of Nutritional Sciences (IUNS). Director of Nutrition at the Food and Agriculture Organization of the United Nations (FAO). Rome. Italy.

The current food system is not delivering on the healthy diets needed for optimal health and nutrition. The nutrition situation and the rising prevalence of diet-related non-communicable diseases have become a global concern. About 30 years ago, our major preoccupation was with hunger. We have been able to reduce undernourishment by about 45% from over 1 billion in 1990/1992. Despite progress on this front, we still have about 795 million people being hungry in 2014-2016 (FAO, 2016). About two billion people worldwide are micronutrient deficient, with more than half a million women of reproductive age suffering from iron deficiency anaemia. Among children under 5 years, 156 million are stunted, 50 million are wasted. Nearly two billion people are overweight or obese. Obesity is one of the drivers for the increase in non-communicable diseases. Children have not been spared; over 40 million children are overweight or obese. Altogether, malnutrition in all forms is estimated to affect 1 in 3 persons globally. Underlying the current nutrition situation are unhealthy diets. The Global Burden of Disease identified dietary risk factors as contributing the highest to early deaths among adults. Our diets are changing: although more varied, less healthy, comprising over processed foods, high is sugar, fat and salt, and less consumption of fruits, and vegetables. The food systems determine the quantity, quality, diversity and nutritional content of the foods available to consumers. Thus a faulty food system affects the food environment, from which the consumer selects food and ultimately access to healthy diets. The current global attention given to nutrition provides the opportunity to put in place the policies and programs to turn the food systems around for the better. At the 2nd International Conference on Nutrition organized by FAO and WHO in November 2014, countries committed to enhance food systems by developing coherent public policies from productions to consumption and across sectors to promote safe and diversified diets. The 2030 Agenda of the Sustainable Development Goals has Goal 2, with improved nutrition as a key outcome of food security and sustainable agriculture. In April 2016, the UN General Assembly declared the period 2016-2025 the Decade of Action on Nutrition. It is time for all stakeholders and sectors to step up efforts to eliminate malnutrition in all its forms. Improved nutrition starts with healthy diets. Nutrition scientists we have a role to play in the quest for healthy diets. There are gaps around healthy diets for which the world is looking for answers: What are the essential elements of foods that contribute to a healthy diet? Studies are needed that relate the long term impact of diets from different geographic regions of the world to health outcomes. What food systems policies will contribute to healthy diets? What is impact of globalization on healthy diets? The evidence-base for food systems for healthy diets is still murky. The space is large for nutrition scientists to step in.

IMMUNONUTRITION AND DETERMINANTS OF LIFESTYLE

Marcos, Ascensión.

Research Professor at the Spanish National Research Council (CSIC). Spain.

Lifestyle habits have suffered enormous changes in the last 30 years, mainly as a consequence of a stressful life and the abuse of new technologies and communications. Obviously, these new behaviours attack all ages, from childhood to adulthood passing through the risky period of adolescence. As an example, the sedentary jobs have been duplicated to the detriment of physically jobs. A growing proportion of computer-user workers are in professional positions, using their computers for more than half their working day. Irregular working schedules and an elevated number of long hours spent on computer devices induce stressful effects on mental performance and also lead to a high risk to suffer from different diseases, most of them, related to inflammatory processes, even musculoskeletal injuries. Overweight and obesity are clear consequences of a stressful type of life that appear more and more frequently early in life, developing a high impact on morbidity and mortality in the mid adulthood, leading to chronic diseases such as type 2 diabetes, cardiovascular and neurological disorders, a high incidence of certain tumours, as well as an increased and undesirable symptomatology of allergies and more severe infections. Nowadays, stress is being confirmed to be related to mental disorders that are acquiring high dimensions in the general population, leading to attention deficit hyperactivity disorder (ADHD), among others. This disorder involves an inflammation process associated with immune dysregulation together with a high oxidative stress, increased toxic metal burden and intestinal dysbiosis. Moreover, food consumption has also suffered the impact of the globalization with a detriment of the intake of healthy diets, such as the Mediterranean diet. Nowadays, the assessment of the adherence to the Mediterranean has been used to evaluate the nutritional status of different groups of population. The study of Immunonutrition includes the knowledge of the interactions between the immune system and nutrition status. Therefore, Immunonutrition has a main role in the evaluation of nutritional situations, including not only food intake, but also eating behaviours, physical activity and sedentary habits, sleep profile and stress situations. Thus, the assessment of immunological and metabolism biomarkers acquires a great interest facing out the big concern about the changes of lifestyle in the last three decades in order to detect risks of disease and to prevent the high incidence of chronic metabolism and inflammation-related illnesses that nowadays is an important burden for public health policies.

MICROBIOTA AND OBESITY

[1]*Martínez, J. Alfredo;* [2]*Reizu-Boj, José Ignacio;* [3]*Milagro, Fermin I.*

[1]Department of Nutrition, Food Science and Physiology. Centre for Nutrition Research. University of Navarra. IdiSNA. Pamplona. Spain. CIBERobn. Madrid. Spain.; [2]Department of Nutrition, Food Science and Physiology. Centre for Nutrition Research. University of Navarra. Pamplona. Spain. IdiSNA. Pamplona. Spain.; [3]Department of Nutrition, Food Science and Physiology. Centre for Nutrition Research. University of Navarra. Pamplona. Spain. CIBERobn. Madrid. Spain.

Metagenomics concerns the study of a complete genome from an environmental sample. The conception and application of culture-independent methods has extended the understanding about the diversity and features concerning gastrointestinal tract microbial populations. Two main methods have been implemented concerning characterization of the microbiome that are not based on pure culture, such as sequencing technologies to define the lineages existing in a sample and metagenomics studies based on the whole metagenome shotgun sequencing. In some cases, the first approach is also termed as a "metagenomic" study because they analyse a heterogeneous sample of community DNA. The involvement of the gut microbiota in the onset and development of a wide variety of diseases, including obesity, is being nowadays thoroughly examined. Actually, disruptions on gut microbiota content and composition may be important causal factors in some pathological conditions, although mechanisms are so far not well characterized. Indeed, the ratio between firmicutes and bacteriodetes, as well as the phyla biodiversity, have been found to be altered in various animal models and in obese subjects as compared to lean individuals. Therefore, promotion of specific gut bacterial communities to improve/benefit the expansion of "healthy" bacterial groups and reduce detrimental bacteria might be a complementary therapeutic approach for the management of excessive body weight and other chronic diseases. In this framework, fiber, carbohydrates, proteins, polyphenols and other food components occurring in plant sources, such as flavonoids (i.e. quercetin) and

non-flavonoids (i.e. trans-resveratrol), or from animal sources, may elicit health protective properties. A parallel interplay between some food compounds and the gastrointestinal microbiota arising at intestinal plane has been hypothesized to be responsible, to some extent, for some wellbeing beneficial outcomes. Moreover, polyphenols and other compounds such as betaine might drive to the formation of other metabolites or bacterial-derived co-metabolites with additional biological activities. Therefore, scientific evidences about the impact of pure natural compounds on gut microbiota and, in turn, host metabolism are important in order to further understand the health benefits derived from the intake of diverse food components taking advantage of new technologies, namely next-generation sequencing and untargeted metabolomics. Noteworthy, the consumption of a high-fat/high-sucrose diet impacts on gut microbiota distribution putatively altering the bacterial balance towards an obesity-associated gut microbial profile. The prescription of some dietary patterns, such as a Mediterranean-based food diet, or the administration of bioactive compounds could counteract the accompanying disturbances on the gastrointestinal microbiota by promoting the growth of some beneficial bacteria while reducing some pathogenic and obesity-associated microbes. Finally, metagenomic analyses also may enable to discriminate people in different groups based on the dietary intake or the dietary prescription they might need. In this context, gut microbiota composition might be used as a predictive biomarker of the metabolic response to different dietary interventions, being one of the main pillars in the development of precision nutrition in obesity and associated clinical complicactions.

HOW TO MAKE THE MOST OF HIGH – DENSITY GENETIC DATA FOR HUMAN NUTRITION RESEARCH

Kohlmeier, Martin.

MD PhD. Nutrigenetics Laboratory. UNC Nutrition Research Center. University of North Carolina Chapel Hill. USA.

The impact of most nutrition exposures depends to some extent on inherited disposition. In many instances the differences in response between genetically distinct individuals are so large that they cannot be ignored. Therefore, common genetic variation always needs due consideration for the design, implementation and evaluation of nutrition endeavors. High-density genetic analyses are rapidly gaining ever wider use, facilitated by the ease, speed and affordability of new generation technologies. This includes the use of common microarrays, analysis of targeted genes as well as whole-genome sequencing. The main challenge in respect to genetic analyses is now shifting from consideration of their inclusion to bewilderment by the information overload. Practical examples will showcase for the non-specialist nutrition scientist some approaches and strategies to extract novel and useful knowledge from available high-density genetic data.

It is often illuminating to use publicly available genome browsers to investigate the architecture of target loci even before engaging with any study data. Repositories of genome data are continuously expanding and are starting to be more representative for non-Caucasian populations. This makes the use of genetic data more predictable for nutrition scientists around the world. Careful study of relevant regions helps them to plan for likely diversity and ensure adequate group sizes. Every beginner should make it a priority to learn how to handle their favorite genome browser and use it often.

Genome-wide genetic data include a wealth of information describing each sample donor. Verifying gender is best practice to detect erroneous sample assignments. Other generic uses may include the detection of duplicates, controlling for population stratification and taking into account major known genetic determinants. Strand-specific sequences (haplotypes) across gene segments, or even extended regions, and the resulting diplotypes (defined by the two haplotypes present in an individual) can greatly simplify resolving the genetic diversity resulting from dozens of polymorphisms in a typical gene. Individual diplotypes are often common enough to single-locus genotypes. Allele counting algorithms can bring together the impacts of multiple influencers in the many instances where several variants are likely to contribute to the same outcome. Modeling functional differences of multiple constituents in metabolic or regulatory networks can be another effective way to explore complex genetic data.

With some relatively simple tools, often available as open source versions, most nutrition scientists can try their hand on exploratory analyses of their study data. While the collaboration with genetics experts is invaluable, research progress and scientific understanding will be greatly facilitated with more active engagement by non-expert nutrition scientists. Unlike many other advanced science approaches, exploration of high-density genetic information is relatively inexpensive, does not pose the risk of breaking expensive instruments and is easy to get started with using available training data sets.

IMPACT OF EARLY LIFE NUTRITION ON THE GUT MICROBIOME AND HOST – MICROBE INTERACTIONS IN THE HUMAN INFANT

Donovan, Sharon.

Professor, Department of Food Science and Human Nutrition, University of Illinois, Urbana, IL 61801 USA.

Nutrition in early life is critically important for short and long-term health outcomes. Epidemiological data show that breast-fed infants have lower incidences of infections in early life and gastrointestinal diseases, reduced risk of childhood obesity and improved cognitive development than formula-fed infants. The perinatal period is also the principal time for acquisition of the gut microbiome and the microbiome has been shown to influence the development of same systems that differ between breast and formula-fed infants (e.g. gastrointestinal, metabolic, immune, and cognitive). However, defining how nutrition influences gut development and host-microbe interactions has been limited by ethical constraints surrounding invasive sampling of infants. To overcome this limitation, we have developed a non-invasive method to assess intestinal epithelial gene expression using exfoliated epithelial cells and host-microbe interactions. Using these approaches, identified key gene networks that were differentially expressed in breast- and formula-fed infants. In addition, virulence genes in the infant fecal metagenome were associated with the expression of immunity and defense genes in exfoliated cells, demonstrating for the first time the potential for the microbiota to influence the host transcriptome in the human infant.

Keywords: microbiota, breastmilk, formula, immune

HETEROGENEITY IN RESPONSE TO NUTRITION INTERVENTIONS DURING THE FIRST 1000 DAYS: EVIDENCE FROM RANDOMIZED CONTROLLED TRIALS USING LIPID-BASED NUTRIENT SUPPLEMENTS FOR MOTHERS AND INFANTS

Dewey, Kathryn G.

PhD. Professor. Department of Nutrition. University of California Davis. USA.

Meeting the high nutrient needs of pregnant and lactating women and young children in low-income countries is challenging because diets are dominated by staple foods with low nutrient density and bioavailability. Strategies to meet nutrient needs during the first 1000 days include increased intake of nutrient-rich foods, improved complementary feeding practices, micronutrient supplements, and fortified products designed for these target groups. In the latter category, small-quantity lipid-based nutrient supplements (SQ-LNS, ~20 g/d, ~120 kcal/d) have been developed and evaluated for prevention of malnutrition among infants and young children, and pregnant and lactating women. Several SQ-LNS trials have been conducted. This lecture will summarize results from the International Lipid-based Nutrient Supplements (iLiNS) Project and from the Rang-Din Nutrition Study (RDNS) in Bangladesh. The iLiNS Project included 4 randomized controlled efficacy trials in 3 countries in Africa: Ghana, Malawi and Burkina Faso. Two trials began in pregnancy (the iLiNS-DYAD trials in Ghana and Malawi) and included maternal supplementation (pregnancy and 6 months postpartum) plus infant supplementation from 6 to 18 months of age. Two trials began in infancy, the iLiNS-DOSE trial in Malawi (from 6 to 18 months) and the iLiNS-ZINC trial in Burkina Faso (from 9 to 18 months). Of the 4 iLiNS Project trials, increased linear growth in response to SQ-LNS was seen in Burkina Faso (25% reduction in stunting) and Ghana (40% reduction in stunting), but not in Malawi. The lack of response in Malawi is likely linked to high rates of maternal and child inflammation and infection, and short maternal stature. The RDNS was a cluster-randomized effectiveness trial (n=4011) to compare 4 interventions in rural Bangladesh: a) combined maternal and child SQ-LNS; b) child-only SQ-LNS; c) child-only micronutrient powders (MNP); and d) control. Prenatal SQ-LNS reduced newborn stunting and small head size; the impact was greatest in younger mothers and those with household food insecurity. By 24 months, maternal and child SQ-LNS, but not MNP, improved child linear growth and head size. All three RDNS intervention groups experienced improved child motor and language development. Taken as a whole, the evidence suggests that SQ-LNS supplementation can promote fetal and child growth and development, but there is heterogeneity in these effects both within and across study populations. Heterogeneity may be explained by differences in: a) potential to benefit (baseline nutritional status and dietary adequacy; evidence of developmental delay or inadequate child stimulation), and b) potential to respond (other factors that constrain the ability to improve growth or development). Further research is needed to examine the role of infection and inflammation, the microbiome, environmental contaminants, maternal mental health and caregiver behaviors, and the long-term effects of prenatal nutrition and epigenetic influences on growth and development. Nutrition interventions may have a greater impact if they are delivered as part of a comprehensive strategy that addresses the multiple causes of stunting and poor development, including control of pre- and postnatal infection, care for women and children, and stimulation of early child development.

INTERFACING FOOD SCIENCE AND FOOD TECHNOLOGY & ENGINEERING FOR BETTER NUTRITION REACH OUT–FARM TO FOLK

Prakash, Vishwesihwaraiah

Ph.D., FRSC. Vice President, IUNS, Former Director of CFTRI, Mysore, India & Distinguished Scientist of CSIR, India.

The role of agricultural practices in a region, harvesting practices, transport facilities, primary processing, saving carbon foot print back to the soil, value addition at different steps with co- and by-products have all a role to play in making available tons and tons of nutrients to the Folks from the Farm. This has principally to address the chain and correct with appropriate and adaptable Food Science and Technologies to reach the nutrients with a holistic approach of nutrition on a food based approach. This should also be of course, a well proved science based approach delivering large amount of benefits of the food in that region based on culture, traditional wisdom, sustainable agricultural practices, sustained varieties of agri-materials for varying weather and climate changes and with no fatigue to the soil through eco-practices. All this must result in healthy food to the population, of course, with food safety imbibed in it. The growth of a healthy society all around has to be differentiated from the normal nutrition programs which surpasses subsidized food for combating malnutrition, undernutrition of the mother and child and micronutrient deficient families irrespective of the economic strata. We find the NCDs are increasing year on year in spite of many programmes. The role that food with different forms of cooking and combination of foods, the sequence of food that is eaten, the fresh and the stored food, the potential of the parenteral nutrition and the first 1000 days of the child and mother from conception to delivery and after delivery with all the nutritional programmes falling under one umbrella of food and nutrition for Translational Nutrition appears to be very crucial. How will we manage these makes a huge difference in our approach to the problems of its Translational Nutrition and challenges, solutions and sustainable approach that will make the difference using appropriate, relevant and adaptable Food Science and Technology with Engineering inputs for scale up. The Value addition of Nutrition to a Food is more valuable than just value addition. It is this challenge that the Food Scientists, Technologists and Engineers must join hands with Nutritionists together and more forward to address the Nutritional Challenges.

"If Translational Nutrition matters to us on Food based approach, we shall matter more to it through Reach out of Nutrition on a Sustainable Approach through appropriate Food Science and Technology and Engineering!"

THE NUTRITION TRANSITION AND FOOD SYSTEM DYNAMICS: THE ACCELERATING SPEED OF CHANGE

Popkin, Barry M.

PhD. Nutrition. Department of Nutrition. University of North Carolina. USA.

The nutrition transition, conceptualized as changes in the patterns of eating, drinking and moving and all the underlying technological and environmental causes, is understood at a basic level. The biological mismatches between our biology of taste and movement and our modern food system and movement-related technology have seen rapid gains in knowledge. While rapid shifts in all low and middle income countries (LMICs) physical activity domains are a major causal factor, increased activity is not the major solution. Improving our global diets are challenged by new rapidly changing shifts in the global food system in LMICs in the last several decades. After laying out our food systems earlier history, we examine the recent remarkable rapid changes in LMICs. The challenges posed for nutrition-related noncommunicable disease, including obesity prevention, are great. We have new actors increasingly controlling LMIC food production (agribusinesses, global and local food and beverage producers, food service companies, and food retailers) and subsequently our food purchases. Understanding the history of the food system changes and the way this has been linked with dietary changes and more recent acceleration of these dietary shifts is important. At the same time we are seeing important changes in our body composition which we have yet to fully understand. These body composition changes, of course, relate not only to diet shift but to increasing shifts in physical activity in all domains. Food policy changes are seen as the major option for prevention but they will not be adequate without shifting our culture of eating.

WHAT THE WORLD CAN LEARN FROM MEXICO'S BATTLE AGAINST OBESITY: VULNERABLE GROUPS, INTERNATIONAL COLLABORATION, EVIDENCE-BASED POLICIES AND MANAGEMENT OF CONFLICTS OF INTEREST

Barquera, Simon.

MD, MS, PhD. Director. Nutrition and Health Research Center. National Institute of Public Health. Mexico.

Mexico has learned a number of lessons that could contribute to other countries' national obesity prevention efforts. In 2002, we documented an alarming rise in diabetes mortality. The finding was received with skepticism at a time when the main perceived health challenge was undernutrition and obesity was only considered a disease of affluence. In November 2016, the government declared a national epidemiological alert due to the diabetes considerable rise. For the past years, we have developed efforts to understand the potential determinants involved in this transition and international collaborations to evaluate policy options. Among these, a soda tax initiative, front-of-pack food labeling and food marketing regulations. The government has adopted some recommendations, but in many cases evidence-based policies have faced intense lobbying and opposition campaigns, mostly led by transnational food and beverage companies [1].

In 2013, a fiscal reform including a soda tax initiative was implemented in response to international reductions in oil prices and increasing inflation rates. Diverse evaluations have demonstrated a decrease in consumption [2] and we have modeled its potential health and economic benefits in the next 10-y [3].

Many developing countries are experiencing transitions with a number of similarities such as increasing participation from transnational companies, increasing availability of ultra-processed foods, lack of adequate regulation of commercial practices, poor nutrition literacy among the population and public health efforts focused mainly in overcoming undernutrition [4]. In this context, five lessons from our experience that should be considered are: a) obesity affects mostly vulnerable groups; however society as a whole pays the costs; b) international collaboration is necessary to modify the obesigenic environment; local efforts to develop evidence and policies have limitations, but there is a supporting international group of academia, civil society and funding agencies with solid expertise, c) obesity prevention requires interdisciplinary teams with experts in the fields of economics, social marketing, good lobbying, etc. Public health alone has a limited chance to achieve the desired outcomes; d) academia needs to develop evidence and provide it when a window of opportunity to support policies rises; and e) preventing and managing conflict of interests could be one of the most important steps to curve the NCDs global epidemic. Unhealthy food and beverage companies' actions that negatively influence and undermine public health efforts must be documented and widely disseminated to make transparency and accountability a social norm.

ENABLING AND DISABLING HEALTH SYSTEMS THROUGH FOOD SYSTEMS

Wahlqvist, Mark L.

MD. Professor. Monash Asia Institute. Monash University. Melbourne. Australia.

Health is more dependent on the prevailing food system than acknowledged. This is for several reasons. First, it may or may not be available Second, it may not be safe. Third, it may not be acceptable. Fourth, it may not be affordable. Fifth, food itself is much more complicated than nutrient composition would suggest or aberrant nutrient intake might contribute to pathophysiology (Wahlqvist Food & Function 2016). Sixth, food plays a sociological as well as physiological role. Seventh, it is eaten at the end of an intricate system of production, transport, processing, packaging, storage and marketing any one of which may have health effects downstream. Eighth, it has effects on every body organ and system, not just the cardiovascular, gastrointestinal, musculoskeletal or immune system, for example. Ninth, it alters gene expression (epigenetics), and heretofore we have over-stated what is genetic inheritance and underestimated the intra-and inter-generational effects of food. Tenth, the growing understanding of our microbiomes provides for explanatory models of food-health associations previously arcane. Finally, we are ecological creatures and not separate from our environment whether through biorhythms, sensory inputs, energy regulation, microbiomic pathways, endocrine-phytonutrient linkages, locomotor activity, eco-immunology, and more (Wahlqvist ML ,Ann Nutr Metab 2016).

The recognition of these food system inputs into human biology offers potentially greater cost-effectiveness in health care systems. We now know that a greater emphasis on plant-derived foods and food biodiversity reduces the prevailing burden of disease and its costs (Lo et al Amer J Managed Care 2013). In addition, the availability of public open space (POS) and gardens is associated with better mental health, longer lives and less so-called chronic disease (Mitchell and Popham, Lancet 2014). Better health outcomes are possible even in the face of risk factors like cognitive impairment, hypertension and obesity with a biodiverse diet, physical activi-

ty and POS (Wahlqvist APJCN, 2014). A deeper understanding of food and health would be represented by an ecosystem health disorder nomenclature (EHD) (Wahlqvist, APJCN, 2014). It has been suggested that we increasingly suffer what might be termed 'nature deficit disorders'. Given that modest exercise is necessary to access nature, and is associated with healthier and longer lives (Wen CP et al Lancet, 2011), the combination of a biodiverse diet, the social role of food and walking among nature and gardens has the prospects of health and economic advantage.

Yet new health risks and costs loom as ecosystems are lost and food systems compromised. One of the most pressing is that of oceanic contamination with microplastics, much of it derived from food and beverage packaging. They are now found in deep sea and coastal seafood whose health risk and benefit must therefore come under review.

An innovative food and health workforce with systems awareness could take a more socio-ecological approach to mitigate the challenges of climate change. Axiomatic will be that we need to appreciate how little we need and not seek how much we can get, in the interests of our ecological selves and a habitable planet.

IMPACT EVALUATION READINESS IN POPULA-TION-BASED NUTRITION PROGRAMS: THE EX-AMPLE OF FOOD FORTIFICATION

[1]Neufeld, Lynnette M.; [2]Friesen, Valerie.

[1]Global Alliance for Improved Nutrition; [2]Global Alliance for Improved Nutrition. Geneva. Switzerland.

Food fortification, or the addition of essential vitamins and/or minerals to a food, is a cost-effective intervention designed to increase micronutrient intakes. Recent evidence confirms that food fortification programs in low- and middle-income countries improve a range of micronutrient deficiency-related outcomes in different population groups when there is high quality and consumption of fortified foods. Programs that did not show impact in the expected health outcomes tended to have low intake of the food, poor compliance with fortification and/or poor bioavailability of the selected fortificant.

High coverage is a prerequisite for impact of any intervention or program and many factors including availability, accessibility and acceptability of products/services may affect program coverage. Measuring coverage across the service delivery process and the factors that limit or facilitate it can be used to directly assess the potential of programs for impact and to identify solutions to improving potential. Considering a typical program impact pathway for food fortification, quality, coverage and utilization, are intermediate outcomes that should be assessed as part of on-going monitoring activities during the implementation phase of a program. Only when there is high enough coverage and utilization of adequately fortified foods for impact on nutritional status to be plausible should biochemical or functional outcomes be assessed.

Currently, such information on coverage and utilization is rarely available in nutrition programs due to gaps in program monitoring and/or process evaluation activities yet impact evaluations are still frequently undertaken, often at substantial expense.

Without measuring and understanding patterns of coverage and utilization, impact evaluations may have limited potential to capture the true contribution of food fortification in a population and subpopulation groups that may be at risk of inadequate micronutrient intake, and also to provide potential explanations if impacts are not observed. Impact evaluation readiness of all nutrition programs must be considered from the outset of program design. Program monitoring and evaluation activities should systematically include coverage assessments with clear criteria for minimum coverage levels to guide evaluators on when it is feasible to undertake impact evaluations.

As part of this short conference, we will present data from recent coverage assessments of food fortification programs (including wheat and maize flour, oil among other vehicles) in 10 countries and discuss implications for potential for biological impact across countries and among different sub-groups within countries. We will also use conclusions from this body of work to discuss implications for improving impact evaluation methodologies for population based programs.

Keywords: fortification, coverage, evaluation, multi-country, impact

KL_144/3066

DECLINING CONSUMPTION OF ADDED SUGARS AND SUGAR-SWEETENED BEVERAGES IN AUSTRALIA: A CHALLENGE FOR OBESITY PREVENTION

[1]Brand-Miller, Jennie; [2]Barclay, Alan.

[1]PhD. Nutrition scientist. Charles Perkins Centre. University of Sydney; [2]PhD. Accredited Practising Dietitian, Sydney, Australia.

Background: Reducing intake of added sugars and sugar-sweetened beverages (SSB) has been the main focus of efforts to stall obesity. According to a global analysis, Australia and New Zealand experienced the single largest absolute increase in adult obesity since 1980 and the single largest increase in adult female obesity. More than 68% of Australian men and 56% of women are overweight or obese. While obesity has risen steeply, some evidence suggests that added sugars and SSB intake declined in Australia over the same timeframe.

Objective: To investigate recent trends in availability of sugars and sweeteners, and changes in dietary intake of total sugars, added sugars and SSB in Australia using multiple, independent data sources.

Methods: A comparison of relevant data published by the Food and Agriculture Organization of the United Nations (FAOSTAT), Australian government, academia and industry.

Results: FAOSTAT food balance sheets for Australia show per capita availability of added/refined sugars and sweeteners fell 16%

from 152 g/capita/day in 1980 to 127 g/capita/day in 2011 (P for trend = 0.001). In national dietary surveys in 1995 and 2011-12, added sugars intake declined markedly in adult men (from 72 to 59 g/day, -18%) but not women (44 to 42 g/day, NS). As a proportion of total energy, added sugars fell by 10% in adult males but non-significantly in adult females. Between 1995 and 2011-12, the proportion of energy from SSB (including 100% juice) declined by 10% in adult males and 21% in females. More marked changes were observed in children 2-18 y. National grocery sales data indicated that added sugars derived from carbonated soft drinks fell 26% between 1997 and 2011 (from 23 g/capita/day to 17 g/capita/day) with similar trends in non-carbonated beverages.

Conclusions: In Australia, 4 independent datasets confirm shorter and longer term declines in the availability and intake of added sugars, including those contributed by SSB. The findings challenge the widespread belief that energy from added sugars and sugars in solution are uniquely linked to prevalence of obesity.

INVOKING THE BASE OF THE ICEBERG: ORIGINS AND CONSEQUENCES OF ENDEMIC SHORT-STATURE (ERRONEOUSLY TERMED "CHRONIC UNDERNUTRITION")

Solomons, Noel W.

Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala City. Guatemala.

Protein-calorie (-energy) malnutrition (PEM) was once the monarch of human nutrition paradigms. Born in 1933, in observations by Ceciley Williams in West Africa, it came into relief as the focus of public health nutrition in the mid-1940s after the founding of the UN and its agencies: WHO and FAO. Attention would remain on clinical syndromes –kwashiorkor and marasmus– for the next three decades, until height/length came into play. This emerged from a classical article by John Waterlow entitled: "Classification and Definition of Protein-Calorie Malnutrition" (1972). This was linked to a concept that the clinical forms were the tip of an iceberg, with preclinical PEM manifested by altered anthropometry; this in turn related to the supply and consumption of macronutrients in the diet. Waterlow termed the process of height decline as linear "retardation" and the extreme status as "stunting", expressed as height-for-age. These were ascribed to the duration of nutritional deprivation, and "chronic malnutrition" became a synonym.

Militating against pure dietary origins of stunting, up to 40% arises in fetal life, with the most accelerated phase of retardation occurring during exclusive/ predominant breast-feeding. Supple-

mentation of neither protein nor micronutrients (individually or in combination) reverses the condition. Observations by Bogin & Varela-Silva and Penny (and confirmed at CeSSIAM) show that short-stature is driven by deficits in the length of the lower extremities, with the torso-length and head-circumference remaining relatively conserved.

Notably, also in the early 1970s, more nuanced nutritional concepts emerged, as one enunciated by Doris Howes Calloway "people eat foods, not nutrients", and another by Victor Herbert that, beyond the ingestion of nutrients, their absorption, retention and utilization were further determinants of nutritional status. These were brought to this present explanation of stunting's origins. Most likely, all of the amino acids, calcium and phosphorus for hydroxyapatite are available within the body from any diet with human (or bovine) milk. A parsimonious theory for the mechanistic origins of retardation and stunting is failure of the utilization of nutrients essential for long-bone elongation due to impairment in the signally in the hormonal cascade regulating the epiphyseal growth-plates. The signallying pathway can be interrupted by inflammatory and stress hormones. The stress-inducing elements common to deprived settings include microbial saturation, ecto- and endoparasite infestation, recurrent infections, mycotoxins, poultry fecal toxins and adverse maternal psychosocial conditions, along with a potential role of malabsorption and systemic inflammation arising from environmental enteric dysfunction (EED), may constitute the constellation of mediators to disrupt long-bone elongation.

The epidemiological variation of stunting across continents, as well as within continents across nations and across areas within nations, suggest the possibility of genetic factors in resistance to or susceptibility for the antitrophic effects of the environmental factors.

So, 45 years after Waterlow's postulation of linear retardation and stunting as part of the preclinical manifestations of the PEM continuum somewhere in the base of the iceberg, their true origins remain submerged in uncertainty. Without a firm dietary explanation, however, "chronic malnutrition" is an unsuitable and outmoded descriptor worthy to be retired.

STUNTING: CHALLENGES IN ESTIMATING PREVALENCE AND POTENTIAL SOLUTIONS

Martorell, Reynaldo.

Emory University. USA.

Stunting is a leading indicator used in policy formulation, social sector investment and program evaluation. For example, the World Health Assembly (WHA) established the goal of reducing the prevalence of stunting in 2010 by 40%, or to 100 million

stunted children, by the year 2025. Stunting is declining but too slowly to meet this goal; by 2025, the decline will have been only 26% relative to 2010 and 171 million children are expected to be stunted. Measurement error inflates the variance of height for age Z-scores and overestimate the prevalence of stunting and there is considerable noise in the country-level data. In addition, program evaluation is compromised when measurement is poor and may even make a successful program appear to be a failure. The purpose of this lecture is to discuss options for improving data quality. There are several diagnostics to identify the quality of measurement. Proper training and supervision are effective in improving the quality of measurement and several groups are working on strengthening training manuals. Another potential solution is to develop new technology to replace anthropometry. One such example is being developed by Body Surface Technology (BST) and Emory University. The system uses three -dimensional imaging (3DI) taken with off the shelf gadgets (Video game technology – Kinect- connected to an iPad) and an app written by engineers to create a three dimensional articulated model of the child from which measurements such as length and head circumference can be taken. The system is light and portable. We are comparing measures taken with 3DI with those obtained from anthropometry in 500 preschool children in Atlanta, with Gates Foundation funds. The idea is that if 3DI is as good (similar accuracy and no bias) as standardized anthropometry and assuming that 3DI requires less training and time to provide accurate and valid length and other measures, that it could substitute for anthropometry eventually in surveys, with improvement in the estimation of stunting. Joel Cockle is leading the data collection and analysis of the 3DI project for his doctoral dissertation at Emory. A next step would be to try 3DI in a developing country setting.

Keywords: Anthropometry, stunting, measurement error, 3-dimensional-imaging

Prof. Demography and social statistics. Co-Director center for global Health Population, Poverty and Policy. university of Southampton. United. Kingdom.; (8)PhD. Epidemiology and anthropology. Director Health Institute. Brown University. United States of America.

Background and objectives: The child survival and development strategy in Kenya aims at improving child health and reduction in child mortality through the acceleration and scale-up of evidence-based high-impact interventions. Promotion of optimal maternal infant and young child delivery of such high impact interventions is marred by lack of clear evidence on what works, how it works and why. The Baby Friendly Community Initiative (BFCI) project conducted a formative qualitative study whose specific objectives were to determine the local contexts and cultural factors that influence breastfeeding and other maternal, infant and young child feeding practices in order to tailor the intervention package to the communities and to determine the enablers and barriers associated with the implementation of Baby Friendly Community Initiative and how to address them

Methods: The formative study employed a cluster randomized trial which used a participatory action research design for qualitative data collection. A total of 205 participants were interviewed in the study which covered 13 community units which were used as sampling units for the main project. A total of 52 interviews were done, 16 Focus Group Discussions, 14 In-depth Interviews and 22 Key Informant Interviews. The key informants included chiefs, village elders, religious leaders, women leaders, CBO leaders, Traditional Birth Attendants and health professionals at sub county and health facilities. In-depth interviews included pregnant women, breastfeeding women, HIV positive women and Health professionals. Focus group discussions were done with fathers, old and young mothers, grandmothers and Community Health Volunteers.

Results: Results revealed that cultural factors and traditions had great influence on maternal and child feeding practices. Mothers' decisions were also highly influenced by the health workers, community and family members, religious leaders and Traditional birth attendants. This information was used to develop

appropriate and targeted intervention strategies for effective BFCI implementation.

Conclusions: End line qualitative data showed a great improvement in addressing some of the key barriers and enhancement of the existing enablers. There were significant positive outcomes for key indicators; the number of antenatal visits, health facility deliveries, exclusive breastfeeding, growth monitoring, motivation and capacity building of community health volunteers and functional mothers support groups.

Keywords: Baby Friendly Community Initiative, Enablers/Barriers

Conflict of Interest disclosure: The authors of this abstract declare that this is an original 3 year intervention research and this presentation is based on findings, there is therefore no conflict of interest.

NEW INSIGHTS INTO OBESITY PREVENTION IN CHILDREN AND ADOLESCENTS

Moreno, Luis A.

GENUD research group. Universidad de Zaragoza. Zaragoza (Spain).

Obesity in children and adolescents has been increasing in the last decades, reaching unacceptable prevalence rates. Public health actions seem to start to be effective in some developing countries. However, more efforts are necessary to achieve the WHO goal of ending with the childhood obesity epidemic. Available evidence concludes the different types on interventions already implemented, have moderate effect in body composition indices, i.e. the body mass index (BMI). Interventions use to be effective in relation with the targeted behaviours, especially fruits intake and sedentary behaviours. Interventions combining different nutrition and physical activity related behaviours are more effective than those targeting isolated behaviours. Ideally, interventions should focus not only in children, but also in the families, the school and the community. The school is an appropriate setting in this population group, as children spend a significant part of their time taking lessons and participating in other school-related activities. Community activities seem to add to what is achieved with the other intervention components.

The main limitation of the studies on childhood obesity prevention is the lack of proper assessment of the process of the intervention and its relationship with the obtained efficacy. Different aspects related with the intervention context should be considered, such as contextual factors that shape theories of how the intervention works, contextual factors that affect implementation, intervention mechanisms and outcomes and causal mechanisms present within the context which act to sustain the status quo, or potentiate effects. The implementation process as how delivery is achieved, training, resources etc. should be considered as well as what is delivered, specifically its fidelity, dose, adaptations and reach. Mechanisms of impact such as participant responses to and interactions with the intervention, mediators and potential unexpected pathways and consequences should be also considered.

Innovative strategies are also promising for future intervention programs. They include social marketing approaches, the use of social networks in order to disseminate health related messages and to take profit of the peers influence, and the use of active games. Future studies should incorporate these promising approaches in order to develop the most effective strategies to tackle the childhood obesity epidemic.

Keywords: Obesity, prevention, child, epidemiology

KL_144/3037

CHALLENGES IN THE CARE OF CHILDREN AND ADOLESCENTS WITH TYPE 1 DIABETES

Mazza, Carmen.

Hopital JP Garrahan , Unit of Nutrition. Argentina.

The Diabetes Control and Complications Trial (DCCT) showed that improved metabolic control reduces the risk of long term complications in both adult and adolescent patients with type 1 diabetes (T1D).

The Epidemiology of Diabetes Interventions and Complications (EDIC) study further proved that good glycemic control had persistent beneficial effects on long term complications. Based on these results it was recommended to optimize glycemic control as early and close to normal as possible in all patients in order to prevent complications. Despite modern approaches to physiologic insulin replacement, insulin analogs and insulin pumps, most children and adolescents fail to achieve optimal metabolic control and do not achieve the recommended Hb A1 c target.

There is a need to identify current barriers and opportunities in diabetes care.

TEENs study of young people with diabetes provides a global approach to explore factors related to glycemic control & quality of life of T1D youths by age class (8–12, 13–18, 19–25 y/o) through multifaceted insights (health-care providers, T1D patients, families) 5960 participants from 20 countries of 5 continents and over 200 centers were included. TEENs study also explores the challenges of transition of care from pediatric to adult in the understudied young adult population. Results show that more than 70% of young people with T1D do not achieve glycemic control targets.

Factors associated with A1c target attainment included treatment approaches (frequent Blood Glucose Monitoring (BGM), carb counting, exercise, avoiding ketoacidosis, and glucagon availability) and family factors (avoiding diabetes-specific family conflict)

In agreement with the TEENs, the type 1 Diabetes Exchange register clinic network from the USA which compared adolescents with excellent vs poor control, showed that both groups differed substantially in diabetes management with excellent control group using insulin pumps, performing more blood glucose monitoring, missing fewer boluses and using meal -specific insulin: carbohydrate ratios than those in poor control.

With another perspective, Huidöre study registers 26 centers from Europe, USA, Japan and Australia evaluated between 1998 and 2009 and summarized in the paper Lessons from the Huidöre International Study Group on Childhood, from 2013. It shows the relevance of modality in applying therapeutic strategies and focusing on communication and visits regularity as predictors of Hb A1c levels

While the patients' expectations are a cure, minimally invasive treatments, and not having any limitations, HPC's goals are control to prevent complications for which we indicate intensive treatments, multiple insulin doses, frequent BGM and pumps.

Finding common goals, incorporating motivational techniques with patient-centered treatments, working as a multidisciplinary team to implement interventions that target modifiable factors may help optimize A1c levels; and providing added support and education to youth with non modifiable factors (at risk demographic and family factors) may help overcome suboptimal control in youth with T1D.

Keywords: Key words: Type 1 diabetes, pediatrics, glycemic control, Hb A1c.

NUTRITION FOR INFLAMMATION: PUT OUT THE FIRE!

Escott-Stump, Sylvia.

RDN. Clinical Assistant Professor. Department of Nutrition Science. East Carolina University. Greenville NC. USA.

Inflammation is a major factor for the progression of diabetes, cardiovascular diseases, eye disorders, arthritis, obesity, autoimmune diseases, and inflammatory bowel disease. Pathological inflammation associated with autoimmune diseases is controlled by networked immune system genes. The nuclear factor kappa-B protein family, as well as signal transducers and activators of transcription 3 (STAT3,) activate over 500 gene products affiliated with inflammation, cell transformation, angiogenesis, and metastasis. Most chemo-preventive blockers act by inhibition of NF-κB and STAT3 pathways. These blockers have numerous side effects whereas plant-derived polyphenols do not. An anti-inflammatory Mediterranean diet supports lifelong health and a reduction in chronic inflammation.

Keywords: Inflammation, Plant polyphenols, Mediterranean diet

KL_144/3642

BIOCHEMICAL PROFILE IN PATIENTS SUFFERING DIFFERENT TYPES OF CANCER AND AIDS

Slobodianik, Nora H.

PhD. University of Buenos Aires, School of Pharmacy & Biochemistry. Dept. Nutrition & Food Science. Argentina.

The aim of this lecture is to show the most important results obtained in our laboratory, related to the nutritional status evaluated through the use of biochemical parameters. Patients suffering from a) head and neck cancer (HNC, n=17), b) colorectal, esophagus or stomach cancer (GG, n=32) and c) HIV+/AIDS (n = 43), were included.

HNC were looked after at the Service of Gastroenterology (Carlos G. Durand Hospital), GG at the Angel Roffo Institute of Oncology and HIV+/AIDS at the Hellios Salud Centre. The study was approved by the University of Buenos Aires Ethics Committee, and all participants agreed to sign the written consent before recruitment.

Blood samples were collected from fasting patients. Specific plasma protein fractions Albumin, Transthyretin (TTR), Transferrin (Tr), C3 and C4 complement fractions (C3c, C4c). Ceru-

loplas¬min (Cp), Haptoglobin (Hp), Fibrinogen and C-reactive protein (CRP) were measured by single radial immunodiffusion technique on agar gel layers (Binding Site, UK; Diffu-Plate, Biocientífica SA, Argentina).

IL-4 concentration and total antioxidant status (TAS) was determined by Elisa and by Randox Kit (UK), respectively in the HNC group. In addition, the fatty acid profile was analyzed on 58% of these patients.

The results (expressed as X±SD) were compared against reference values performed in a group of healthy subjects.

HNN group

Data showed lower TTR, C3c, Tr and IL-4 levels together with higher Cp and Hp plasma concentrations than those from the reference values. These results pointed out to a depressed nutritional status and an inflammation process. Moreover, a decreased total antioxidant status and changes in essential fatty acids pattern were observed. These findings showed the importance of an early and periodical nutritional evaluation that could help to perform an adequate nutritional support concomitant to the specific treatment.

GG group

Statistically significant decreases were shown in Tr, ApoB, C4c and TTR plasma concentrations together with concomitant increased albumin levels when data were compared with reference values. This behaviour suggests nutritional disorders associated with an hemoconcentration status in this group of patients. It is important to highlight that nutritional differences depend on diverse stages of the disease.

HIV+/AIDS group

HIV+/AIDS patients showed changes in biochemical parameters, particularly an increase in Fibrinogen and ApoB together with a tendency to diminished TTR levels. These data could lead to a compromised nutritional status with an altered lipid profile.

The global analysis of the biochemical profile of individuals suffering from these different pathologies emphasize the importance of including the periodic evaluation of functional biochemical parameters in these patients, since the diagnosis of the pathology. This outcome would allow an early assessment to achieve an appropriate nutritional support, implemented along with the specific therapy, leading to the delay of the progression of the disease, and improving survival and quality of life outlook.

BENEFICIAL EFFECT OF PROBIOTICS CONSUMPTION ON THE IMMUNE SYSTEM

(1)Perdigón, Gabriela; (2)Maldonado Galdeano, Carolina.

(1)Researcher from CONICET-CERELA and Tucumán University. Argentina.; (2)Researcher fron CONICET-CERELA and Tucumán University. Argentina.

The gastrointestinal tract is one of the most active microbiologically ecosystems that play a crucial role for the functioning of the Mucosal Immune System (MIS). In this ecosystem, probiotic microorganisms, that enter orally can stimulate the Immune System and induce a network of signals, mediated for the whole bacteria or their cell wall structure (originated by the effect of antimicrobial substances from the Paneth cells): 1) to the intestinal epithelial cells or the immune cells associated, to the lamina propria; 2) the interactions induce the production of different cytokines or chemokine as MCP1 (macrophage chemoattractant) from the IEC, that in turn will send signals to the immune cells, which contribute to the MIS activation. We demonstrate: a) probiotic strains stimulate the mucosal immunity increasing the number of IgA +cells in the intestine, the activity of T cells, and induce inmunomodulation by IL-10 release. We determined the importance of the probiotic viability b) that in the interaction with the epithelial cell and macrophages, Tol like receptors (TLRs), mainly TLR2 are involved, and also the mannose receptor, 3) probiotics favor the innate immune response, where macrophages and DCs play an important role, without inducing an inflammatory immune response, they only produce a slight increase in the cellularity of the lamina propria. We demonstrate the effectiveness of probiotics in Salmonella infection by an increase in the microbicidal activity of peritoneal and spleen macrophages. In malnutrition models with an improvement in the histology of intestine and thymus in both: undernutrition and obesity with an improvements in Immune System functionality. We determine in a respiratory allergy model, that a PFM diminished the levels of IgE by induction of Th1 balance, that favor the production of IgG instead of IgE. These biological mechanisms observed mediated by probiotic stimulation, open the door for the study of anti-inflammatory mechanisms. We demonstrated the anti-inflammatory effect of yogurt in IBD model, where we observed a decrease in the inflammatory cytokine IL-17. We conclude that probiotic strains, PFM and yogurt have an important role in the functionality of the MIS and in the immune surveillance, through the mechanisms of immunoregulation

KL_144/3501

MEAL PATTERN ANALYSIS: NEW INSIGHT INTO DIETARY PATTERN AND THEIR HEALTH CONSEQUENCES

Boeing, Heiner.

German Institute of Human Nutrition. Germany.

It is still a debate whether public health aspects of diet should be addressed preferentially as single dietary component or as dietary pattern. The pattern approach has gained prominence during the past decade and the scientific community can find many scientific publications on this topic. Of particular interest had been statistical approaches that identify dietary patterns in a specific study population from empirical data and relate these patterns to disease risk.

The motivation to investigate dietary patterns instead of single components comes mainly from the observation that many of the components of dietary intake correlate with each other. This observation usually makes it difficult to interpret the health impact of a single component properly in view of the many alternatives. However, it is still not widely discussed how exploratively identified dietary pattern can be interpreted and why they exist in a study population. The interpretation of dietary pattern is getting even more complex when habitual dietary intakes had been used as prime data source. This is the case of nearly all studies conducted so far on dietary pattern.

Information on the course of food intake at the different eating occasions over a day is nowadays widely available due to the increased use of 24-h-recalls. The investigation of food intake at meal occasion is in line with the idea of foods eaten together as well as with the idea that a specific food consumption at a particular time during the day is meeting with a metabolism that is following a circadian rhythm. Thus, the analysis of meals regarding food intake and their patterns could help understanding the formation of food pattern on the habitual level but also understanding their immediate metabolic impact. In this way meal and meal pattern analysis open up a new promising research area.

In our group we recently analyzed with different statistical approaches (PCA and network analysis) how meal pattern relate to habitual pattern. We found that - in the German context - breakfast is the most stable meal but has less impact on the formation of habitual pattern than other meals particular if variation reduction methods are used to identify dietary pattern. Dinner is the meal with the highest impact on the formation of dietary pattern on habitual level. We also found that only part of the pattern identified in habitual data originate from foods eaten together at meals. Currently we are searching on how otherwise foods are combined at habitual level into a food pattern.

A statistically more comprehensive approach to investigate meals with a particular focus on foods being eaten and its health implication is multi-level analysis. This statistical approach is trying to trace the origin of variance at the different levels and also could relate this variance to covariates. The covariates can also include metabolic and health parameters measured at the individual level. First results from this investigation will also been presented in this lecture.

Keywords: Meal, meal pattern, dietary pattern, multilevel analysis

KL_144/2877

FROM TASTE TO WEIGHT

Rolla, Arturo R.

Beth Israel Deaconess Harvard Medical School. Boston, MA 0221. USA.

Obesity is a chronic intoxication with calories. Eating causes a pleasure sensation that starts with the sense of taste in the gustative receptors of the papillae in the tongue, mouth and pharynx.

There are specific receptors in the papillae for sweet, bitter, umami, salty and rancid.

In the last couple of years another set of receptors for fatty substances was discovered.

Foods with sweets and fatty components are the most stimulating.

This information is transmitted first to the Nucleus of the Tractus Solitarius, from there to the hypothalamus and higher centers in the brain, recently started to be discovered with fMRI research.

Similar receptors are also found in the intestine with sensations transmitted to the Central Nervous System mostly by ascending fibers of the Vagus nerve.

The overall sensation transmitted to the brain is one of gratification and reward.

The neurotransmitters in charge of these pleasurable sensations seem to be mostly dopaminergic, although serotonin, GABA and norepinephrine are also present in some of these pathways.

The hypothesis to be presented is that the pleasure sensation of eating is the main reason that makes obesity so common and resistant to treatments in a world of excessive calories offered by the food industry.

Keywords: Obesity, Taste, Gustatory Receptors, Pleasure sensation.

KL_144/3384

MOLECULAR MECHANISMS OF ACTION OF PROBIOTICS

Gil, Ángel.

PhD. Prof. Department of Biochemistry and Molecular Biology. Institute of Nutrition and Food Technology. Centre of Biomedical Research. University of Granada. CIBERobn. Spain.

Probiotics are living microorganisms that confer a health benefit on the host when administered in adequate amounts, although dead bacteria and their components can also show probiotic properties. Bifidobacterium and Lactobacillus strains are the most widely used bacteria exhibiting probiotic properties and are included in many functional foods and dietary supplements. Beneficial effects of probiotics in allergy, intestinal-related diseases (IRD), chronic liver disease, urinary tract infections and respiratory infections have been reported, among others.

The current scientific evidence regarding to overweight and obese patients that received some probiotics and synbiotics shows a significant reduction in the abdominal adiposity and BMI; and also, probiotic supplementation produced an improvement in the metabolism of carbohydrates, as well as a reduction in the metabolic stress in patients with type 2 diabetes (T2D) and IRS. Moreover, an improved serum lipid profile was observed in patients with T2D after the consumption of synbiotics. The effects of probiotics in patients with non-alcoholic fatty liver disease (NAFLD) were primarily an improvement in the liver function and metabolic parameters, although there is some controversy on the effects of probiotics on those chronic diseases, which might be related to inappropriate design such as diversity, the use of several strains, and the small number of individuals receiving some interventions. Undeniably, further studies to evaluate the best dose-response effect of probiotics and synbiotics are needed, including following up with patients after the probiotic intervention to evaluate the persistence of their potential beneficial effects in obesity, IRS, T2D, and NAFLD.

Major mechanisms underlying the effects of probiotics include improvement of the gut barrier function, increased competitive adherence to the mucosa and epithelium, gut microbiota modification, and regulation of the gut associated lymphoid immune system. In this regard, probiotics communicate with the host through intestinal cell pattern recognition receptors, such as Toll-like receptors and nucleotide-binding oligomerization domain-containing protein-like receptors, which modulate important key signalling pathways, such as nuclear factor-κB (NF-κB) and mitogen-activated protein kinase (MAPK), to enhance or suppress activation and influence downstream pathways. Some authors have also described the modulation of intestinal gene expression mediated by probiotics. In this regard, our group has recently shown that L. paracasei CNCM I-4034, B. breve CNCM I-4035 and L.

rhamnosus CNCM I-4036 are able to inhibit the expression of both Adamdec1, a gene involved in dendritic cell maturation, and Ednrb, a gene that codifies for endothelin B receptor involved in vasoconstriction/vasodilation and cell proliferation in the intestinal mucosa of the Zucker rats. Beyond understanding the molecular mechanisms of action for probiotics, further studies to evaluate the best dose-response-effect of probiotics, including following up with patients after the probiotic intervention and persistence of beneficial effects, are clearly needed.

FEEDING THE IMMUNE SYSTEM: THE DANONE INTERNATIONAL PRIZE FOR NUTRITION 2016

Calder, Philip C.

Faculty of Medicine, University of Southampton, Southampton, UK.

A well-functioning immune system is key to providing good defence against pathogenic organisms and to providing tolerance to non-threatening organisms, to food components and to self. The immune system works by providing an exclusion barrier, by identifying and eliminating pathogens and by identifying and tolerating non-threatening sources of antigens, and by maintaining a memory of immunological encounters. A breakdown in host defence increases susceptibility to infection while a breakdown in tolerance results in immune-mediated diseases like food allergy or autoimmunity. The immune system is complex involving many different cell types distributed throughout the body and many different chemical mediators some of which are involved directly in defence while others have a regulatory role. Babies are born with an immature immune system that fully develops in the first few years of life. Maturation factors in breast milk, acquisition of an "appropriate" microbiota, and exposure to environmental antigens for example from microorganisms and from are all important in early life immune maturation. Immune competence can decline with ageing. The sub-optimal immune competence that occurs early and late in life increases susceptibility to infection. Undernutrition decreases immune defences, making an individual more susceptible to infection. However, the immune response to an infection can itself impair nutritional status and alter body composition. Practically all forms of immunity are affected by protein–energy malnutrition, but non-specific defences and cell-mediated immunity are most severely affected. Micronutrient deficiencies impair immune function. The gut-associated lymphoid tissue (GALT) is especially important in health and well-being because of its close proximity to a large and diverse population of organisms in the gastrointestinal tract and its exposure to food constituents. There are strong interactions between the gut microbiota and the host GALT and it is considered that an altered gut microbiota can affect host immune responses. Strategies to modify the gut microbiota include prebiotics and probiotics and through such modifications host immune defence may be improved.

Keywords: Nutrition, immunity, life course, microbiota

OLIVE POLYPHENOLS – IMPORTANT MEDIATORS OF HEALTH BENEFITS OF THE MEDITERRANEAN DIET ?

Rowland, Ian.

PhD. Department of Food and Nutritional Sciences. University of Reading. UK.

There is extensive evidence that the Mediterranean diet is associated with health benefits for cardiovascular disease, cancer and type-2 diabetes. Extra virgin olive oil is often highlighted as an important component of the diet's health promoting effects and recent evidence suggests that the polyphenols present, including oleuropein and hydroxytyrosol, may be the main factors involved.

We have been studying olive polyphenol extracts derived from olive oil or olive leaves to evaluate their influence on cardiovascular health and on aspects of cancer development. Such polyphenol extracts improved vascular function and certain inflammatory markers in an acute intervention study. In a longer term (6 weeks) double blind, placebo controlled intervention, olive leaf polyphenols lowered blood pressure and decreased total and LDL-cholesterol and plasma triglycerides. Using a similar olive leaf extract, others have reported beneficial effects on insulin resistance and plasma glucose profile in oral glucose tolerance tests.

In vitro, olive polyphenols were also shown to inhibit DNA damage in colon cells and to inhibit tumour cell invasion. In a SCID Balb/c mouse model of metastasis, olive polyphenols markedly inhibited the rate of growth and metastasis of an invasive colon tumour cell xenograft

Keywords: Mediterranean diet, olive oil, olive polyphenols, cardiovascular disease,

MEMBRANE LIPID PEROXIDATION IN HUMAN NUTRITION AND AGING

Miyazawa, Teruo.

PhD., NICHe, Tohoku University, Japan.

Phospholipids are of critical importance in mammalian cell biology, both through providing a permeability barrier and acting as substrates for synthesis of lipid mediators. Such membrane phospholipid peroxidation receives attention in connection to evaluate nutritional states and also to aging. For measuring phosphatidylcholine hydroperoxide (PCOOH) as a primary oxidation product of membrane lipids, liquid chromatography combined with chemiluminescence (LC-CL) detection and/or with tandem mass spectrometry (LC-MS/MS) is employed with using synthetized authentic standards. Nowadays it becomes possible to determine total PCOOH, positional isomer, and stereo isomers of PCOOH in human plasma, red blood cells (RBC), tissue organs and cultured cells. High PCOOH concentration is confirmed in atherosclerotic plasma with angiographically significant stenosis in which PCOOH accelerates monocyte adhesion to ICAM-1. In Alzheimer patients, aged RBC rich in PCOOH is found in peripheral blood, and such PCOOH-rich RBC lacks CO_2/O_2 exchange function that contributes to develop the senile dementia. The data further indicate that radical and/or enzymatic oxidation, rather than singlet oxygen oxidation, is recognized to cause oxidation of membrane PC in our body. Age-dependent accumulation of PCOOH is also confirmed in cultured human diploid cells, the microsomal and plasma membrane of the rat hepatocytes, and the brain and liver of the rat, and intensely in a mouse model for hepatitis C virus associated hepatocarcinogenesis. Food nutrients generally influence these membrane lipid oxidations, and moderate intake of dietary antioxidants (vitamin E, C, carotenoid, polyphenols and so on) would be recommendable.

Track 7: Food Culture Practices and Nutritional Education

KL_144/3572

WEIGHT LOSS USING A HEALTHY DIET AND EXERCISE PROMOTION TO PREVENT CARDIOVASCULAR DISEASE: THE PREDIMED-PLUS TRIAL

Salas-Salvadó, Jordi.

Director Human Nutrition Unit. Department of Biochemistry & Biotechnology. School of Medicine. Rovira i Virgili University. Reus, Spain.

Since there are no clinical trials demonstrating that sustained weight loss over >2 years with diet and changes in lifestyle reduce the risk of cardiovascular disease, we have designed the PREDIMED-PLUS Study, an intervention trial on primary prevention of cardiovascular disease in patients with metabolic syndrome and overweight or obesity.

The PREDIMED-PLUS Study is a parallel group, multi-centre, randomised, primary prevention trial (PREDIMED-PLUS) on men aged 55-75 years and women 60-75 years, with a body mass index ≥ 27 to <40 kg/m^2 and meeting at least 3 criteria for the metabolic syndrome. The objective of the present research is to compare the cardiovascular effect of two interventions: a) intensive weight-loss intervention on lifestyle program with hypocaloric Mediterranean diet, physical activity and behavioural therapy, b) non intensive care with recommendations on Mediterranean diet following the usual care of medical physicians. The principal end-points are: 1) a composite of major hard clinical cardiovascular events, and 2) weight loss and weight maintenance at long term. Other secondary end-points include the incidence of several chronic conditions or diseases secondary to obesity and metabolic syndrome.

Recruitment of participants began in September 2013, and finish in November 2016, with 6,874 participants randomized to the trial. The final results will be available from 2020.

We hypothesize that an intensive weight-loss lifestyle intervention, including physical activity, based on the traditional Mediterranean food pattern is a sustainable long-term approach for weight reduction among overweight/obese adults and that the achieved lifestyle changes will exert beneficial effects on cardiovascular disease incidence, according to our experience and to research by other investigators. The rationale for the proposed investigation is that it can provide a new, affordable, and sustainable approach to reduce excess cardiovascular morbidity and mortality among overweight/obese adults, beyond what was already observed in the PREDIMED I trial.

At the IUNS Congress, we will present the results of the PREDIMED-PLUS pilot study in the first 600 participants randomized to the trial.

Keywords: Weight loss, diet, exercise, cardiovascular disease.

KL_144/3572

SUSTAINABLE DIET FOR A SUSTAINABLE WEIGHT

Raben, Anne.

Professor, Dep Nutrition, Exercise and Sports, University of Copenhagen. Denmark.

To achieve and maintain a sustainable body weight is a challenge, especially in the westernized world. Overweight and obesity have reached epidemic levels with ensuing increases in type-2 diabetes and cardiovascular diseases. An abundance of energy-rich, easily available foods and lack of physical activity are major reasons for these effects. A high protein intake has been shown to increase weight loss and improve weight maintenance compared to a low protein intake (1). A high-carbohydrate diet has also been shown to induce weight loss, although not to the same extent (2).

In recent years, increasing attention has been put on the environmental impact of different foods, and when comparing eg CO_2 emission for legumes with meat, the CO_2 equivalent (in kg) is 30 times increased (3). Therefore, a replacement of protein from animal sources such as beef and pork with protein from vegetable sources, such as legumes, would be an environmental-friendly approach. This could also lead to an increased intake of dietary fiber, which in most countries is not yet at the recommended level. We examined if a meal based on vegetable sources (legumes) was comparable to a meal based on natural animal sources (pork and veal) regarding satiety and energy intake. The conclusion was that vegetable-based meals (beans/peas) influenced appetite sensations favorably compared to animal-based meals (pork/veal). Interestingly, a vegetable-based meal with lower protein content

was as satiating and palatable as an animal-based meal with higher protein content (4). A recent meta-analyses including 21 studies also supports that dietary pulses can be a beneficial weight-loss strategy (5).

Potatoes are a predominant staple in most diets of the Western world and the primary non-grain food item produced globally. Potatoes have a high glycemic index, but compared with other carbohydrate sources, they have a low energy density and consequently a low glycemic load. Furthermore, potatoes provide potassium, vitamin C, phosphorus, magnesium, folate, dietary fiber, and polyphenols. Evidence from meal test studies has suggested that intake of boiled potatoes increases satiety compared with intake of other preparations of potatoes or carbohydrates such as rice, bread, and pasta on an energy-equivalent basis. How these short-term effects translate into long-term effects is, however, not yet clear. We conducted a systematic review to evaluate the association of intake of potatoes and risk of obesity, T2D, and CVD in healthy adults. We found only observational studies and the 13 identified studies did not provide any convincing evidence to suggest such associations (6). Still, there is a need for well-designed long-term, randomized controlled trials in this field.

In conclusion, it is worth considering that an increased proportion of vegetable sources could be a possible way to achieve a sustainable diet for a sustainable weight.

BUILDING CAPABILITY AND CAPACITY IN NUTRITION: CANCER AS A MODEL

(1)Wiseman, Martin; (2)Jackson, Alan; (3)Allen, Kate.

(1)FRCP. FRCPATH. FAFN. Medical Doctor. Nutritionist. World Cancer Research Fund International and University of Southampton. UK.; (2)FRCP. FRCPath. FRCPCH. FAfN. Medical Doctor. University of Southampton. UK.; (3)PhD. Science Director. WCRF International. London. UK.

The appropriate detection, diagnosis and management of nutritional problems in public health and clinical care is impeded by the lack of an adequately resourced workforce who are appropriately trained in nutrition. In addition, necessary infrastructure for addressing nutritional problems is often lacking. The link between nutrition and cancer offers an example both of the problems and of potential solutions.

There is abundant evidence that nutritional factors are central to the causation and prevention of several cancers, and mounting evidence that they also predict and possibly influence outcome of cancer once diagnosed. Most of the evidence supporting these conclusions comes from higher income countries, and while is expected to increase more in low income settings over the coming decades, little resource is directed to building the infrastructures necessary to explore the specific aspects of nutrition and cancer prevention and care in these settings.

National and international agencies for nutrition and for cancer exist to prosecute agendas relating to professional, research, care and policy aspects, but there is little structured coordination between them. Developing structured collaborations between nutrition and cancer activities offers the possibility of improved prevention and care, saving lives and money. Establishment of cancer registries with basic nutritional information, and of a core nutritional status assessment as routine in cancer care, would be simple initial projects.

A new collaboration between IUNS, UICC, IARC and IAEA will be described as a model for how progress might be made.

Keywords: Cancer, capacity building, international collaboration.

GASTRONOMY AT THE INTERSECTION OF NUTRITION AND EDUCATION

Varela-Moreiras, Gregorio.

Professor of Nutrition & Food Science. Faculty of Pharmacy. CEU San Pablo University, Madrid (Spain). President Spanish Nutrition Foundation (FEN).

In March 2014, the European Parliament approved the Resolution on the European gastronomic heritage: cultural and educational aspects, that was impulsed by the Spanish Nutrition Foundation (FEN) cojointly with the Royal Academy of Gastronomy mainly based on the following principles: developments in recent years have highlighted that diet, in its broadest sense, is extraordinarily important in modern society; it is essential to incorporate learning about diet and nutrition, taste workshops and a knowledge and culture of food and gastronomy into the various national education systems; It is also evident that gastronomy and cooking have become an increasingly important form of artistic and cultural expression, that food and good cooking are one of the fundamental pillars of family and social relationships and that satisfaction at meal times is of course essential in sensory and psychical terms, as it is a substantial element of psychological and emotional balance, education in nutrition and gastronomy, including respect for nature and the environment, should include the participation of families, teachers, the educational community, information channels and all education professionals; and finally, that it is not only possible but necessary to combine healthy eating with gastronomy. Therefore, the aim of this lecture is not only to explain and debate the development, approval of this Resolution at European level, but also to share and discuss the recent achievements in this field in Spain to be extrapolated to the rest of Europe and worldwide.

NUTRITION-SENSITIVE AGRICULTURE – WHAT DOES IT MEAN AND WHICH IMPACT IT CAN HAVE IN ADDRESSING ACTUAL MALNUTRITION PROBLEMS

Charrondiere, U. Ruth; Rahmanian, Maryam; Unver, Olcay; Hemrich, Guenter; Toppe, Jogeir; Muir, Giulia; Dahdouh, Sergio; Rolle, Rosa; Mottet, Anne; Scherf, Beate.

FAO.

Food production is immensely important but undervalued in the food system approach aiming to improve malnutrition. Nutrients that are not produced through agriculture, cannot be conserved or consumed. They would have to come from fortification or supplementation, or would remain in insufficient amounts leading to micronutrient deficiencies or undernutrition, or if available in excess will lead to overweight/obesity and waste of resources.

Agriculture includes large-scale monoculture with high productivities and market access, and small-scale farming or pastoralism, where most of the biodiversity is conserved but having lower productivity, market access and income. Important challenges are climate change; environmental degradation; loss of biodiversity; lack of agricultural research for non-stables and minor species; water scarcity; and urbanization. Most agriculture is geared more towards quantity, income and industrial requirements than towards nutritional quality or consumers' preferences (including taste and strive towards agro-ecological products). Previously, it was thought that if energy needs are covered the micronutrient needs will be fulfilled; or that economic/agricultural growth will automatically lead to improved nutrition – we know today that these are wrong.

Ways forward to meet nutritional requirements while producing foods sustainably could be to simultaneously increase diversification; higher production/use of species, varieties and breeds rich in micronutrients; use resources efficiently; integrate value chains; and reduce food loss and waste. They all aim to produce more diverse and nutritious foods and sell them at decent prices, hopefully resulting in the consumption of sustainable diets. A multi-sectorial approach is most efficient (following the principle 1+1=3) because change is most likely to be efficient if all elements of the food system are moving into the same direction, i.e. production is linked with consumer and environmental demands, enhanced by appropriate value chains, progammes and policies (e.g. agriculture, trade, health, nutrition, education) and nutrition education. FBDG are central here and can inform consumers and policies.

Examples are integrated systems coupled with improved water management: aquaponics (integrated fish-poultry-vegetables system); rotation or intercropping (e.g. pulses and cereals); valuing wild foods often coming from the forest; home-based animal husbandry; crop-livestock-fish integration for improved use of manure and crop residues; or promoting insect consumption. Efficiency will be enhanced by producing foods and varieties rich in micronutrients and ensuring high overall productivity and income. Key elements are mainstreaming biodiversity and the use of FAO's new tool Nutrient Productivity Scale combining yield, food composition and human nutrient requirements. These, together with agro-ecological approaches could achieve efficient resource use. An increased production without taking into account value chain and transportation leads to high losses in income, foods and inputs. Therefore improving value chains is essential, e.g. cold chains for fruits, vegetables and animal-based foods. Another possibility is the use of micronutrient-rich fish by-products for human nutrition.

For all these steps, food composition data are needed at food and variety level for raw, cooked and processed foods – but in 99% of cases they are absent. Investments in their generation could be highly beneficial.

Once agriculture is more nutrition-sensitive, many of the global malnutrition problems can be solved.

Keywords: nutrition-sensitive agriculture, food system, malnutrition, food composition

WHY EXPERIENCING FOOD INSECURITY HAS BAD CONSEQUENCES FOR CHILDREN AND HOW WE CAN PREVENT THEM

Frongillo, Edward.

Department of Health Promotion, Education, and Behavior, University of South Carolina, United States.

Children experience food insecurity when households are food-insecure. Children's experiences of food insecurity differ from those of adults. Children are cognitively, emotionally, and physically aware of food insecurity, and take responsibility for managing food resources through participation in parental strategies, initiation of their own strategies, and generation of resources to provide food for the family. Even when household food insecurity is mild or moderate, these experiences are associated with many negative consequences for children, including behavior problems, poor health, disrupted social interactions, delayed development, shame, poor school performance and absenteeism, lower physical activity, altered daily activities, and poor or less healthy diets. The paths through which these consequences occur are both nutritional and non-nutritional. Non-nutritional paths may involve psychological and social effects of and responses to the stress that food insecurity places on families. The traditional lens for child food insecurity concentrates attention on food, hunger, and malnutrition, but, to guide effective intervention, we should also attend to other interconnected domains of children's daily lives, including food-related challenges within the psycho-social, family, educational, and community domains in which child development unfolds. Understanding why experiencing food insecurity has bad

consequences for children and knowledge about these mechanisms can guide effective and beneficial actions to prevent them.

Keywords: Children, food insecurity, interventions, development, stress.

HOW TO MAKE FOOD SYSTEMS MORE NUTRITION-SENSITIVE

Haddad, Lawrence.

Executive Director. Global Alliance for Improved Nutrition (GAIN). United Kingdom.

Poor quality diets affect more than 1 in 3 people worldwide. Diets are imbalanced in terms of the quantity and sources of calories consumed and in the excess consumption of certain components such as added sugar, salt and some forms of fats. So it is no surprise that diet related factors account for 6 of the top 11 risks behind the global burden of disease. Income growth and urbanization are not going to make it any easier to purchase healthy diets in the future. Increased income allows the increased consumption of foods that are health promoting as well as foods that are not. Urbanisation puts a premium on convenience and this can lead to the excess consumption of highly processed foods. Global and national food systems are part of the problem and part of the solution. What we produce, how we store, process, market and retail food affects its availability, affordability and desirability—and hence its consumption. The quality of consumption of food by key groups – infants and women for example-- is well below the minimum standards required. The food system commands large resource flows which can be guided towards advancing nutrition, through a combination of positive and negative incentives, at all stages of the food system. At the moment low and middle income countries are on course to follow the damaging pathway that the high income countries have taken. This presentation stresses that policymakers have choices to make, outlines the options available to them, urges them to take decisive action to make their food systems become more nutrition sensitive, and outlines the consequences of not changing course.

Keywords: Diet, food systems.

INVESTING IN NUTRITION: WHAT WILL IT BUY?

Shekar, Meera.

PhD. The World Bank. USA.

Ensuring optimum nutrition—particularly during the 1,000-day period from pregnancy to a child's second birthday—can alter an individual's development trajectory and maximize her or his productive potential. Chronic malnutrition has important lifelong consequences for health and cognitive development. Being stunted (low height-for-age) in early childhood is associated with a delayed start at school, reduced schooling attainment and substantially decreased adult incomes at both the individual and country level. These consequences add up to overall gross domestic product (GDP) losses of 4 to 11 percent in Africa and Asia. Importantly, chronic undernutrition can be transmitted through an inter-generational cycle, where malnourished mothers are more likely to have stunted children. There is a strong body of evidence that shows high economic returns to investing in nutrition. Scaling up these proven nutrition-specific interventions can ensure that mothers are healthy and well-nourished and that they can provide optimal nutrition to their children, that children realize their full physical and cognitive development potential, and that women's productivity is not hampered by illness, especially anemia. Furthermore, investments in nutrition are highly cost-effective and among the best value-for-money development actions. In 2016, the World Bank, Results for Development Institute, and 1,000 Days, with support from Bill & Melinda Gates Foundation (BMGF) and the Children's Investment Fund Foundation (CIFF) released innovative, in-depth economic analyses and developed a global investment framework for achieving four of the six global nutrition targets (for stunting, wasting, anemia, and exclusive breastfeeding). To scale up the package of key nutrition-specific interventions to reach the global nutrition targets, an investment of about $70 billion is needed over the next 10 years, in addition to what low and middle income countries currently spend on nutrition. Combined with improvements in underlying determinants of malnutrition, over the next decade, investing in these nutrition-specific interventions would reduce the number of stunted children in low and middle income countries in 2025 by 40%, compared to the 2015 baseline. In addition, the scale up of this package of interventions would allow to prevent over 3.7 million child deaths and 265 million of cases of anemia in women of reproductive age. It would also allow to treat 91 million additional cases of severe acute malnutrition in children and result in 105 million additional babies being exclusively breastfed. Finally, the investment framework also showed very high returns on every dollar invested in nutrition: from $4 in returns for treating acute malnutrition (wasting) to $11 for preventing stunting, $12 for the treatment and prevention of anemia, and $35 for increasing the prevalence of exclusive breastfeeding. Not only do investments in nutrition produce substantial economic benefits, but they also lay the groundwork for the success of investments in other sectors.

THE BIOLOGY OF THE FIRST 1,000 DAYS OF LIFE

EPIGENETICS, NUTRITION AND INFANT HEALTH

[1]James, Philip; [2]Silver, Matt; [3]Prentice, Andrew M.

[1]RNutr (Public Health). MRC International Nutrition Group. MRC Unit The Gambia.; [2]PhD. Bioinformatician. MRC International Nutrition Group. MRC Unit The Gambia.; [3]PhD, FMedSci, MRC Unit The Gambia & MRC International Nutrition Group. London School of Hygiene & Tropical Medicine. London. United Kingdom.

The field of epigenetics is currently garnering a great deal of interest, exploring how our very molecular make-up in the form of modifications to the genome can be altered by factors as diverse as ageing, disease, nutrition, stress, alcohol and exposure to pollutants. Epigenetic changes have previously been implicated in the aetiology of a variety of diseases, notably in the development of certain cancers and inherited growth disorder syndromes, but the exploration of its role in fetal programming is still in its infancy. This review focuses on how nutritional exposures during pregnancy may affect the infant epigenome, and the impact that such modifications may have on the long-term health of the child. We start by describing some keys concepts in epigenetics and discuss windows of epigenetic plasticity in the context of the Developmental Origins of Health and Disease (DOHaD) hypothesis. We then review some of the key mechanisms by which nutrition can affect the epigenome, with a particular focus on the role of one-carbon metabolism. We finish by outlining some of the child health outcomes that have been linked to epigenetic dysregulation and discuss possible next steps that need to be realised if insights into the basic science of epigenetics are to be translated into tangible public health benefits.

Keywords: Epigenetics; maternal nutrition; methyl donors; developmental programming; DNA methylation

Conflict of Interest disclosure: The authors declare no conflicts of interest.

BEFORE AND BEYOND THE 1,000 DAYS: A ROLE FOR PRECONCEPTION NUTRITION

[1]De Regil Velez, Luz Maria; [2]Snyder, Taylor; [3]Martinez, Homero; [4]Wuehler, Sara.

[1]Nutrition International. Canada.; [2]MPH, Director. Maternal & Infant Health Consulting. Salt Lake City, USA; [3]PhD. Senior Advisor Micronutrient Forum. Nutrition International. Canada; [4]PhD. Senior Technical Advisor. Nutrition Information System. Nutrition International. Canada.

A woman's health, nutritional status, and lifestyle prior to pregnancy, referred to as preconception health, influence pregnancy outcomes for both mother and baby. Preconception interventions should begin early and continue through the reproductive years because many maternal risk factors are rooted in childhood and adolescence.

The supply and availability of nutrients to the developing fetus are based on maternal nutritional status, physiological requirements and her ability to build and maintain nutrient stores. The mother's nutritional status can also influence gene expression (namely, related to reproductive organs, eggs, and sperm) by disrupting highly regulated processes through which specific genes are turned on and off at certain time intervals during fetal development. Energy and both macro and micronutrients, particularly folic acid, iron, iodine, zinc, vitamin A, and vitamin B12; play essential roles in organ growth and development, and are critical to the development of the fetal brain and nervous system.

Nutrition interventions during the preconception period focus largely on micronutrients and include supplementation, dietary modification, fortification of staple foods and condiments, point-of-use fortification, and biofortification. Complementary public health actions include interventions and strategies to reduce the incidence of infectious diseases, reduce alcohol consumption and smoking, delay the age of the first pregnancy, support optimal inter-pregnancy intervals, improve the nutrition and health of male sexual partners, and decrease male partners' unhealthful habits. This presentation focuses predominantly on the role of preconception weight and micronutrient nutrition on pregnancy outcomes, reviewing relevant biological factors, and recommended interventions to address dietary gaps.

NUTRITIONAL REGULATION OF THE GROWTH PLATE

Lui, Julian

Staff Scientist, Section on Growth and Development, Eunice Kennedy Shriver National Institute of Child Health and Human Development, Maryland, USA

Abstract Elongation of the long bones is what primarily makes children grow taller, and it is driven by a process called endochondral ossification that takes place at a cartilaginous structure found near the ends of long bones called the growth plate. A thorough understanding of the normal physiology of the growth plate, and how various endocrine, paracrine, and intracellular mechanisms collectively regulate growth plate function is important for deciphering the causes of childhood growth failure and designing new therapeutics.

Malnutrition remains as one of the leading causes of childhood growth attenuation globally. Nutritional status serves as a physiological permissive signal to partially shut off childhood growth under suboptimal conditions. Interestingly, when nutritional status improves, body growth often occurs at a rate greater than normal for the chronological age of the malnourished child, a phenomenon also known as catch-up growth. Catch-up growth helps bring the child closer to his/her original growth trajectory. However, in many cases, catch-up growth is incomplete, leading to a permanent growth deficit. Our recent studies on growth plate senescence, or how growth plate function declines with age, have improved our understanding of the mechanism of catch-up growth, and might provide new insights into developing better nutritional and therapeutic regimens for more complete catch-up growth in children with malnutrition and growth disorders.

Keywords: Growth plate, cartilage, catch-up growth, malnutrition, hormone

PS_144/93

ADDRESSING CHILD MALNUTRITION: NEWER MEASURES TO ADVANCE PREVENTION AND TREATMENT OUTCOMES

PROTEIN QUALITY, AMINO ACIDS AND GROWTH: HISTORICAL CONTEXT, NEW TECHNIQUES AND MEASURES

Kurpad, Anura Vishwanath.

MD, PhD. Professor of Physiology and Nutrition. St John's Medical College. Bangalore. India.

The recent re-evaluation of human indispensable amino acid (IAA) requirements by the WHO/FAO/UNU in 2007, showed that the daily requirement of important and potentially limiting IAA such as lysine was higher than earlier thought. This has had an impact on protein quality in terms of the amino acid score, where cereal proteins, which are the mainstay of the daily protein intake in many low and middle income countries (LMIC), now would have a lower quality, due to their lower lysine content. In turn, protein quality impacts human health, as it is important for linear growth and the prevention of stunting in children, and possibly also to mental development. Protein quality is an important factor in healthy diets. With the use of nationally representative household protein consumption data in India, the percentage of the population at risk of quality protein deficiency was found to vary between 4% and 26% among different age groups and between the urban or rural sector. Mitigating these risks requires a greater intake of high quality proteins, such as pulses and milk, and that food subsidy policies move beyond cereals and become more quality conscious.

The measurement of protein quality is based on an assessment of the indispensable amino acid content in relation to the pattern of their requirement, along with a term for the intestinal digestibility of protein into its constituent amino acids, and their subsequent absorption. This was measured by the oro-fecal balance of the fed protein. However, the digestion and absorption of protein occurs in the small intestine, while colonic (large intestinal) bacteria confound the oro-fecal balance. Therefore, protein digestibility should ideally be measured by measuring the oro-ileal balance of the fed protein. In addition, oro-ileal digestibility varies by IAA and should therefore be defined for each IAA. It has been proposed that protein quality should be measured for each IAA from each digestible IAA content (using specific IAA oro-ileal digestibility) in relation to the requirement pattern, in what is called the Digestible Indispensable Amino Acid Score, or DIAAS.

The measurement of the oro-ileal balance of IAA is difficult in human subjects, and usually impossible without intubation or intestinal fistulation. However, it can be performed in a relatively non-invasive manner, by a dual tracer technique, in which an intrinsically isotope-labelled test protein is simultaneously fed with a different isotope-labelled 'reference' protein, whose digestibility is known. This relatively non-invasive method offers a way to measure digestibility in vulnerable groups, and will be more relevant in settings where environmental enteric dysfunction (EED) already affects nutrient absorption. Current research into measuring plant protein digestibility in children in relation to EED and growth, is ongoing.

GUT MICROBIOTA TARGETS IN NUTRITION

FUNCTIONS AND DYSFUNCTION OF THE GUT MICROBIOTA

Doré, Joël.

Research Director. French Research Institute in Agricultural Sciences INRA (France). Gut Microbiota for Health.

The human intestinal tract harbours a complex microbial ecosystem which plays a key role in nutrition and health. Interactions

between food constituents, microbes and the host organism derive from a long co-evolution that resulted in a mutualistic association.

Recognized functions of the dominant gut microbiota relate to a contribution to nutrition via provision of key vitamins such as B12 and K and short chain fatty acids as well as a major implication in the breakdown of fibers and the bioconversion of plant-born phenolics. It also contributes to trophic functions of the gut, modulation tissue renewal and mucus production in quantity and composition. Finally, it regulates the vigilance of the immune system.

Current investigations into the human faecal metagenome are delivering an extensive gene repertoire representative of functional potentials of the human intestinal microbiota. The most redundant genomic traits of the human intestinal microbiota are identified and thereby its functional contribution. These observations show a unique segregation of the human population into individuals with low versus high gene-counts or microbiota richness. It significantly expands our ability to look for dysfunctions and specificities of the microbiota associated with human diseases and to ultimately validate microbial signatures of prognostic and diagnostic value in immune mediated diseases.

As an example, the microbiota is a key player in the development of obesity. the overall phenotypic characteristics are worse in individuals with low gene counts (LGC) microbiota, which represent 25% of overweight to moderately obese subjects and up to 75% of extreme obese (candidates for bypass surgery). LGC patients present a low grade inflammatory context also associated with insulin-resistance, and the worst response to a dietary intervention in terms of weight loss or improvement of biological and inflammatory characteristics. Conversely, a calorie restricted diet, with low fat, high protein and especially high-diverse fiber content, was able to correct the low gene count microbiota, raising by more than 25% the gene count during a 6 weeks intervention. Gastric bypass surgery rapidly corrects average gene richness and restores higher proportions of symbionts that appear deprived in extreme obesity. The effects seem durable over a 12 months follow up.

The human intestinal microbiota should hence be regarded as a true organ, amenable to rationally designed modulation for human health. Dysbiosis and dysfunctions appear in essence as alterations of man-microbes symbiosis which trigger interest in the application of functional metagenomics to better understand the crosstalk between intestinal symbionts and food constituents on the one hand, and human cells and tissues on the other hand.

DYSBIOSIS IN FUNCTIONAL BOWEL DISORDERS

Enck, Paul.

Dept. of Internal Medicine VI. University Hospital Tuebingen. Gut Microbiota for Health. Gut Microbiota & Health section.

Functional bowel disorders (FBD) resemble a group of diseases of the gastrointestinal tract (esophagus to anus - swallowing problems to defecation disorders) that are without a clear pathogenesis, that are quite frequent, and bothersome for the individual; best know is probably the "irritable bowel syndrome" (IBS). Because many FBD symptoms are associated with eating and elimination, is has very early been assumed that food eaten on the one hand, and bacteria involved in its processing may play a key role in FBD origin and/or its clinical picture. But only recently we have been able to explore the role of the gut microbiota in FGD, due to progress in microbiological analytic techniques.

The term "dysbiosis" implies that the microbiota - the community of microorganisms living in an environment, e.g. in the human gastrointestinal tract - is unbalanced, that the composition of the different bacterial genera living there regularly (called: commensal bacteria, to distinguish them from pathogen bacteria) is disturbed, that some or many bacteria are missing and others may become more prevalent or dominant. While we have learned of many new bacterial species and their role in health and disease, unfortunately the proper "balance" of the several hundred different bacterial species (and the total of trillions of bacteria) is unknown, as is the role of single bacterial species and their metabolic functions for a healthy gut.

There are different ways to explore the role of the gut microbiota and its balance or unbalance (dysbiosis) is FGD. For one, we can compare the microbial composition in a group of patients with FGD, e.g. with IBS to a group of healthy volunteers, but in such a study extreme care has to be taken that the "controls" are not only of similar age and gender, but also of the same cultural background and nutritional habit, since these factors affect the microbial composition and diversity. Studies have shown that the microbiota in FGD is different from that of healthy controls, but the recorded differences are not necessarily specific for FGD, they may also occur in other diseases.

Another approach to explore the role of the gut microbiota in FGD is to challenge the existing "flora" with novel bacteria (probiotics) or with nutritional substrates that stimulate bacterial growth (called prebiotics), especially in randomized clinical trials (RCT) where only a fraction of patients receive the true challenger, while the other receive a placebo. This has been done excessively in FGD, especially in IBS, with more than 60 trials including several thousand patients. These studies have produced mixed outcome: some probiotics appear to be better than others, and some appear to work only for a part of the IBS symptoms and not for all. An extreme of this approach is the transfer of an entire microbiota from one healthy person to another, called fecal microbiota transplantation (FMt). This has rarely been tested in FGD, but is not without risk in benign disorders.

More experimentally designed approaches will be presented, but are currently not yet approved for clinical purposes.

Keywords: Dysbiosis; functional bowel disorders; IBS

THE GUT MICROBIOTA IN OBESITY, METABOLIC SYNDROME AND T2D

Hansen, Torben.

Professor of Genetics of Human Metabolism. The Novo Nordisk Foundation Center for Basic Metabolic Research. Faculty of Health and Medical Sciences. University of Copenhagen.

We are not alone. Recent findings have demonstrated that the gut microbiome complements our human genome with at least 100-fold more genes. In contrast to our Homo sapiens-derived genes, the microbiome is much more plastic, and its composition changes with age and diet, among other factors. An altered gut microbiota has been associated with several diseases, including obesity and diabetes, but the mechanisms involved remain elusive. In order to understand the impact of gut microbes on human health and well-being we have described the Illumina-based metagenomic sequencing assembly and characterisation of 3.3 million non-redundant microbial genes from faecal samples of 124 European individuals. Nearly 10 million genes are now described in a recent updated gene catalogue. The extensive gene catalogue has enabled us to perform studies of association of the microbial genes with human metabolic phenotypes.

Several studies have suggested that altered gut microbiota composition and function are associated with overt type 2 diabetes, obesity and atherosclerosis. However, in a recent study we questioned previously reported associations between gut microbiota and type 2 diabetes by demonstrating that metformin, the first-line of choice for treatment of hyperglycaemia in type 2 diabetes, confounds this relationship. Accordingly, although gut microbial signatures can be used with high accuracy to distinguish metformin-treated patients with type 2 diabetes from healthy controls, this is not the case when attempted in metformin-naïve patients indicating that drug treatment is an important factor to take into account when evaluating associations of microbiome composition to disease. New data in treatment naïve individuals indicate that gut microbial signatures are altered in individuals with impaired glucose regulation and that low bacterial diversity is associated with elevated levels of biomarkers of poor metabolic health, including markers of glucose regulation, insulin resistance, inflammation, obesity, and dyslipidaemia.

Keywords: Gut microbiota; obesity; metabolic syndrome, T2D

MODULATION OF THE GUT MICROBIOTA, CURRENT APPROACHES AND PATHOPHYSIOLOGICAL SIGNIFICANCE

Verdú, Elena.

Associate Professor at the Division of Gastroenterology Dep. of Medicine at McMaster University. Gut Microbiota for Health.

The gastrointestinal tract represents an enormous interface with the environment. It has its own unique immune system that accounts for over one third of the body's immunological cells. The number of autochthonous bacteria (1014) living on mucosal surfaces exceeds the number of cells forming the human body. Indeed, the size of the genome of the intestinal microbiota exceeds the human genome by 2-3 orders of magnitude. It is evident from studies on germ-free animals that the human genome is insufficient to maintain efficient bodily function. For example, germ-free mice have a rudimentary mucosal immune system because of the absence of stimulation by enteric bacteria. Germ-free mice also consume 30% more calories than conventionalized mice, as they are inefficient in harnessing all energy sources in the diet. It is also evident that the behavior of germ-free mice differs from that of conventionalized mice, and becomes normalized following bacterial colonization. Thus, there is an axis of communication between dietary constituents, commensal bacteria, mucosal immune activity, gut physiology and brain function. In this context, it is easy to envisage how altered interactions between diet and bacteria could produce dysregulated inflammation and disease. There is general consensus that genetic susceptibility is insufficient to cause chronic inflammatory disorders such as IBD, and that environmental factors, such as alterations in composition or metabolic function of the colonic microbiota, play a role in driving and maintaining inflammation. Even in celiac disease, a condition with a clear dietary trigger, gluten, and a known HLA association, alterations of the small intestinal microbiome have been recently implicated as modulators of disease risk. A microbiota associated with disease has been referred to as "dysbiotic". However, a specific disease-microbiota signature has been difficult to define and, how specific dysbiosis contributes to inflammation is unknown. Despite this, therapies targeted at modulating the microbiota with the objective to prevent or treat gastrointestinal inflammation have emerged. These include probiotic supplementation, fecal matter transplantation or modification of specific dietary-microbiota interactions. The potential and limitations, as well as gaps in knowledge, regarding these approaches will be discussed.

NEW TECHNOLOGIES TO DETECT AND STUDY ADVERSE LIFESTYLES IN CARDIOMETABOLIC DISEASES

APPLICATION OF GEOSPATIAL TECHNOLOGIES FOR ANALYSIS OF CARDIOMETABOLIC DISEASES RELATED TO FOOD AND NUTRITION

Alvarez Di Fino, Eliana Marina.

MSc. Nutritionist. Escuela de Nutrición. Facultad de Ciencias Médicas. Universidad Nacional de Córdoba. Instituto de Altos Estudios Espaciales Mario Gulich. Comisión Nacional de Actividades Espaciales (CONAE). Universidad Nacional de Córdoba. Argentina.

In last decades, the rapid changes in levels and composition of dietary and activity/inactivity patterns in transitional societies are related to a number of socioeconomic and demographic changes. To solve this situation it is necessary to study this epidemiological behavior from different approaches. In this context, geospatial technologies -understood as a set of tools used to obtain, process, store, analyze and represent data centered in a geographical, temporal and spatial context- have provided a new analytical approach.

The aim of this conference is to present the results obtained in an exploratory study through different geospatial tools to analyze the distribution of overweight and obesity in Córdoba city, Argentina.

Epidemiological data (prevalence of obesity and overweight in 2013) were obtain from 79 Primary Health Care centers in the city. A surrounding area with radius of 1000 m around each point was considered as its zone of influence, and used to explore the environmental conditions around it.

For this study we used a multispectral SPOT 5 image. This commercial high-resolution optical imaging Earth observation satellite provides a 10 meters resolution image with four spectral band on: green ($0.50 – 0.59$ μm), red ($0.61 – 0.68$ μm), nearest infrared ($0.78 – 0.89$ μm) and middle infrared ($1.58 – 1.75$ μm). All images used were supplied by National Commission on Space Activities (CONAE), and the SPOT image was acquired in January 2013.

As a first step, we focus our attention on exploring the possibility to describe social strata used to describe the social dimension and economic access to food.

To evaluate the environmental parameters in this area, a land cover map is required, and it was decided to exploit the SPOT 5 image using spectral and spatial features for classification. Specifically, textural features based on the Grey-Level Co-Occurrence Matric (GLC).

By using land cover maps as well as statistical and spatial information, the existence of statistically significant relationships between the prevalence of obesity and overweight according to the data from the health centers, and the geophysical variables obtained from the satellite image was explored. Specifically, in addition to the environmental variables such as the above mentioned NDVI, the Normalized Soil Index (NSI), and the distance from water bodies and crops were included. For this analysis, different tools were used -like machine learning technique called Maximum Entropy Modeling (MaxEnt)- and the free software SatScan that analyzes spatial, temporal and space-time data using the spatial, temporal, or space-time scan statistics.

PROSPECTIVE ANALYSIS: ELIMINATING ARTIFICIAL TRANS FATTY ACIDS IN ARGENTINA AND ESTIMATED EFFECTS ON THE BURDEN OF CORONARY HEART DISEASE

Elorriaga, Natalia.

MSc. Nutritionist. Centro de Excelencia en Salud Cardiovascular para América del Sur. Instituto de Efectividad Clinica y Sanitaria. Argentina.

Consumption of TFAs alters the plasma lipid profile in such a way that it increases the risk of coronary heart disease (CHD). A 2% increase in energy intake from TFAs may increase the risk for a coronary event by up to 23%. Other potential adverse effects of TFAs include systemic inflammation, endothelial dysfunction, insulin resistance and arrhythmias. Based on these adverse effects, several countries have implemented policies to reduce industrial TFA consumption.

In Argentina, before 2004, artificial TFAs were present in most sweet or salty solid snack foods, such as biscuits. Be¬tween 2004 and 2014, Argentina implemented several policies to reduce artificial TFAs. After 2004, the industry voluntarily reformulated foods by replacing approximately 40% of TFAs from partially hydrogenated vegetable oils. Regulations enforcing mandatory labelling of artificial TFAs in food were introduced in 2006 and the country's food code was amended, such that, by the end of 2014, industrially-produced TFAs in food should not exceed 2% of total fats in vegetable oils and margarines and 5% of total fats in other foods.

To estimate potential reductions in annual CHD events, disability-adjusted life years (DALYs) and associated health-care costs attributable to reductions in artificial TFAs we used a model.

We built a policy model including baseline intake of TFA, the oils and fats used to replace artificial TFAs, the clinical effect of reducing artificial TFAs and the costs and DALYs saved due to averted CHD events.

To calculate the percentage of reduction of CHD, we calculated CHD risks on a population-based sample before and after implementation. The effect of the policies was modeled in three ways, based on projected changes: (a) in plasma lipid profiles; (b) in lipid and inflammatory biomarkers; and (c) the results of prospective cohort studies. We also estimated the present economic value of DALYs and associated health-care costs of coronary heart disease averted.

We estimated that projected changes in lipid profile would avert 301 deaths, 1066 acute CHD events, 5237 DALYs and 17 million United States dollars (US$) in health-care costs annually. Based on

the adverse effects of TFA intake reported in prospective cohort studies, more deaths and CHD events would be averted annually.

In conclusion, even under the most conservative scenario, reduction of TFA intake must have had a substantial effect on public health.

COMPUTER TOOLS FOR FOOD INTAKE DETERMINATION IN NUTRITIONAL EPIDEMIOLOGY OF CARDIOMETABOLIC DISEASES

Defagó, Maria Daniela.

PhD. Nutritionist. Escuela de Nutrición. Facultad de Ciencias Médicas. Universidad Nacional de Córdoba. Instituto de Investigaciones en Ciencias de la Salud INICSA-CONICET. Argentina.

The relationship between diet and disease has been studied for more than a century and diet has been shown to play an important role in the development of chronic diseases of high prevalence, such as cardiometabolic diseases. In this sense, nutritional softwares have been emerged for different research needs in food intake studies.

According each technological development, the software selection includes several aspects such as alimentary questionnaire format, accessibility, adaptability, intuitive system, support contact, information about food databases and result reports. In response of Argentina food research needs, a software called Interfood v.1.3 was development. The program is based on three fundamental components: first, a food frequency questionnaire (FFQ) to obtain the food intake profile about 242 foods more frequent in the country; second, a food composition table database (FCD) based on food composition tables of Latinfoods-Argenfoods, the Food and Agriculture Organization and the USDA Food Composition Databases. The reporting includes 131 compounds (macro/micronutrients and phytochemicals) per 100 g of food. The third component is a relational database, which through the interaction between FFQ and FCD calculates the amount of each of the foods, nutrients and phytochemicals consumed by day, week and month. The information is obtained on a Microsoft Excel format basis applicable to its subsequent analysis in other programs.

One strength of Interfood is its focus in fatty acids and bioactive compounds, nutrients related in prevention and pathogenesis of cardiometabolic diseases. Also, like other softwares developed by researchers of the region, prioritizes the use of local food databases. Nutritional softwares allow easy management of food and nutritional information and can be used in epidemiological studies in different geographic areas, socioeconomic levels and age groups. In conclusion, technological advances in computer sciences can be incorporate into the methodological tools in nutritional epidemiology of cardiometabolic diseases and other pathologies related to diet.

The South American Youth/Child cARdiovascular and Environmental Study (acronym: SAYCARE Study) is an observational multicenter feasibility study was carried out in seven South American cities: Buenos Aires (Argentina), Lima (Peru), Medellin (Colombia), Montevideo (Uruguay), Santiago (Chile), Sao Paulo and Teresina (Brazil). The study children and adolescents (3 to 18 years). In this feasibility phase we performed quality controls, develop valid and reliable measurement methods to obtain information from: social and environmental factors, family environment, food intake, preference and food choices, physical activity and sedentary behaviors body composition, oral health, lipids and cardiovascular health biomarkers. After the developing we measured the reliability and a validity coefficient of these methods by several analyzes: kappa coefficients for categorical variables and intraclass correlation coefficients for quantitative variables, which were complemented by the development of Bland-Altman. The correlations were calculated by Spearman and Pearson correlation coefficients for nonparametric and parametric variables respectively. Our total sample is composed with 237 children (preschool and school children) and 258 adolescents, provided data during 1stphase

measurements. The results of the SAYCARE study are expected to provide higher accuracy of the assessment of cardiovascular disease risk factors (eating behaviors, body composition, physical activity, sedentary behaviors, lipid profile and cardiovascular health biomarkers, oral health, social conditions, environmental factors and home environment) and of their determinants in children and adolescents aged 3-18, from seven South American cities.

Keywords: Reliability, validity, children, cardiovascular diseases, risk factors.

ASSESSING DIETARY INTAKE IN CHILDREN AND ADOLESCENTS: DEVELOPMENT OF A FOOD FREQUENCY QUESTIONNAIRE

Global epidemic levels have been reach by non-communicable diseases (including obesity) in children and adolescents. South American children under 5 years have an estimated prevalence of overweight of about 7%; in school age children, overweight and obesity prevalence ranged from 15% to 36.9%, and among adolescents from 16.6% to 38%.

Food Frequency Questionnaires (FFQs) are often used in epidemiological studies to evaluate long-term food consumption. They should be created and validated in the specific population in which they will be used.

The aim of this study is to describe the process of development of a FFQ, to assess dietary intake to be used in children and ado-

lescents from six countries of South America and to assess their feasibility in the target population.

Methods: A semi-quantitative FFQ was designed to be self-administered and to assess the dietary intake over the past three months among children and adolescents aged 3 to 17 years from seven cities of six South American countries: Buenos Aires (Argentina); Lima (Peru); Medelin (Colombia); Montevideo (Uruguay); Santiago (Chile) and Sao Paulo and Teresina (Brazil). In order to compile the food list, multiple approaches were considered. Eleven food groups were included (cereals, tubers, vegetables, fruits, oils, meat and derivate, fish and eggs, milk and dairy products, legumes, beverages, sugar products and miscellanea). To determine the frequency categories of the questionnaire, Willet´s proposal of a nine response category, was adopted. A food photo booklet was produced.

Results: In order to develop the FFQ, national food consumption surveys and several local studies were considered. Experts from all the cities involved in the SAYCARE study completed the food lists for every country. A preliminary common core food list was developed that included food items that represent at least 30% of the children/adolescent's total food intake and appear in at least two of the six countries involved. Countries´ food items were included to the common core. At the end, Medelin had 55 food items, 58 for Santiago, 60 for Montevideo, 63 for Lima and Buenos Aires, 67 for Sao Paulo and 68 for Teresina. It was developed in Spanish and translated to Portuguese.

345 children and 357 adolescents were considered for analysis. Food consumption (in grams per day) for male children consumption of crackers, sweet cookies, filled sweet cookies, pork, milk, yoghurt and fruit juices was lower in the older one than in the younger one. Female children consumption of sweet cookies and yoghurt was lower and packed juice was higher in the older one, compared with the younger children. In male adolescents soft drinks consumption was lower in the younger one, compared with the older one. In female adolescents cookies, filled cookies, fried potatoes, pork and canned fish consumption was lower in the older one, compared with the younger one.

Conclusion: A culturally appropriate, semi quantitative FFQ, was developed in order to assess dietary intake in children and adolescents of the SAYCARE Study.

Background: The Healthy Diet Score was developed by the American Heart Association as one component of cardiovascular health to assess adherence to dietary guideline recommendations. Objective: To validate the SAYCARE food frequency questionnaire (FFQ) to assess the Healthy Diet Score. Methods: A sample of 409 (50.93% female) children and 270 (53.58% female) adolescents (aged 3-18 years) from the SAYCARE study were included in this validation analyses. The children's parents/guardians or the adolescent themselves answered the FFQ and three 24-hour-dietary-recalls. Children and adolescents were given one point when they ate ≥ 400mg of fruits & vegetables, and drunk < 70 kcal of sugar-sweetened beverages per day. If they did not meet these recommendations no point was scored. Therefore, these eating components were summed up and classified according to the Healthy Diet Score, adapted into poor (zero points), intermediate (one point), and ideal (two points). To estimate the validity of the FFQ the weighted cohen's kappa, and the sensitivity and specificity analyses were applied, using the 24-hour-dietary-recall as a reference method. Results: The proportions of the Healthy Diet Score were 41.56% poor, 50.86% intermediate, and 7.58% ideal for children; and were 42.96% poor, 50.37% intermediate, and 6.67% ideal for adolescents. The FFQ validity coefficients were: k=0.110 (73.59% of agreement) and k=0.165 (76.48% of agreement), and sensitivity of 70.53%; 69.23% and specificity of 19.58%; 41.43% for children and adolescents, respectively. Conclusions: The SAYCARE food frequency questionnaire presents fair agreement and validity for two components of the Healthy Diet Score (fruits & vegetables and sugar-sweetened-beverages).

ASSESSING THE DETERMINANTS OF DIET IN THE SAYCARE STUDY: REPEATABILITY AND RELIABILITY OF A BODY IMAGE SCALE

[1]Restrepo-Mesa, Sandra; [2]González-Zapata, Laura Inés; [2]Aristizabal, Juan; [3]Skapino, Estela; [4]Sadalla Collese, Tatiana; [5]Azzaretti, Leticia; [6]Nascimento-Junior, Walter; [7]Moreno, Luis A.; [8]Ferreira De Moraes, Augusto César; [8]Barbosa Carvalho, Heráclito; [9]Estrada-Restrepo, Alejandro.

[1]Professor. Colombia.; [2]PhD. Nutritionist. School of Nutrition and Dietetics, University of Antioquia, Medellín. Colombia.; [3]MsC. Nutritionist. School of Nutrition, Universidad de La Republica, Uruguay.; [4]MsC. Nutritionist. University of São Paulo, School of Medicine, Department of Preventive Medicine, São Paulo, Brazil.; [5]MsC. Nutritionist. School of Nutrition, Medicine Faculty, University of Buenos Aires, Argentina.; [6]Federal University of Piaui, Center for Health Sciences, Teresina, Brazil.; [7]PhD. Md. Faculty of Health Sciences, University of Zaragoza, Zaragoza, Spain.; [8]PhD. University of São Paulo, School of Medicine, Department of Preventive Medicine, São Paulo, SP, Brazil.; [9]MsC. School of Nutrition and Dietetics, University of Antioquia, Medellín. Colombia.

Background and objective: In children and adolescents, overweight and obesity are associated with body image dissatisfaction. Low body image may trigger unhealthy behaviors, such as, following a very low energy diet, and doing extreme exercise routines. Given the high prevalence of overweight and obesity in South American youth, this study aimed to evaluate validity and reliability of a body image scale in children and adolescents from the SAYCARE Study.

Materials and methods: 228 children (3 to 10 years old) and 142 adolescents (11 to 17 years old) answered the SAYCARE- questionnaire twice, two weeks interval. Children and adolescents body weight and height were measured following standard procedures. Children parents/guardians answered the questions: "Do you think that your son is: Lean, little bit lean, healthy weight, little bit overweight, overweight?". "Choose the figure (13-body image scale developed by Gardner) that best represents your child's physical appearance". Adolescents answered these questions themselves. Repeatability was evaluated between the first and the second response of every child or adolescent. Validity was assessed comparing the answers against the body mass index classification developed by the World Health Organization. Kendall's tau-c coefficient and weighted Kappa statistics were calculated and interpreted according to Landis and Koch.

Results: In children, the repeatability to the question "Do you think that your son is? was acceptable (K=0.337) but showed poor validity (k=0.176). For the Gardner scale the repeatability was deficient (K=0.124) with poor validity (K=-0.018). In adolescents, the repeatability to the question "Do you think that your son is? was notable (K=0.709) with acceptable validity (K=0.268). For the Gardner scale the repeatability was notable (K=0.599) but the validity was poor (K=0.023).

Conclusions: The questionnaire answered by parents or guardians showed acceptable repeatability but failed to assess child's body weight adequacy. The adolescents questionnaire showed good repeatability and validity to assess physical appearance by using direct questions, but not through the Gardner body image scale.

University of São Paulo, School of Medicine, Department of Preventive Medicine, São Paulo, SP, Brazil.

Physical activity (PA) is one of the most important determinants of obesity and cardiovascular risk factors in children and adolescents. In the majority of the countries, and especially in urban areas, children and adolescents have low levels of PA and the proportion of children complying with PA recommendations (60 minutes per day of moderate-vigorous PA) is also very low, especially in girls. There are several methods to assess PA in children and adolescents. The most widely used are the questionnaires. The reference method for free-living PA assessment is the doubly labelled water method. There are also some objective methods providing a good compromise between accuracy and feasibility; they are movement sensors (accelerometers) and heart rate monitoring. In the SAYCARE feasibility study, two methods were used: questionnaires and accelerometers. Questionnaires are self-reported and they measure the routine activities of the last week in three different PA domains (PA at school, PA at leisure time and active

commuting). The perceived intensity is measured in three levels: light, moderate and vigorous. Accelerometers provide objective measures of total PA and the time spent in the different intensities. For both methods, the optimal accuracy and reliability should be achieved. The main goals of this study is to provide methodological aspects related with the use of a questionnaire adapted to be used in children and adolescents in seven centres in six countries and to compare the results with those obtained with accelerometers in four centres in three countries in South America.

For reliability assessment 161 children (49.8 % females) and 177 adolescents (58.3 % females) were studied. Questionnaires were completed by the parents or caregivers in the case of the children's sample and by the adolescents themselves. They filled in the questionnaire twice, two weeks apart. In children, the questionnaire showed good reliability for moderate-vigorous PA ($rho = 0.56$), and very good for vigorous PA ($rho = 0.89$); however, reliability for moderate PA was moderate ($rho = 0.37$). In adolescents, the questionnaire showed good reliability for moderate-vigorous PA ($rho = 0.60$), and very good for vigorous PA ($rho = 0.93$); however, reliability for moderate PA was also moderate ($rho = 0.36$). Results obtained with the questionnaire were compared with those measured with accelerometers in 82 children (54.4 % females) and 60 adolescents (55.7 % females). In children, correlation between moderate-vigorous PA assessed both with the questionnaires and the accelerometers was moderate ($rho = 0.44$) and it was good for moderate PA ($rho = 0.61$). In adolescents, correlation between moderate-vigorous PA assessed both with the questionnaires and the accelerometers was very good ($rho = 0.88$) and the same apply for vigorous PA ($rho = 0.65$).

In conclusion, measurement of PA using both questionnaires and accelerometers is feasible in children and adolescents in urban areas of six countries in South America, with a good reliability, especially when considering vigorous PA.

Overweight and obesity are independent risk factors for cardiovascular diseases, associated with other risk factors such us hyperlipidemia, hyperinsulinemia and insulin resistance. In clinical epidemiological multicenter studies, the managing of the correct selection of biomarkers that will ensure the identification of these risk factors is required and it is considered the "pre pre analytical stage". Moreover, the concentration of these biomarkers in blood samples depends on several factors, including those inherent to the individual, such as age and gender, ethnic and cultural diversity, sociological, psychological, environmental factors and others referred to pre analytical conditions. Besides, the quality assurance and harmonization of all procedures in the pre analytical stage, the drafting of the informed consent and the standardization of patient preparation is very important in order to reduce error comparison between different laboratories. The SAYCARE Study was held in children and adolescents (3 to 17 years) from seven South American cities: Sao Paulo and Teresina (Brazil), Buenos Aires (Argentina), Santiago (Chile), Montevideo (Uruguay), Lima (Peru) and Medellin (Colombia). The aim of SAYCARE was to develop methods to collect reliable, comparable and validated data about cardiovascular health biomarkers, lifestyles and environmental, social and familial factors. Regarding blood samples collection, investigators from each participating center were involved in the planning and development of the protocol, which included the study design, the impact of pre analytical conditions on different blood biomarkers and the stability of these biomarkers according to time and frozen storage of the samples and transport at reference laboratory in Sao Paulo for it biochemical evaluation. Different blood biomarkers were evaluated in 474 fresh samples of serum, in different country centers: glucose, total-cholesterol, HDL-cholesterol, LDL-cholesterol, triglycerides, iron, and hs-CRP. We also evaluated the stability of different biomarkers according to time and frozen storage within this pilot study across the concordance of the results obtained from the 49 blood samples measured in two different centers. An excellent concordance and correlation between different centers were observed, in most of the evaluated parameters. This concordance is a consequence of the strict compliment of the pre analytical conditions previously established in the SAYCARE study.

REDUCTION OF SALT CONSUMPTION IN DIETS FOR COMBATING NCDS FOR BETTER HEALTH AND WELLNESS

POLICY AND TECHNICAL ISSUES OF SODIUM REDUCTION – CHALLENGES AND GLOBAL PERSPECTIVES

Prakash, Vishwesihwaraiah.

(Vice president, IUNS), Mysore ,India.

The intake of Salt has been a matter of many discussions both from the Nutritionists point of view and the Clinicians point of view and from the point of combating NCDs on diet based approach. The consumption pattern of salt and its relation to the over all health status of the individual is a well established fact with most consumers. In this connection over the last eight years plus IUNS has been able to address this globally in several regions with workshops on Salt Reduction. A few publications have also emerged as a result of this and has captured the attention of Regulators and Academia. This is basically restricted to added salt to the food while cooking and also on the table largely keeping the figure of 5 gms. per day recommended by WHO. However this does not take into consideration the invisible salt in food as well as the climatic conditions and the Regional lifestyles. This is only a generic recommendation rather than customizing for a region based on life style. Regulators in many countries have recently come in with measures such as high tax, banning high consumption of salt by either pegging the level of salt in the processed foods or discouraging their purchase thus bringing about large awareness amongst the public for low consumption of salt in the interest of health and wellness.

Having said this the final solution may not be in the immediate horizon but will take a long way and thus one must bring in awareness of the problems of high salt consumptions at a very young age in schools to ensure at least the next generation if it can peg salt consumption to not more than 2 to 3 gms. a day it would be wonderful. Perhaps at that time we can take the agenda back to WHO to refix the recommended daily salt intake minimum to a lower level. The focus also is to manage the electrolyte balance in order that the entire concept of consumption of salt is holistically seen for the body. Regulations alone may not change the mind set but working together of Regulators, Industries, manufacturers of Processed Foods, Consumers and NGO's and media has a very large

role to play by networking and working in synergy in the Global Salt Reduction Programme from the bottom of the Pyramid approach and Top down approach in this agenda.

REDUCING SALT INTAKE IN WEST AFRICAN COUNTRIES: CONTROVERSIES AND CHALLENGES

Steiner-Asiedu, Matilda.

University of Ghana. Ghana.

In recent times West African countries just like other countries across the globe are experiencing an alarming increase in non-communicable diseases including hypertension. Apart from overweight/obesity, high dietary salt intake has been recognized to be one of the major contributory factors to the high prevalence of NCDs in the sub-region. This evidence was the consensus at the salt reduction forum held by the West African Health Organization (WAHO) on Salt Reduction in West Africa, July 17 2013 in Bobo-Dioulasso, Burkina Faso. Generally the average salt intake exceeds the WHO recommendation of <2 g/day sodium (5 g/day salt). The increasing trend of hypertension in West Africa as documented by various epidemiological studies is therefore not surprising. The population is also in a dilemma since high salt intake are influenced by traditional food systems, social, environmental, economic and industry practices as well as globalization of market systems. This presentation therefore discusses the controversies and challenges surrounding salt intake reduction in the West African Sub-region and calls for nutrition and public health interventions that consider multi-sectorial and multi-disciplinary approaches backed by government efforts.

DIET COMPOSITION AND SODIUM INTAKES-A LOOK AT CHINA'S DATA

Yang, Yuexin; Gao, Chao; Ting, Gangqiang.

National Institute of Nutrition for Health. China.

The latest National Chroinc Diseases and Nutrition Survey data released by National Health and Family Planning Commission (NHFPC) China , Sodium intake shows that overall the population is still consuming too much salt and not enough fruit, milk. population-based blood pressure levels and prevalence of hypertension are increased rapidly in the past decades in China . Meanwhile, sodium intake, is a major risk factor for hypertension. The studies is conducted to collect information on sodium intake, the reason of analysis and the national strategy making .

The study is an once every two years survey designed to assess the food composition , food consumption of a China representative sample living in private households. Salt content in food measured, Salt and condiment intake information of aged 18 years upwards was collected by the 3-condecutive days-24-hour dietary recall and food weighting method, the sudium content the average salt intake was calculated based on energy percentage of family members. And Industry Salt Reduction strategy design by trend analysis.

The report development the food sodium content data for the nutrition survey. The development work involved food analyses and recipe calculation. And presents the results combined and supersedes the previous report published by China CDC 2012 which covered the salt intake during 2010-2012. The average salt intake for aged 18 years and above was 10.5g /day from national survey in 2010- 2012. Compared to 30 years of data, it can be found that it continues to decline. The average salt intake was 12.0g /d in 2002, and 13.9g /d in the year 1992 respectively. But the salt intake of Chinese all redidents was still in higher level than 6g/d, which is the salt intake goal from national dietary guideline.

For diet towards the 6g a day goal. A slat reduction plan including set the 10% reduction target in the year 2018 , And a target for food industry by the 2020-2030 to encourage companies to reformulate recipes, including to use FOP and guide people choose lower salt options – through promotional and other activities; Push the catering and takeaway sector by setting new maximum targets for the most popular dishes and chips.

The daily average salt intake among Chinese adult was still in high level, and salt reduction plan should be gradually by consumer education and public policy.

ADDRESSING CONSUMER CHALLENGES IN REDUCING SODIUM INTAKES

van het Hof, Karin; Zandstra, Liesbeth.

PhD. Nutritionist. Unilever R&D. Vlaardingen. The Netherlands; PhD. Unilever R&D. The Netherlands.

Globally, average dietary salt intake is much higher than the recommended World Health Organization level of less than 5 grams of salt per day. As part of its Sustainable Living Plan, Unilever set itself the challenging target of helping consumers to cut their salt intake to this recommended level of 5 grams a day. The challenge here is to achieve further reductions in the salt content of our foods, while maintaining good taste, stability and texture to ensure consumers will like (or even prefer) these reformulated products. Moreover, a change in consumer behaviour is also required. Reducing salt in products is often perceived to negatively influence the taste, making it hard to encourage consumers to use these products without adding salt back at the table. In order to increase the effectiveness and health impact of efforts in this area, an approach is required that is directed at both manufactured foods as well as consumer behaviour. The presentation will address aspects that are relevant from a consumer perspective, such as communication, taste perception, acquired preferences and salt usage. These are crucial insights to consider in developing effective salt reduction strategies and/or policies.

Keywords: Consumer, sodium reduction, salt

Conflict of Interest disclosure: Both authors are employees of Unilever, a manufacturer of Food and Beverages products.

CURRENT INTAKE OF SALT AND ITS REGULATIONS IN INDONESIA

Hardinsyah, Ridwan.

Professor in Nutrition. Department of Community Nutrition. Bogor Agricultural University. Indonesia. Food and Nutrition Society of Indonesia.

Indonesia, a tropical developing country in the South East Asian Region, is now facing a double burden of malnutrition and increasing incidence of non-communicable diseases. Cardiovascular diseases, especially stroke and coronary heart diseases are the main cause of death in Indonesia. Epidemiological and clinical studies showed that high intake of salt, sugar and fat are part of risk factors for cardiovascular diseases. One of the strategies by WHO to reduce incidence of non-communicable diseases is to limit the intake of sugar, salt and fat. In line with the strategy, the Indonesia government through Ministry of Health formulated the new dietary guidelines for Indonesians, in which messages include to limit intake of sugar, salt and fat. The MH also issued a regulation number 30/2013 on Sugar, Salt and Fat Information for Labeled Packed Foods and Fast Food, that will be implemented from 2019. Ten years ago (2007), the mean intake of salt among Indonesian was 5.6 g/cap/d, which is now increased to 6.3 g/cap/d from both visible and invisible sodium. Based on Total Diet Survey by MH, 52.7% of Indonesian population had sodium intake exceed the limit sodium intake recommended by the MH. Regarding age groups, the highest prevalence of high sodium intake was among teenagers, and the lowest among children under-five years. In Indonesian diets, the salt intake predominantly from the non-label packed foods, especially from family foods and food away from home such as salted dried fish, salted soybean sauce, chilly sauce, meat ball soup, fried rice, porridge, fried foods, snacks and spices. The data on salt or sodium intake in Indonesia may suffered from estimation bias, since the data derived from the food consumption survey. The salt data are from visible and non visible salts, which is more likely under-estimated . The weaknesses of the salt intake data are inherent in the weakness of food data collection using one-day and seven-day food recall, there is no standard recipe on the utilization of salts of Indonesian foods, there is no data on sodium content of Indonesian foods, not all packed food provide information on sodium content. It is difficult and facing a great challenge from the stakeholders while the regulation is in placed without strong or adequate evidence about where we are now, what is the specific targets and how to achieved the targets. This implies that more detail data on sodium content of Indonesian foods and sodium education efforts need to be done before the implementation of the salt regulation.

The ongoing epidemiological transition is leading to increased burden of obesity-associated chronic diseases worldwide, including the Latin American region. These disease conditions are determined by inadequate lifestyle involving unhealthy food intake and physical inactivity, which have not been consistently evaluated in Latin American countries. Aim: The purpose of ELANS (Estudio Latinoamericano de Nutrición y Salud) was to obtain high quality data on food intake, physical activity and nutritional status in Latin America. Methods: A multicenter cross-sectional survey was performed between November 2014-July 2015 in nationally representative samples of major urban populations from 15 to 65 years old in eight Latin American countries (Argentina, Brazil, Chile, Colombia, Costa Rica, Ecuador, Peru, and Venezuela). Diet was assessed by two 24-h food recalls using the multiple pass method and the Nutrition Data System for Research (NDS-R) software. Physical activity was analyzed by the long version of IPAQ in the total sample and a subsample was subjected to triaxial accelerometry. Anthropometric measurements included body weight, height as well as neck, waist and hip circumferences. Statistical analyses were applied to total sample data and to each separate country. Findings: ELANS included 9,218 individuals (48% men and 52% women) with validated data. The age distribution of the sample was 13, 38, 28 and 21% for 15-19, 20-34, 35-49 and 50-65 years old, respectively. 42% of the subjects enrolled were from low socioeconomic level (SEL), 43% from medium and 15% from high SEL. 60% of participants had primary school education, whereas 29% attended middle-high school, and 9.5% had college or high-

er education. Mean body mass index (BMI) was 26 kg/m2 with higher values from women (27.5 kg/m2) than men (26.3 kg/m2). Overall, only 37% of the ELANS sample had normal body weight, while 3% exhibited underweight, 34% were overweight and 26% were obese. Conclusions: ELANS provides a unique dataset for Latin America, enabling cross-country comparisons of energy, macro- and micro-nutrient intake and physical activity as well as establishing associations between these lifestyle components and nutritional status within this region. In this symposium, the main results obtained in this study will be reported and discussed.

The Latin American Study of Nutrition and Health/Estudio Latinoamericano de Nutrición y Salud (ELANS), which is randomized cross-sectional multicenter investigation of food intake and physical activity status of adolescents and adults in eight Latin American countries (Argentina, Brazil, Chile, Colombia, Costa Rica, Ecuador, Peru, and Venezuela) was designed and executed simultaneously, using the same protocols to gather information, and provide accurate and updated information on diet, dietary patterns, physical activity and nutritional status of the region. Dietary patterns have been widely used for the assessment of dietary intake and evaluation of diet's association with several health outcomes. To our knowledge, only few studies have assessed diet quality of Latin American population and none has applied the same index in several populations at the same time. Thus, we aim to develop and apply a single and simple index of diet quality index for Latin American adolescents and adults and to evaluate its association with excess weight.

We will model two different dietary patterns: one based on relatively high consumption of ten healthy items (fruits, vegetables, beans and legumes, nuts and seeds, whole grains, milk, total polyunsaturated fatty acids, fish, vitamin D, and dietary fiber); and another based on relatively low consumption of ten unhealthy items (unprocessed red meats, processed meats, sugar-sweetened beverages, added sugar, saturated fat, trans fat, dietary cholesterol, refine grains, sodium and high glycemic index foods). For comparison, we will also model a third overall dietary pattern that incorporated all 20 dietary factors together. A diet quality score will be derived from each pattern; higher scores will be equivalent of healthier diets. Then, diet quality score association with excess weight will be analyzed using logistic regression analysis. Also, Factor Analysis will be performed to identify factor loading of each variable in two dietary patterns, using the average weight consumed (g/d) by each individual of 20 dietary items. Dietary intake will be adjusted for 2000 Kcal, in order to access diet quality independently of the quantity consumed. Preliminary analysis has shown a high prevalence of excess weight among eight countries, and a high intake of certain foods, food groups and nutrients, such as added sugar, sweetened beverages, fats (total, saturated and trans) and sodium, and a low intake of fruits and vegetables, vitamin D and calcium. Following this analysis, it will be possible to develop a diet quality index for Latin American countries, using the same tool that will allow us to compare diet quality by age and sex and country, and will provide information to evaluate and monitor dietary intake. It will also help to better understand the association between diet quality and increased weight in each population in order to contribute to the planning of public health politics to reduce obesity prevalence in the region.

The enormous increment of the excess weight in humans all over the world in the last 40 years is a new epidemiological situation, not seen in other nutritional problems.

It is very probable that excess weight and obesity is not a one only disease or caused by one only cause. The combination of genetic heritage with external conditions as a modification of food intake (amount or density) and a decrease in energy expenditure, determines a final condition that results in excess weight, an increase in fatty mass and metabolic alterations.

In the last years, modernization and the urban modifications, with sedentary behavior and excess energy intake, have modified the ways human beings are managing energy.

There are no reported papers of evaluating nutritional status and physical activity in Latin American populations, using a standardized methodology and representative surveys for adolescent and adult population, at the same time. ELANS- Estudio Latinoamericano de Nutrición Y Salud- or Latin America Study on Nutrition and Health, has evaluated more than 9000 people in 8 countries (15-65y), in urban settlements, in a randomized domiciliary census.

Anthropometric measurements, nutrition evaluation by means of two 24hs- recall survey and a food frequency questionnaire was performed with physical evaluation by two methodologies-IPAQ (International Physical Activity questionnaire large version) - In person-reported physical activity; leisure-time and transport activity were included; Mexican (Spanish) version of IPAQ (Salvo et al, 2014) was adapted for ELANS. Outcomes: total vigorous, moderate, sedentary time in minutes/week, Transport and Leisure time vigorous, moderate, sedentary time in minutes/week by week and weekend days.

An active evaluation was done by means of accelerometry measurement (model GT3X+, ACTi Graph, Pensacola, FL, USA) in 40% of the whole population, representing more than 3000 people. Accelerometers were fixed by elasticized belt at hip level on the right mid-axillary line, being used for 7 days, and for at least 5 days of valid measurements.

By anthropometric evaluation, 60% of ELANS population presented excess weight, varying from 54%-62%(male-female), with lowest prevalence in Colombia and higher in Chile. Energy intake was lower in Chile, for plausible cases (excluding misreporting).

As for physical evaluation by questionnaires observation (IPAQ), it was seen that 48% of ELANS population were insufficiently active, with 22% in Ecuador and 65% in Venezuela.

When actively observed (accelerometry), the overall sedentary time was higher than 9 hours a day, being higher during weekends and in adolescents. Senior adults have lower physical activity in all measurements in all countries.

As conclusion, we can observe that excess weight epidemic has strongly reached Latin American countries and some observations must be discussed- despite low energy intake, food density must be evaluated. Physical inactivity and sedentary behavior is strongly associated with excess weight, in all countries, and being much important in adults and senior people. Political and educational policies must be implemented for preventing obesity and its morbidities. Implementing changes toward public policies and education interventions must be made for preventing obesity and its co-morbidities.

LA countries have been experiencing the nutrition transition during the last 40 years moving from under to overweight but also experiencing nutritional deficiencies. As a result of this transition, alarming rates of overweight and obesity have been described in LA, which coexist with hidden malnutrition especially in developing countries . It has been suggested that the excessive energy intake is also associated with the decreased of food quality and multiple micronutrient deficiencies.

The deep knowledge about LA diet is still a scientific concern. Few studies have investigated the LA diet composition reporting not only the differences across countries but also among the regions within a country. ELANS (Latin American Study of Nutrition and Health) has examined the pattern of habits and micronutrient's food sources in 8 LA, using a single methodology for data collection and analysis. Data were analyzed by country, gender, socioeconomic level (SEL) and group of age.

Micronutrients outcomes of ELANS were Calcium, Vitamin A, D, C and Iron and the estimated average requirements of the Food and Nutrition Board of the Institute of Medicine were the references used for making comparisons. The prevalence of inadequate intake of Vitamin A was 52% (range: 21-80,) no association with socio economical level and/or nutritional status was observed. Intake of Vitamin D was very low for all the countries with little variations between them and higher intake in men was observed (mean: 3.1 mcg/d EAR: 10 mcg/d). On the contrary, Calcium intake showed a wide variation of inadequate intake with lower rates in Argentina (70%) and higher ones in Costa Rica and Peru (95 and 97% respectively). Iron deficiency is higher in Brazil and significantly associated with SEL. Vitamin C inadequate consumption is higher in southern countries (Argentina and Chile) and lower in northern ones, associated with natural juice and fruit consumption. Combined prevalence of inadequate micronutrient intake showed to be higher in vulnerable age groups (adolescents and older adults) and this is a common pattern in all the eight countries. Differences observed in culture and meal habits from one country to another seem to be associated to micronutrient intake and centered in two key aspects: main food sources, and behavior regarding fruit and vegetable consumption

In conclusion, despite the eight Latin American countries show alarming rates of micronutrient deficiencies, cultural differences in meal patterns and food sources explain variations in consumption between the countries. Vulnerable groups are the youngest and oldest of the sample that do not reach to meet intake recommendations and this pattern is shared by all the countries, gender, and social and economic groups within the Latin American region.

The interest on developing public health policy interventions to reduce obesity and improve nutrition in last decades has progressively grown as a response to increasing overweight and obesity prevalence. ELANS (Estudio Latinoamericano de Nutrición y Salud) or Latin America Study on Nutrition and Health, is a household-based multi-national cross-sectional survey whose aim is to describe the nutritional status of the Latin-American people, and investigate food and nutrients intake as well as physical activity status of nationally representative samples from urban populations. This study evaluated with an unique methodology, a randomized sample with 9218 people (15-65y) in 8 countries simultaneously (Argentina, Brazil, Chile, Colombia, Costa Rica, Ecuador, Peru and Venezuela).

Many challenges and barriers to conduct this study arose at the very beginning: the complexity of the selection of team members, communications, inclusion of technical scientific advisors. The requirement of having a common protocol with the same set of data collection tools, involved 15 months of collaborative work. In addition, obtaining ethical approval from 8 different boards plus a centralized external Institutional Review Board (IRB) at a similar range of time became an extra challenge. A Contract Research Organization (CRO), was responsible for the recruitment and data collection. To ensure the feasibility, efficiency and adherence to the study protocol and procedures a pilot study was crucial. A simultaneous fieldwork, under standardized and uniformed conditions of application of questionnaires and measurements required a continuous and exhaustive work from the Coordination Center consisted in two chairs, one co-chair and two project managers. A tight collaboration with each academic / research team was performed. During the fieldwork periodical controls of data quality were carried out and a general consistency after completion of data collection was developed. Specifically, the dietary intake consistency was the most complex: technical support and guidance to all research teams were necessary.

From ELANS many lessons were learned regarding the conduction and coordination of a multicenter study: 1- the inclusion of a multidisciplinary team with deep knowledge in specific areas was essential, 2-the key role of a proactive supervision and coordination of an international team allowed the simultaneous developed of the study at every country, 3- designing and following a feasible and realistic protocol required more effort than expected, 4- the value of taking care of local characteristics of each site at the moment of planning and developing the fieldwork allowed to identify and solve local barriers 5- the communication with the CRO and the supervision of its work was critical to ensure data quality. These are a tiny example of many other learnings achieved. The findings of this study will provide scientific information on nutrition and physical activity, and due to strict procedures of data quality control allowing the comparison between the LA countries. It is also a good example of a multi center collaboration study that contributes with learnings and tools for other research teams.

50 YEARS OF NUTRITION RESEARCH SUPPORT IN LOW INCOME COUNTRIES: ACHIEVEMENTS AND NEEDS

THE NESTLÉ FOUNDATION 50TH ANNIVERSARY

Suter, Paolo M.; Wahli, Walter.

Nestlé Foundation, Lausanne, Switzerland.

In 2016 the Nestlé Foundation (NF) celebrated its 50th anniversary. To the best of our knowledge, the NF is one of the oldest foundations exclusively focused on improving child health and

nutrition in low-income countries, through supporting research and capacity building.

During these fifty years the Foundation supported over 300 research projects in more than 55 low / lower-middle income countries, which resulted in nearly 600 publications, many of them in high impact journals. The key criteria for support continue to be the relevance of the research question for improving local nutrition conditions, the potential for implementation in the long term, and the quality and quantity of local capacity building.

During these 5 decades the NF supported many individuals in their research activities and to obtain advanced degrees at internationally-recognized universities. Many of our awardees are currently engaged at local universities, Ministries of Health, public health NGO's or international organizations such as UNICEF and WHO. These alumni of the Foundation carry on our conviction that only the strong involvement of locally-based, well-trained health professionals will lead to a sustainable improvement in health and nutrition in developing countries. During the symposium we will present typical examples of projects from 3 continents, which will give an opportunity to discuss further strategies to improve the health of children in low-income countries by advancing research capacity at the local level.

Keywords: Capacity Building, Nutrition Research, Health research capacity, maternal and child health, sustainability

THE EFFICACY OF PEARL MILLET VERSUS MAIZE IN CHILDREN < 2 Y IN RURAL EASTERN KENYA: A RANDOMIZED COMMUNITY TRIAL

[1]Ndiku, Hellen; [2]Sabate, Joan.

[1]DrPH. Associate Professor. University of Eastern Africa, Baraton Kenya School of Science and Technology; [2]DrPH MD Professor of Nutrition Loma Linda Univesity CA USA.

Twenty six percent of under five children in Kenya are stunted as a result of chronic malnutrition. Stunting in the first 2 years of life leads to irreversible damage, including shorter adult height, lower attained schooling, reduced IQ, reduced adult income and decreased offspring birth weight. Until about 50 years ago pearl millet was a staple crop in Eastern Kenya, but it has now been replaced by maize in most areas.

The objective of this study was to assess the efficacy of a one year supplementation with pearl millet compared to maize in children less than one year of age at baseline on physical growth as measured in stunting rate, attained height, body weight, mid upper arm circumference and head circumference. Hemoglobin levels were also assessed.

The study used a randomized community dietary intervention trial design. It was conducted in Mbooni West Sub County because it has a semi-arid climate and most villages currently grow maize. Four villages, at least 50 km away from each other to avoid contamination, were randomized to a one-year pearl millet or maize intervention. The dietary interventions consisted of food distribution and nutrition education. Mothers were provided a weekly ration (2 Kg) of pearl millet or maize flour for the family. 178 children were enrolled [90 from maize and 88 pearl millet villages]. Anthropometry was measured at baseline, midyear and end year. Data was obtained from 133 children [67 maize and 66 pearl millet] at the end of the study.

Children on the pearl millet supplementation attained higher height (79.2 +3.5) as compared to the maize supplemented (76.4+7.7), p<0.016. More children from the maize supplementation villages were stunted (17.1% stunted, 5% severely stunted) as compared to the pearl millet (stunted 13.6%, severely 1%), p< 0.001. Children on pearl millet supplementation had higher Z-score indices (Height-for-age = -1.42 +2.4) than children on maize (-1.03 +1.0). Hemoglobin levels, mid upper arm circumference and head circumference were not significantly different between the two groups.

Malnutrition in rural Eastern Kenya is still pronounced. However, children supplemented with pearl millet attained slightly better nutritional parameters compared to their maize supplemented counterparts. Results from this study could infer that consumption of pearl millet may better nourish children in arid and semi-arid areas. Further research is needed to assess the impact of pearl millet consumption in a controlled clinical trial.

Keywords: Keywords: Pearl millet; maize, stunting, children, Mbooni west

IMPROVING NUTRITION BY LINEAR PROGRAMMING

[1]Fahmida, Umi; [2]Htet, Min Kyaw.

[1]PhD. Academic Staff. South East Asian Ministers of Education Organization Regional Center for Food and Nutrition (SEAMEO RECFON), Pusat Kajian Gizi Regional Universitas Indonesia, Jakarta, Indonesia; [2]PhD. Research Fellow. Sydney School of Public Health. University of Sydney. Sydney. Australia.

Goal/linear programming (LP) is an optimization method that can be used to identify optimal but realistic, available, and affordable complementary feeding recommendation (CFR) to meet Recommended Nutrient Intakes (RNIs) of energy and nutrients given the food availability, food patterns, food portions, and cost. LP approach can also be used to identify nutrient gap and formulate complementary intervention such as fortification. Several intervention studies where optimized CFRs developed using LP were promoted have been conducted in Indonesia and Myanmar. Findings from 6-month intervention in Lombok Indonesia showed that 12-17mo children whose mothers received nutrition education with optimized CFRs had higher dietary diversity score, consumed the nutrient-dense foods more frequently, and had higher nutrient intakes and nutrient densities for problem nutrients (Fe, Zn, Ca) in their CF diet than children in control group. While difference in growth was not found by the end of the 6mo intervention, a follow-up study conducted two years later on these children (mean age 47±3 months) showed that there was lower prevalence of stunting in CFR than control group (36.6% and 45.8% in CFR and non-CFR, respectively, p=0.05). Six month intervention study on stunted 12-23mo children in Dompu

Indonesia showed that children receiving optimized CFR without fortified food (meeting approximately 65% RNI or close to Estimated Average Requirement) showed better length and length-for-age gain than those who received standard and high nutrient density CF diets which included fortified food. In 6-month intervention trial in Myanmar, optimized CFR for 12-18mo children can minimize the negative effect of iron supplementation (15mg elemental iron in the form of ferric NaEDTA) on zinc status and gut microbiota. The findings suggest the benefit as well as the sustainability of promoting optimized CFR and further study is needed to provide more evidence of its effectiveness at the public health level.

THE NEED FOR EFFECTIVE NUTRITION RESEARCH IN AFRICA

Lartey, Anna.

President of the International Union of Nutritional Sciences (IUNS). Director of Nutrition at the Food and Agriculture Organization of the United Nations (FAO). Rome. Italy.

Africa is the region where improvements in nutritional status has been slow. About 37% of the world's 156 million are stunted children and 28% of the world's 50 million wasted children are in Africa. Malnutrition has a huge cost affecting cognitive development, educational attainment and subsequently affecting adult productivity and economic earnings. Economic losses due to malnutrition are estimated at 11% of the GDP for Africa. Noting this, at the Malabo declaration, Heads of States and Governments of the Africa Union committed to end hunger and improve nutritional status, specifically by reducing child stunting to 10% and underweight to 5% by 2025. These commitments must be translated into actions. Attempts to address malnutrition in Africa would not be effective if efforts are not made to invest in research. The unique nutritional problems in sub-Sahara Africa call for effective research to identify interventions that fit the context. Unfortunately, the current nutrition research environment is not conducive for effective research. A survey among African researchers identified the lack of recognition by policy makers on the relevance of nutrition research, absence of nutrition research priorities, low capacity, poor infrastructure and inadequate funding. As a result, the research agenda is determined by donors not too familiar with the real nutrition problems of the Africans. For example, the food systems in most sub-Saharan countries are fast changing, traditional diets rich in whole grains, legumes, fruits and vegetables are being replaced by highly processed foods. There is little research on-going to explore the use of local food ingredients in improving diets, especially for children. Very few African countries have analysed the nutritional composition of their foods. Until African researchers and governments take and lead the nutrition research agenda, the large research funding chanelled into Africa will not make the expected impact of moving the malnutrition situation in the continent. To move forward, African researchers must position themselves to take advantage of the current opportunities presented by the SDGs to address malnutrition by developing their capacity to source needed funds to carry out the research that really address the nutritional problems of Africa.

THE FUTURE OF YOUNG AFRICAN RESEARCHERS

Ashong, Joseph.

Nutriton Specialist. USAID Ghana.

Nurturing and empowering young African researchers is important to the success of reducing malnutrition in Africa. The young African researcher is faced with numerous obstacles in his quest to contribute to reducing malnutrition in Africa. The first obstacle is the 'system'; the 'system' rejects the young African researcher simply because he is young and inexperienced irrespective of his qualification. The system fails to realize the young African is well trained and ready to work for mother Africa. The response to this obstacle is, the young African leaves to other countries, commonly to North America or Europe. There are very talented and hardworking young Africans performing and contributing to research in the Americas and Europe who are refusing to return home simply because the 'system' is not welcoming. It is the same 'old' faces who attend conferences, workshops or symposia to discuss solutions to malnutrition in Africa, with no room for the opinion of the young African. Unfortunately, donors and funding agencies contribute to 'embolden' the 'system' by funding proposals, travel grants and fellowships of the 'known' faces, who are mostly the older generation to the neglect of the young African. Another major obstacle facing the young African is the non-availability of opportunities such as localized funding opportunities. Most funding opportunities are from outside the continent with their attached conditionalities which limits the young African to explore in his quest to find solutions to the malnutrition problem. It is high time African leaders, philanthropists and other stakeholders invest substantially in research funding to encourage the young African to explore in terms of research to the benefit of the continent. Given the opportunity and "freedom" to contribute their quota, young Africans are more than willing to contribute meaningfully to the fight against malnutrition. What the young African needs is the exposure, platform and freedom to contribute their part. The African Graduate Nutrition Students Network (AGSNet) seeks to build in its members at their formative stages of their studies and professional careers, the spirit of collaborating and sharing of ideas to solve problems. AGSNet was initiated in 2002 by a group of African students then studying at Cornell University, USA, as a platform for networking and relationship building among mostly African students studying nutrition and related courses, and young professionals. AGSNet aims to build core nutrition competencies, organizational and leadership skills as well as appropriate attitudes and values while fostering the development of strong African nutrition advocates or champions who will keep the fight

against malnutrition in Africa at the forefront of their work. The AGSNet approach is to explore all available platforms, partnerships and opportunities both within and outside the continent to build the capacity of its members. Nestle Foundation prioritizes projects in Africa which leads to sustainable development with a strong emphasis on capacity building. This fits perfectly with the objectives of the AGSNet. Nestle Foundation has thus supported AGSNet over the years to provide capacity building opportunities for its members

OXYGEN: A NEGLECTED NUTRIENT

HYPOXIA AND ADIPOSE TISSUE DYSFUNCTION IN OBESITY

Trayhurn, Paul.

Obesity Biology Unit. University of Liverpool. UK. and Clore Laboratory. University of Buckingham. UK.

Oxygen is rarely considered as a nutrient and this is principally because it is delivered through the lungs rather than by the diet via the gastrointestinal tract. However, oxygen is an essential 'macronutrient' without which oxidative metabolism, particularly oxidative phosphorylation in mitochondria, cannot take place. Once absorbed from the lungs, the delivery of oxygen to cells from the circulation by haemoglobin parallels the carrier mechanisms by which a number of nutrients are transported. At a physiological level the consequences of, and adaptations to, low oxygen tension have been extensively investigated, especially in relation to high altitude. A relative lack of oxygen is apparent in a range of diseases where lung function is impaired, such as pulmonary fibrosis and chronic obstructive pulmonary disease. These conditions impact on the provision of oxygen to the body as a whole, but a reduction in individual tissues can occur even when the total body supply is not compromised; examples include the site of wound healing following tissue damage and in solid tumors. There is growing recognition that low oxygen tension, and indeed overt hypoxia, can also occur in normal tissues with important implications for cellular function. White adipose tissue (WAT), a major endocrine and signalling organ with adipocytes secreting a multiplicity of protein and lipid factors, is one site where hypoxia has been demonstrated. There is substantial evidence from animal studies that hypoxia develops in WAT as the tissue mass expands with obesity, resulting in changes in adipocyte function which may underpin the dysregulation that leads to obesity-associated disorders - including insulin resistance and the metabolic syndrome. In particular, the reduction in oxygen tension is considered to underlie the inflammatory response with the expression and secretion of several inflammation-related adipokines being up-regulated; these include major adipokines such as leptin, IL-6 and VEGF. In contrast, the expression and secretion of the key adipocyte hormone adiponectin is inhibited by low oxygen levels. Adipocytes in culture, both murine and human, exhibit extensive functional adaptations to hypoxia, there being changes in the expression of up to 1,300 genes. A switch from oxidative metabolism to anaerobic glycolysis is evident, glucose utilisation being greatly increased in hypoxic adipocytes with a corresponding elevation in lactate production, both changes involving increased recruitment of the key transporters GLUT1 and MCT1, respectively. Importantly, hypoxia directly induces insulin resistance in fat cells and leads to the development of adipose tissue fibrosis. Exposure to graded levels of oxygen indicate that adipocytes titrate small differences in oxygen tension with alterations in gene expression and glucose utilisation. Other cell types within WAT also respond to hypoxia, with the differentiation of preadipocytes to adipocytes being inhibited and preadipocytes transformed into leptin-secreting endocrine cells. Overall, hypoxia has pervasive effects on the function of white adipocytes and appears to be a key factor in adipose tissue dysfunction in obesity. Finally, oxygen should be recognised as a critical nutrient and part of the landscape of nutritional science.

Keywords: Adipocytes; Hypoxia; Obesity ; Oxygen tension; White adipose tissue

OXYGEN DEPRIVATION IN TUMOURS

Gilkes, Daniele.

Johns Hopkins University School of Medicine.

Intratumoral hypoxia has been identified in a majority of solid tumors and has been associated with an increased risk of metastasis and cancer patient relapse. Hypoxia within a solid tumor arises from an increase in oxygen utilization by rapidly proliferating cancer cells, which ultimately results in a decrease in oxygen availability. The abnormal blood vessels formed within tumors further limit the diffusion of oxygen. Cancer cells adapt to the hypoxic microenvironment by increasing the activity of the hypoxia-inducible factors, HIF-1 and HIF-2. In breast cancer, regardless of lymph node status, patient survival is significantly decreased in patients with the highest HIF-1α levels in their diagnostic breast cancer biopsies. This is consistent with studies showing HIF-1α overexpression within metastatic lesions arising from breast tumors. A growing body of data from preclinical and clinical studies has shown that hypoxia can induce and/or select for cells with altered characteristics, including (a) maintenance of replicative potential, (b) maintenance of stem cell properties, (c) genetic instability, (d) angiogenesis, (e) metabolic reprogramming, (f) autocrine growth factor signaling, (g) invasion, (h) metastasis, and (i) resistance to radiation and chemotherapy. We will discuss how cells alter their metabolism to support continuous growth and proliferation in challenging hypoxic environments. Furthermore, we will discuss how hypoxia forces changes in cell behavior and the associated extracellular matrix to increase their migratory and metastatic behavior.

Keywords: Oxygen, hypoxia, tumour, HIF, cancer

SCIENCE UPDATE OF PHYTONUTRIENTS IN AGING SOCIETIES AND PUBLIC HEALTH

SCIENCE UPDATE OF PHYTONUTRIENTS

Miyazawa, Teruo.

Tohoku University.

Attention to the benefits of phytonutrients has been increased recently. Our vision is to make phytonutrients as the first value of people's health for consumers and scientists, as a part of daily life based upon scientific evidence. Objective of Global Phytonutrient Society (GPS) is to promote usefulness of phytonutrients based on advanced scientific evidence from the world; to utilize promising phytonutrients applying to super-aging society; to link to global leading experts and societies for use in supplements/health foods and as essential choice to achieve optimal health; to collaborate with governmental scientific organizations in major legions; and to establish global subsidiaries in the future. Our goal is that botanicals, especially sources phytonutrients, are universally accepted by policy makers, regulators, academia and consumers for use in supplements/health foods and as essential choice to achieve optimal health.

For example, phospholipids are of critical importance in mammalian cell biology, both through providing a permeability barrier and acting as substrates for synthesis of lipid mediators. Such membrane lipid peroxidation receives attention to evaluate nutritional states and also to cellular aging. For measuring phosphatidylcholine hydroperoxide (PCOOH) as a primary oxidation product of membrane lipids, CL-HPLC and/or with LC-MS/MS is employed. High PCOOH concentration as a biomarker of membrane lipid peroxidation is confirmed in atherosclerotic plasma with angiographically significant stenosis. In Alzheimer patients, aged RBC rich in PCOOH is found significantly in peripheral blood, and such PCOOH-rich RBC lacks CO_2/O_2 exchange function that contributes to develop the senile dementia. The data further indicate that radical and/or enzymatic oxidation is recognized to cause oxidation of membrane lipids in our body. Age-dependent accumulation of PCOOH is confirmed in cultured human diploid cells, the microsomal and plasma membrane of the rat hepatocytes, and the brain and liver of the rat, and intensely in a mouse model for hepatitis C virus associated hepatocarcinogenesis.

Phytonutrients (vitamin E, C, carotenoid, polyphenols and so on) prevent the membrane lipid oxidations, and intake of phytonutrients as dietary antioxidants would be recommendable for public health.

PHYTONUTRIENTS IN AGING SOCIETIES: A PRACTICAL APPROACH

Williamson, Gary.

Prof. University of Leeds. Leeds. UK. LS29JT.

Phytonutrients include flavonoids, phenolic acids, sulfur-containing compounds, isoflavones and other secondary metabolites which are found in plant-based food and beverages, and are consumed as part of the diet. According to epidemiological and intervention studies, diets rich in these compounds protect against developing the chronic diseases of aging, such as cancer, type 2 diabetes and cardiovascular disease [1-4]. Studies on human cells in vitro have indicated mechanisms by which this protection might occur, and these have been complemented by experimental animal models and by studies in healthy and at risk human volunteers. Taken together, this huge effort has provided part of the scientific platform for government recommendations on consumption of diets high in fruit and vegetables, to maintain health and slow down aging processes. Many mechanisms of action have been suggested, but the most viable effects are those which take into account the bioavailability of phytonutrients. Pathways of absorption and metabolism for the major classes have been studied extensively and are in general well understood [5]. It is clear that the beneficial effects of phytonutrients are on specific cellular targets and are not due to direct chemical antioxidant action [6]. Taken together, the current data in the literature indicate a robust and widely applicable protective effects of phytonutrient-rich foods against chronic diseases of aging. However, the doses required and to what extent the phytonutrients can be supplied as supplements both remain issues of debate, and probably depend on formulation, processing, combination with other ingredients, time and frequency of consumption.

MEDITERRANEAN DIET AND PHYTONUTRIENTS FOUND IN SUCH DIET CAN HELP TO SUPPORT IN PREVENTING AND REDUCING AGE-RELATED DISEASES

Bilia, Ana Rita.

PhD professor. Department of Chemistry. University of Florence. Italy.

Benefits of Mediterranean diet type have been known for well over half a century. In the last decade, an increasing amount of scientific evidence has supported its beneficial effects in human health confirming how this diet could be useful in preventing and reducing cardiovascular disorders, in diabetes type II, metabolic syndrome and fatty liver, and the cognitive decline of neurodegenerative diseases. A number of plant constituents naturally occurring in foods, particularly polyphenols, terpenoids, glucosinolates have a dramatic role in the modulation of cellular signaling pathways and nutritional genomic is a developing research field to study the effects of foods and food constituents on gene expression, focusing on identifying and understanding molecular-level interaction between nutrients and other dietary bioactives with the genome. Olive oil is the main source of fat and health-promoting component of the Mediterranean diet. Solid evidence was obtained on the homeostatic control of genes having a role in lipid metabolism, immune-inflammatory pathways, vessel protection and blood pressure control, metabolic regulation and detoxification of reactive species. Oleurepein, hydroxytyrosol and oleocanthal are the principal constituents responsible for such natural functional food. Citrus fruits such as oranges, bergamots, lemons and grapefruit contain special classes of flavonoids (polymethoxylated flavone and flavanones), are emerging for their considerable nutraceutical value. Juices from fruits or single flavonoids constituents can reduce the incidence of cardiovascular disease risk, pre-clinical investigations highlight cellular and subcellular targets that are responsible for these beneficial effects. Typically, plants from Brassicaceae family represent a large botanical family comprising many edible species. The organosulfur compounds of these species, denominated isothiocyanate derivatives (deriving from a myrosinase-mediated transformation of glucosinolates) have an important preventive effect in many human diseases, particularly prevention of neurodegenerative processes and cardiovascular diseases. Similarly, species belonging to Allium genus such as garlic, contain sulfur derivatives. S-allyl cysteine (SAC) is the active and main component of aged garlic extract with anti-inflammatory, neuroprotective, and nootropic potential.

Keywords: Mediterranean diet ; prevention and reduction aged-related diseases; polyphenols; terpenoids; glucosinolates

THE CURRENT STATE OF COMPUTER SUPPORT FOR GENOTYPE-BASED NUTRITION AND LIFE-STYLE GUIDANCE

Kohlmeier, Martin.

MD PhD. Nutrigenetics Laboratory. UNC Nutrition Research Center. University of North Carolina Chapel Hill. USA.

The responses to many foods, nutrients and bioactives differ greatly between individuals. In many instances known gene variants are the underlying cause for such distinct differences in effects and outcomes. A typical example is the persistence of intestinal lactase expression in carriers of variants located in enhancer regions of the LCT gene. These variant carriers usually tolerate the consumption of significant lactose amounts while non-carriers respond with bloating, abdominal cramps and other discomfort to such intake. In light of the rising number of such well-documented examples of actionable genetic information, the call for genotype-based nutrition guidance is getting stronger.

Current-generation nutrition information tools should meet several key requirements: (1) Estimate individual dietary targets by flexibly integrating genetic data with variable layers of personal information such as age, gender, body size, activity level, intolerances and dietary preferences; (2) Shield raw genetic information both from the user to avoid distress and from third parties to avoid abuse; and (3) Generate individually actionable information such as personal nutrition suggestions, life-style tips, and tailored meal plans.

The tailoring of meal plans to individual nutritional needs and personal preferences is a major challenge because of the large number of factors that have to be taken into account. The macronutrients, sugar, saturated fat, sodium, minerals, a few vitamins, a few trace elements, fruits, vegetables, vegetarian, vegan, gluten-free, low-lactose and pork-free already add up to more than twenty targets and conditions.

Fully configured food databases are essential for generating individually tailored meal plans. Building such a database is a tall order because it can only include items with all the data used by the search criteria. To be suitable for a gluten-free meal plan, the absence of gluten in every single meal component has to be know. Foods with even one missing data item missing are useless. The lack of comprehensive nutrition information for most commercially available foods is the major limiting factor.

So far, PONG (Personal Online Nutrition Guidance) appears to be the only computer-supported nutrition information tool that meets these minimal requirements. It is a comprehensive platform that can integrate all types of personal information for generating nutrition target estimates. To the extent that evidence-supported rules are available, an unlimited number of genetic variants and other factors can be used to estimate individual nutrition targets. Another set of rules dependent on the acquired information and estimated targets provides a personalized narrative of major di-

etary and life-style goals, tips for practical implementation, and hints for daily success. Most importantly, the tool offers individualized meal plans that fully meet the user's personal needs. The tool lists the nutrient composition of suggested meal plans next to the intended target amounts. Plans that are reasonably close to what the user wants can be further modified to personal preferences and food availability. Colors and other visual aids signal the suitability of combinations.

Head-to-head comparisons with other available nutrition information tools should assess how well they meet these advanced criteria for safe, effective and user-friendly translation of genetic information into daily nutrition and life-style choices.

GENOMICS OF EATING BEHAVIOR IN RELATION TO OBESITY

Santos, José Luis.

Department of Nutrition, Diabetes and Metabolism. School of Medicine. Pontificia Universidad Católica de Chile. Santiago, Chile.

The prevalence of obesity (Body Mass Index BMI> 30 kg/m2) has increased in the last decades via "obesogenic" environments characterized by easy access to high energy-density foods and a reduction in physical activity levels. In Chile, a middle-income country, childhood obesity prevalence has tripled over the last decades and continues to rise. The evaluation of the change in the population distribution of BMI over time indicates that the increase in body weight is not uniform in the population, implying that there are groups of subjects that are resistant to the development of obesity, while other groups are especially susceptible. Among the multi-level factors that are related to obesity, increased energy intake is likely to play a dominant role. In this context, eating behaviour is acquired in early childhood, and changes over time according to personal subjective experiences and family influences, which ultimately determines food consumption patterns. Despite the decisive influence of the environment on the obesity epidemic, twin studies have reported that both BMI and eating behaviour scores are traits with important genetic basis. Genetic variation in taste receptors (for example, TAS2R38 among others) and components of neuroendocrine systems (FGF21, MC4R, among others) have has been linked with variation in food responsiveness, food selection and hunger. Additionally, genome-wide association studies have identified more than 200 loci related to BMI that can be used to create genetic risk scores for obesity. Appetitive traits have been proposed to mediate the relation between genetics and obesity, in accordance to the "behavioural susceptibility theory" (Llewelyn and Fildes. Curr Obes Rep 2017; 6: 38-45) that states that individual differences in eating behaviour scores are the mediators of the relation between genetic susceptibility and the development of obesity. In relation to rare monogenic syndromes characterized by obesity and hyperphagia, most cases diagnosed with genetic obesity are caused by disruption of genes belonging to the leptin-melanocortin pathway such as LEP (encoding leptin), LEPR (leptin receptor), MC4R (melanocortin-4 receptor), POMC (proopiomelanocortin) and PCSK1 (proprotein convertase subtilisin/kexin type 1), among others. It was reported that subcutaneous leptin administration to obese patients with genetic leptin deficiency reduced dramatically their energy intake and body weight. Recently, new therapeutic strategies based on MC4R agonism have led to the modification of eating behaviour and body weight in patients with POMC deficiency, (a rare obesity syndrome with hyperphagia). In conclusion, the study of monogenic forms of obesity and hyperphagia has led to new biological knowledge and therapeutic strategies to manage eating behaviour and increased body weight. On the other hand, intricate relations of obesity-related variables have led to the concept of eating behaviour as a mediator connecting genetics and the development of obesity in the context of a modern obesogenic food environment.

NUTRITION AND GENETICS: THE MISSING LINK

Escott-Stump, Sylvia.

MA, RDN, LDN, FAND. Clinical Assistant Profesdor. Department of Nutrition Sience. East Carolina University. USA.

The aims of this presentation will be to provide a deeper appreciation of the role of nutrition in genetics. Differences between the stable human genome and the ever-changing microbiome have led to discoveries of the single nucleotide variants and dietary changes that affect human health. The Human Variome Project documents specific genes and their relationship with diseases. Recent studies show that epigenetic programming during the developmental years and alterations during aging have important implications in disease management. Key nutrients affecting gene expression include folic acid, Vitamins B-12 and Vitamin D. Tumorigenesis and several age-related diseases are linked to DNA methylation-dependent activities. Thus, dietitians should understand the significance and be ready to create new employment opportunities in the emerging fields of Nutrigenomics and Nutritional Genetics. Competencies, knowledge and desirable professional traits have been identified and adopted for interpretation of genetic and genomic information and personalized nutrition therapy.

Chronic diseases, including obesity, diabetes, and cardiovascular events, are related to important clinical complications and lower longevity. Nutrition and dietary patterns, as well as other lifestyle factors, are crucial elements with potential interactions on genes impacting on health outcomes. Personalized nutrition relies on knowing the genotype of the individual, which influence the response to foods and also on the principle that nutrients regulate gene expression. Thus, precision nutrition depends on the genetic make-up (i.e., DNA sequence and epigenetic markers), on clinical and physiological issues (i.e., phenotypical traits, perinatal nutrition, diseases history and drug prescriptions, allergies,...) and on social/cultural differences (i.e., lifestyle, physical activity, food habits and preferences, mating, religion and food accessibility, likes and dislikes, etc...)…

Precision nutrition is evolving as an important part of disease management accounting the individual's genetic and epigenetic information, together with subject´s personal aspects (previous or current diseases, endocrine disruptions, fat distribution, sex, age) and environmental influences (including diet). Indeed, omic advances are generating a better knowledge about the involvement of genetic variants/SNPs and epigenetic marks as well as gene expression patterns or metabolites/microbiome changes depending on nutrition and their interactions with the development/treatment of acute and chronic diseases.

The convenience of modern omic technologies, the discovery of new biomarkers based on genomic and metabolic data together with a wider understanding of gene and lifestyle interactions are becoming important endeavors in precision nutrition areas. Also, metabolomics and metagenomics (microbiota) studies are contributing, together with progress in dietary assessment and biochemical/genetic tests, to better interpreting every person individuality through blood, urinary, and fecal differentiating features.

Investigations to unravel omic markers in groups with different genetic and epigenetic backgrounds (i.e., GWAS and EWAS strategies), together with advances in NGS or Omic tools and bioinformatics are enabling to deduce new relationships among genes and dietary factors. These findings are disentangling the genetic predisposition to complex metabolic diseases and providing suitable recommendations for precision nutrition.

The "Nutrient-gene interactions: Knowledge to action" IUNS Task Force has been since 2005 specifically devoted to these tasks. Indeed, the number of publications related to nutritional genomics and associated omics branches, such as Nutrigenetics, Nutrigenomics, Metabolomics and Metagenomics, are continuously evolving (more than 1.000 documents with more than 12.000 citations since 2001), which is paving the way to provide an efficient precision nutrition for a healthy life.

HYDRATION AND WORK

HYDRATION IN THE WORK ENVIRONMENT

Figueredo Grijalba, Rafael.

MD, MSc. Faculty of Health Sciences. Catholic University. Asuncion. Paraguay.

The human organism is composed of approximately 60% water. The function of water is essential for the maintenance of health, acting in the development of different physiological processes, all essential for life. Therefore, it is evident the need for a person to be adequately hydrated, both to maintain health, and to properly perform their tasks.

Different causes can make a worker quickly lose body water, become dehydrated and suffer complications both in their work capacity and in their own health. In industrial work, among these causes we can mention:

1. Use of encapsulated protective clothing that can raise sweat rates by 2.25 liters per hour.

2. Intense physical work, for example, construction workers.

3. Work in hot environments, for example, mining.

4. Air conditioning in offices, shops, gyms, hospitals, even in vehicles that are used in long journeys, which can accelerate losses by skin or respiratory tract.

5. Difficulties in access to water, for example, in long distance driving, work in controlled environments, construction sites, hospitals and also in educational institutions.

Different researchers have shown that body water losses around 2% of body weight, regulate changes in mood, can cause fatigue and reduce the level of alertness, conditioning the individual's work capacity.

Institutions and companies should ensure that workers have adequate availability of drinking water. In addition, accessibility should be ensured, i.e. there should be water in strategic locations, visibly marked and with the necessary utensils (glasses, etc.) to drink it.

There are no specific recommendations on water consumption for the worker, considering environmental factors such as protective clothing, high temperature, work in heated or outdoor environments, work intensity, etc.

The Institute of Medicine (IOM) of the National Academy of Sciences of the United States of America recommends adequate fluid consumption for adults 2.7 to 3.7 liters / day. The worker should consume at least the maximum recommendation cited and increase this consumption until reaching 5 or 6 liters daily, according to work intensity and environmental conditions. The American Occupational Safety and Health Administration recommends replenishing liquids by drinking a 250cc glass of water every 20 to 30 minutes.

Finally, we can conclude that a correct hydration at work is oriented to avoid diseases, reduce absenteeism at work and increase productivity.

Keywords: Hydration, Work.

HYDRATION AND PHYSICAL ACTIVITY

Sangenis, Patricia.

MD. Cardiologist. Sport Medicine. Instituto Deporte y Salud, Buenos Aires. Argentina.

A well-hydrated athlete always functions at a higher physiologic and performance level than a dehydrated one

Prolonged exercise leads to progressive water and electrolyte loss from the body as sweat is secreted to promote heat loss. The rate of sweating depends on many factors and is increased in proportion to the work rate and the environmental temperature and humidity. Sweat rate is highly variable between individuals and can exceed 2, 5 l h for prolonged periods.

Since it is established that the dehydration will impair exercise capacity and can pose a risk to health, the intake of fluid during exercise to offset sweat loss is important.

Fluid intake is also aimed at providing a source of substrate, usually in the form of carbohydrate. The availability of ingested fluids may be limited by gastric emptying or by intestinal absorption. Gastric emptying of liquids is slowed by the addition of carbohydrates in proportion to the carbohydrate concentration and osmolality of the solution.

Water absorption in the small intestine is a passive process and is stimulated by the active absorption of glucose and sodium.

The optimum fluid for rehydration during exercise depends on many factors, particularly the intensity and duration of the exercise, the environmental conditions and the individual physiology of the athlete. The composition of fluids to be used will depend on the relative needs to replace water and to provide substrate.

Where rehydration is a priority the solution should contain some glucose or polymers and sodium and should not exceed isotonicity.

Dehydration refers to an imbalance in fluid dynamics when fluid intake does not replenish water loss. A moderate exercise workout generally produces a 0,5 to 1,5 liters sweat loss over a 1 hour period. Significant water loss occurs during several hours of heavy exercise in a hot environment.

Intracellular and extracellular compartments contribute to the fluid deficit (dehydration) which can rapidly reach levels that impede heat dissipation, reduce hot tolerance and severely compromise cardiovascular function and exercise capacity.

Because sweat is hypotonic with other body fluids, the hypovolemia caused by sweating correspondingly increases blood plasma osmolality

Just about any degree dehydration impairs physiologic function and thermoregulation. Adequate fluid replacement sustains the exceptional potential for evaporative cooling of acclimatized humans.

Changes in body composition indicate the extent of water loss during exercise and the adequacy of rehydration during and after exercise or athletic competition. Voiding small volumes of dark yellow urine with a strong odor also provides a qualitative indication of inadequate hydration. Well hydrated individuals tipically paroduce urine in large volumes, light in color, and without a strong smell.

Prepubescent children have a lower sweating rate and exhibit a higher core temperature during heat stress than adolescents and adults, despite their larger number of heat-activated sweat glands per unit skin area. For a practical standpoint, children exposed to heat stress should exercise at reduce intensity and receive additional time to acclimatize compared to more mature competitors.

Keywords: Well hydrated, Health,Sweat

ADVANCES IN FEEDING BEHAVIOR RESEARCH AND ITS RELATION TO NUTRITION

THE WHY? AND FOR WHAT? OF FEEDING BEHAVIOR RESEARCH AND ITS RELATION TO NUTRITION

López-Espinoza, Antonio.

Behavioral Feeding and Nutrition Research Center (CICAN) CUSur. University of Guadalajara. México.

The why? and for what? of feeding behavior research and its relation to nutrition

The development of a perspective that links knowledge related to how, what with, where, whom with, when, what for and why we feed, and its effects on well-being, life quality and health, has a particular dimension. Its importance lays in the fact that the development of such a perspective is a crucial element to understand the current world food situation, and therefore is also the best possibility to prevent and control feeding related pathologies among

others. In this sense, it is possible to indicate that such scientific perspective is the study and research of feeding behavior. One of the major challenges of this young area of science has been to place behavior and conduct as central elements of study. This task has not been easy, given the historical bias towards biologically based explanations. In general, there is a great ignorance of issues as basic as identifying what a behavior is, and not to mention the techniques and theories that explain their relationships and function. However, resistance and ignorance have not only been of the biological area, psychology in particular and radical behaviorism especially, disdain to establish cooperation links with other scientific perspectives. The same is true of anthropological, social, political or economic perspectives. It would seem, then, that we are hopelessly seeking to understand, predict, and control phenomena, blindly, with partial visions, which might be described as petty. Therefore, it is necessary to question ourselves, why is it pertinent to establish behavior and conduct as central elements to explain the feeding phenomenon? For this, it is necessary to consider the preponderant role of behavior as a mean and regulatory mechanism in biological, psychological and social processes. A second point is that behavior is a distinctive element of organisms, product of the evolutionary process. Finally, the last point to consider is the perception that organisms have of the behavior of their conspecifics or other organisms, that is, what is perceived in the first instance in a moment of interaction, is necessarily the behavior of the persons or other organisms with whom we interact. In this sense, the behavior of the demonstrator subject acts as stimulus and modifies the behavior of the observer. These three points are necessary and sufficient conditions to point to behavior as an integrating element of other scientific perspectives knowledge around on food. Thus, the study and investigation of feeding behavior is characterized as the conjunction of knowledge and understanding related to everything that organisms do to feed. Therefore, this particular perspective integrates the basic, applied, theoretical, experimental and non-experimental knowledge, as well as the conjectures, predictions, and the analysis of the different disciplines and scientific perspectives that are linked in one way or another to the act of feeding.

Keywords: Feeding behavior, research, nutrition

relationship among physiological, environmental and behavioral factors with respect to an essential act for the survival of organism: feed. Since the proposal of Homeostasis Theory by Walter Cannon in 1929 whose origin is precisely based on evidence generated from experimentation, the considerations of John B. Watson in 1924 with regard to the physiological functionality of organism is observable through of the behavior and the incorporation of the behavior as a fundamental part in the homeostatic regulation of organism by Curt Richter in 1947, are only some findings that have consolidated the base of feeding behavior studies. Feeding behavior was defined as: Everything that an organism does to feed itself (López-Espinoza & Martínez Moreno, 2012). If feed is studied as a process in which the actions connected with the intake as: eating, drinking, smell, taste, look for food, buy it, select it, cook it, produce it etc. A fruitful space is generated for the realization of experimental studies to characterize: what?, how?, when?, how much?, with whom? and for what? Eat. In this process, the learning is a key element in understanding the responses of human and animal organisms in the presence and absence of food. The research about preferences, aversions, hungry, appetite, satiety, selection, choice, intake, energy expenditure, sensation, perception, social interaction etc., are phenomena that have been observed, measured, evaluated and explained through experimentation demonstrating the versatility but also the complexity of the study of food behavior and above all in order to understand the relationship between organisms and the process of feeding themselves. In this way is explained for example: a) How the food deprivation and the experience with palatable food increase the intake; b) The neophobia (refuse) to eat different foods; c) Determine how post-ingestive effects encourage or reduce the probability of intake food; d) Explain how eating behavior can occur even when there is no physiological stimulus of hunger and c) As well as identifying the fundamental role of women in convincing other to accept and consume novel foods "The Eva Effect" (López Espinoza, et al. 2011). In this way, it proves that experimentation in humans and animals models helps to characterize the phenomena and identify the variables that lead to these and accordingly to plan different strategies of intervention in the process of feeding in people of all ages in conditions of health and disease.

[1]Behavioral Feeding and Nutrition Research Center (CICAN) CUSur - University of Guadalajara – México; [2]MD. Nutrition Specialist. Favaloro University Buenos Aires Argentina.

Experimentation has been established as a fundamental part in the generation of knowledge in all the sciences. At the study of feeding behavior is not an exception. The empirical evidence generated from experimentation in animal and human models it has allowed the application of theories and models that explain the

CLINICAL APPLICATIONS OF FEEDING BEHAVIOR RESEARCH

Martinez Moreno, Alma Gabriela.

PhD. Analysis of Behavior. Behavioral Feeding and Nutrition Research Center. University of Guadalajara.

Eating is often seeming as a simple process. But that is an illusion. Eating behavior is an extraordinary complex process that can be challenging for many individuals. Human eating behavior is defined as an individual´s fed actions that have one or more dimensions that can be observed and recorded. Feeding and eating behaviors have an impact on the physical and social environment.

For this reason, feeding behavior research can provide to nutrition professionals a comprehensive set of postulates from Applied Behavior Analysis (ABA) to modify some feeding problematic behaviors. It distinguished by types of clinical problems addressed, the mode of therapeutic intervention, and settings in which therapy is typically conducted. Within clinical contexts, ABA is used extensively in a variety of circumstances and it has proven its efficacy in many areas including: developmental disabilities, mental illness, education and special education, rehabilitation, community psychology, clinical psychology, business, industry, and human services; self-management, child behavior management, prevention sports performance, health-related behaviors; and lately, educational settings above feeding behavior. One of the biggest challenges is helping our people to be a good eaters and no to be a problem or a resistant eater. We all want our kids, patients and all people to eat nutritious foods from a wide variety of sources in the proper portion sizes. But eating the right foods is not easy. Behavior modification procedures can help to resolve eating difficulties. Besides of a medical, nutritional and sensorial evaluation we need a behavioral evaluation. Just as you need to identify any medical, physical, and sensory issues that may be contributing to your feeding problems before starting to food chain, you need to understand behaviors that may be playing a role. ABA principles have helped to identify a negative and positive behaviors in eating time. Reinforce the positive and change the negative is no too difficult that we think. Clinical applications of feeding research provide an evaluation to the behaviors in meals and common positive and negative behaviors identification, procedures to modification and rules to maintain an optimum feeding. The importance of maintaining a well-balanced perspective when managing problems with eating. Parents and professionals must seek out support and training in their community and strive for excellence and consistency when working with special population. A collaborative approach within a multidisciplinary team will ensure the long-term success of the program: Are you a problem eater? Are you a normal eater? Are you a resistant eater? Maybe you can resolve this questions if you learn about behavior and feeding behavior research.

FOOD COMPOSITION DATA FOR DECISION-MAKING TO PROMOTE HEALTHY DIETS

[1]Coates, Jennifer; [2]Rogers, Beatrice; [2]Bell, Winnie; [2]Colaiezzi, Brooke; [2]Gersten, Zachary; [2]Wafa, Sarah; [3]Leclercq, Catherine; [3]Charrondiere, U. Ruth.

[1]Associate Professor, Tufts University Friedman School of Nutrition Science and Policy; [2]Tufts University Friedman School of Nutrition Science and Policy; [3]Food and Agriculture Organization of the United Nations.

Food composition data are critical inputs into the process of food security and nutrition assessment, food labeling, nutrition education, poverty estimation and agricultural investment for healthy diets, such as crop breeding for nutrient dense cultivars. However, in most countries food composition data are out-of-date, incomplete, and inaccurate. When such data exist, they are not always publicly available or in a format that can be easily matched to information on the quantity of food produced or consumed. Though standards for identifying foods and describing their attributes exist, such as the FoodEx2 classification system and CODEX guidelines for nutrient labeling, they have not yet been widely adopted. The data gaps and associated needs continue to grow, with the global trend toward more diversified diets and increased consumption of processed foods, alongside a rapid decline in the biodiversity of food species. These types of weaknesses in food composition data are rarely revealed as limitations or uncertainties in relevant data analyses to inform policy.

This presentation will discuss a set of theoretical and empirical case studies in which poor food composition data could either slow the process of policy formulation or lead to fuzzy or inaccurate conclusions. Case studies will include: the role of food composition data in diagnosing and acting on anemia in Ethiopia; the sensitivity of the global prevalence of undernourishment indicator to food composition assumptions; the challenge of isolating the role of diet in the rapid rise of overweight in Bangladesh; and how an accurate understanding of the effects of agricultural management practices, crop breeding, and climate change on the nutrient value of food supply depends on up-to-date food composition values.

Despite progress by actors like INFOODs, food technology institutes, and academics to remedy these data gaps, donors have been reluctant to scale up support to their endeavors. As a step toward crystallizing an investment agenda, the authors propose an ambitious set of approaches for rounding out food composition resources. Potential investments include: applying a standardized food coding system (FoodEx2) to all food composition databases to facilitate food identification and matching with food consumption data (e.g. through the FAO/WHO GIFT and INDDEX 24 platforms); creating a central repository for food composition data that can be more easily linked to dietary data (INDDEX24); honing innovative technological solutions to reduce the cost and speed of food analysis; strengthening regional composition databases with the mandate and funds for routine updates; incorporating more mixed dishes, fortified and biofortified foods, wild foods, and biodiverse cultivars into existing FCTs; and exploring private sector partnerships for amassing processed food composition information. These types of solutions, if adequately resourced, would mark a significant step toward improving the ability to make sound decisions that affect the diet quality of people worldwide.

Keywords: Food composition, Food policy, Diet quality, Diet assessment

PROMOTING NUTRIGENOMIC EDUCATION IN NUTRITION, DIETETICS AND OTHER ALLIED HEALTH CURRICULA, AN ISNN INITIATIVE

NUTRIGENOMICS CASE STUDIES AS TEACHABLE MOMENTS IN NUTRITION EDUCATION FOR HEALTH PROFESSIONALS

Kohlmeier, Martin.

MD PhD. Nutrigenetics Laboratory. UNC Nutrition Research Center. University of North Carolina Chapel Hill. USA.

Curricula of health professionals are crowded and leave little room for further content. It is difficult to add disciplines such as nutrigenomics despite their importance in clinical research and practice. The challenge can be met by integrating nutrigenomic case studies into many different parts of existing curricula. There are numerous opportunities to highlight specific roles of the genome while explaining key concepts in a wide range of foundational and clinical subjects. Such teachable moments may bring to life important complexities of intestinal absorption, metabolic homeostasis and clinical pathologies. Other examples may highlight how specific anatomical structures, the blood coagulation system, genetic disposition and avoidable behavior may trigger catastrophic clinical outcomes.

An example that may bring together multiple levels and topics of instruction is the well-documented correlation of the common FUT2 variant rs601338G>A (W143X) with vitamin B12 inadequacy. At the simplest level, here is an opportunity to weave a tapestry illuminating vitamin B12 function and macrocytic anemia, the mechanisms governing vitamin B12 absorption, secretor status and atrophic gastritis due to chronic H. pylori infection. Vitamin B12 supports DNA methylation, which may explain the slower fetal brain development in mothers with FUT2 variants and the risk of accelerated cognitive decline with aging due to a stomach bug. At another level, the FUT2-vitamin B12 link could transition to fucosylation of proteins including ABO antigens and intrinsic factor, the epithelial exocrine origin of Lewis antigens on red blood cells, vulnerability of secretors to gastrointestinal virus infections, and overly simplified links of blood groups to health risks in general. Yet another conversation could explore the analogous importance of different FUT2 missense variants in non-Caucasian populations, such as I129F (rs1047781A>T) in people of Indian and Chinese descent. This could raise awareness of risks from limiting human research to mostly Caucasian cohorts and thereby potentially failing to serve the needs of many others.

Teaching the urea cycle may become less tedious with case histories illustrating potentially fatal consequences of high-protein foods in seemingly healthy young women who happen to carry a loss-of-function variant of the X-linked gene ornithine transcarbamylase. An unaccustomed large steak may be enough to trigger an episode of ammonia accumulation in blood. At the simplest level, the presentation would probably cover the biochemistry and pathophysiology of ammonia metabolism, best diagnostic practices and treatment options. Another strand could emphasize that uncommon variants taken together are not rare, mention copy-number variants, X-inactivation and mosaicism. Instructors could also highlight how some people respond differently to nutritional exposures than others, explore the metabolic consequences of diverse eating patterns, and recognize that pressuring adolescents to discontinue vegan lifestyles may put some of them at grave risk.

Another teachable moment could explore the intersection of vitamin C, cardiovascular disease and common haptoglobin variants Hp1/Hp2. Presentations could touch on iron-mediated oxidative stress, hemoglobin clearance rates differing by genotype, and increased cardiovascular risk with mega-dose vitamin C supplementation in Hp2-Hp2 carriers.

Illustrative examples of nutrient gene interactions abound everywhere we look and can add color and context to many subjects in healthcare education.

OMIC EDUCATION FOR GRADUATES IN NUTRITION AND HEALTH-RELATED SCIENCES

Santos, José Luis.

Department of Nutrition, Diabetes and Metabolism. School of Medicine. Pontificia Universidad Católica de Chile. Santiago, Chile.

We show herein a Chilean experience providing postgraduate courses on "-omics" disciplines to MSc and PhD students at School of Medicine of Pontificia Universidad Católica de Chile. After an introduction on genetics concepts and nutritional epidemiology studies, a nutrigenetic approach of classical topics is first presented in the context of day-to-day nutrition examples and human evolution (focused on genetic variation of lactase persistence, salivary amylase, taste sensitivity). Strong emphasis is provided to nutrition strategies that apply to management of severe monogenic diseases (for example, glycogen storage diseases, phenylketonuria, GLUT1 deficiency), as examples of precision medicine based on nutritional strategies. We specially focus on strategies involving the use of next-generation sequencing techniques to find new genetic causation of diseases that might be eventually actionable through nutrition (examples of monogenic forms of autism with epilepsy are presented). Additionally, selected examples are provided for gene-environment interaction and/or mediation in complex traits in a genomic context, with especial focus on the study of Body Mass Index. Examples of nutrition-related variables as effect modifiers (gene x environment interactions; sweetened beverages) or as mediators (eating behaviour variables) are provided in the context of childhood obesity. Nutrigenomic studies assessing gene expression modulated by nutrients are shown in different contexts, ranging from acute or chronic nutritional interventions. Epigenomic studies on body weight regulation are mainly contextualized within the description of animal models (for example, obesity in the Agouti mice with viable-mutations, methylation in honey bees) and in the study of human eating behaviour (example: methylation in the POMC gene). Metabolomic contribution in the study of human nutrition is presented from the point of view of the assessment of biomarkers of intake on one hand, and in the in-depth study of human metabolome after the ingestion of nutrients (for example, after oral glucose loads) on the other hand. The incorporation of the study of microbiome adds an additional layer of complexity in

the assessment of the relation between nutrients/diets and human health. In general, we perceived a great and growing interest in our postgraduate students and in general in the biomedical community in Chile for acquiring knowledge on techniques, approaches and methods of analysis that apply to the integration of omics disciplines in the study of nutrition-related diseases and traits.

THE STATE OF NUTRIGENOMICS EDUCATION

[1]*Chmurzynska, Agata;* [2]*Mlodzik, Monika.*

[1]PhD. Nutritionist. Department of Human Nutrition and Hygiene. Poznan University of Life Sciences. Poland. International Society of Nutrigenetics/Nutrigenomics (ISNN).; [2]MSc. Biotechnologist. Department of Human Nutrition and Hygiene. Poznan University of Life Sciences. Poland.

The European higher education system formerly varied from country to country, until 1999, when 29 states signed the Bologna Declaration and the European Higher Educational Area was created. This European higher education system is divided into three sequential cycles, leading to bachelor's, master's, and doctoral degrees. The European Qualification Framework was also established by the European Union. Teaching programs can vary from country to country, but also between universities in the same country.

In Poland, 45 third-level institutions, including medical and life science universities, teach dietetics. Of these, 14 offer nutrigenomic or nutrigenetic courses. Specifically, almost 40% of private universities and 26% of public universities teach nutrigenetics.

In addition, summer schools of nutrigenomics have been organized by the NuGO and the International Society of Nutrigenetics and Nutrigenomics. The latter was the organizer of the European Summer School of Nutrigenomics in Camerino (Italy), as well as of national summer schools, which have been held in Poland and France, among other places.

Separate nutrigenetic or nutrigenomic courses are not commonly included in the programs of dietetics courses.

Evaluation of the courses usually shows that students of dietetics generally expect information about the practical aspects of nutrigenomics.

Keywords: Higher education, dietetics, nutrigenomics, summer school

LEARNING COMPLEX NUTRIGENOMICS TOPICS USING IN SILICO LAB ACTIVITIES AND WEBEX™ CONFERENCING

Good, Deborah.

Ph.D. Department of Human Nutrition, Foods, and Exercise, Virginia Tech. USA.

Upper level undergraduate and graduate course should not only teach students advanced concepts, but also help them to utilize the information in their research projects. Within the department of Human Nutrition, Foods, and Exercise at Virginia Tech, the undergraduate/graduate joint class in Nutritional Genomics is structured to provide concept learning, hands-on activities, and weekly discussions with international scientists doing nutrigenomics research. The course is held in a "scale-up" room that was specifically designed to facilitate active learning, with round tables, four projection screens, walls of whiteboards, and connected laptops for all students in the course. The course is structured as a 3-times-per-week, 50-minute time period, with lectures and discussion Mondays, in silico hands-on exercises on Wednesdays, and invited international speakers, via WebEx™ conferencing, on Fridays. The topics in the course are built on one another such that students start off examining single nucleotide variants (SNVs) in a gene of nutritional interest (i.e. methylene tetrahydrofolate reductase gene, MTHFR), and then examine these SNV-specific allele frequencies in populations. In the subsequent weeks, they examine whether an SNV changes the amino acid sequence or if it is in a non-coding region and affects gene or protein expression. In the later weeks of the course, the topics include increasingly complex areas, such as gene-gene and gene-environment interactions, and the ethical and societal implications of nutritional genomics. Students utilize online analysis sites, such as the National Center for Biotechnology Information (NCBI) website (http://www.ncbi.nlm.nih.gov/), other free genomic databases and software, such as My Family Health Portrait (https://familyhistory.hhs.gov/FHH/html/index.html), Howard Hughes' biointeractive site "Creating Phylogenetic Trees" (http://www.hhmi.org/biointeractive/creating-phylogenetic-trees-dna-sequences), and some pages devoted to specific genetic diseases, such as the G6PD page (http://www.g6pd.org/en/Home.aspx) and Online Mendelian Inheritance in Man page (http://omim.org/). The students write up their lab reports weekly, and the course culminates in a final paper in which students choose a gene of interest to them, and analyze this gene using at least five of the tools they had learned. On Fridays, WebEx™ conferencing brings in renowned speakers from all over the world, including the United States, England, Spain, Tanzania, and Italy. Speakers are chosen based on the weekly topic, giving a ~25-minute seminar on that topic, followed by a ~10-minute question and answer period. Since the WebEx site allows for live interaction, the speakers are able to control their own presentations and students are able to hear and see the slides, regardless of the time zone. Likewise, the speakers are able to see and hear each of the students through their own live video feeds and audiocasts. Overall, this course structure give students the background knowledge they need to understand nutrigenomics, as well as hands-on activities to use this knowledge in their own studies, and interactions with scientists working in nutritional genomics around the world.

Aging is a highly complex process marked by a temporal cascade of events that promote alterations in the normal functioning of an individual organism. The triggers of normal brain aging are not well understood, even less so the factors which initiate abnormal cognitive decline or steer neuronal degeneration which underlies disorders such as dementia. A wealth of data on how nutrients and diets may support cognitive function and preserve brain health is available yet the neurobiological mechanisms of action of nutrition in both normal aging, age-related cognitive decline and in the development of neurodegenerative disorders have not been clearly elucidated.

This talk aims at evaluating the vulnerabilities associated with poor cognitive aging, highlighting potential protective mechanisms and evaluate dietary interventions as a strategy to promote these mechanisms, and addressing vulnerabilities which predispose towards accelerated or dysfunctional brain aging.

This presentation will focus on some of the current state of knowledge on nutrition and cognitive aging reflecting the academic research talks and discussions held during the 2nd workshop 'Nutrition for the Aging Brain: Functional Aspects and Mechanisms', held in Copenhagen in June 2016 and produced by the Nutrition and Mental Performance Task Force under the auspice of the International Life Sciences Institute Europe (ILSI Europe).

In the first part of this talk, we will examine early-life stress, the gut-microbiome and non-communicable diseases such as obesity and diabetes as vulnerabilities associated with poor cognitive aging. We will then highlight potential cellular and molecular mechanisms mediating cognitive health such as adult hippocampal neurogenesis, inflammation and epigenetics. Finally, we will show evidence that those mechanisms can be targeted and modified by nutritional intervention such as Omega-3 fatty acids and polyphenols to mitigate cognitive aging.

Conclusion: We will conclude that future research on the impact of nutrition on cognitive aging will need to adopt a "longitudinal" approach to ensure the effect of early-life is adequately controlled, and multimodal nutritional interventions will likely need to be imposed in early-life to observe significant impact in older age.

Keywords: Cognitive aging, nutrition, early-life stress, neurogenesis, epigenetics

Conflict of Interest disclosure: ST declares no conflict of interest. This review highlights some of the academic reports from the workshop 'Nutrition for the Aging Brain: Functional Aspects and Mechanisms', held in Copenhagen in June 2016. This workshop was organized with funds from the ILSI Europe Nutrition and Mental Performance Task Force. Industry members of this task force are listed on the ILSI Europe website at www.ilsi.eu.

COMPARING HEALTH INDICATORS ACROSS GEOGRAPHY: A LOOK AT ASIA AND LATIN AMERICA

Amarra, Sofia.

PhD, Director, Research (Nutrition), International Life Sciences Institute Southeast Asia Region, Singapore.

Background and objectives: The One ILSI (International Life Sciences Institute) Healthy Aging Project is a multi-branch research collaboration whose goal is to identify mid-life factors that contribute to healthy vs. pathological aging in Asia and Latin America. The purpose of this presentation is to compare selected countries in these two regions with respect to: 1) indicators describing the health status of the adult population; 2) disease causes of premature mortality, causes of disability, and risk factors for disease and disability among adults. Methods: Indicators (health status indicators, risk factor indicators) were chosen from the Global Reference List of Core Health Indicators adopted by the United Nations for reporting health priorities of the Sustainable Development Goals (SDGs). Country-specific data for these indicators were obtained from WHO reports. Information for disease causes of mortality, causes of disability, and risk factors for disease and disability were obtained from the Global Burden of Disease (GBD) 2015 studies. Data for 15 countries in Asia and 17 countries in Latin America were extracted and compared. Results: As a region, Lat-

in America had higher average life expectancy, higher healthy life expectancy (HALE), and lower probability of dying between exact ages 30 and 70 from CVD, cancer, diabetes or chronic respiratory diseases than Asia. Within Asia, high income Asia Pacific countries (Brunei, Japan, Singapore, South Korea) had the longest life expectancy, HALE, and lowest probability of dying between ages 30 and 70 from chronic diseases. Within Latin America, Southern Latin American countries (Argentina, Chile, Uruguay) had the longest average life expectancy and HALE, while Andean countries (Bolivia, Ecuador, Peru) had the lowest probability of dying between ages 30 and 70 from chronic diseases. The greatest health risk factors for the Latin American region were overweight, obesity, and per capita consumption of pure alcohol, while those for Asia were smoking and diets low in whole grains. In both regions, high blood pressure was a risk factor for premature death and disability. High income Asia Pacific and Andean Latin American countries had the lowest prevalence of raised blood pressure in adults. Results of GBD studies showed that ischemic heart disease is a cause of mortality across all countries in both regions. Common causes of disability in both regions were migraine, depression, skin and subcutaneous diseases, sense organ diseases, and low back and neck pain. Diabetes was a leading cause of disability across Latin America while stroke was a leading cause of death across Asia. Conclusion: In Asia, better population health is associated with higher socio-economic development but is not the case in Latin America. Both regions had similar causes of mortality and disability and a few differences. Risk factors differed between the two regions. The One ILSI Healthy Aging Project seeks to uncover underlying factors that drive these similarities and differences, both within and between geographic regions, and identify country- and region-specific best practices, policies, and programs to promote healthy and successful aging.

PS_144/161

IMPACT OF MENOPAUSE ON THE NUTRITIONAL HEALTH OF ARGENTINIAN WOMEN" UBACYT PROJECTS 2008-2017

BODY MODIFICATIONS IN ADULT WOMEN AND INCREASED CARDIOMETABOLIC RISK. PROJECT PRESENTATION UBACYT 2008-2017

Torresani, María Elena.

PhD Nutritionist. Chair of Adult Dietary Therapy. Nutrition Career of the School of Medicine. UBA. Director Ubacyt Project 2008-2017. Argentina.

The line of research on Nutrition in Perimenopause begins as an activity within the 1st Chair of Adult Dietary Therapy in the Nutrition Career of the School of Medicine at the UBA.

The topic was chosen evaluating the global problem and the statistical data that show that coronary disease and stroke are the main cause of mortality in adult women worldwide, being osteoporosis the second health problem for women during this period of their lives.

Cardiovascular disease in women appear later (an average of ten years later) than in men, mainly because the hormonal profile of the woman protects her until the onset of menopause.

The original objective of our research was to consider the impact at the bone and cardiometabolic level of the most prevalent nutritional risk factors in adult women, by screening population-related risk factors related to nutrition and analyzing the intake of certain nutrients critical in this population under investigation.

During aging per se, and particularly during the perimenopausal period, a number of body modifications are generated at a general level, with loss of height, increase of body weight and increase of abdomen-visceral fat distribution, the main anthropometric variations documented by Literature several years ago.

Regarding the corporal modifications undergone in this stage, the main results were:

Loss of average height of 1.26 cm, being accentuated as from the age of 55, postmenopause and time spent in menopause over 5 years. Only 10.8% lost> 3 cm, cut value considered a risk of increased osteoporotic fractures.

Regarding body weight, although at the onset of perimenopause, it was already increased by most of the women being studied, more than half of these women reported an increase of body weight [3] 10% of their usual weight. This gain of weight was independent of the caloric intake, and it was inversely correlated with the time elapsed in menopause. Being the greatest impact observed during the first years of estrogen deficiency.

With regards to cardiometabolic risk, the lipid profile is affected in this stage, with an increase in total cholesterol (ColT) and low density lipoprotein (LDL), triglyceride elevation (TG) and reduction of high density lipoprotein (HDL).

The waist-height index (CWI) showed a good correlation with the CVR factors and components of the metabolic syndrome. There was a strong positive linear correlation between the CI and the of WC and BMI values, and weaker but equally significant with age.

It is a priority to find a good indicator of risk at this stage, since the SF recognized worldwide as one of the main tools for its calculation, underestimates in this population the risk by not considering any of its variables any anthropometric component, nor the values of TG characteristic of the abdominovisceral phenotypic distribution.

Facing all these problems, it is essential that both, women and the professionals who accompany them, recognize cardiovascular risk factors, estimate it over time and understand the importance of making lifestyle changes that can reduce it, and implement preventive strategies more intense when necessary.

Keywords: Body changes; Cardiometabolic Risk; Adult woman; Perimenopause.

CHANGES IN EATING BEHAVIOR: CARB COMPULSION, BINGE EATING AND NIGHT-EATING IN RELATION TO THE STATE OF ANXIETY, STRESS AND SELF-ESTEEM OF WOMEN

Oliva, María Laura.

Nutritionist. Nutritions School. University of Buenos Aires (UBA). Argentina.

The objective of this dissertation is the analysis of the changes in the alimentary behavior during the hormonal transition of the adult woman and its relation with the own mood of this stage.

Eating is a complex behavior in which intervene, in addition to numerous hormones and systems of the body, a pleasure / reward mechanism that obeys specific and natural stimuli, regulated by neurotransmitters, allows the individual to develop learned behaviors. Estrogens seem to intervene in the regulation of appetite. Its modulating effect on the neurotransmitter system is broad and includes regulation of the synthesis and metabolism of various neurotransmitters. Substances that decline during the hormonal transition.

On the other hand, insulin, one of the hormones responsible for the regulation of dietary intake, plays an important role in the control of body weight. Its increase in blood, mediated by carbohydrate intake, significantly decreases the concentration of tryptophan's competing amino acids, allowing a greater entrance of the same to the brain, thus causing a greater increase of serotonin. In turn, increased serotonergic agents reduce the intake of foods rich in carbohydrates and stimulates the secretion of melanocortins, the most potent anorectic agents in the brain. Serotonin-dependent defects in neurotransmission have been postulated to cause mood disorders and an over-enthusiasm for consumption of foods rich in carbohydrates; This has led to the description of a syndrome called "carbohydrate addiction" characterized by signs of atypical depression accompanied by an urgency to consume foods rich in carbohydrates and consequent obesity. These signs are very common during this stage of a woman's life, being an obstacle to controlling the increase in body weight. Influencing negatively in all the cardiovascular risk factors that are presented.

Keywords: Alimentary behavior - menopause - serotonin

BONE CHANGES AND NUTRITIONAL APPROACH TO REDUCE THE RISK OF OSTEOPOROSIS. PROJECT UBACYT 2008-2017

Torresani, María Elena.

PhD Nutritionist. Chair of Adult Dietary Therapy. Nutrition Career of the School of Medicine. UBA. Director Ubacyt Project 2008-2017. Argentina.

Life expectancy has increased significantly worldwide, rising in women over the past 160 years at a steady pace of about 3 months per year. However, the age when menopause occurs has remained relatively stable, so that, nowadays women will live more than a third of their lives with estrogen deficiency. It will produce specific effects in all organs that have estrogen receptors, among them the skeletal system.

The WHO refers to osteoporosis as the second health problem in adult women, after cardiovascular diseases. It is a global public health problem. It affects more than 200 million people and it is estimated that between 30 and 50% of postmenopausal women will develop this disease. But although it is a frequent disease, its real prevalence is difficult to establish since it is asymptomatic until the appearance of its complications. The peak bone mass of premenopausal women is the major determinant of subsequent risk of osteoporotic fracture. Therefore, maximizing bone mass during skeletal growth, developing it and maintaining it in the premenopausal years, will be important strategies in the prevention of osteoporosis.

According to the Argentine Society of Osteoporosis, in Argentina, there are 298 fractures annually per 100,000 women over 50 years of age. It is assumed that 25% of osteoporotic fractures are due to the lack of an adequate bony capital during adolescence; and the remaining 75% to have had excessive postmenopausal losses. Among the modifiable factors involved in progressive bone demineralization with age, lifestyle (less physical activity, smoking and alcohol consumption) and the type of diet consumed (low intake of calcium and vitamin D, increased ratio P / Ca, and consumption of sodium, protein and caffeine by participating in increased urine calcium excretion).

In this Symposium data on the research about the risk of osteoporosis, risk of fractures, the study of bone mineral density in relation to the lifestyle and the dietary profile of the women studied will be presented.

As expected, the social cost of morbidity and mortality associated to female menopause is very high, so it would be convenient to evaluate during this period the possibility of establishing a model of primary health prevention, applicable to women who begin this stage of their life, and that could include actions on their lifestyle, tending to reduce the risk of osteoporosis and fractures. In this context, the health care in during the Climacteric implies considering the nutritional aspects due to the great impact they can have on the quality of life. And within them, food education plays a predominant role in the prevention during this biological stage in the life of a woman.

Keywords: Bone changes. Risk of osteoporosis. Adult woman. Perimenopause.

PS_144/91
EARLY NUTRITION AND ITS EFFECTS ON HEALTH

GENETIC SUSCEPTIBILITY OF EARLY METABOLIC SYNDROME IN CHILDREN AND LATER CONSEQUENCES

Gil, Ángel.

PhD. Prof. Department of Biochemistry and Molecular Biology. Institute of Nutrition and Food Technology. Centre of Biomedical Research. University of Granada. CIBERobn. Spain.

Childhood obesity is one of the most important public health problems of the 21st century, affecting both developed and de-

veloping countries. Obesity plays an important pathophysiologic role in the development of insulin resistance, dyslipidemia, and hypertension, leading to type 2 diabetes (T2D) and a risk of early cardiovascular disease (CVD). Obese children can exhibit metabolic syndrome (MetS) when a number of cardio-metabolic criteria, namely, hypertension, dyslipidemia, or altered glucose metabolism, all of them features of insulin resistance (IR), are present. However, there is a strong debate on the diagnosis and early phenotypic expression of the MetS in children. Nonetheless, our group has shown that irrespective of the classification used, the MetS is not only present in pubertal but also in prepubertal children. Indeed, international definitions of the MetS should consider criteria specific for children in the prepubertal period, i.e. children aged <10 years. In addition specific biomarkers of inflammation, insulin resistance and CDV risk are already associated with central obesity and early onset of MS in prepubertal obese children. The association of a continuous MetS score with specific risk biomarkers of inflammation, endothelial damage and CVD supports its use in the early identification of children at increased risk of metabolic dysfunction.

Numerous gene variants including SNPs and CNVs have been reported to be associated with obesity and some features of the MetS in adults, particularly, dislipidemia and hypertension. However, scarce data are found in children. We have described some variants in 11-BSDH, NPY and NPR genes, as well as to others related to the antioxidant defence system genes, namely CAT, GPX and PRDX, which are associated with some features of MetS in children. Characterization of the genes expressed in adipose tissue (AT) is key to understanding the pathogenesis of obesity and to developing treatments for this condition. Indeed, we have recently compared the gene expression in visceral AT (VAT) between obese and normal-weight prepubertal children and found previously unreported dysregulated genes that may be candidate genes in the aetiology of obesity and MS. As validated by qPCR, expression was upregulated in genes involved in lipid and amino acid metabolism (CES1, NPRR3 and BHMT2), oxidative stress and extracellular matrix regulation (TNMD and NQO1), adipogenesis (CRYAB and AFF1) and inflammation (ANXA1); by contrast, only CALCRL gene expression was confirmed to be downregulated. Additional functional studies of some genes as CAT, NPR document the importance of those genes in the control of glucose and lipid metabolism and their potential implication in the early development of MetS.

Keywords: Childhood obesity. Genes. Insulin resistance. Lipid mestabolism. Metabolic syndrome.

EPIGENETICS OF UNDERNUTRITION AND OBESITY

[1]Ramos-Lopez, Omar; [2]Riezu Boj, José Ignacio; [3]Milagro, Fermin I.; [4]Martínez, J. Alfredo.

[1]Department of Nutrition, Food Science and Physiology. Centre for Nutrition Research. University of Navarra. Pamplona. Spain. Department of Molecular Biology in Medicine. Civil Hospital of Guadalajara; [2]Department of Nutrition, Food Science and Physiology. Centre for Nutrition Research. University of Navarra. Pamplona. CIBER Fisiopatología Obesidad y Nutrición (CIBERObn). Instituto de Salud Carlos III. Madrid. Spain. IMDEA. Madrid. Spain.

Malnutrition involves either energy undernutrition or nutrient deficiencies, as well as overnutrition implicating calories or food excess consumption. Undernutrition usually concerns underfeeding, famine and poor nutritional status while obesity refers to excessive fat accumulation. These conditions are largely dependent on unbalanced energy equilibrium or in some nutrients, which are associated with starvation, impaired food consumption, or diseases, which trigger metabolic alterations. Interestingly, maternal undernutrition or overnutrition during gestation/lactation (inadequate maternal diet or health) negatively impact child growth and future physiopathological functions. Additionally, malnutrition is related to immunodeficiency, disease onset and accelerated aging, and has adverse influences on health in the adulthood, including excessive body weight, diabetes, dyslipidemia, cardiovascular events and eventually cancer or other diseases. Growing scientific evidences are supporting the view that environmental and social factors, including undernutrition, can alter epigenetic signatures (particularly DNA methylation, covalent histone modifications and non-coding RNA expression), affecting gene expression and subsequently cell functions, with lasting effects on adult life health. In this context, inadequacies in dietary methyl-donors (folate, choline, betaine or B vitamins) and other micronutrients, low-protein diets or calorie restriction and famine exposure during early stages, but also excessive calorie intake, high-fat and high-sugar diets, or obesity itself may modify the epigenome and promote the onset of several pathological conditions by impairing epigenetic mechanisms affecting genes associated with insulin sensitivity, growth, inflammation, adipogenesis, lipid turnover, etc. Interestingly, these breakthroughs are contributing to devise original dietary approaches targeting the epigenome.

Differences among individuals in disease predisposition rely on the DNA sequence (e.g. SNPs), and also on epigenetic phenomena affecting gene expression including the regulatory actions of DNA methylation and miRNA. Indeed, the recognition of individuals eliciting epigenetic changes at a perinatal period in the methylation profiles of specific genes might contribute to assess the future susceptibility for obesity and related comorbidities in adulthood. Furthermore, newer approaches for individualized dietary treatments by means of algorithms based on genetic and epigenetic

knowledge are paving the way for their possible implementation in precision individual´s nutrition by better understanding the role of genes regulating appetite, thermogenesis, nutrient turnover and deposition, oxidative and reticulum stress, and other metabolic pathways.

Summing up, current undernutrition and obesity research should be focused on understanding epigenetic marks and messengers related to the regulation of cell signaling, inflammatory and intermediate metabolic pathways, accentuating health interactions with social and environmental factors (diet, physical activity, stress, sleep) to achieve precision nutrition. Actually, recent findings have demonstrated an epigenetic underlying of different metabolic disorders with appearance in adulthood, such as obesity, cardiovascular diseases, and type 2 diabetes as well as cancer, and the involvement of some specific processes participating in the developmental origin of disease in the adult known as the DoHAD hypothesis.

PREVENTION OF UNDERNUTRITION AND OBESITY IN CHILDREN AND ADOLESCENTS: A GLOBAL PERSPECTIVE

Moreno, Luis A.

PhD. Md. Faculty of Health Sciences, University of Zaragoza, Zaragoza, Spain.

Obesity prevalence is high in both developed and developing countries. Different types of undernutrition coexist with obesity, and this is more the case in developing than in developed countries. Growth retardation is often observed in children having obesity. Some micronutrient deficiencies are also frequent in children with obesity, such as iron deficiency anaemia or insufficient serum concentrations of vitamin D, as the most widely documented. This double burden of malnutrition observed at the population and at the individual level may be due to different causes. First of all, metabolic imprinting related with foetal malnutrition may be related with low birth weight in an important proportion of the new-borns. Obesity in the mothers and an excessive weight gain during pregnancy may also result in infants born large for their gestational age. Maternal micronutrient deficiencies should also be considered as part of the antenatal causes, mainly vitamin A and zinc.

During infancy and early childhood, children are often exposed to energy dense foods with low nutritional value. In addition, they are often sedentary. These factors may lead to the development of the double burden of malnutrition even at the individual level. Adequate nutrition is an essential driver of sustainable development because it plays a critical role in child brain development and generates broad-based economic growth.

Different strategies to prevent under- and over-nutrition are possible. At the general population level, policy changes should be introduced in order to reduce the exposure to the above mentioned determinants. Targeting the child, the family, the school, the community and the primary care health centres is also a necessary approach. Nutrition-specific interventions should be implemented by clinicians, including promotion of breastfeeding and complementary feeding practices and micronutrient supplementation and food fortification. Provision of nutrient dense foods with low energy density and reducing food insecurity are also efficient strategies. The final goal will be to reduce both sides of the malnutrition issue, affecting mainly low-income populations.

Keywords: Obesity, undernutrition, prevention, child, epidemiology

NEW EVIDENCE OF THE IMPORTANCE OF EARLY NUTRITION DURING THE FIRST 1,000 DAYS OF LIFE

Martorell, Reynaldo.

Robert W. Woodruff Professor of International Nutrition. Hubert Department of Global Health. Rollins School of Public Health. Emory University.

The first 1000 days of life (gestation and the first 2 years) represents a window of vulnerability for human development for several reasons: it is a period of high nutritional requirements, greater susceptibility to infections, rapid growth and development and full dependence on others for care, nutrition and social interaction. An area of great interest is the high sensitivity to programming affects during early life. In this presentation, we will review evidence of nutritional conditions that reduce human capital in the first 1000 days, among them iodine deficiency, iron deficiency and anemia, lack/short duration of breastfeeding, severe acute malnutrition, stunting and exposure to famine. Also, poor nutrition as well as excess in early life enhance risk of chronic diseases, perhaps through epigenetic changes, but the extent to which they do is not clear. It is important to recognize that the environment of the first 1000 days in low and middle-income countries has changed and is changing dramatically. From a combination of maternal underweight, short adult stature and micronutrient deficiencies, we are transitioning to maternal short adult stature (although heights are increasing slowly through improved growth in the first 1000 days) and obesity. In summary, the first 1000 days are a period of vulnerability but also a window of opportunity because it is during this time that nutrition interventions will be most effective in improving human capital and adult health. Effective policies and programs are needed for optimal child development in a globalized environment.

Keywords: 1000 days, human capital, adult health

USING IMPLEMENTATION RESEARCH TO BUILD BETTER MULTISECTORAL PROGRAMS FOR IMPROVING MATERNAL AND CHILD NUTRITION OUTCOMES

INTRODUCTION: USING IMPLEMENTATION RESEARCH IN THE CONTEXT OF COMPREHENSIVE EVALUATIONS OF MULTISECTORAL PROGRAMS TO ASSESS PATHWAYS OF IMPACT AND INTERPRET IMPACT FINDINGS

Ruel, Marie; Olney, Deanna.

International Food Policy Research Institute.

There is increasing evidence that multisectoral programs can improve maternal and child nutrition outcomes. However, multisectoral programs are complex and understanding the pathways by which such programs achieve impacts, and how these pathways can be leveraged to optimize impacts and coverage is not well understood. Some of the knowledge gaps can be addressed by working with program implementers as early as possible in the program cycle to design a program theory framework and the hypothesized pathways by which the program is expected to achieve impact, and embed data collection along these pathways as an integral part of the overall evaluation process. In recent years, there has been growing interest in using implementation research to fill the knowledge gaps related to program operation and implementation, as reflected for example in the launch of the Society for Implementation Science in Nutrition (SISN) in 2016. In response to this interest, a new generation of well-designed large-scale comprehensive evaluations of multisectoral programs focused on improving nutrition now includes implementation research as part of their overall evaluation plan.

This symposium reports on recent experience using implementation research in the context of comprehensive evaluations of multisectoral programs to assess how programs achieve impact and how researchers have worked with program implementers to promote uptake of the findings for program strengthening and scale-up. The target audience for this session includes researchers program implementers, donors, and policy makers who are interested in understanding how implementation research can be used to build better multisectoral programs.

The three learning objectives of this session are:

1) To strengthen the collective understanding of how implementation research can be used to build better multisectoral programs

2) To understand some of the challenges and opportunities of having program implementers and researchers working together to conduct implementation research

3) To catalyze collective action on using implementation research to build better multisectoral programs.

The introductory presentation in this session provides a general overview of what implementation research is and how it can be used to build better and more effective programs, drawing upon concepts highlighted by SISN.

LESSONS LEARNED FROM THE PROCESS EVALUATION OF HKI'S HOMESTEAD FOOD PRODUCTION PROGRAM IN BURKINA FASO

[1]*Nielsen, Jennifer;* [2]*Nielsen, Jennifer;* [3]*Olney, Deanna;* [4]*Ouedraogo, Marcellin;* [5]*Pedeombga, Abdoulaye;* [6]*Rouamba, Hippolyte.*

[1]PhD. Senior Nutrition Advisor. Helen Keller International. New York NY; [2]PhD. Senior Nutrition Advisor. Helen Keller International. New York. USA.; [3]PhD. Senior Research Fellow. International Food Policy Research Institute. Washington DC. USA.; [4]Project Coordinator. Helen Keller International. Ouagadougou. Burkina Faso; [5]Researcher. Agence de Formation, de Recherche, et d'Expertise en Sante pour l'Afrique. Ouagadougou. Burkina Faso; [6]Social and Behavior Change Communication Officer. Engender Health. Ouagadougou. Burkina Faso.

Helen Keller International (HKI) has implemented its nutrition-sensitive agriculture model, Enhanced Homestead Food Production, across Asia for over 30 years, but only recently begun to adapt if for the context of sub-Saharan Africa. Thus, the collaboration with the International Food Policy Research Institute (IFPRI) on the first effort to deliver the program in Eastern Burkina Faso was especially valuable, both to evaluate the extent to which this multisectoral approach can improve nutritional outcomes in mothers and young children and to understand and strengthen the impact pathways in this setting. The study included a process evaluation carried out at midterm to assess the quality of delivery, request feedback from implementers partners and participants, and recommend necessary adjustments to strategy. A program impact pathways framework that identified how inputs and activities were expected to lead to changes in knowledge, practices and impact shaped questions for key informant and semi-structured interviews administered with implementing agents and beneficiaries, and with residents of control communities. Data were analyzed by IFPRI and shared with project managers and partners through a series of workshops, where weaknesses were discussed and solutions proposed. Overall, findings indicated that knowledge of both production and nutrition concepts was good and enthusiasm for the program was strong. However, water shortages due to fragile infrastructure and high poultry mortality posed major challenges to production, while lower than expected activity by community volunteers reduced the potential for impact on behavior change. To address constraints along the production pathways, the project team supported reparations to water points, promoted additional water conservation techniques, more drought resistant garden vegetables for the dry season, and expansion of vegetable production to the rainy season, and strengthened links to government veterinary health services. Solutions on the nutrition knowledge and practice pathways included organizing public recognition and

small gifts for community volunteers, and additional training to strengthen skills for interpersonal counseling and group facilitation and knowledge of key practices such as control of anemia and feeding the sick child. Changes were made to the program model as well to adapt it more closely to the local context. There were challenges to implementers in managing a complex, multisectoral intervention while meeting the demands of a rigorous research design with multiple rounds of data collection, analysis and application of learning. However, exposure to IFPRI's research methodologies also developed new skills among the implementing partners and deeper understanding of both quantitative and qualitative analysis. The collaboration between the research and implementing teams contributed to stronger program delivery and richer understanding of implementation challenges.

Keywords: Nutrition-sensitive agriculture, process evaluation

SCALING UP BEHAVIOR CHANGE INTERVENTIONS TO IMPROVE CHILD FEEDING: REFLECTIONS ON THE USE OF RESEARCH FINDINGS IN PROGRAM IMPLEMENTATION AND SCALE-UP

[1]Sanghvi, Tina;

PhD. Nutritionist. Alive & Thrive FHI360 Washington DC. USA;

Alive & Thrive's main purpose in using implementation research is to learn what works for program delivery. After developing an implementation framework based on experience across three countries in 2009-2014, we now apply implementation research as a tool for tailoring this framework and its components to new contexts in the following ways:

1. Making program design choices, specifically finding the priority behaviors in each program context that have the greatest potential to benefit and the specific determinants or drivers of these behaviors plus key influentials that need to be engaged including how best to reach these audiences for maximum coverage at the right time. The choice of program platforms is often driven by reach and timing of contacts.

2. Engaging the needed stakeholders and additional donors in the program by generating and compiling the evidence they need on critical gaps as well as what works.

3. Identifying exactly how and when to engage with other sectors such as WASH, education, and livelihoods by reviewing past experiences and conducting joint operations research and assessments to understand how these sectors can address design gaps or enhance program outcomes.

4. Monitoring, learning & evaluation to reach scale, and strengthen sustainability and equity components. This involves, continuous monitoring of reach and uptake, addressing gaps in quality as programs scale up, identifying where investments in institutional strengthening need to take place, conducting special studies.

Evaluation surveys conducted by IFPRI strengthened program strategies through identifying: the important role of local health providers in shaping IYCF practices in Bangladesh, negative im-

pact of C-section deliveries on early initiation of breastfeeding in Viet Nam, and dose-response relationship between the number of communication channels reaching mothers and their IYCF practices (all countries). IFPRI also demonstrated the value of investing in rigorous evaluation methods to advance credibility and global investments in large scale behavior change programs.

Implementation research covered a range of topics and methods in A&T countries:

• Qualitative rapid household trials in all countries on the feasibility of adopting new behaviors

• Willingness to pay study in Ethiopia on the viability of a processed complementary food

• Assessment of a franchising model within a government primary health care structure for IYCF counseling services in Viet Nam

• Media habits studies and opinion leader surveys in all countries

• Feasibility study of a package of maternal nutrition intervention integrated within an MNCH program in Bangladesh

• Studies on fasting in Ethiopia and the role of religious leaders to improve dietary diversity

• Testing a multi-component approach to improving washing hands with soap before feeding children in Bangladesh

• Assessing the role of husbands in Viet Nam and how to engage them effectively for supporting exclusive breastfeeding.

Challenges in A&T's use of implementation research included, limited research and analysis capacity in countries, reluctance to utilize research findings to shift program designs once the processes and materials were finalized at the start, short period of time to build a deep understanding of and commitment to a continuous cycle of 'design-learn-re-design' approach.

Keywords: Program delivery research, behavior change evidence, scaling up, breastfeeding, complementary feeding

ADDRESSING ISSUES OF SCALE, RIGOR AND CONTEXT IN THE DESIGN OF EVALUATIONS OF LARGE-SCALE BEHAVIOR CHANGE INTERVENTIONS IN BANGLADESH, VIETNAM AND ETHIOPIA

[1]Menon, Purnima; [2]Nguyen, Phuong; [2]Kim, Sunny; [3]Saha, Kuntal K; [4]Frongillo, Edward; [5]Ruel, Marie; [6]Rawat, Rahul.

[1]PhD. Senior Research Fellow. International Food Policy Research Institute. Washington DC USA.; [2]PhD. Research Fellow. International Food Policy Research Institute. Washington DC. USA; [3]PhD. Technical Officer. World Health Organization; [4]PhD. Professor. University of South Carolina Columbia USA.; [5]PhD. Division Director. Poverty Health and Nutrition Division. International Food Policy Research Institute.; [6]PhD. Program Officer. Bill & Melinda Gates Foundation.

Multisectoral programs are being launched globally to address the multiple determinants of poor nutrition simultaneously. As these program are designed and rolled out, it is apparent that interventions to support behavior change are a necessary major component of most multisectoral programs. However, the evidence

base on how to roll out and achieve impact through large-scale nutrition behavior change programs is limited, partly because of limited program efforts that are truly at scale and partly due to the challenges of rigorously evaluating complex large-scale programs. This presentation and its accompanying presentation (Sanghi et al, on Alive & Thrive) together address issues related to design and implementation of large-scale behavior change interventions and the evaluation of these large-scale interventions.

The evaluation of Alive & Thrive (A&T), a multi-year initiative that aimed to improve IYCF practices in Bangladesh, Vietnam and Ethiopia using multiple delivery platforms, addresses several evaluation challenges including: the technical aspects related to evaluating the nutritional impact of interventions targeted during the first two years of life when rapid growth faltering occurs; the identification of proper counterfactuals in the context of rapidly scaling-up programs; and the development of methodologies and tools to assess implementation, utilization and program impact pathways within evolving program portfolios. We designed the impact and process evaluations through a technically robust and programmatically engaged, step-wise process in three countries.

In Bangladesh and Vietnam, cluster-randomized probability evaluation designs were used; in Ethiopia, the evaluation used an adequacy design. In addition, different methodological approaches were utilized to answer critical "how" questions and to generate information on the many processes and pathways to program impact. The methodological approach that guided all process evaluation activities included four components: 1) developing detailed program impact pathway models, 2) linking data collection to program impact pathways (PIPs) utilizing mixed methods, and multiple data sources, 3) linking evaluation timelines with program implementation timelines, and 4) engagement with the program implementation and management teams.

Using these approaches, in all three countries, theory-driven impact and process evaluations based on program impact pathways, and using mixed methods, generated information on impact of the interventions and on factors that facilitated or prevented achievement of impact and scale. Intervention impacts on infant and young child feeding practices, were largely positive, but mixed. Behavioral impacts were greater with intervention platforms that were able to reach higher coverage and where the population context was conducive to behavior change. There was no impact on child growth in any of the contexts, although impacts were seen on motor and language milestone achievement in Bangladesh.

We conclude that robust impact and process evaluations of complex, large-scale nutrition programs are feasible, but that early implementer-evaluator engagement and shared vision and motivation to establishing rigorous designs are essential. The positive, but mixed, impacts on behaviors suggests that accompanying multisectoral interventions that address other constraints may deliver much greater impact. The program and evaluation experience offer multiple lessons for implementation and evaluation of behavior change interventions at scale.

LESSONS LEARNED FROM DESIGNING AND IMPLEMENTING AN INTEGRATED NUTRITION, LIVELIHOOD AND ECD PROJECT IN MALAWI

[1]Roschnik, Natalie; [2]Twalibu, Aisha Laila.

[1]MSc. Senior Nutrition Advisor. Save the Children UK; [2]MSc. Research Officer. Save the Children Malawi.

Abstract In Malawi, 37 percent of children aged 6-59 months are stunted and 63 percent are anaemic (DHS, 2016). As a member of the Scaling Up Nutrition movement, the government promotes a multi-sectoral approach to tackling malnutrition in Malawi. The national Early Childcare and Development (ECD) programme targets all children aged 0-8 years by providing safe, stimulating environments, access to health and nutrition services, and capacity building for parents and caregivers through community based preschools and parenting groups. Today, there are an estimated 9,000 community-run preschools across Malawi, serving 32 percent of all 3-5 year olds in the country, of which 20% are orphans and vulnerable children.

One of the main causes of low preschool attendance and closure in Malawi is lack of food (The World Bank, 2014), when communities are not able to provide food for the mid-morning snack. To address this issue, Save the Children began integrating nutrition, agriculture and livelihood components to its ECD programmes to build community capacity to provide nutritious food in preschools all year round, and improve household food security and nutrition at the same time. Best practice was drawn from large nutrition and livelihood projects like the USAID funded Wellness and Agriculture for Life Advancement project (WALA) and used to create an ECD nutrition and livelihood package. It was piloted and implemented in the World Bank Protecting Early Childhood Development Project (PECD) reaching 199 preschools in 4 districts with support from Conrad N Hilton Foundation. It was then further improved and evaluated in Save the Children's ongoing ECD programme in Zomba district with support from PATH's Nutrition Embedding Evaluation Program (NEEP).

Using preschool kitchens and gardens and parent groups as training platforms, parents and community members learn new recipes, food processing and preparation techniques, agricultural methods, and techniques to grow and store climate resilient nutritious foods all year round. A village savings and loans system is also set up to help community members, women in particular, set up small businesses and earn cash. This integrated ECD, nutrition and livelihood package benefits the preschool, the households and the community as a whole to become more organised, climate resilient and food secure, which in turn helps improve child nutrition and development.

Where community preschools are present, they provide a valuable platform for building community and household capacity and resilience to improve food security, child health, nutrition and development. A cluster randomised trial has been conducted by IFPRI, the University of Malawi and Save the Children to evaluate the impact of this integrated package on agricultural production, caregiver behaviours, child nutrition and development (presented separately). Further work is needed to simplify the training package and prioritise messages across the sectors before scale up nationwide.

OPTIMIZING AN ECD-BASED, AGRICULTURE AND NUTRITION PROGRAM TO IMPROVE THE DIETS OF PRE-SCHOOL CHILDREN IN MALAWI

Gelli, Aulo.

PhD. Nutrition. Poverty Health and Nutrition Division. IFPRI.

The Nutrition Embedded Evaluation Program Impact Evaluation (NEEP-IE) study is a cluster randomised controlled trial designed to evaluate the impact of a childcare centre-based integrated nutrition and agriculture intervention on the diets, nutrition and development of young children in Malawi. The intervention includes activities to improve nutritious food production and training/behaviour change communication to improve food intake, care and hygiene practices. This presentation summarises the findings of the cluster randomised trial and the implications for policy and implementation.

THE WHA GLOBAL NUTRITION TARGETS FOR 2025: TACKLING THE DOUBLE BURDEN OF MALNUTRITION THROUGH THE LIFECYCLE

WHO TOOLS TO SUPPORT COUNTRIES IN SETTING NATIONAL NUTRITION TARGETS

[1]*Engesveen, Kaia;* [2]*Nishida, Chizuru;* [3]*Montez, Jason.*

[1]MSc. Technical Officer. Department of Nutrition for Health and Development. World Health Organization. Switzerland.; [2]PhD. Coordinator. Department of Nutrition for Health and Development. World Health Organization. Switzerland.; [3]Department of Nutrition for Health and Development. World Health Organization. Switzerland.

The translation of global targets into national targets needs to consider country context. This involves, first, the identification of nutrition challenges and, second, setting targets to address those challenges. The WHO Nutrition Landscape Information System (NLIS) provides country profiles with key indicators in nutrition s a system that links to all WHO nutrition databases. It provides country profiles that combine data from WHO and its partners on nutrition outcomes and causal factors related to food, health and care at the immediate, underlying and basic level. National targets are adapted from the Global Nutrition Targets, using tools such as the WHO Tracking Tool.

Third, countries need to select priority interventions to address the identified problems and reach their national targets. The WHO Global Nutrition Targets Policy Briefs provide a summary of action needed to effectively address the targets. Furthermore, the WHO e-Library on Evidence for Nutrition Action (eLENA) provides the evidence, the current recommendations and the rationale for more than 100 nutrition interventions. Interventions in eLENA are also linked to the Global Nutrition Targets, where evidence suggest linkages exist.

Fourth, the detailed planning for scaling up priority interventions will depend on the political willingness, the health system, human resources and other infrastructure in the country. The Landscape Analysis country assessment tools provides a methodology for rapid assessment of country commitment and capacity, as a measure of their readiness to scale up nutrition action. The UN OneHealth Tool allows countries to do the detailed costing and planning of different scaling-up scenarios. The Tool contains a series of health programme modules including one for nutrition covering the WHO Essential Nutrition Actions that target the 1000-days window of opportunity from conception to 2 years of age. It incorporates the Lives Saved Tool (LiST), which estimates the impact of planned programmes on child mortality and morbidity as well as stunting, wasting, anaemia, low birth weight and breastfeeding. The WHO Global Database on the Implementation of Nutrition Action (GINA) provides information on policies and actions being implemented in countries, including lessons learnt and best practices that would be helpful to other countries.

The fifth and final step involves monitoring of progress made and evaluation and outcomes reached, using key indicators such as those in the Global Nutrition Monitoring Framework. Another aspect of monitoring includes tracking of expenditures to nutrition specific and sensitive actions implemented through the health sector, which could be facilitated by the Health Accounts.

OBJECTIVE ASSESSMENT OF BREASTFEEDING PRACTICES

THE IMPORTANCE OF OBJECTIVE ASSESSMENT FOR EVALUATION OF BREASTFEEDING PRACTICES IN AFRICAN INFANTS

[1]*Mulol, Helen;* [2]*Coutsoudis, Anna.*

[1]PhD. Paediatrics. Department of Paediatrics and Child Health. Nelson R Mandela School of Medicine. University of KwaZulu-Natal. Durban. South Africa.; [2]PhD. Paediatrics. Department of Paediatrics and Child Health. Nelson R Mandela School of Medicine. University of KwaZulu-Natal. Durban. South Africa.

Exclusive breastfeeding has been recommended by the World Health Organization for the first six months of an infant's life, yet

in Africa reported exclusive breastfeeding rates are low. There are many cultural barriers and breastfeeding myths that prevail and in a continent with high levels of HIV infection, HIV-infected mothers also experience many challenges when wishing to practice exclusive breastfeeding.

The dose-to-mother deuterium dilution technique has made it possible to distinguish between water ingested by the baby via breastfeeding and water from sources other than human milk thus allowing objective evaluation of whether a mother is exclusively breastfeeding her infant as well as the volume of human milk. This technique makes it possible to compare this objective measure of exclusive breastfeeding with maternal recall of infant feeding practices. Furthermore the technique also enables these objective measures of infant feeding to be used to assess the true impact of exclusive breastfeeding on other infant outcome measures.

The dose-to-mother deuterium dilution technique was used to evaluate human milk intake and the exclusivity of breastfeeding, which was taken to be ≤25g/day of water from sources other than human milk. Determination of exclusive breastfeeding by maternal recall was established from a list of foods / liquids that the mother gave to the baby.

Infants from seven African countries were enrolled as part of various national and regional projects supported by the International Atomic Energy Agency. Reported and objective exclusive breastfeeding data was collected at 3 months (459 infants) and 6 months (154 infants).

Using the human milk intake data, further studies were carried out in South Africa, viz. human milk output in HIV-infected and –uninfected mothers and the effect of early breastfeeding practices on infant body composition at 12 months.

The pooled results revealed that at 3 months there was no significant correlation between reported and objectively measured exclusive breastfeeding (P=0.14, K=0.03). At 6 months the correlation was significant but the Kappa value was low (P=0.00, K=0.28) indicating only a poor agreement between the two methods of determining exclusive breastfeeding.

Other key findings using the dose-to-mother technique in South Africa included that HIV-infected mothers were able to produce sufficient volumes of human milk, which were comparable to non-infected mothers and without compromising their own health; and that infants who were exclusively breastfed up to 6 months had a lower percentage fat mass at 12 months.

The large discrepancies found between reported and objectively measured exclusive breastfeeding suggest that maternal recall, while being a good indicator for large-scale health surveys, is not ideal when an objective measure is needed to study the impact of exclusive breastfeeding interventions. Measurement of exclusive breastfeeding using the dose-to-mother technique has thus made it possible to objectively study important infant outcomes that could result from early infant feeding choices.

The benefits of an objective measurement of exclusive breastfeeding in this pooled study of African infants were highlighted by the poor correlation with maternal recall of exclusive breastfeeding and its potential to be used to study other important infant outcomes.

BREASTFEEDING IMPACT ON BODY COMPOSITION AND GROWTH IN THE FIRST YEAR OF LIFE IN LATIN AMERICAN INFANTS

[1]Mazariegos, Monica; [2]Weisstaub, Sergio Gerardo; [3]Slater, Christine; [4]Ramirez-Zea, Manuel.

[1]Researcher. INCAP Research Center for the Prevention of Chronic Diseases (CIIPEC). Institute of Nutrition of Central America and Panama (INCAP). Guatemala.; [2]Researcher. University of Chile. Chile.; [3]Formerly Division of Human Health. International Atomic Energy Agency (IAEA). Vienna, Austria.; [4]Director. INCAP Research Center for the Prevention of Chronic Diseases (CIIPEC). Institute of Nutrition of Central America and Panama (INCAP). Guatemala.

Breastfeeding promotes infant growth through its nutritional and bioactive properties, by reducing incidence and severity of potentially growth-affecting infections, and by improving feeding during illness. Besides preventing growth deficit, especially among poorer populations, breastfeeding may prevent obesity during childhood. Evidence about breastfeeding, growth, and body composition has rarely been studied in Latin America. Therefore, we aimed to assess the association of breastmilk intake with body composition and growth in the first year of life in Latin American infants.

290 Latin American mother-infant pairs, who were part of an IAEA regional project in Latin America, were evaluated. They were from Argentina (n=18), Brazil (n=32), Chile (n=81), Cuba (n=24), Dominican Republic (n=50), Ecuador (n=27), Guatemala (n=36) and Uruguay (n=22). Infants were eligible if they had adequate length-for-age (> -2 SD) and BMI-for-age (-2SD>BMI-for-age<+2SD), and if they were receiving breast milk at 3 months. Breast milk and non-breast milk water intakes were measured using the deuterium-oxide 'dose-to-mother' technique at 3 months. Exclusively breastfed (n= 170) and non-exclusively breastfed infants (n=120) were defined based on mother's report. Growth was evaluated with length-for-age z-scores, and body composition was also determined using the deuterium dilution technique at 3 and 12 months. To assess the association between breastmilk intake, body composition and growth in the first year of life we ran random effects models with exposure defined as breastmilk intake at 3m, and outcomes defined as change in z-scores for length-for-age, and change in fat mass index (FMI) and fat-free mass index (FFMI) from 3 to 12 months, adjusted for sex.

48% were girls. At enrollment, the mean (SD) age was 3.8 (0.6) months, mean length-for-age and BMI-for-age z-scores were -0.83 (1.19) and, 0.64 (1.13), respectively. Exclusively breastfed infants received 857.6 (821.8, 893.4) g/day (mean, 95% CI) of human milk and 69.7 (46.3, 93.1) g/day of non-breast milk water, whereas non-exclusively breastfed infants received 516.0 (454.2, 577.8) g human milk and 451.2 (358.9, 543.6) g non-breast milk water per day at 3m. We did not find differences in body composition and length-for-age (z-scores) between exclusively breastfed and non-exclusively breastfed infants at 3 and 12 months, and no effect on changes in body composition was observed. However, a daily breastmilk intake of 100 g/day was associated with a mean increment of 0.01 (95% CI= 0.003, 0.11) length-for-age (z-scores) during the first year of life in infants who were exclusively breastfed at 3 months of age.

This study in eight Latin American countries did not find any association between breastfeeding patterns at 3 months and changes in body composition in the first year of life. Exclusive breastfeeding led to a modest increment in length in the first year of life.

St. John's National Academy of Health Sciences. Bangalore. Karnataka. India.; [4]Professor and Head. Division of Nutrition. St John's Research Institute. St. John's National Academy of Health Sciences. Bangalore. Karnataka. India.

Exclusive breastfeeding for first six months of life, followed by complementary feeding and continuation of breastfeeding is advocated by international health agencies. The preliminary results of the National Family Health Survey of India (NFHS-4, Year 2015-16) show that the prevalence of stunting, wasting and underweight in under-5 children is 38.4, 21 and 35.7% respectively. Percentage of children under age 3 years who are breastfed within one hour of birth is 41.6, and only 55% of infants under age 6 months are exclusively breastfed. Complementary feeding is introduced in 42.7% of infants aged 6 to 8 months, and minimum adequate diet, as defined by the WHO-UNICEF, is seen in only 8.7% of breastfed infants in the age group 6 to 23 months.

Our observation of infant and young child feeding practices in 500 urban and rural infants in India are similar. The rate of continued breastfeeding in rural infants at 12 months was 90% and at 24 months it was up to 52%. In longitudinal follow up of rural breastfed infants, human milk intake measured using stable isotope technique, was 693 ± 178 g/d (190 ±37 g/kg/d) at 1 month age, 866 ± 127 g/d (128 ±18 g/kg/d) at 6, 596 ± 193 g/d (79 ±29 g/kg/d) at 12, and 380 ± 239 g/d (38 ±24 g/kg/d) at 24 months. The total human milk intake per day observed in this population was comparable to that reported from other developing and developed populations. Poor dietary diversity in infants beyond 6 months age was predominated by low consumption of animal-source food and also of vitamin-A rich fruits and vegetables.

High rates of continued breastfeeding beyond the age of 12 months in rural infants underpins the need to ensure adequate nutrition of lactating women. Ensuring optimal dietary diversity in infants through complementary feeding should also be a priority to prevent growth faltering.

Use of stable isotope technique helps not only to measure intake of human milk and non-milk oral water intake in breastfed infants, thereby providing quantitative information about the practice of exclusive breastfeeding, but also the follow up measurements give valuable information about milk intake volume in infants who continue to be breastfed beyond 6 months of age. Combination of data obtained from stable isotope techniques (viz. human milk intake and infant's body composition) and data from anthropometry and dietary intake provide important tools to measure determinants of growth in early life. This research was funded by the International Atomic Energy Agency, Vienna, Austria.

INFECTIONS IN PREGNANCY: A HUGE, AND AVOIDABLE, CAUSE OF MALNUTRITION IN CHILDHOOD

MAINSTREAMING THE CONTROL OF MATERNAL INFECTIONS INTO NUTRITION PROGRAMMES

[1]Morris, Saul; [2]Askari, Sufia Askari; [3]Smith, Jeffrey.

[1]Director. Strong Start. Children's Investment Fund Foundation. United Kingdom.; [2]Manager. Strong Start. Children's Investment Fund Foundation.; [3]Vice President, Technical Leadership. Jhpiego. USA.

Across the world, many women suffer from infections during pregnancy. Even when not specific to the reproductive organs, these infections can disrupt the normal course of pregnancy and/or reduce the flow of nutrients to the foetus, causing premature delivery, intrauterine growth restriction, or both. Both prematurity and intrauterine growth restriction manifest in small body size at birth, and very often these low birth weight babies fail to catch up their growth during infancy and childhood and remain visibly malnourished into adolescence and beyond. Given the high prevalence in some locations of infections such as malaria and peri-

odontal disease, and the high attributable risk of others such as syphilis, it is quite plausible that maternal infections could contribute as much as one third of the total burden of low birth weight in Africa and Asia.

At present, the detection and treatment of infections during pregnancy is not considered an integral part of nutrition programming in low or middle income countries. Instead, nutrition programmes delivered during pregnancy tend to focus on the provision of micronutrients (particularly, iron and folic acid) and dietary advice. Interventions which are not focused on increasing intake of one or a combination of nutrients are seen as "somebody else's business". A concerted effort needs to be made to re-conceptualise nutrition programmes, during pregnancy and beyond, as a comprehensive set of interventions delivered to clients with the aim of improving nutritional outcomes—such an approach would immediately elevate the importance of tackling infections during pregnancy.

We propose a *R-A-D-I-C-A-L* approach to mainstreaming the control of infections in pregnancy within the context of nutrition programmes. This would involve:

- *R*eviewing the local epidemiology of relevant infections to determine which are likely to be contributing to prematurity and small-for-gestational age in specific sub-groups of women;

- *A*ntenatal care promotion as a key component of nutrition programming;

- Point-of-care *d*iagnostics in antenatal care to screen for infections such as malaria or asymptomatic bacteriuria;

- *I*mmunising pregnant women against preventable infections such as influenza;

- *C*ounselling to encourage appropriate management of illness such as STIs;

- *A*ward recognition for health workers who increase the prevalence of detection and treatment;

- *L*ine-listing and follow-up of all pregnant women to ensure that tests and treatments are not missed and treatments are effective.

The recent publication of new WHO guidelines on "antenatal care for a positive pregnancy experience" provide an ideal opportunity for strengthening the co-delivery of effective nutrient and infection control interventions. In India, this has coincided with the announcement of a new Prime Ministerial Initiative to improve antenatal screening at each health facility once a month. Building on these opportunities, the Children's Investment Fund Foundation is supporting Jhpiego and the Government of Rajasthan to pilot the R-A-D-I-C-A-L approach in four districts in the state, with results expected early in 2019.

Background: Stunting affects a quarter of the world's children and is associated with increased mortality and developmental delay. We showed earlier that intermittent preventive treatment against malaria and other infections in pregnancy was associated with reduced prevalence of neonatal stunting in Malawi. In this follow-up, we assessed whether these gains were sustained and reflected in the epidemiology of childhood growth, development, and mortality.

Methods: We enrolled 1320 women with uncomplicated second-trimester pregnancies in a randomised, partially placebo-controlled, outcome assessor-blinded, three-arm clinical trial in rural Malawi and preventively treated them for malaria and other infections with either two doses of sulfadoxine-pyrimethamine (SP, control), monthly SP, or monthly SP and azithromycin twice (AZI-SP). Child height/length and mortality were recorded at one, six, 12, 24, 36, 48 and 60 months and child development at 60 months of age. Our primary hypothesis was that the difference in mean length at birth would be retained for five years and reflected in a permanently lower incidence and prevalence of stunting among babies born to women treated with AZI-SP. We also hypothesized that these children would have a higher mean developmental score at the age of five and a lower mortality by five years than children born to women in the control group.

Findings. Between December 1, 2003 and October 11, 2006 we enrolled 1320 women to the study and randomised them to the control (n=436), monthly SP (n=441) and AZI-SP group (n=443). There were 3, 2 and 2 twin pregnancies in the control, monthly SP and AZI-SP groups, respectively, resulting in 1327 fetuses for follow-up. Throughout the follow-up mean child length was

0.4–0.7 cm higher (p<0.05 at 1-12 months), prevalence of stunting 6-11% lower (p<0.05 at 12-36 months) and five-year cumulative incidence of stunting 13% lower (hazard ratio 0.70, 95% CI 0.60 to 0.83) in the AZI-SP than control group. Mean developmental score was 108.6, 110.2 and 112.4 (difference in means AZI-SP vs control 3.8, 95% CI 1.1 to 6.4; AZI-SP vs monthly SP 2.2, -0.4 to 4.8) in the control, monthly SP and AZI-SP group, respectively. There were no statistically significant differences between groups in the cumulative five-year mortality (hazard ratio AZI-SP vs control 0.84, 95% CI 0.59 to 1.20; AZI-SP vs monthly SP 0.85, 0.60 to 1.21). Total mortality during pregnancy (abortion/stillbirth) and childhood was 15.3%, 15.1%, and 13.1% (risk ratio AZI-SP vs control 0.86, 95% CI 0.62 to 1.19; AZI-SP vs monthly SP 0.87, 0.62 to 1.20) in the control, monthly SP and AZI-SP group, respectively. For postneonatal mortality (secondary outcome), the proportions were 5.5%, 3.3%, and 1.9%, respectively (risk ratio AZI-SP vs control 0.34, 0.15 to 0.76; AZI-SP vs monthly SP 0.56, 0.24 to 1.32).

Interpretation. Provision of AZI-SP rather than two doses of SP during pregnancy reduced the incidence of stunting in childhood in Malawi. AZI-SP during pregnancy also had a positive effect on child development and may have reduced postneonatal mortality.

MATERNAL HIV EXPOSURE AND POOR CHILD GROWTH

Filteau, Suzanne.

Professor, London School of Hygiene and Tropical Medicine.

Areas of high HIV prevalence, mainly in Sub-Saharan Africa, overlap with areas of food insecurity and high exposure to other infectious diseases. Simultaneous exposure to maternal HIV, deficient diet, and infectious diseases can have both additive and synergistic adverse effects on infant and child growth and nutrition.

With the roll-out of antiretroviral therapy (ART) in Africa, including Option B+ which permits safer breastfeeding by HIV-infected, ART-treated women, the proportion of HIV-exposed infants who themselves become HIV-infected has decreased dramatically. However, those who do become HIV-infected continue to suffer high levels of malnutrition. Growth deficits of HIV-exposed infants start in utero, as indicated by their lower birth weight than that of HIV-unexposed infants, so that even those who remain HIV-uninfected themselves are at risk of stunting. Once a child becomes HIV-infected, growth faltering can be progressive so that the earlier in life HIV infection occurs, the greater the growth failure. Fortunately, growth faltering can be mitigated by early infant HIV diagnosis and treatment with ART. In addition, it is now recognized that many children who became HIV-infected years ago, before ART was widely available, are surviving into adolescence and adulthood with chronic malnutrition and frequent infections. Diagnosing these older children and getting them onto ART in order to improve their growth, nutrition and health is a priority.

Slow growth in itself is not a major concern unless it is associated with functional problems. In the case of maternal HIV exposure, there is evidence that the poor growth is associated with functionally important deficits to the immune system and in mental and motor development. Although as yet data are limited for African children, HIV-exposed children may be at high risk for chronic diseases in later life because of low birth weight, early growth faltering and, for the HIV-infected children, being treated with ART for most of their lives.

The causes of poor growth among HIV-exposed children are likely multiple and interacting. Socioeconomic consequences of parental HIV infection may contribute to malnutrition. Parental HIV infection, with consequent increased household exposure to opportunistic pathogens, increases rates of child infections which reduce growth. In the past, reduced duration of breastfeeding in order to reduce risk of child HIV infection could have reduced children growth through both poor nutrition and reduced immunological protection; however, with Option B+, breastfeeding rates by HIV-infected African women have improved. Placental abnormalities, including inflammation and infection, may contribute to the prenatal growth faltering and, through reduced placental transfer of immunoglobulins, increase risk of infant infection.

Maternal ART, in spite of its potential side effects on child growth, has both direct and indirect, through reduced maternal infection and improved ability to care for her family, benefits on health of HIV-exposed children so programs scaling up maternal ART should be supported. Since there is evidence that the growth faltering begins in utero, all forms of maternal care during pregnancy, including improved nutrition and treatment of infections, will likely benefit the infant's growth and nutrition.

Dhaka Shishu Hospital. Dhaka. Bangladesh.; [13]DrPH. Johns Hopkins Bloomberg School of Public Health. Baltimore. Maryland. USA.

Approximately half of preterm births are attributed to infections in pregnancy, which are commonly undetected and untreated in low-resource settings. Maternal genitourinary tract infections may result in systemic infection and inflammation, increasing risk of preterm birth and, potentially, fetal growth restriction. Two infections that are potential targets for antenatal screening include abnormal vaginal flora (AVF) and urinary tract infection (UTI).

We aimed to determine the impact of early pregnancy screening and treatment of maternal genitourinary tract infections (AVF and UTI) on the incidence of preterm live birth and small-for-gestational-age (SGA) in Sylhet, Bangladesh.

We conducted a cluster-randomized, community-based trial in rural Sylhet district, Bangladesh. Twenty-four clusters (population/cluster: ~4000; births/year: ~120), each served by a community health worker (CHW), were randomized to either: 1) the intervention arm, which received routine home-based antenatal and postnatal care, plus screening and treatment of pregnant women between 13-19 weeks of gestation for genitourinary tract infections, or 2) the control arm, which received routine home-based antenatal and post-natal care only. In the intervention clusters, CHWs performed home-based screening for AVF and UTI. Self-collected vaginal smears were Gram stained and Nugent scored. Women with AVF (Nugent score ≥4) were treated with oral clindamycin, rescreened and retreated after 3 weeks as needed. Urine culture was performed and UTI treated with nitrofurantoin. Repeat urine culture was performed after 1 week for test of cure.

Between January 2012 and March 2016, 9712 pregnancies were enrolled (n=4840 intervention clusters, n=4391 control clusters). There were 3818 live births in the intervention arm and 3557 in the control arm. The prevalence of AVF infection was 16.3% (95%CI: 15.1-17.6%) and UTI was 8.6% (95%CI: 7.7-9.5%) in the intervention arm. Coverage of home-based treatment and rates of cure were 86.2% and 58.0%, respectively, for AVF, and 85.5% and 70.7% for UTI. There were no significant differences between intervention (I) and control (C) groups in: mean gestational age (I: 38.7 wks [SD 3.1], C: 38.9 wks [SD 3.1]; mean difference: -0.14 [95%CI: -0.37-0.07]), incidence of preterm birth (I: 21.8%, C: 20.6%, relative risk (RR): 1.07 [95%CI: 0.91-1.24]), incidence of low birthweight (I: 21.4%, C: 20.7%; RR: 1.03 [95% CI: 0.78–1.37]), or SGA (Intergrowth 21st) (I: 29.7%, C: 33.1%; RR: 0.90 [95%CI: 0.76-1.06]). Rates of stillbirth (I: 53.3/1000 births, C: 44.6/1000; RR: 1.19 [95%CI: 0.91-1.55]) and neonatal mortality (I: 31.4/1000 live births, C: 37.7/1000; RR: 0.82 [95%CI: 0.57-1.18]) did not significantly differ between groups.

A community-based screening and treatment program for AVF and UTI did not reduce the incidence of preterm birth or SGA in rural Sylhet, Bangladesh. Potential reasons for the lack of population-level impact include the relatively low prevalence of infection and rates of cure, as well as heterogeneity in the composition of AVF. Further research is needed to understand the microbiota of AVF in different populations and its role in preterm birth, as well as the identification of other targets for the primary prevention of preterm birth.

ADOLESCENT NUTRITION GLOBALLY: A NEW FRONTIER FOR ACTION

ADOLESCENT HEALTH AND NUTRITION ANALYSIS FROM OBSERVATIONAL STUDIES: KEY FINDINGS FROM A GLOBAL LEARNING INITIATIVE

McLean, Mireille.

The Sackler Institute for Nutrition Science. The New York Academy of Sciences.

Supporting the transition from childhood to adulthood is an important element of the Sustainable Development Goals. Researchers have started addressing the information gap about the adolescent's demographic group, examining issues of health and access to health services, food security, empowerment, nutritional status, enrollment in education, etc. The Sackler Institute has been contributing to this global effort by focusing on describing the multi-faceted nature of challenges faced by adolescents in low and middle income countries through a collaborative learning initiative.

Nine studies were funded in 2015 with the goal of mining existing datasets for information on adolescent's nutritional status from

Asia (China, Bangladesh, India, the Philippines), Africa (South Africa, Ethiopia, Gambia, Ghana) and Latin America (Peru), thus gathering and comparing data from cross-sectional surveys, longitudinal studies and intervention trials. Taken together, these studies painted a heterogeneous picture in terms of size and direction of effects of known predictors (e.g. living in rural areas, household income, schooling, and gender) on dietary adequacy and quality. Regarding nutritional status, rising rates of overweight and obesity at an increasingly younger age prompts the need to better capture food decisions and the influence of the food environment in low and middle income countries. When discussing implications for future interventions, this group of studies illuminated an unanticipated research gap: there is a dearth of knowledge relating to the type of activities and occupations adolescent girls and young women engage in, including formal and informal, full time or part time, employment. Describing occupation types and how it links to nutrition and health will highlight a potentially important pathway towards empowerment, and help inform intervention strategies aimed directly at this group. An additional round of studies, funded in 2017, will be addressing this specific question.

Keywords: Adolescent, Nutrition, Occupation, Collaboration

GLOBAL BURDEN AND EPIDEMIOLOGY OF ADOLESCENT NUTRITION: ISSUES AND RISK FACTORS

Christian, Parul.

DrPH. Nutrition Team. Bill & Melinda Gates Foundation. USA.

Globally there are 1.2 billion adolescents, equivalent to almost 20% of the total world population, 90% of whom live in low and middle income countries (LMIC). In the coming decade, regions with high fertility rates such as sub-Saharan Africa will see rapid growth in their adolescent populations, as compared to regions where fertility is declining, such as in Asia and Latin America. Adolescence is a period of rapid growth and development when the influence of adequate nutrition may be high. Peak linear growth velocity occurs in adolescence, wherein 15-25% of adult height and 50% of adult weight is attained. As such, adolescence and the growth spurt that occurs in this period is often thought of as a period of potential catch up of growth deficits that occurred in early childhood. Nutritional status also influences onset of menarche and subsequent linear growth, both of which have a wealth differential.

In many settings, adolescents especially girls fail to reach their full growth and development potential. Although global data are lacking on the burden of poor growth and nutritional deficiencies, stunting, low BMI and anemia (largely related to iron deficiency) have been identified as public health concerns. Another rising concern in LMIC is the trend of high BMI, although the cluster of countries where low and high BMI exist tends to be different. Iron deficiency has been identified as one of the top 15 leading global risk factors for death and DALYs in ages 10-19 y among box sexes in 2013. Additionally, vitamin A deficiency was included in the 15 top ranking factors for DALYs in ages 10-14. Micronutrient

deficiencies beyond these are not well recorded and dietary intake data are urgently needed to determine inadequacies, given high nutritional requirements for energy, protein, calcium, iron, and other nutrients during this time.

Social factors such as gender norms discriminating against girls, early marriage, school drop out, and sexual abuse are important drivers of poor adolescent health and nutritional well-being, especially among girls. Eating patterns, food habits and preferences, peer and parental influences, and body image all influence the diets of adolescents in addition to socioeconomic and cultural factors influencing food intake. In some settings, adolescents may be vulnerable to food insecurity. In contrast, snacking, lower physical activity, and alcohol and tobacco use frequently begin during this period of life, especially in urban locales, and likely impact nutritional status during this age.

Adolescent pregnancy, especially in girls 15-19 y of age, not only increases morbidity and mortality risk but compounds the nutritional problems. Young mothers are at an increased risk of adverse birth outcomes, including preterm birth and fetal growth restriction. Preconception undernutrition and increased nutrient requirements of pregnancy takes a toll on both the young woman and her infant. Premature pregnancy can result in halting linear growth among adolescents with consequences for short stature in adulthood.

The period of adolescence is overwhelmingly data-poor related to nutritional status, calling for the need for systematic assessment of nutritional indicators, diet, and factors influencing these, globally.

EFFECTIVENESS OF NUTRITION INTERVENTIONS AMONG ADOLESCENT GIRLS; HOW DOES THE EVIDENCE STACK UP?

[1]*Bhutta, Zulfiqar;* [2]*Lassi, Zohra;* [3]*Keats, Emily.*

[1]Robert Harding Chair in Global Child Health & Policy, Centre for Global Child Health, Hospital for Sick Children, Toronto, ON M6S 1S6, Canada; [2]University of Adelaide, Australia; [3]Centre for Global Child Health, Toronto, Canada.

Adolescence is a critical stage in the lifecycle and adequate nutrition is necessary for the proper growth and development of individuals, and of their offspring. In this paper we have comprehensively reviewed all published systematic reviews (till October 2016) on adolescents (10-19 years) and women of reproductive age including pregnant women that targeted interventions related to nutrition. For interventions where there was no existing systematic review on adolescents, we reviewed primary studies/trials. We included interventions on micronutrient supplementation, food energy/protein supplementation, nutrition education for pregnant adolescent, obesity prevention and management and management of gestational diabetes.

We identified a total of 35 systematic reviews of which only five were conducted on adolescents; and 107 primary studies on adolescents. Our review suggests that iron alone, iron-folic acid,

zinc and multiple micronutrient supplementation can significantly improve serum hemoglobin concentration. While there was a lot of variability in study design to detect dose-response results, the overall evidence suggests that daily IFA supplementation reduced the prevalence of anemia (RR 0.52; 95% CI 0.28, 0.96; 3 studies, n=1979) and improved the serum hemoglobin concentrations (MD 10.07; 95% CI 4.05, 16.10; 5 studies, n=822) among adolescent girls; and that weekly iron/folic acid supplementation also led to reduction in anemia (RR 0.73; 95% CI 0.58, 0.92; 9 studies) and improved the serum hemoglobin concentration (MD 2.24; 95% CI 0.36, 4.12; 6 studies, n=2839). While, zinc supplementation among pregnant adolescent showed improvement in preterm birth and low birth weight, we found paucity of trials on food protein/energy supplementation and other micronutrients. We shall also share findings from the individual subject data analysis from a recent collaborative exercise on the impact of multiple micronutrient supplements on adolescents during pregnancy compared to other age groups. Interventions to prevent and manage obesity showed a non-significant impact on reducing body mass index.

This review underscores the importance of adolescent nutrition interventions and paucity of policy relevant information therein. It is imperative that countries should design nutritional interventions particularly for adolescents.

HOW CAN COMMUNICATIONS FOR MATERNAL INFANT AND YOUNG CHILD NUTRITION BE IMPROVED? LESSONS FROM SOUTH ASIA

CHALLENGES IN DEVELOPMENT AND IMPLEMENTATION OF M-SAKHI – (MOBILE-SOLUTIONS AIDING KNOWLEDGE FOR HEALTH IMPROVEMENT) TO IMPROVE MATERNAL AND CHILD HEALTH AND NUTRITION IN RURAL MAHARASHTRA, INDIA

[1]Patel, Archana; [2]Kuhite, Priyanka; [3]Puranik, Amrita; [4]Khan, Samreen Sadaf; [5]Dibley, Michael.

[1]MD. DNB.Masters in clinical epidemiology.PhD.Community Medicine and Clinical Epidemiology.Chief Functionary Officer and Program Director.Lata Medical Research Foundation. Nagpur.India; [2]BHMS. Assistant Study coordinator. Lata Medical Research Foundation.Nagpur.India.; [3]MSc. Project Manager. Lata Medical Research Foundation.Nagpur.India.; [4]BAMS. Project Manager. Lata Medical Research Foundation.Nagpur.India.; [5]BSc(Med).MBBS. MPH. Professor. Global Public Health Nutrition. School of Public Health. University of Sydney. Australia.

Innovative mHealth solutions have the potential to enhance the monitoring and delivery of nutrition, healthcare and other supportive services to pregnant and lactating women and their infants even in remote rural areas of India. We recently deployed M-SAKHI (Mobile-Solutions Aiding Knowledge for Health Improvement) a mobile based IT solution in 241 villages of central India that has enrolled 1540 pregnant women, for improving nutrition and health outcomes in the first 1000 days of life. This multi-component package aims to promote data collection by community health workers (CHW), aid in counseling of beneficiaries, provides timed targeted text and voice messages, and, real time monitoring of beneficiaries on the server. Numerous challenges are encountered when new technology is deployed. Identification, addressing and sharing of experienced challenges serves to enable sustainability and inform other M-health interventions.

To describe the challenges identified in development and deployment of M- SAKHI

This qualitative study collected data on challenges during technical development, and deployment in the field in the following ways i) weekly meetings with developers and the implementers, ii) daily reporting using Whatsapp groups, iii) daily reporting of challenges put into a "challenge reporting box". The recorded challenges were then sorted and categorized under various themes.

Challenges identified were in the following area - i) Obtaining government approvals for the use of M-Health technology by the existing government health providers, ii) obtaining funding, iii) sourcing technological partners, public health, nutrition and clinical expertise to develop technology that responds to the nutrition and health needs of rural pregnant women, iv) recruiting experienced staff for implementation, v) developing culture and language specific counseling messages and videos embedded in the App, vi) formulating nutritionally appropriate, culturally acceptable text and voice messages of suitable length, vii) synchronization of triggers for delivery of server based alert messages, viii) data entry and synchronization of data across different delivery platforms of multiple health providers, ix) training and retention of CHW, x) beneficiary outreach – poor cell phone network, unavailability of personal phones, missed calls, switched off phones, frequent change of contact numbers, wrong mobile numbers, "do not disturb" category of clients, xi) other nutrition related issues–unaffordability, lack of availability of foods, and cultural barriers that deter behavior change.

M-Health solutions requires initial technological investments and support, frequent training of project staff and proficient monitoring for its sustenance. Despite the multiple challenges, it has the potential to enhance coverage of appropriate nutrition and health practices in hard to reach rural areas.

In Sri Lanka, 0.9 million people (4.3% of population) live in plantations, predominantly in tea and rubber estates. Nutritional status of children in these estates is poor, and innovative strategies are needed to improve this situation. With the advancement of technology, mobile health communications (m-health) have been used effectively in many countries to strengthen primary health care. However, it is rare to find use of m-health for infant and young child feeding (IYCF) counselling in South Asia. The SAIFRN Sri Lankan group used a stepwise and scientific approach towards using m-health for IYCF counselling in the tea estates. This presentation aims to discuss development and feasibility of the m-health intervention.

Our approach consisted of:
Phase 1: Formative study to explore perceptions of stakeholders
Phase II: Development of mobile phone intervention package
Phase III: Pilot testing of the intervention

Phase 1: A formative study was conducted among pregnant mothers, mothers of children, family members, and health staff in two tea estates, using Focus Group Discussions and In-depth Interviews. We found that mobile phone usage was common in this community and m-health platform could be a promising initiative to strengthen the existing face-to-face nutritional advice provided by the health staff to improve the nutritional status.

Phase II: Age appropriate text and voice messages were developed for pregnant women and mothers of children. Overall there were 108 messages, which were incorporated to a mobile platform.

Phase III: In this pilot study, 108 participants (pregnant mothers over 28 weeks of gestation and mothers of infants up to 2 years of age) were enrolled from one tea estate, and provided with mobile phones. Age appropriate voice and text messages were sent according an automated schedule. Each participant received 2 voice and 2 text messages per week for 12 months period. Pre- and post-intervention assessments were performed using qualitative research.

Estate health team and study participants expressed positive attitudes toward IYCF counselling through mobile phone, message delivery times, and content of messages. Use of mobile health technologies reduced the workload of the estate health care team. Husbands helped their wives to answer the calls, reading the text when his wife was involved in the household work; and provided cash for maintenance phone account. Few young participants shared the messages with their family members, friends and neighbours. Most of participants confirmed that the intervention improved their knowledge and behaviours on IYCF.

Perceived barriers included weak signal strength and network coverage, lack of recharge facilities, and poor literacy.

We found that IYCF counselling through mobile phones is a culturally acceptable and efficient communication method. Mobile health is a possible technology to deliver IYCF counselling, with relatively lower costs in these settings by improving access, quality, and timeliness. Use of mobile phone technology could strengthen the existing services to improve the nutritional status of children.

The study resulted in a m-health package. We recommend that a large-scale trial be conducted to evaluate the effects of this m-health package in improving nutrition status of infant and young children.

LEARNING FROM IMPLEMENTATION: EXPERIENCE OF REACHING URBAN WORKING MOTHERS IN BANGLADESH

[1]Rasheed, Sabrina; [2]Khan, Nazib Uz Zaman; [2]Sharmin, Tamanna; [3]Nahar, Syeda Kamrun.

[1]PhD, Associate Scientist, Health systems and population studies division, icddr,b; [2]Assistant Scientist. icddr,b. Bangladesh; [3]Breastfeeding counselor. Dhaka. Bangladesh.

Exclusive breastfeeding for 6 months followed by continued breastfeeding along with adequate complementary feeding for 2 years is recommended as the feeding pattern providing the best child survival and nutritional status. Community-based interventions peer counseling have shown to improve breast feeding practices in many countries. However, successful models of improving breastfeeding patterns of low income working mothers are not

available. Few studies in nutrition have comprehensively examined the steps of implementation and utilization in pilot interventions, thus limiting the interpretation of impacts of interventions. In this analysis we have mapped pathways of how a novel intervention to promote breast milk feeding was implemented and utilized to enable contextually grounded interpretation of results, differentiate poor design from poor implementation, and identify factors that might influence the utilization of interventions. Objective: We used program impact pathway (PIP) analysis to understand study an intervention that installed breast milk supportive technology such as breast pumps and breast milk pastaurization device in a garment factory setting to promote expressed breast milk feeding among low income working women in Bangladesh. Methods: The study was conducted among 70 mothers working in a readymade garment factory with <1 year old infants in Gazipur, Bangladesh from August 2015-March 2016. The PIP was developed through an iterative process with the program implementation team; the PIP then guided the choice of methods and tools. Using mixed methods, we reviewed the content of training materials for implementation staff, measured their IYCF knowledge (n = 2), observed their communication with mothers (n = 10), and examined factors influencing promotion of IYCF practices and their trial and adoption by mothers (n = 62). Results: Implementation staff demonstrated good knowledge and maintained fidelity to the intervention to a large extent. Mothers identified them as their primary sources of information, and a majority of mothers tried recommended breastfeeding practices. Key facilitators included family support, positive attitude towards breast milk feeding and perception of cost reduction whereas lack of time, lack of care givers and perceived negative health outcome of the infant were salient barriers to adopting recommended practices. Conclusion: Using a PIP analysis identified critical issues pertaining to implementation (e.g., the role of work breaks and supervisor support) and utilization such as supportive care givers at home, supplementary food for lactating women that need further research and programmatic attention. These conclusions will help address the needs of women in the workforce.

COMBATING MALNUTRITION IN MAHARASHTRA

Krishna, Vandana.

MA (Economics). M.Phil (Economic Planning). IAS. Principal Secretary. Finance and Director General. Rajmata Jijau Maternal Child Health and Nutrition Mission. Government of Maharashtra. India.

Background: In Maharashtra, 39% of children below the age of two years were stunted in 2005-06 and 19.9% were wasted. Maharashtra was the first state in the country to take a decision to tackle malnutrition in 'Mission – mode' with the purpose of reducing child malnutrition by focusing on the first 1000 days from conception. The Rajmata Jijau Mother – Child Health & Nutrition Mission was thus launched in its first phase in 2005 and the second phase in 2011.

Objective: To describe the goals of the mission, its activities, and its impact and future policies for sustaining the impact of the mission.

Methods: This is a description of policies that enabled the development of the mission and its goals to significantly reduce rates of child malnutrition by targeting mother and child nutrition for the first 1000 days of from conception.

Results: The mission was funded by the state and received technical support from UNICEF. It had the highest political commitment of the Chief Minister and a cabinet approval. There was a phase wise expansion of the mission over five years to cover all 0-6 year old children leveraging on the existing tracking systems used by the public health department and the Integrated Child Development Scheme (ICDS) for service delivery. The mission specially focused on high burden districts, blocks and tribal areas. The three pillars were i) capacity building and skill development, ii) inter-sectoral collaborations between government, non-government organizations, UN bodies like UNICEF and the corporate sector, iii) community ownership and participation. The phase wise activities were as follows: a) establishment of Nutrition Rehabilitation Centres (NRCs) at District Hospitals for management of SAM (Severe Acute Malnutrition) and MAM (Moderate Acute Malnutrition) cases b) training of Anganwadi workers in the new WHO growth standards, taking height and MUAC measurements, identifying wasting i.e. SAM and MAM, c) establishment of Village Child Development Center (VCDC) and day care centres in tribal areas for under 3 children in phase I. In phase II, partnerships were established with the government bodies like the ICDS, National Rural Health Mission (NRHM), public Health department, NGOs, civil society and corporate sector to help achieve the mission goals.

The impact of the mission is evident from the improved rates of stunting and wasting from 39.0% to 23.3% and from 19.9% to 16.3% respectively and the fact that other states are also considering its adoption for malnutrition alleviation. The mission provides a holistic approach for addressing malnutrition through inter-sectoral collaboration in the areas of health, nutrition, agriculture, WASH (water, sanitation and hygiene), education, food security, agriculture, tribal and rural livelihoods. The public health department has taken over ownership of the nutrition mission and has proposed a comprehensive MIYCN (Maternal, Infant and Young Child Nutrition) policy which covers adolescent health, maternal health during pregnancy and lactation, breast feeding and complimentary feeding.

Conclusion: The mission demonstrates that high level political commitment and inter-sectoral collaborations help to reduce malnutrition and provide sustainability for mainstreaming comprehensive nutritional interventions.

OVERVIEW OF THE PAKISTAN IYCF POLICY ENVIRONMENT

[1]Hazie, Tabish; [2]Mahmood, Hana.

[1]Principal Investigator. Maternal, Neonatal and Child Health Research Network(MNCHRN) and SAIFRN-Pakistan. Pakistan; [2]Project Director. Maternal, Neonatal and Child Health Research Network(MNCHRN). International Research Force (IRF). Pakistan.

High levels of malnutrition have serious consequences on the health and survival of infants and young children. Almost 44% of children in Pakistan are stunted, 30% are underweight and 15 % are severely wasted according to the National Nutrition Survey of 2011. One of the major reasons for such high rates of malnutrition is inappropriate Infant and Young Child Feeding (IYCF) practices which includes breastfeeding and complementary feeding. Association of inappropriate feeding practices with malnutrition has been shown by various studies. The World Health Organization (WHO) and United Nations International Children's Emergency Fund (UNICEF), with the broad participation of many stakeholders, developed the Global Strategy for IYCF to revitalize global commitment for improving infant and young child nutrition by promoting, protecting and supporting appropriate IYCF. Effective interventions for IYCF are well established, including but not limited to interventions for skilled support by the health system, interventions for community based counseling /support and IYCF in emergency circumstances. Additionally, training and capacity building of community health workers to deliver IYCF support and intervention is also imperative. But for the best outcomes at national level, such interventions need to be supported by appropriate policies. And the development of these policies is influenced by the major stakeholders of the policy environment including the ministry, nutrition officers, academicians, researchers, development partners, etc.

The health policy environment of Pakistan has been markedly influenced by its unsteady political environment especially, after the devolution of the Ministry of Health in 2011, whereby a number of federal health responsibilities were placed under the jurisdiction of other government ministries/divisions. However, within the past couple of years an improvement has been observed at the policy level showing commitment of the major stakeholders to the cause. This paper outlines the progress made so far in the IYCF policy environment in terms of implementation, especially of the provinces of Punjab and Sindh, two of the most populous provinces in Pakistan with the most rapid pace towards development.

Keywords: Malnutrition, IYCF, policy, Pakistan

OPPORTUNITIES TO STRENGTHEN THE POLICY ENVIRONMENT TO BETTER SUPPORT APPROPRIATE IYCF AND REDUCE CHILDHOOD MALNUTRITION: SRI LANKAN EXPERIENCE

[1]Jayawickrama, Hiranya; [2]Senarath, Upul; [3]Godakandage, Sanjeeva.

[1]MBBS. MSc. MD.Consultant Community Physician. National Programme Manager Child Nutrition. Family Health Bureau. Ministry of Health, Nutrition & Indigenous Medicine. Sri Lanka; [2]Professor in Community Medicine. Faculty of Medicine. University of Colombo. Sri Lanka.; [3]Consultant Community Physician. Family Health Bureau. Ministry of Health, Nutrition and Indigenous Medicine. Sri Lanka.

Sri Lanka provides free health for all through a well established preventive and curative government health service island wide. Family Health Bureau of the Ministry of Health is assigned with the responsibility for the implementation of MCH programme where maternal and child nutrition services are delivered as an integrated package. All relevant evidence based interventions are implemented throughout life cycle at all levels of health system.

National Nutrition Policy (2010), MCH Policy (2012), MNH strategic plan (2012-2016),National Strategy for IYCF 2015-2020,Code to regulate marketing of designated products provide guidance for implementation. Formal training packages on IYCF for capacity building of health personnel ingrained in the MCH programme.

A well established mechanism is in place to strengthen policy implementation at various levels. At the Presidential Secretariat National NutritionSecretariat has been established to facilitate multi-sector collaboration to improve nutrition; NationalNutrition Council comprises of senior ministers and chaired by HE the President, National Nutrition Steering Committee consists of secretaries of relevant ministries and Technical Advisory Committee provides technical guidance for policy formulation. At Ministry of Health, Nutrition Steering Committee (NSC) chaired by the secretary health functions as a multi-sector platform to address nutrition issues in health sector. Two subcommittees of this NSC, Maternal and Child Nutrition subcommittee and Nutrition Communication subcommittee chaired by the Deputy Director General Public Health Services function as technical advisory bodies to make recommendations to the NSC which includes advice on policy formulation, planning, financial allocation, resource management and other relevant issues pertaining to MCN and guidance in the development, review/revision of policies, strategies, guidelines and other relevant documents in relation to maternal and child nutrition.

TOWARD A NEW PARADIGM FOR ASSESSING CHILD GROWTH: A CAPABILITY APPROACH

HOW SHOULD WE DEFINE HEALTHY CHILD GROWTH?

[1]Haisma, Hinke; [2]Yousefzadeh Faal Dhagati, Sepideh; [3]Boele, Pieter.

[1]PhD. Nutritionist. Population Research Centre. Faculty of Spatial Sciences. University of Groningen. Netherlands.; [2]PhD. Political Scientist. Population Research Centre. Faculty of Spatial Sciences. University of Groningen. Netherlands; [3]PhD. Philosopher. Globalisation Studies Groningen. Faculty of Arts. University of Groningen. Netherlands.

Measuring a child's weight and height has been central to the assessment of child growth. This has had implications not only on how we identify poorly or healthily growing children but also on how we assess the achievements of the targets for the Millennium Development Goals, and more recently the Sustainable Development Goals. Over the past decades, the focus has shifted from a mere biomedical approach to a social epidemiological approach, and several multi-sectoral frameworks have been developed in the recent years. Although, these frameworks have allowed an increased insight into the social determinants of child growth, they still fail to address how people's capabilities are central to healthy growth. We argue that there is a need for advancing current frameworks and monitoring practices toward a capability approach to child growth to allow better targeting of inequity and inequalities. In such an approach child growth is considered as a plural space, including but not restricted to the physical dimension. Other dimensions could be derived from the broader clusters love and care, mental well-being, bodily integrity and safety, social relations, participation, education, freedom from economic and non-economic exploitation, shelter and environment, leisure activities, respect, religion and identity, time autonomy, and mobility as derived from the Rights of the Children. Dimensions and indicators could be identified using theories from other disciplines, such as demography and evolutionary biology. The nutrition transition theory helps to understand that we may want to deal with low birth weight differently depending on a countries stage in the nutrition transition: in countries where low birth weight is highly prevalent, rapid growth may result in adverse later health outcomes and the advice to parents should be accordingly. Theories from evolutionary biology, such as life offspring theory, or parent offspring conflict theory are indicative of the importance of including for example, birth order or maternal body composition as indicators of child growth. By conceptualising child growth as a multi-dimensional outcome, we fundamentally change our perspective to child growth, and open up new ways for policies and interventions. In such a capability approach societal and parental context will be embedded into the growth measurements. This will have consequences not just on how children are being measured, but also on how health professionals will be trained, how care-givers will be counselled and how policies and interventions will be developed. Eventually, this could contribute to improved morbidity and mortality rates.

CHILD HEALTH: JUSTICE AND CAPABILITIES

Venkatapuram, Sridhar.

Senior Lecturer. Global Health & Philosophy. Dept Global Health & Social Medicine. King's College London. London. United Kingdom.

The initial, modern idea for the theory of human capabilities can be traced back to the 1979 Tanner Lecture on Human Values entitled "Equality of what?" given by the Nobel Prize laureate Amartya Sen. In the lecture he identified the weaknesses of measuring inequality, poverty and well-being purely in terms of income or resources, negative liberties, basic needs, or utility (happiness) and suggested human "capabilities" and capabilities equality/equity as a more coherent alternative. Over the three decades since the lecture, and following from many publications by Sen and others on the subject, an extensive interdisciplinary school of thought has developed around the initial idea of human capabilities. Scholars, researchers, and practitioners have developed and used the approach as an analytical and normative framework in which to ground theoretical, evaluative, and prospective analyses as well as concrete applications in a broad range of fields. These have included the analysis and measurement of national wellbeing, poverty and inequality, the prescription and design of welfare policies, the modelling and evaluation of development projects, and the assessment of living standards. The papers in the present task force symposium are applying the capabilities approach to child growth and wellbeing.

This paper will present the basic conceptual components of the capabilities approach such as resources, capabilities, conversion factors, functionings and how these concepts can be applied in measurements of child growth. The discussion will then explain how capabilities are seen to be both constitutive of human wellbeing as well as instrumental to human wellbeing; both the means and ends of policy. If the argument that human wellbeing should be seen in terms of capabilities is convincing, then the argument is that measuring wellbeing is in the space of capabilities, and the causes of the contraction or expansion of capabilities encompass biological and social factors. This has important implications when applied in child growth. This conceptual framework of human wellbeing in general, and in child growth in particular in terms of capabilities will then be situated in discussions about equity and justice.

Keywords: Capabilities approach, Amartya Sen, wellbeing, equity, justice.

ALL ELSE EQUAL – A CAPABILITY FRAMEWORK TO CHILD GROWTH MEASUREMENT

[1]Yousefzadeh Faal Dhagati, Sepideh

[1]Population Research Center, Faculty of Spatial Sciences, University of Groningen, Groningen, The Netherlands.

In the past few decades, scholars of child nutrition and healthy growth have increasingly become interested in scrutinizing the social determinants of growth faltering. Those efforts were crucial to argue that child growth is not only about nutritional inputs, but also about the economic arrangements and resource allocations, societal settings and individual differences. Nevertheless, when it comes to the monitoring and measurement of child growth, anthropometric outcomes remain to be the sole output to be evaluated. In this paper, we claim that, by measuring the anthropometric indicators as the key output, we do not pay due attention to the plurality of elements that interact together to make healthy growth.

The paper applies the Capability Framework to Child Growth (CFCG) as the conceptual framework. The CFCG helps bringing a multidimensional paradigm to the measurement level. This paper defines child healthy growth as the process of continuous physical, psychological and social change that builds a child's capacities to maximize life chances at the individual and societal level. The paper aims to examine how a CFCG gives insights into multiple attributes of healthy growth as a set of capabilities. I use Demographic Health Survey data on India (2005-2006) as the case study. Capabilities of healthy growth are defined under eight core dimensions: life and physical health; love and care; bodily integrity; education; shelter and environment; respect and personal autonomy; social relations and mobility

Some of the findings of this paper include:

Of all dimensions of child healthy growth, the mean achieved functionings are lowest under the "utilization of childcare services," "information", and "sanitation". Children with higher and lower functionings for healthy growth are not equal in their parental education and in using prenatal and breastfeeding services. Furthermore, our analysis suggest that improving utilization of prenatal services, information, sanitation and birth registration improves height for age (fertile functionings). This is while disadvantage under physical integrity (domestic violence) and service dignity has negative impacts on height for age (corrosive effect).

At the first glance, our results may sound similar to studies that apply Social Epidemiology (SE). The paper elaborates in detail on differences between CFCG and

SE at the conceptual and empirical level. However, one key difference is about distinguishing social and individual characteristics (conversion factors) from capabilities. In SE, 'predictors' include factors such as age, sex or religion (individual or social characteristics), as well as capabilities (education or employment). The CFCG distinguishes between the two concepts. Focusing on capabilities helps us acknowledging the 'agency' of caregivers.

Track 3: Public Health Nutrition and Environment

HISTORY AND LEGAL CHALLENGES OF CREATING AND PROTECTING A SUGAR–SWEETENED BEVERAGE TAX IN MEXICO: LESSONS FOR THE GLOBE

CAMPAIGN STRATEGY FOR A TAX ON SUGAR-SWEETENED BEVERAGES IN MEXICO

[1]Calvillo, Alejandro; [2]Espinosa, Fiorella.

[1]BS. Sociology. Executive Director. El Poder del Consumidor. Mexico; [2]Nutritional Health Researcher. El Poder del Consumidor. Mexico.

Background and objectives: Mexican civil society organizations together with academics and public interest lobbyists played a fundamental role in securing the approval of a 1-peso-per-liter tax ($0.05 U.S. dollars [USD]) on sugar-sweetened beverages, and subsequently have succeeded in defending this fiscal measure against attempts of the industry to reduce and eliminate it.

Methods: The tax on sugary beverages in Mexico was achieved through a three-pronged effort, that included academics, a large network of civil society organizations, and lobbyists working in the public interest. The civil society campaign strategy was composed of three stages: a) exposing the human drama of obesity and diabetes, including its catastrophic future consequences, in order to generate the urgency to act; B) highlighting one of the main causes of this tragedy, which is the consumption of sugary drinks and, c) presenting a proposal for the first action necessary to confront this situation, a tax on sugary drinks. The campaign focused on transmitting these three campaign stages through both traditional media and social networks using a variety of tools: academic forums, public demonstrations, public campaigns (in traditional media), formal and ironic videos (in social networks). The campaign also ensured the maintenance of a strong and consistent presence in the media and the capacity to react quickly to the strategies of the beverage industry to stop this measure.

Results: The tax was presented by the executive branch as part of the 2013 fiscal reform package and was approved by Congress despite strong lobbying of the beverage industry, which experienced its highest sales per capita in Mexico, the country that is also home to the largest Coca Cola bottling plant in the world. In 2015, civil society, academia and public interest lobbyists were able to curb the industry's attempt to reduce the tax levied on sugary drinks that contained under a certain threshold of sugar.

Conclusions: The experience of the struggle for a sugary-sweetened beverage tax in Mexico demonstrates three important lessons. First, the importance of collaboration among academia, civil society organizations, and the work of public interest lobbyists with decision-makers. These three axes are essential to

provide evidence and build consensus for the need for a tax on these products. Secondly, the Mexican experience demonstrates the need to make the dimension of the health problem resulting from the consumption of these drinks, visible, in order to create awareness across the population for the need to act, and consistently relying on scientific evidence to support such action. Thirdly, the importance of rigorous activism to maintain the topic in the public eye and to constantly explore diverse and attractive ways of communicating and engaging the public on the issue.

Keywords: Sugar-sweetened beverage tax. campaign strategy. coalition building

LOBBYING AND LEGAL STRATEGY

[1]*Rocha Camarena, Adriana;* [2]*Arango Perez, José Alonso;* [3]*Encarnación Cruz, Luis Manuel.*

[1]BS. Economics. Civil Society and Legislative Affairs Director at Polithink. Mexico; [2]BS. Political Science. Founder and General Director at Polithink. Mexico; [3]BS. International Affairs. Director at Salud Critica and Coordinator of the ContrPESO Coalition. Mexico.

Background and objectives: The lobbying and legal activities for the promotion and approval of the excise tax on Sugar Sweetened Beverages (SSBs) in Mexico started in early 2012, as part of a broad advocacy strategy on obesity prevention that included the participation of different stakeholders, including the National Institute of Public Health (research purposes), the non-governmental organization El Poder del Consumidor (communications and awareness purposes, as well as strategic litigation) and the advocacy firm Polithink (design and carrying out of the advocacy and the legislative strategy).

The tax is conceived as part of a comprehensive policy agenda on obesity prevention in Mexico, which includes the regulations on child-targeted marketing, front-of-package labeling and school food policy and nutrition, as well as the access to potable water in schools and public spaces. The decision to choose the tax as the first policy to be promoted was based on an analysis of adequate timing, political scenarios, implementation processes, short-term effects in consumption and awareness, and the possibility of creating a strong social and political debate.

Methods: The main objective of the lobbying strategy was to position the tax in the political and legislative agendas, by taking into consideration several key elements for the promotion of the tax with the Federal Government, and for the introduction and approval of the tax in Congress. The six key elements of the lobbying strategy were: problem identification; context analysis; stakeholder mapping and engagement; definition of policy needs; communication strategy; and political outreach. The strategy considered a combination of direct lobbying activities performed by Polithink, and advocacy activities performed by civil society organizations and coalitions (such as the ContraPESO Coalition).

Results: The lobbying strategy was developed in four stages: (1) The drafting of the bill; (2) The introduction of the bill in Congress; (3) The winning of the debate; (4) and the Voting of the bill

in Congress. It is important to highlight that the lobbying activities carried out through these stages were not isolated to the research and communication activities done by the other partners. Hence, it is not coincidence that the launch of some awareness campaigns, or the release of research studies, matched key congressional timings, which supported advocacy strategies.

Conclusion: The tax was approved on October 2013 and implemented on January 2014 as a \$1 peso per liter on all SSBs. Following this win, the lobbying strategy was shaped to defend the tax from industry proposals to discard it or reduce it after its first year of implementation, and to increase it to an optimal level of a \$2 pesos per liter (a 20% rate based on international recommendations).

Keywords: Advocacy. lobbying. legal strategy. civil society coalitions. political timing

RESEARCH TO PROMOTE POLICY CHANGE AND MEASURE IMPACT OF POLICIES

Rivera, Juan.

Professor. Health and Nutrition Research Center. National Institute of Public Health. Mexico.

Background and objectives: México is facing an obesity epidemic (overweight and obesity) of 70% in adults and about 33% in school-age children and adolescents. The National Public Health Institute in Mexico (INSP) has generated scientific evidence supporting the design of obesity prevention policy. Monitoring though periodic National Health and Nutrition Surveys since 1988 has provided information about the magnitude, distribution and trends of excess BMI during the last three decades. From 1988 to 2012, obesity in adult women increased from 9.5% to 35.2%. This dramatic rise alerted the government about the urgent need for interventions.

Methods: INSP has conducted the following set of studies aimed at generating information to inform policymaking: a) Monitoring changes in key drivers of obesity have been useful to identify shifts in the diet that may be responsible for the increase of obesity. b) Formative research allowed recognition of obesity promoting elements in different environments and barriers for the adoption of healthy eating and physical activity. c) Randomized efficacy trials have tested effects of specific interventions. d) The evaluation of policy actions has provided feedback for redesign or improvements.

Results: The research conducted by INSP to justify the SSB´s tax implemented in Mexico since 2014 is an example of the use of evidence to support the design of policies. The study of the dietary intake of the Mexican population, using 24-hour recall methodology, showed that about 25% of total energy intake in the diet was provided by sugar-sweetened beverages and non-basic energy-dense processed-foods (referred to by the population as "junk food"). One of the known dietary risk factors for obesity is the

high intake of added sugars and particularly of sugar-sweetened beverages. It also showed that the average intake of added sugars is 12.5% of total energy intake, well above the WHO recommendations. Moreover, SSB´s contribute with 70% of all added sugars. Estimations of own and cross price elasticity of the demand for SSB showed that the demand of these products was elastic and that substitutes were healthy beverages. These findings indicated that taxes would result in a reduction in the intake of SSB´s. Modelling effects of different tax levels on weight loss and diabetes prevention provided evidence about potential impacts of the tax on health. This scientific evidence produced by INSP, along with the information about the negative effects of SSB intake on health, was instrumental for approval of the SSB´s tax by the congress in 2013.

Conclusion: INSP along with the University of North Carolina (UNC) have evaluated the effects of the tax on prices and on the intake of SSBs. Results indicate that tax passed along to consumers for SSBs in general and that the purchases of taxed products have decreased while those of untaxed substitutes have increased. In addition, the tax has generated revenue that should be used to fund obesity prevention actions and for partially correcting high negative externalities. The Mexican experience has demonstrated that taxing SSB and other unhealthy foods are successful components of a multifaceted prevention strategy.

DIETARY GUIDELINES IN EUROPE: RECENT DEVELOPMENTS

FOOD BASED DIETARY GUIDELINES IN EUROPE AND THEIR SCIENTIFIC BASIS

Fogelholm, Mikael.

University of Helsinki, Department of Food and Environmental Sciences.

Nutrition recommendations can be divided into nutrient-based recommendation and food-based dietary guidelines. Traditionally, the food-based guidelines were merely a graphical example of how individuals and populations could reach the nutrient-based recommendations. Hence, these guidelines could be regarded more as communication, not as something based on solid science. The situation is different at present. This is mainly due to a great number of recent population-based cohort studies linking foods, food groups and entire diets to health outcomes.

Studying the relationships between foods and health is difficult and therefore conclusions must be based on a considerable number of studies. Some patterns are, fortunately, quite consistent: higher consumption of whole-grain cereals, fruit, vegetables, legumes, fish and oil (particularly olive oil) are predictors of, e.g., lower mortality lower incidence of type 2 diabetes and cardiovascular diseases. In contrast, higher consumption of sugar-sweet-

ened beverages, processed meat and also red meat are predictors of worse health outcomes. Theoretical measures of a healthy diet (e.g. the Mediterranean Diet Score, the Health Eating Index and the Baltic Sea Diet Score) are also quite consistent predictors of positive health outcomes. The number of randomized, food-based clinical trials is lower, but positive results have been found for, e.g., adding olive oil or nuts to the diet.

The European food-based dietary guidelines are at first glance rather similar, but some important differences exist. The main differences are apparently related to how much the above mentioned scientific basis for food vs. health associations are applied. Several guidelines still include butter and oils/margarine in the same "box", they do not separate whole-grain cereals from refined grains and meat is recommended to the same extent as fish. Others are now using a more detailed classification of foods and these food-based dietary guidelines can be regarded as more science-based.

Some researchers have suggested that since the food-based dietary guidelines pay attention also to non-nutrients in the foods (e.g. flavonoids), they could even replace the nutrient-based guidelines. I don't totally agree with this suggestion, since surveillance and food-policies are still partly dependent also on information related to nutrient intakes and distributions. However, the role of food-based dietary guidelines is clearly emerging.

Keywords: Food, diet, recommendations, guidelines, health

THE ROLE OF FOOD BASED DIETARY GUIDELINES IN TRANSLATING NUTRITIONAL RECOMMENDATIONS FOR PUBLIC USE

MacDonald, Ian A.

University of Nottingham.

The basic principle underlying nutritional recommendations is that the essential nutrients need to be identified and the amounts needed to prevent deficiency disease arising need to be determined. For most essential nutrients (except for energy) for which there are such recommendations, the latter exceed the minimum requirement to achieve maximum population protection. In order to derive these recommendations, it is necessary to have quantitative information about the role of the nutrient, and the values then derived (whether RDA, DRV, DRI) are based on a statistical analysis of the data available such that the recommendation is normally 2 SDs above the mean intake, as this will prevent deficiency in the majority of the population. Clearly attitudes towards nutrition and health have moved on substantially from the 'prevention of nutritional deficiencies' which dominated nutritional science and public health in the early to mid parts of the 20th Century, but this is not reflected in the principles underlying dietary recommendations. Thus, achieving optimum health is the goal of good nutrition but we do not have any evidence based dietary recommendations which are designed to achieve this.

The UK Scientific Advisory Committee on Nutrition released a report on Carbohydrates and Health in 2015, which recommended a change in one of the Carbohydrate DRVs (namely for dietary

fibre) and also recommended that there should not be a reference value for Free sugars as these were not essential components of the diet. The report did recommend limiting Free Sugars intake to no more than 5% of total energy in order to minimise disease risk and promote good oral and cardiometabolic health.

The challenge for Public Health professionals and the general public itself, is how to translate the quantitative nutrient recommendations into food based guidelines. Different countries use different approaches - plates, wheels, pyramids etc - and some are simply qualitative whereas others are more prescriptive about ho often certain foods should be eaten and how others should be limited. This presentation will compare some of the major national food based dietary guidelines and show how easy, or otherwise, it is to turn these guidelines into actual meals and diets. The other challenge about food based dietary guidelines is of course that individual foods are usually sources of more than one nutrient and so whilst the guidelines may be phrased in simple language, the actual contributions to achieving a good nutritional status are much more complex.

FOOD BASED DIETARY GUIDELINES: OPTIONS FOR REGIONAL INITIATIVES

[(1)]Sobajic, Sladjana; [(2)]Boeing, Heiner.

[(1)]PhD. Pharmacist. Department of Bromatology. Faculty of Pharmacy-University of Belgrade. Serbia; [(2)]PhD. Nutritionist. Department of Epidemiology. German Institute of Human Nutrition. Potsdam-Rehbruecke. Germany.

Food-based dietary guidelines (FBDGs) are recognized as modern, simple, and practical tools in public nutritional education, as well as in process of forming national strategies for dietary improvement. Their overall goal is to recommend the intake of certain foods and food groups and their combinations in order to provide the adequate intake of all necessary nutrients. Since different countries have different nutrition situation, different food culture, specific nutrition-related health problems, development of specific national FBDGs are of vital importance. In last two decades the process of developing and implementing national FBDGs has received increased attention from national and international scientific bodies. Food and Agricultural Organization (FAO) has published guidelines for FDBG development and has formed The Nutrition Education and Consumer Awareness Group with a task to help developing FBDG in different countries based on scientific principles. The European International Life Sciences Institute (ILSI Europe) has also organized workshops and published document on experiences in FBDG development in 2004. European Food Safety Authority (EFSA) gave scientific opinion on FBDG in 2009 intended for the whole European region.

The process of scientifically-based national FBDG development consists of several steps and requires existence of reliable data on country specific nutrition-related health problems and dietary deficits, as well as data on national specific food consumption patterns and food composition tables. Unfortunately, for many low-income countries those data are either unavailable or not collected in standardized way, and adequate expertise in data interpretation is often lacking. One solution for mentioned problems could be development of FBDG on regional level that could be used in countries with similar geographic characteristics and dietary cultural heritage.

Federation of European Nutritional Societies (FENS) in order to assist South-East European countries in the process of FBDG development organized at the end of 2016 a workshop to discuss the status and potential developments of dietary recommendations and guidelines in this region. The representatives from public health institutions from Slovenia, Croatia, Serbia, Montenegro, Macedonia, Bosnia and Herzegovina, Romania and Bulgaria, participated at the workshop. The workshop intention was to establish a nucleus of scientists from nutrition and public health that could work conceptually and practically at improving and aligning such guidelines in this region. It was recognized that there is a high potential for capacity building in this area which could best be addressed by collaboration among the local stakeholders and input from those who already went through phases of establishing such guidelines. The following conclusions were drawn: (1) The Belgium food-based dietary guidelines, currently under development, could be a good show case for the South-Eastern countries; and (2) for those countries which are candidates to become a member of the European Union, a common initiative might be worthwhile to ask for expertise and funds for meetings and capacity building within the region. It was the common conviction that the countries of South Eastern Europe share similar backgrounds in scientific infrastructure and culinary practices and that some of the recommendations and guidelines should been issued not nationally but for the region.

NOVEL DEVELOPMENTS IN FOOD BASED DIETARY GUIDELINES

Boeing, Heiner.

German institute of Human Nutrition.

There is a worldwide interest to establish Food Based Dietary Guidelines (FBDGs) for each country or region as a tool to counsel the population and to formulate health/nutritional policy aims. An excellent overview of the situation is currently being available at the website of FAO. This international organization together with WHO can also refer to a number of documents – some of

them from the 1990ies – that describe the background of the FB-DG-concept. In modern terms, FBDGs are a translational tool of nutritional scientific knowledge into a practical food guide. FB-DGs should consider the dietary practice and understanding of the population by giving guidance regarding the intake of food and food groups. In contrast to nutrients, there is a high common understanding what a specific food or food group include. Thus, in the WHO/FAO documents, the communication of FBDGs is an important aspect. FBDGs are often communicated as simple and understandable graphics such as plates, cycles, and pyramids. The documents also highlight that the process of developing FB-DGs for a country/region should involve as many stakeholder as possible.

EFSA, the European Food Standard Agency, also contributed to the concept of FBDGs in 2009 by an own panel-document, available as article in the EFSA-Journal. This document gave guidance how to establish regional/national FBDGs in the European Union.

We should realize that some of the basic documents on FBDG are reflecting thoughts that had been partly developed two decades ago. This might not be bad but it is the question whether these documents still provide a suitable frame that helps to issue a FBDG for each region/country. In particular, with more FBDGs, the need is increasing to harmonize the scientific concepts underlying a FBDG. We already learned from the previous lectures that different criteria are addressed in the European FBDGs such as risk reduction or meeting the nutrient recommendations. In addition, new areas of concerns recently became obvious in relation to food use such as sustainability and energy overflow. It is therefore the question, on which basis new initiatives such as the South-Eastern-Europe FENS initiative should work.

In the upcoming time, therefore, the development of FBDGs should been given an updated concept. This regards several aspects ranging from the scientific basis to the graphical display. One aspect is the scientific basis and the way evidence is generated and used. It is obvious that only solid evidence can be used to guide the population regarding a healthy diet. This principle of solid evidence regards all criteria underlying a FBDG such as recommended nutrient intakes, food –disease relationships and potentially climate impact. Thus, it would be a useful to establish public data bases that collect the single study results and make them accessible to all groups working on FBDGs. It should also been agreement on how to weight the many findings and which of them give priority and why. Similar discussions and harmonizing the thoughts including presenting suitable alternatives could be done regarding other aspects of FBDGs.

IMPACT OF LARGE-SCALE FOOD–RELATED REGULATORY EFFORTS: MEXICO AND CHILE

OVERVIEW OF GLOBAL REGULATORY EFFORTS

Popkin, Barry M.

Phd. Nutrition. Department of Nutrition. University of North Carolina. United States.

Background and objectives: The major focus for preventing obesity, diabetes and all nutrition-related noncommunicable diseases lies with shifting our populations toward a much healthier eating pattern and ultimately creating a culture of healthy eating.

Methods: I review the main set of large-scale regulatory tools and taxes considered.

Results: First, to date we have focused on attempting to create a price structure where we tax unhealthy foods and sugary beverages with a great focus on sugary beverages as a prime example, but there are other economic tools affecting subsidies and trade being considered. Second, is the area of marketing controls that are based on some nutrient profiling system. Third, is front-of-the-package (FOP) logos. It is ideal if these are based on the same nutrient profiling systems as the marketing controls. The major nutrient profiling systems that are increasingly being deployed in all regions of the world include a negative or positive FOP logos. It is strongly recommended that one not allow claims on food packaging not allowed under each FOP system. And as the Chilean law has shown, removal of characters from nonapproved products is also very important. In all cases the goal is to minimize added sugars, unhealthy saturated fats, sodium and promote fruit and vegetable, legume and whole grain-based diets. This is the big three we expect will have the largest impact. A fourth area is food in public institutions, especially schools and hospitals. To date much less work and few studies show major impact on shifting school and other public facilities (e.g., hospitals) meals, marketing, and availability of junk food and beverages; however, we see this also as critical to changing the entire culture of eating and our overall food system in a healthier direction. The short-term and long-term impact of these changes needs to be better understood, but we do also deem them important to achieve any long-term shift in eating patterns.

We have completely neglected globally systematic regulations related to the away-from-home fast food and restaurant sector (e.g., calorie pricing where each calorie charged for a burger or drink must cost the same). Similar with the massive transition of our farm to fork food system we have not figured out how and what impact shifts in government policies toward farmers can make. We do know that until we eliminate major marketing efforts of unhealthy eating, it will be imposible for public education to make a major impact.

Conclusion: As we will show with this set of presentations there are several countries that have or will provide strong evidence on the impact of various regulatory and tax efforts.

Keywords: Taxation. marketing bans. front-of-the-package labeling. nutrient profiling

IMPACT OF MEXICO'S SUGAR-SWEETENED BEV-ERAGE TAX: OVERALL AND ACROSS SUBPOPU-LATIONS

(1)Colchero, Arantxa; (2)Ng, Shu Wen; (3)Guerrero-López, Carlos; (3)Molina, Mariana; (4)Popkin, Barry M.; (5)Rivera, Juan.

(1)PhD. Cener for Health Systems Research. National Institute of Public Health. Mexico; (2)PhD. Research Professor. Nutrition Department. University of North Carolina at Chapel Hill. USA; (3)MS. Research Assistant. Center for Health Systems Research. National Institute of Public Health. Mexico; (4)Phd. Nutrition. Department of Nutrition. University of North Carolina. United States.; (5)PhD. Health and Nutrition Research Center. National Institute of Public Health. Mexico.

Background and objectives: Mexico implemented a 1-peso per liter excise tax on sugar-sweetened beverages (SSB) on January 1, 2014. We present evidence on changes in taxed and untaxed beverages sales and purchases overall, and by subgroups of the population, before and after the SSB tax was implemented.

Methods: Three different data sets have been used for evaluating how Mexico's SSB tax relates to beverage purchases and sales: 1) Household purchases by a longitudinal panel of urban households (2012-2015) to estimate changes in overall purchases of taxed and untaxed beverages and by socioeconomic status, adjusting for pre-tax trends, household sociodemographic characteristics, seasonality and macroeconomic variables. 2) National Income and Expenditure Surveys (ENIGH) rounds 2008, 2010, 2012 and 2014 to estimate changes in overall purchases and by income level, place of residence and type of household, adjusting for household sociodemographic characteristics and economic. 3) Aggregated monthly data on national sales of SSB and bottled water (2007-2015) to estimate changes in per capita sales adjusting for economic activity and seasonality activity.

Results: Among the panel of urban households, we found an average 7.6% reduction in purchases of taxed beverages two year after implementation of the tax (5.5% reduction in 2014 and a 9.7% reduction in 2015). The reduction was higher among household at the lowest socioeconomic status. We also found a 2.1% increase in untaxed beverages. Meanwhile, estimates from the ENIGH show a 6.3% reduction in SSB purchases in 2014, higher among lower income households, residents living in urban areas and households with children; and a 16% increase in bottled water. Finally, Mexico's national sales showed that there was a 7.3% average reduction in sales of sugary beverages and a 5.2% increase in bottled water compared to 2007-2013.

Conclusions: Results across the different studies using various data sets show that the SSB tax was associated with a reduction in purchases/sales of SSB and increases in untaxed beverages. Reductions in SSB purchases were larger among key populations: low income groups and households with children, but there were lower reductions in rural areas. Findings from the second year suggest a sustained and increasing response from the population. Results from Mexico provide important evidence for other countries considering the use of fiscal policies to lower the consumption of SSB along with other interventions.

MEXICO: IMPACT OF THE NONESSENTIAL ENER-GY- DENSE FOODS TAX

(1)Batis, Carolina; (2)Smith Tallie, Lindsey; (3)Rivera Dommarco, Juan Ángel; (4)Popkin, Barry M.

(1)CONACYT- Nutrition and Health Research Center. National Institute of Public Health of Mexico. Mexico.; (2)Department of Nutrition, Gillings School of Global Public Health, Carolina Population Center, University of North Carolina, Chapel Hill, Chapel Hill, North Carolina, United States of America; (3)National Institute of Public Health. Mexico.; (4)Phd. Nutrition. Department of Nutrition. University of North Carolina. United States.

Background: In an effort to prevent continued increases in obesity and diabetes, in January 2014, the Mexican government implemented an 8% tax on nonessential foods with energy density ≥275 kcal/100 g and a peso-per-liter tax on sugar-sweetened beverages. Limited rigorous evaluations of food taxes exist worldwide.

Aim: examine changes from 2012-2013 (pre-tax) and 2014-2015 (post-tax) in volume of taxed and untaxed packaged food purchases and in the proportion of taxed purchases from total purchases. We examined the effects in the entire sample and stratified by socioeconomic status and by pre-tax purchasing pattern.

Methods: This study uses longitudinal data on household packaged food purchases representative of the Mexican urban population from The Nielsen Company's Mexico Consumer Panel Services. We included 6,248 households for the 2014 evaluation and 6,089 households for the 2015 evaluation. We used a longitudinal, fixed-effects model that adjusted for preexisting trends to test whether the observed post-tax trend was significantly different from the one expected based on the pre-tax trend. We controlled for household characteristics and contextual factors like minimum salary and unemployment rate.

Results: The mean volume of purchases of taxed foods in 2014 changed by -5.1% beyond what would have been expected based on pre-tax (2012–2013) trends, with no corresponding change in purchases of untaxed foods. Low SES households purchased on average 10.2% less taxed foods than expected; medium SES households purchased 5.8% less taxed foods than expected; whereas high SES households' purchases did not change. In 2015 there was a decrease in both taxed and untaxed purchases, therefore we focused instead in the change in percentage of taxed purchases from total purchases. Post-tax declines in the % taxed food purchases were -4.8% in 2014 and -7.4% in 2015 (-6.0% in 2014-2015), beyond the counterfactual. Households were classified based on median pre-tax purchases: low untaxed/low taxed ("low"), low untaxed/high taxed ("unhealthy"), high untaxed/low taxed ("healthy"), and high untaxed/high taxed ("high") purchasers. In 2014-2015 Healthy purchasers showed no post-tax change in % taxed food purchases beyond the counterfactual, while unhealthy, low and high purchasers decreased (-12.3%, -5.3% and -4.4%, respectively).

Conclusions: Household purchases of nonessential energy-dense foods declined in the first and second year after the implementation of Mexico's nonessential foods taxes. Households with low SES and greater preferences for taxed foods before the tax showed a larger decline in taxed food purchases. Future studies

should evaluate the impact of the taxes on overall energy intake and dietary quality.

CHILE: IMPACT OF THE SSB TAX

[1]Smith Tallie, Lindsey; [2]Corvalan, Camila; [3]Reyes, Marcela; [4]Silva, Andres; [5]Caro, Carlos; [6]Popkin, Barry M.

[1]PhD. Nutrition. Department of Nutrition. University of North Carolina. United States; [2]PhD. Assistant Professor. Institute of Nutrition and Food Technology. University of Chile. Chile; [3]PhD. Associate Professor. Institute of Nutrition and Food Technology. University of Chile. Chile; [4]Ph.D. Assistant Professor. Central University of Chile. Chile; [5]MSc. Nutrition. University of North Carolina at Chapel Hill. USA; [6]Phd. Nutrition. Department of Nutrition. University of North Carolina. United States.

Background and Objectives: In October 2014, Chile, a middle-high income country, implemented an 18% excise tax (representing a 5% increase over previous levels) on sugar-sweetened beverages (SSBs) ≥15g sugar/240mL, while SSBs <15 g sugar/240 mL were reduced 3% to a 10% tax rate, and beverages including milk, juice, and water remained untaxed. To our knowledge, there has been no evidence to date about the impact of an SSB tax on household food purchases in a middle-high income country. The objective is to examine the change in price and change in household beverage purchases after Chile's SSB tax.

Methods: Using longitudinal data on 2,000 households from Jan 2013- Dec 2015, we used a fixed-effect model to explain change in unit values of 0%, 10% and 18% taxed beverages (Chilean pesos/liter). We utilized fixed effects models to examine post-tax changes in the volume and kcal of household 0%, 10% taxed, and 18% taxed beverages and compared these to the counterfactual (the expected post-tax purchases based on projected pre-tax trends), controlling for household characteristics and macroeconomic conditions. We examined whether there was a difference in response for high vs. low socio-economic status households.

Results: Preliminary results show that the price increase from the tax was not passed on to consumers for the 18% tax, and that households did not change their purchases of 18% taxed, 10% taxed, or untaxed beverage purchases. There were no differences by socio-economic status.

Conclusions: Despite a higher overall tax rate, the relative increase in price of SSBs was small and not passed through to the consumers. Governments considering the use of an SSB tax to change SSB purchasing behavior should consider greater than a 5% relative price increase.

CHILE: THE CHILEAN MARKETING LAWS: INITIAL STUDIES

[1]Corvalan, Camila; [1]Reyes, Marcela; [2]Correa, Teresa; [3]Dillman Carpentier, Francesca; [4]Mediano, Fernanda; [5]Popkin, Barry M.; [6]Smith Tallie, Lindsey.

[1]PhD. Assistant Professor. Institute of Nutrition and Food Technology. University of Chile. Chile; [2]PhD. Associate Professor. Institute of Nutrition and Food Technology. University of Chile. Chile; [3]PhD. School of Media and Journalism. University of North Carolina at Chapel Hill. USA; [4]MA. Health Psychology. University of North Carolina at Chapel Hill. USA; [5]Phd. Nutrition. Department of Nutrition. University of North Carolina. United States.; [6]PhD. Research Assistant Professor. University of North Carolina at Chapel Hill. USA.

Introduction: To prevent the continued increase of obesity and obesity-related non-communicable diseases in children and adults, the Chilean government recently passed the most comprehensive set of food environment regulations in any country to date. In July 2016 the National Law of Food Labeling and Advertising was implemented with 3 major components: (i) improving consumer information by using front-of-package warning labels on unhealthy packaged foods, (ii) restrictions on marketing (i.e. prohibitions of using any licensed character, toy or give-away or child-targeted imager) and advertising (on TV or websites) of unhealthy foods to children under age 14y, and (iii) limiting the availability of unhealthy foods at preschool and school settings by restricting sales of any product with a warning label. Methods: This comprehensive evaluation includes before and after analyses of: i) Nutrient content of 5,000+ packaged foods and beverages, Ii) Marketing on packages (e.g. characters, health claims) of the 5,000+ products photographed, iii) Marketing on TV using a representative sample of two months of TV programming from the four main broadcast channels and four cable networks with the highest children´s audience, iv) Food/beverages purchases at home using the Kantar World Panel, which follows a representative sample of 2,000 households from urban areas, and v) food knowledge and perceptions, diet, and anthropometry (body mass index and waist circumference) collected through face-to-face surveys of 700 +low-middle adolescents and 900+ low-middle preschoolers.

Results: Baseline analyses show that 63% of the packaged foods studied would be classified as unhealthy based on the policy's initial nutrition standards (this number will increase to about 83% as standards become more stringent, based on the policy's incremental rollout). Preliminary analysis on beverages reveals that products with a child-friendly character had higher sugar and calorie content than beverages without a character. Baseline evaluation of the marketing restrictions indicate that children see a lot of food ads for sweet and savory snacks (22%) and sugary drinks (12%), and about 2 out of 3 food ads include strategies attractive to children. Post-implementation data will allow us to assess the impact of the different actions implemented.

Conclusion: There is an unique opportunity of understanding how the package of regulatory actions implemented in Chile will

impact the food environment, people's behaviors and ultimately, people's diet and obesity rates.

Keywords: Obesity regulatory actions. Chilean law of labelling and marketing restrictions. food environment

MONITORING AND ENFORCEMENT OF THE INTERNATIONAL CODE OF MARKETING OF BREAST-MILK SUBSTITUTES: EXPERIENCES WITH A NEW WHO/UNICEF PROTOCOL

NATIONAL IMPLEMENTATION OF THE INTERNATIONAL CODE OF MARKETING OF BREAST-MILK SUBSTITUTES: CURRENT STATUS

Clark, David.

Legal Specialist, Nutrition Section, UNICEF, New York, USA.

The international Code of Marketing of Breast-milk Substitutes was adopted by the World Health Assembly (WHA) in 1981, in an attempt to halt the aggressive and unethical promotion of breastmilk substitutes that undermines breastfeeding practices and places infant and young child health, development and survival at risk. In adopting the Code, the WHA called on all Member States to translate the Code into national legislation, regulations or other suitable measures. In spite of some progress, the World Health Assembly has expressed concern over persistent reports of Code violations and the ineffectiveness of some national measures, particularly voluntary measures, to ensure compliance. In 2016, WHO, UNICEF and the International baby Food Action Network (IBFAN) collaborated on the realization of a comprehensive report on the status of Code implementation around the world, utilizing all data and information sources available to the three organizations, and using agreed criteria to categorize national measures. This talk will present the status of implementation of the Code in accordance with the findings of the joint Report, describing briefly the methodology, findings in terms of legislative status of the Code, as well as a discussion of the challenges faced by Governments in implementation, monitoring and enforcement of the Code, as well as recommendations for action.

Keywords: International Code of Marketing of Breast-milk Substitutes; implementation; legal status; challenges

WHO and IBFAN

A NEW PROTOCOL FOR MONITORING AND ENFORCEMENT OF CODE VIOLATIONS

Grummer-Strawn, Laurence.

PhD. Department of Nutrition for Health and Development. World Health Organization. Switzerland.

As of March 2016, 135 countries had enacted legislation implementing at least some of the provisions in the International Code of Marketing of Breast-milk Substitutes and subsequent relevant World Health Assembly resolutions (the Code). However, very few of these countries have operational monitoring systems to assess compliance with either the full Code or with national laws. WHO and UNICEF have formed a Global Network for Monitoring and Support for Adherence to the Code (NetCode) to assist countries and civil society in strengthening their capacity to monitor the Code. NetCode has developed a monitoring protocol with practical tools and guidance to help countries establish effective monitoring systems. The protocol is composed of two main components. The first focuses on ongoing monitoring to detect, investigate and act on alleged violations of existing national measures and the Code. The second component is a standard for periodic assessment of the state of marketing of breast-milk substitutes.

For ongoing monitoring, national systems need to include systems for detection of violations, reporting, validation, and activation of an enforcement mechanism. While NGOs and consumer organizations could feasibly assist with detection and reporting of violations, validation and enforcement are inherently governmental functions. Therefore, it is critical that governments, including nutrition, health services, food and drug control, and trade departments, are actively engaged in the monitoring and enforcement process. Monitoring should cover media advertisements (TV, radio, online, print materials), promotion in shops and pharmacies, interactions with health professionals, health facility activities, and community promotions. The NetCode protocol includes a standard monitoring and reporting form with electronic tools for easy data collection and management.

The periodic assessment component of the monitoring protocol covers four main groups or settings for assessment of how breast-milk substitutes are being promoted: mothers of children under 24 months, health workers in primary health care facilities, retail outlets, and media including television and the internet. The protocol includes detailed instructions for conducting a survey of mothers of children under 24 months of age that are attending primary health care centers. The survey asks about exposure to advertising through multiple channels, receipt of gifts, feeding advice received, and interactions on social media. Health workers in the same primary health care centers are to be asked about their interactions with representatives of manufacturers and distributers of breast-milk substances. In addition, visual inspection of the centers is to be conducted along with analysis of any educational materials on infant feeding. Retail outlets similarly are to be inspected for promotion and products purchased for analysis of the labels on all infant feeding products. An analysis of television and internet advertising is also included.

Countries that utilize this new protocol can protect mothers from the marketing pressure that interferes with breastfeeding and thus create a more supportive environment for optimal feeding.

MARKETING OF BREAST-MILK SUBSTITUTES IN MEXICO: RESULTS FROM MATERNAL AND HEALTH PROVIDER SURVEYS

[1]*Hernandez-Cordero, Sonia;* [2]*Lozada-Tequeanes, Ana Lilia;* [2]*Shamah-Levy, Teresa;* [3]*Gonzalez-Cosio, Teresita;* [4]*Saturno, Pedro;* [5]*Herrera-Maldonado, Nazarea;* [6]*Grummer-Strawn, Laurence.*

[1]1 Nutrition and Health Research Center, National Institute of Public Health. México; [2]Researcher. Nutrition and Health Research Center, National Institute of Public Health. México; [3]Director of Health Department, Universidad Iberomaricana, Mexico; [4]Evaluation Surveys Center, National Institute of Public Health. México; [5]Director of the Maternal and Perinatal health Ministry of Health, Mexico; [6]World Health Organization, Geneva, Switzerland.

Background: Breast-milk subtitutes marketing has been identified as a barrier to improving breastfeeding practices. The international code of marketing of breast milk substitutes (The Code) was adopted by the World Health Assembly in 1981 to encourage breast feeding and to protect mothers from pressure to use substitutes for breast milk. It is of paramount importance to ensure the compliance to The Code.

Objective: To estimate the prevalence of violations of the international code of marketing breast milk substitutes (BMS) and its subsequent resolutions in health facilities, point of sales and labelling on BMS in Mexico.

Methods: Sampling was based on the Network for Monitoring and Support of the International Code of Marketing of Breast-milk Substitutes (NetCode) protocol. The sample included 10 municipalities (5 per state), selected according to their birth rate, of two States of Mexico, Puebla, located in East-Central Mexico, and Chihuahua, located in Northwestern Mexico . For each municipality between 4 to 5 health care facilities were randomly selected, according to the number of prenatal consults provided the previous year of the study. At health care facility level 16 to 17 mothers of infants under 24 months of age were selected and 1 health care provider (total in two states: 693 mothers and 48 health providers). In addition, 10 points of sale were selected. In both settings it was explored BMS promotions, free-samples, and marketing. Finally, and inventory of BMS available was done from the points of sale visited and labelling and inserts were evaluated according to The Code. Data analysis considered the cluster sampling, using Stata V. 14.1

Results: Almost 50% of the interviewed mothers reported they were recommended to use BMS to feed their infant and more than 80% mentioned they had seen publicity of BMS in the media in the previous 6 months. More than 10% of them reported receiving BMS sampling and 8.5% of them had received baby bottles as gifts. The recommendations, coupons and gifts were mainly from health providers. On the other hand, 15 % of health providers interviewed reported that BMS manufactures had contacted them at least once in the last 6 months. More than 50% of health providers reported not knowing The Code or strategies for its implementation in Mexico, and less than 30% reported had received any training on the Code. Promotions of BMS were identified in all point sales visited, being price promotions the most common. Finally, more than 90% of BMS labels used an image or text idealizing its use .

Conclusions: Violations of The Code were detected in two states of Mexico using the NetCode protocol. There is BMS samples distribution in the health facilities as well as distribution of gifts and coupons. BMS manufactures had contact with health providers in the previous six months and BMS products do not comply with The Code. Important to design and implement a monitoring system to identify violations of the Code.

[1]MHS. ARCH Project. Helen Keller International. Cambodia.; [2]MPH. Deputy Country Director. Helen Keller International. Cambodia.; [3]MD MPH. National Maternal and Child Health Center. Ministry of Health. Cambodia.; [4]Ph. Department of Drug and Food. Ministry of Health. Cambodia.; [5]MA. ARCH Project. Helen Keller International. Cambodia.; [6]MPH. NCDs and Health Throughout the Life Course. World Health Organization. Cambodia.; [7]MD MPH. Maternal and Child Health Program. World Health Organization. Cambodia.; [8]MPH. Maternal and Child Health Program. World Health Organization. Cambodia.

In 2005, the Royal Government of Cambodia enacted the Sub-Decree on Marketing of Products for Infant and Young Child Feeding (SD133) which includes many provisions of the International Code of Marketing of Breast-milk Substitutes. However, a decade after SD133 was passed, research found low awareness and enforcement of SD133 by the four line ministries tasked with upholding the law and aggressive promotion of breastmilk substitutes. In response, the government established a multi-sectoral Oversight Board led by the Ministry of Health, which included Ministries of Commerce, Information, and Industry and Handicraft. With support from WHO's Netcode initiative and Helen Keller International, the board developed terms of reference and implementation guidelines for monitoring, and monitoring checklists for all relevant institutions at the national and sub-national level.

Municipalities in four provinces were chosen to pilot the routine monitoring, and officials from the Ministries of Health, Commerce, Information, and Industry and Handicraft were trained on their respective responsibilities between October 2016 and January 2017. SD133 monitoring began in early 2017, including supervision visits to health facilities and inspections of retail locations. The monitoring checklists were used to identify potential violations, which were then reported to the Oversight Board for action.

Early observations suggest monitoring responsibilities have been undertaken with greater ease the more closely they align with existing routine responsibilities. Ease of implementation is also dependent on whether the underlying system is well-functioning. Officials with existing inspection protocols and schedules have been more successful in integrating their new SD133 responsibilities, while others, particularly at the subnational level, have been challenged by limited or siloed human and financial resources. There have also been challenges transferring the strong commitment and political will from the Oversight Board and national level down to the subnational officers responsible for the routine monitoring for violations.

Integrating monitoring into routine services and inspections capitalizes on existing capacity, infrastructure, and resources; however, additional attention may be required to reinforce the underlying systems.

THE SCALING-UP NUTRITION (SUN) MOVEMENT STUNTING PREVENTION PROGRAM 'RIGHT FOODS AT THE RIGHT TIME: TARGETING NUTRITION OF CHILDREN UNDER TWO' IN MALAWI

IMPACT EVALUATION OF A COMPREHENSIVE NUTRITION PROGRAM TO PREVENT STUNTING AMONG CHILDREN 6-23 MONTHS OF AGE IN RURAL MALAWI

[1]Hurley, Kristen; [2]Hurley, Kristen; [3]Kang, Yunhee; [4]Ruel-Bergeron, Julie; [5]Oemcke, Rachel; [6]Fune Wu, Lee; [6]Mitra, Maithilee; [7]Phuka, John; [8]Klemm, Rolf; [9]West, Jr., Keith.

[1]PhD, Assistant Professor, Center for Human Nutrition, The Johns Hopkins Bloomberg School of Public Health; [2]PhD, Assistant Professor, Center for Human Nutrition, The Johns Hopkins Bloomberg School of Public Health, USA; [3]PhD, Postdoctoral Fellow, Center for Human Nutrition, The Johns Hopkins Bloomberg School of Public Health, USA; [4]PhD, Center for Human Nutrition, The Johns Hopkins Bloomberg School of Public Health, USA; [5]MSPH, Center for Human Nutrition, The Johns Hopkins Bloomberg School of Public Health, USA; [6]Center for Human Nutrition, The Johns Hopkins Bloomberg School of Public Health, USA; [7]MD, College of Medicine, University of Malawi, Blantyre, Malawi; [8]Phd, Center for Human Nutrition, The Johns Hopkins Bloomberg School of Public Health, USA ; Nutrition, Helen Keller International, NY; [9]DrPH, Professor, Center for Human Nutrition, The Johns Hopkins Bloomberg School of Public Health, USA.

Background: The Malawian Government launched a comprehensive stunting prevention program with technical and financial support from the World Food Program (WFP) and the Children's Investment Fund Foundation (CIFF), respectively. The program provides a daily lipid-based nutrient supplement (LNS) and social behavior change communication (SBCC) package to improve infant and young child feeding practices (IYCF), targeting children 6-23 months.

Objective. To evaluate the impact of the comprehensive program on child nutritional status.

Method: A quasi-experimental study design was used to measure nutrition outcomes in one program and comparison district. The impact evaluation included three cross-sectional surveys (baseline, midline, endline) and an imbedded longitudinal cohort of children. Results for the endline survey are being examined and will also be shared during the symposium.

Midline evaluation: The one-year (interim) program impact was measured using cross-sectional baseline (January-March, 2014; n=2,404) and midline (January-March, 2015; n=2,378) survey data. Estimates of impact were generated using Kernel Propensity Score Matching Difference-in-Difference (PSM-DID) analyses using both baseline and midline data.

Longitudinal evaluation: Two cohorts of infants (n=367), aged 6-7 months, were enrolled in either the program (n=176) or comparison (n=191) district, and followed-up after 6, 12, and 18-months, or at 12, 18, and 24-months of age, respectively. Program impact was estimated using a difference-in-differences (DID) method at 6, 12, and 18-months follow-up, adjusting for confounding variables and study design.

Results: Midline evaluation: While the burden of undernutrition remained high at midline (after one-year program exposure) with half of children stunted across both districts, improvements in nutritional status between midline and baseline in child weight, MUAC, WAZ, and WLZ favored the program over comparison district by 0.20kg, 0.29cm, 0.23 Z-score and 0.30 Z-score, respectively ($p<0.05$). In the same way, the percent children underweight, wasted, or experiencing MAM were 7.5, 3.8%, and 2.8% lower, respectively ($p<0.05$). No significant differences were seen for indicators of LAZ or stunting.

Longitudinal evaluation: Early and full (18 months from 6 to 23 months) program exposure improved LAZ and WLZ by $0.34z(p=0.01)$ and $0.22z(p=0.07)$ respectively, with increasing (but non-significant) impact between 6 to 12-months of program exposure. Similarly, the program impact on WAZ was significant at $0.16z(p<0.05)$ from 6-month follow-up and maximized at 18-month follow-up ($0.41z,p<0.01$). Further, relative to the comparison district, at 12 and 18-month follow-up, the percentages of children stunted was marginally reduced by $10.4\%(p=0.08)$. In the same way, the percentages of children underweight were significantly reduced by $8.2\%(p<0.05)$ and $11\%(p<0.01)$ at 12 and 18-months follow-up, respectively. After 6-month of program exposure MUAC was significantly improved ($0.25cm,p<0.01$) relative to the comparison district, but there was no program impact in reducing wasting or moderate acute malnutrition (MAM), at any follow-up.

Conclusion: The more gradual impact on linear growth is consistent with a biologically plausible explanation that 18-month program exposure (starting at 6-months) may be required to detect improved linear growth, whereas weight gain is more responsive and, thus, evident within months of program exposure.

Seattle, WA. United States.

The delivery of efficacious nutrition interventions in a programmatic context can hamper the achievement of nutrition impact due to logistical and sociocultural challenges associated with their implementation. Understanding how programs work to improve child nutrition and feeding behaviors is critical for scaling up nutrition interventions globally.

To study how a nutrition program in rural Malawi was perceived, accepted, and implemented.

Methods: The nutrition program in Malawi includes the monthly distribution of lipid-based nutrient supplements, Nutributter, to all children 6-23 months, and a social behavior change communication campaign to promote optimal infant and young child feeding (IYCF) practices. An independent impact evaluation was led by Johns Hopkins University to measure child nutrition outcomes after 3 years of implementation. This study falls under the impact evaluation, which included a qualitative and a process evaluation study. The qualitative study employed in-depth interviews (IDI) with mothers (n=34) and household members (fathers, n=11; and grandmothers, n=4), focus group discussions (FGD) with village leaders (1 with n=11) and program staff (3 FGD with n=12, n=10, and n=11), to elicit beneficiary and community perceptions of the facilitators and barriers to the uptake of the program's intervention components. Grounded theory guided all study processes, wherein emerging themes were incorporated into continuing data collection, coding, and analysis. The process evaluation study measured the program's conformity to its original design (program fidelity) through direct observations of program activities (n=28), knowledge questionnaires with program staff (n=84), and use of existing data from program monitoring mechanisms (pooled n=2,901). Process indicators were categorized as "working well" (>75%), "needing improvement" (25%-75%), and "not working" (<25%).

Findings from the qualitative study demonstrated that Nutributter was viewed positively by all members of the household and community, who ascribed perceived changes in child health and growth to the consumption of Nutributter. Barriers to the monthly collection of Nutributter were competing household obligations, such as caring for ill family members. When asked to discuss program messages, mothers demonstrated limited and superficial knowledge of IYCF messages. This, in combination with the lack of financial and physical access to nutritious foods promoted by program messages were perceived as significant barriers to enacting desired IYCF behaviors among mothers.

Direct observations of Nutributter distributions conducted under the process evaluation demonstrated that most procedures were functioning at 85% or higher, with some areas needing improvement, such as the conduct of multiple counseling sessions throughout distributions to account for latecomers. Despite the relatively high implementation of training activities as planned (73.3%), the completion of training modules for breastfeeding (22.9%) and complementary feeding (18.6%) was low, which may have contributed to the limited focus of observed one-on-one counseling on these same topics. Nevertheless, knowledge level of key IYCF messages among program staff was high (85.3-85.7%), with the exception of being able to list the 6 food groups (22.9%).

The documentation of the perceptions, facilitators and barriers to, and implementation of the Malawi program generates important lessons for current and future policy, programming, and scale-up of nutrition interventions in this setting.

COMPREHENSIVE PROGRAMING LEADS TO IMPROVEMENTS IN OUTPUTS AND OUTCOMES ACROSS THE PROGRAM IMPACT PATHWAY

(1)Mlambo, Trust; (2)Farhikhtah, Arghanoon; (3)Nyirenda, Jason; (4)Aburto, Nancy.

(1)MPH. Nutritionist. Nutrition Unit. UN World Food Programme (WFP). Lilongwe. Malawi.; (2)MSc. RD. Nutritionist. Nutrition Division. UN World Food Programme. Rome. Italy.; (3)MSc. Nutrition Unit. UN World Food Programme. Lilongwe. Malawi; (4)PhD. MSc. Nutritionist. Nutrition Division. World Food Programme. Headquarters. Rome. Italy.

The Government of Malawi initiated the Scaling-up Nutrition (SUN) 1000 special days initiative in 2011. In Ntchisi District, World Food Programme and World Vision provided technical and operational support to this initiative. Programming included comprehensive social and behaviour change communication (SBCC) for improved infant and young child feeding (IYCF) and improved water, sanitation and hygiene (WASH). Nutrition-sensitive activities included small animal husbandry and homestead gardening promotion for diet diversification. Nutrition-sensitive activities and SBCC messages were delivered through peer-to-peer support (caregroups). The programme also strengthened community management of acute malnutrition and provided small-quantity Lipid-based Nutrient Supplement (LNS) to all children 6 – 23 months.

document changes along the programme impact pathway that are associated with nutritional status including formation and activity of caregroups, SBCC message delivery, nutrition-sensitive activity completion, as well as WASH and IYCF changes.

Output indicators were monitored monthly through programme performance reporting. Outcome indicators were measured using statistically-representative surveys conducted three times per year applied to mothers of children 6-23 months. Output indicators analysed for this report were caregroup formation, activity and coverage; activities to reinforce SBCC messages; and small animal husbandry and home gardening activities. Outcome indicators were MAD, MDD and handwashing facility ownership.

MDD and MAD were measured following the WHO/UNICEF methodology and calculated twice. LNS consumption was first included in a composite category of 'fortified and flesh foods' and, second, not included. The former analysis was performed to measure impact of LNS on dietary adequacy (i.e. dietary micronutrient profile) and latter to measure dietary diversity based on common home-foods. A Z-test for two population proportions comparing the same indicator annually (January 2015 and January 2017) was used to test for significance at an alpha value of 0.05.

The number of caregroups formed increased steadily: 2014 (268), 2015 (479), 2016 (513) and 2017 (610), which led to continuous increase in caregroup volunteer home visits from 2014 to 2017. By 2016, the coverage of caregroups was 100% in the district. There was an increase in SBCC activities from 2016 to 2017 such as number of billboards (14 to 21) and theatre performances (14 to 32), promoting nutrition and WASH. In 2016, small livestock were distributed to 3000 households. Another 3000 households received vegetable seeds. There was a continual improvement in children's MDD and MAD, and household handwashing facility ownership from 2015 to 2017. MAD and MDD including provision of LNS increased from 32% to 43% and 36% to 50%, respectively (p<0.05). Without LNS, MDD increased from 10% to 25% (p<0.05) and MAD increased from 12% to 29% (p <0.05). There was a significant increase in handwashing facility ownership from 45% to 17.4% (p < 0.05).

LNS significantly increased the number of children with adequate micronutrient intake, as indicated by MAD. The increase in MAD without consideration of LNS consumption indicated a benefit of SBCC and nutrition-sensitive activities. The quantified increase in SBCC and nutrition-sensitive activities is likely responsible for the positive impact on MDD, MAD, and WASH outcomes over the course of the stunting prevention programme.

SUPPORTING SCALING UP NUTRITION – FROM POLICY TO ACTION AT THE LOCAL LEVEL

(1)Botomani, Malango; (2)Mlambo, Trust; (3)Farhikhtah, Arghanoon; (4)Aburto, Nancy.

(1)District Commissioner. Ntchisi District. Malawi. Government of Malawi.; (2)MPH. Nutritionist. Nutrition Unit. World Food Programme. Country Office Malawi. Lilongwe. Malawi.; (3)MSc. Nutritionist. Nutrition Division. World Food Programme. Headquarters. Rome. Italy.; (4)PhD. MSc. Nutritionist. Nutrition Division. World Food Programme. Headquarters. Rome. Italy.

A multi-year stunting prevention programme was launched in Ntchisi District as a part of the roll-out of the 'Scaling-up Nutrition (SUN) 1000 special days' initiative' in Malawi in 2014. Ntchisi district was targeted due to its high stunting prevalence (above 50%) in children 6-23 months of age. The stunting prevention programme is a comprehensive approach to tackling stunting, including complementary feeding (distribution of a small quantity lipid-based-nutrient supplement) to children 6-23 months of age, as well as rigorous social behaviour change communication (SBCC) components, engaging the local community through various mechanisms, including peer to peer counselling through care groups. Additionally, community management of acute malnutrition (CMAM) treatment and Water Sanitation and Hygiene (WASH) activities were scaled up to include all health facilities in the district. To date, the programme has reached over 44,000 children between 6-23 months of age, with attendance rates being over 90% in the last seven months.

to demonstrate how the SUN movement, combined with other international and national initiatives and policies, was translated into local action to address stunting for improved nutrition in one district in Malawi.

a well-structured National SUN framework, reliable coordination platforms related to nutrition and health, and district owner-

ship by local stakeholders willingly taking leadership of the nutrition agenda.

Additional methods include capacity augmentation in the program area through staff presence. This has been in order to enable the creation of common nutrition vision, coordination and resource pooling and purpose at district level and promote country capacity strengthening and development.

Considering the stunting prevention program in Ntchisi, Malawi, was aligned with the national SUN movement roll-out, it supported strengthening nutrition governance capacities at both national and district level. Furthermore, making the best use of currently existing coordination platforms related to nutrition and health has enabled the program to situate itself in a strong in-country position and district ownership

Successful decentralisation and operationalisation of SUN at sub-national levels requires engaged local leadership and use of the existing structures, hence creating synergies and ownership.

PROGRAMMATIC IMPLICATIONS FROM RISK-BENEFIT ANALYSIS OF IRON INTERVENTIONS IN YOUNG CHILDREN

RISK-BENEFIT ANALYSIS OF IRON INTERVENTIONS IN YOUNG CHILDREN

[1]Pasricha, Sant-Rayn; [2]Bode, Michael; [3]Gheorghe, Adrian; [4]Ashour, Fayrouz; [5]Arcot, Amrita; [5]Murray-Kolb, Laura; [6]Suchdev, Parminder S.

[1]MRC Human Immunology Unit. MRC Weatherall Institute of Molecular Medicine. University of Oxford.; [2]James Cook University; [3]Oxford Policy Management; [4]University of Maryland; [5]Pennsylvania State University; [6]Emory University.

The World Health Organization (WHO) recommends universal distribution of iron supplementation or multiple micronutrient powders to all children under-2 years in settings where anaemia is prevalent. However, there is evidence these interventions may also promote infections including malaria and diarrhoea. Thus, a decision to implement anaemia control interventions must incorporate a holistic analysis of both expected benefits and risks along with associated costs or economic gains. Differing epidemiology and infectious disease burdens likely mean the effects of interventions are different in each country-context. In each country where the prevalence of anaemia is such that universal iron interventions are recommended, or where interventions are presently being piloted, we modeled the risk-benefit and cost effectiveness of the iron interventions to under-2 children.

We developed a microsimulation model that generated individual patient histories over an 18 month horizon. We populated the model with country-specific epidemiologic, health service utilization and cost data, and simulated three cohorts of 5000 infants receiving different anaemia-control interventions between the ages of 6 and 12 months: 1) MNPs, 2) iron supplementation or 3) no intervention. We estimated country-specific, lifetime net differences in health outcomes (measured as disability-adjusted life years [DALYs] averted) and costs between MNPs and iron supplementation when compared with no intervention. Effects sizes were based on updated systematic reviews of MNPs or iron supplements versus control which have been used to inform WHO anaemia control recommendations, and modulated at the country level depending on malaria endemicity and individual level depending on access to malaria prevention. Cost data were based on estimates of unit-costs of interventions, programmatic costs, probability of health seeking, and costs per visit of health attendances.

There was marked variation in overall benefit in net benefit-risk from iron interventions between different regions, and in different countries within regions, from overall beneficial to overall harmful. The burden of disease attributable to anaemia was chiefly due to moderate and severe, but not mild, anaemia. Increases in diarrhoea from anaemia control interventions contribute considerable to DALYs in this model. Data on long term effects of iron interventions on cognitive performance were sparse but indicate no effect; this precluded incorporation of an effect from intervention on earning potential. There were differing costs per DALYs averted and different affordability of programmes between countries, with costs in some countries exceeding US$5000 per DALY averted. Benefits from iron would be entirely negated if iron raises mortality risk in children by 1 per 10000.

Iron interventions generally have a positive but modest effect on child health and are moderately cost-effective. Data from randomised controlled trials reporting on effects of iron interventions on functional health outcomes would inform and improve precision of the model.

SCIENCE BASED MEASURES TO INCREASE NUTRITION QUALITY IN GERMANY

EVIDENCE-BASED GUIDELINES ON FAT AND CARBOHYDRATE INTAKE

Heseker, Helmut.

PhD. Professor. Institute of Nutrition, Consumption & Health. University of Paderborn.

Nutrition-related chronic diseases contribute increasingly to the total disease burden in many populations. Fat, carbohydrate and protein intake play a major role in human nutrition. However, consumer are faced with conflicting and sometimes contradictory

publications and opinions. In this systematic review the scientific evidence for the primary prevention of diseases like obesity, type 2 diabetes mellitus, dyslipoproteinaemia, metabolic syndrome, hypertension, coronary heart disease (CHD), stroke and cancer through the intake of various fat and fatty acids (SFA, MUFA, PUFA, TFA), carbohydrates (mono-, di-, polysaccharides) and proteins was evaluated. The evaluation was conducted by expert groups of the German Nutrition Society.

Method: Systematic literature searches were conducted with the primary focus on meta-analyses, systematic reviews and monographs. If these were not available, original intervention and cohort studies were considered.

Results: There is convincing evidence that a reduced intake of total fat and SFA as well as a larger intake of PUFA at the expense of SFA reduces the concentration of total and LDL-cholesterol in plasma. Furthermore, there is convincing evidence that a high intake of TFA increases risk of dyslipoproteinaemia and that a high intake of long-chain PUFA reduces plasma TGC concentrations. Additionally, a high fat intake increases the risk of obesity with probable evidence in an ad libitum diet. A larger intake of PUFA at the expense of SFA reduces the risk of CHD with probable evidence and a high intake of long-chain n3-PUFA reduces the risk of hypertension and CHD, whereas a high TFA intake increases the risk of CHD. A high carbohydrate intake at the expense of total fat and SFA reduces the concentration of total, LDL and HDL cholesterol. Conversely, a high carbohydrate intake at the expense of PUFA increases total and LDL cholesterol, but reduces HDL cholesterol. Furthermore, a high consumption of sugar sweetened beverages increases the risk of obesity and type 2 diabetes, whereas a high dietary fibre intake, mainly from whole-grain products, reduces the risk for obesity, type 2 diabetes, CHD and colon-cancer.

Conclusion: The evaluation shows that both the total amount of fat and the pattern of fatty acids as well as carbohydrate quality must be carefully considered in dietary recommendations. The findings suggest that a modification of the fatty acid pattern in favour of unsaturated fatty acids at the expense of SFA and TFA and of carbohydrates in favour of polysaccharides at the expense of mono- and disaccharides is desirable.

Keywords: Carbohydrate, fat, intake, chronic diseases

HEALTH EFFECTS OF PLANT-BASED DIETS: FROM WHOLESOME-MIXED DIETS TO EXTREME VEGETARIAN DIETS

Boeing, Heiner.

German Institute of Human Nutrition.

There is a high interest in a diet that based primarily on plant foods. The German Nutrition Society is favoring a diet which is composed of 75% of foods that originate from plants. The remaining 25% include mainly milk and milk products, fish, and to a comparable lesser extend meat and processed meat. The intake of meat including processed meat should be restricted to 600g a week at maximum. This recommendation in amount for a food group

that had been highly debated due to its relation to disease risk and environmental impacts consists of about half of the amount of current intake. Milk and milk products among the food groups of animal origin are particularly favored due to its content of calcium and also fish due to its content of long chain polyunsaturated fatty acids.

A diet characterized in such a way with some further specifications is been labelled as a wholesome mixed diet by the German Nutrition Society. It is obvious that compared to the current dietary practice particularly the reduction of meat and processed meat and the increase of fish will have impact on disease occurrence due to the many relationships with chronic disease endpoints in meta-analyses and also due to the discussed mechanisms. A further reduction of disease occurrence is expected by an increase of intake of fruit and vegetables. The German Nutrition Society is clearly in favor of 5 portions of fruit and vegetables which is equivalent to 650g/d according to German portions.

The German Nutrition Society discussed recently the impact of increasing the proportion of plant foods beyond the wholesome mixed diet approach in respect to nutrient intake and nutrient related health consequences in a specific working group. This working group also published a statement regarding the implication of a vegetarian and vegan diet in respect to nutrient recommendations. The working group concluded that the provision with some critical nutrients such as specific amino acids, vitamin b12, riboflavin, calcium, iron, iodine, zinc, selenium, and ω3 fatty acids is getting more and more difficult as more sources of animal food need to be replaced by plant food. The omission of meat and processed meat in the diet as prime aspect of a vegetarian diet does not seem problematic if replaced by proper plant foods. However, a diet without any animal food sources should include a consultation with diet expert and also a medical a surveillance of clinical markers reflecting the critical nutrient particularly vitamin B12. The German Nutrition Society does not favor a vegan diet for young children and pregnant women due to its high risk of nutrient deficiencies.

In terms of reduction of disease risk it is not be expected that a further reduction of animal foods beyond a mixed wholesome diet will have a large impact. Rather, it is to be expected that a lack of fish and milk and milk products will result in small increased risks compared to a diet with some portions of animal foods.

QUALITY STANDARDS FOR CATERING IN DIFFERENT SETTINGS

Arens-Azevedo, Ulrike.

Hamburg University of Applied Sciences, Faculty of Life Sciences.

Background: The nutritional situation in Germany is characterized by high prevalence of overweight and obesity in both: children and adolescents as well as adults. With increasing age also malnutrition, especially in the elderly and hospitals occur frequently. Against this background the Ministry on Health and the

Ministry on Food and Agriculture adopted the National Initiative on physical activity and healthy nutrition in 2008. Based on this publication the German Nutrition Society developed after intensive discussion within large expert groups quality standards for diverse settings like nurseries, schools, workplace canteens, geriatric care centers, meals on wheels and hospitals. Actually in these settings round about 2.49 billions of lunch per year are consumed.

Objectives: The quality standards make part of the primary prevention. They aim to support the persons responsible in mass catering for implementing adequate and nutritionally balanced meals and allow the guests a healthy choice. In schools and nurseries a link to nutritional education has to be established, so that nutritional behavior can be sustainably shaped. In other settings like workplace canteens or hospitals nutritional information is focused so that adults might learn what is good for them.

The content of the standards: The focus is on the nutritional quality of meals and drinks. For this purpose, the food quality of each group is clearly defined and the frequencies in which they should be offered in one week or during four weeks. The recommendations are derived from the German food-based dietary guidelines. At the same time, the D-A-CH reference values are important, but only some nutrients such as carbohydrates, fat and protein, fibre, vitamin C, vitamin E, folate, iron, magnesium and calcium as well as energy are checked. In addition, requirements to the preparation of food are established, as for instance a maximum warming time of 3 hours or frying with a minimum of fat, preferring rapeseed or olive oil.

Since the standards adopt Donabedian`s quality management systematical approach looking to the quality of structure, processes and results, other aspects beside the nutrition-relevant ones are also important. Therefore the standards describe requirements to the framework conditions such as the dining atmosphere, the quality of hygienic processes, the sustainability of food and production or the qualification of the staff.

Conclusion: The quality standards were harmonized and continuously updated in the last years. Within the scope of the 13th nutritional report of the German Nutrition Society research in nursing homes and nurseries has shown to what extent and in which way the implementation of the quality standards has changed the meal offer. However, up to this point of time, studies are missing that could reveal an alteration in the nutritional situation or the nutritional behavior of the guests. Such studies should be carried out in the future in order to demonstrate the effects of quality standards as primary prevention in different settings.

Universidade São Judas Tadeu São Paulo. Brazil.

Overweight and obesity not only represent significant risk factors for developing non communicable diseases, the leading cause of deaths worldwide, but also imply high healthcare costs for governments. Nowadays, Latin American countries are facing not only the challenge of trying to overcome malnutrition due to deficiencies but also to stop the rapidly rising prevalence of overweight and obesity. The projection is that Latin America will be one of the regions with the highest increment during the next decade. Due to the high impact of overweight and obesity on human well-being, the world Health Organization has developed guidelines in relation to sugars intake, as this is one of the most important contributors to high energy intake.

The Latin American Health and Nutrition Study (ELANS), a multicenter study conducted in urban areas of 8 Latin American countries was developed with the objective to describe dietary intake and anthropometric nutritional status on this population. Two 24 hour detailed dietary recalls and anthropometric measurements (height and weight; neck, hip and waist circumferences) were collected in 9218 Latin Americans (15 to 65 years old). Food consumption was processed using the Nutritional Data System for Research (NDS-R) software. Multiple Source Method was applied to estimate the individual usual intake.

Around 14% of total energy intake came from added sugars. Argentina reported the highest percentage of energy intake from added sugars, in contrast to Ecuador with the lowest.

Beverages accounted for the highest percentage of energy intake from added sugars. All countries reported soft drinks/regular sodas, infusions and natural or ready to drink juices as the main dietary sources of sugar.

Dietary consumption analysis found that more than 25% of the participants are under or over reporters. After adjusting for plausible subjects, no association between added sugar consumption and body mass index was observed. Only Argentina and Chile seems to have a higher consumption reported by underweight people, but still not significant difference was observed.

This study contributes to improve our knowledge about added sugars consumption in the region and its main dietary sources. This can help to focus region and country health policies in order to decrease added sugar consumption and reduce excess calorie intake.

Keywords: Added sugar, beverage, energy, obesity, Latin America.

MAJOR FOOD SOURCES FOR ENERGY AMONG COUNTRIES OF ELANS: ARE WE ALIKE?

Departamento de Nutrición. Diabetes y Metabolismo. Escuela de Medicina. Pontificia Universidad Católica. Santiago. Chile; [9]Nutritionist. Faculdade de Ciências Biológicas e da Saúde - Universidade São Judas Tadeu – São Paulo. Brazil.

It is well known that during the last 4 to 5 decades Latin America (LA) has undergone a process of nutritional transition, resulting in an increase of total energy intake that may be raising the overweight and obesity prevalence.

International comparisons of dietary intake are important to understand food habits and to contribute to the development of public health policies. However, comparisons of dietary intake across nations are not frequently reported due to the difficulty in collecting comparable data among different countries. Besides that, most of the scientific evidence has limited information on Latin American countries that have their own individuality as a region.

In order to correct this weakness, the ELANS group decided to evaluate the energy intake of 9218 subject, 15 to 65 years of age in 8 LA countries using two 24-hours dietary recall (24HR), following the multiple pass method. A total of 3351 types of food and beverages, reported in both 24HR, were grouped into 93 food types and 19 food groups. The percentage contribution of each food item to energy intake was calculated using weighted-proportions formula developed by Block et al (1985).

Ecuador had the highest intake of energy among the eight countries, followed by Argentina, Colombia and Peru. Conversely, Chile had the lowest intake, followed by Brazil, Costa Rica and Venezuela (data to be verified excluding miss reporters). The main source of energy in all countries was grains, pasta and bread followed by meat (not processed) and eggs and oils, fats and dressings. On the other hand, food groups such as vegetables, beans, legumes and soybeans and fruits have a low contribution to the total energy intake. Comparison between countries, reported that Peru is the one that get the highest energy from grains, pasta and bread and Colombia the lowest. Sugars and sweets are an important source of energy in the Argentinean diet, while oils, fats and dressings are the sources for the diet of Ecuadorians.

The distribution of energy throughout the day in the different meal times does not have a homogeneous distribution among the eight countries. For example, Venezuela gets the majority of the energy intake from breakfast and lunch, while Argentina does it from lunch and dinner. Finally, Brazil has an important intake of energy during the snacks along the day.

In conclusion, independent of the gender, in all countries, the main source of energy was grains, pasta and bread, followed by meat. The results reflected a dietary pattern that has been identified in LA population: high protein intake and low fiber, as fruits and vegetables are not consumed in the quantity recommended by the WHO. Regarding the mealtime pattern, none of the countries followed the pattern recommended by the FAO regarding the distribution of energy throughout the day (breakfast 20-25%, lunch 35-40%, dinner 15-25% and snacks 10-20%).

Keywords: Energy intake. Main source of energy. Energy distribution.

Water has been considered as the most important drink in relation to a healthy and adequate hydration. Therefore, its daily intake should be sufficient to compensate for metabolic needs such as body composition, physical activity level or fever. In a healthy adult, with normal physiological conditions and without exposure to extreme environmental conditions, the intake recommended by the EFSA (European Food Safety Authority, 2010) for daily fluid consumption is 2.0 liters for women and 2.5 for men. These values are lower than those previously proposed by The Institute of Medicine of the National Academies in 2005. According to these recommendations, water should be the most important drink and in great abundance among the population; however it does not specify the average amount that should represent the consumption of pure water in relation to the liquids ingested daily.

The Latin-American Study of Nutrition and Health (Estudio Latinoamericano de Nutrición y Salud - ELANS) evaluated the intake of pure water in relation to the total of fluids consumed in the population taking into account variations according to gender, age, socio-economic status, and region of residence. The results of two 24-hours (24HR) dietary recalls were used, following the multiple-step method in three Latin American countries (Argentina, Ecuador and Peru).

From the total sample of participants included in the study, 88.9% consumed pure water and the remaining 11.1%, were participants that consumed liquids from others liquids than water. Argentina had the highest total fluid consumption among the three countries studied, followed by Ecuador and finally Peru with significant statistical differences between them. The contribution of pure water in relation to the total of liquids consumed was superior in Ecuador representing 18%, unlike Argentina and Peru where 16% corresponds to pure water, with a significant differences between gender.

Water consumption of the studied population followed the recommendations established by the EFSA for total liquids daily consumption (2.5 for men and 2.0 liters for women). The percentage of pure water consumed by the population of the Latin American countries included in the present study represents a low percentage of the total fluids consumed.

Pure water is recommended as the main source to cover the daily needs of liquids.

In conclusion, the implementation of proposals must be directed to motivate and to improve the different ways to hydrate, prioritizing the consumption of water over other drinks that provide energy. This could contribute to prevention of overweight, obesity and their comorbidities.

Keywords: Hydration; consumption habits; water; population.

Women of child bearing age should achieve and maintain good nutritional status and lifestyle prior to conception in order to minimize health risks to both: themselves and their babies. Evidence supports that at the time of conception maternal nutritional status is an important determinant of embryonic and fetal growth. The characteristics of Latin American women of fertile age in terms of nutrition status, physical activity level and the socio-economic elements that define their environment are key to understand if they are well prepared to face pregnancies in adequate conditions.

Latin America (LA) has been deep into the nutrition transition process and showed the double burden of malnutrition, including "hidden hunger", as reported in the literature. How this process has influenced wellbeing in women of fertile age at regional level is a big concern for the scientific community in LA, and the question on the implementation of public policies is: how early should prevention start?

The Latin American Study of Nutrition and Health (Estudio Latinoamericano de Nutrición y Salud –ELANS), is a cross-sectional study conducted in eight Latin American countries with the aim to study: food consumption, physical activity level and socio-demographic and anthropometric characteristics. The study included 4,809 women, divided in four groups: adolescents; women between ages 19-34, women 35-44; and 45 -65 years old.

In general ELANS data reported a prevalence of overweight or obesity in 27% of adolescents, 50.77% of women between 19-34 years and 66.52% of women 35-44 years old. Chilean female adolescents showed the highest prevalence of overweight and obesity, whereas Costa Rican adolescents reported the lowest prevalence of excess. Waist circumference shows a trend for increasing with age in all countries.

Institute of Medicine estimated average requirements were taken as reference. Mean energy intake among all groups of ages are inadequate except for Costa Rica, where caloric intake reached 2000 Kcal/day or above in all age groups. All countries showed a trend to diminish caloric intake with age,. Interestingly, 99.3% of women of all ages had adequate intakes of protein. Micronutrients intake outcomes showed: calcium intake to be inadequate in all countries, and adolescents and women over 45 years were the most inadequate. Regarding vitamin A, the most inadequate intakes were in Brazil and Venezuela in all groups of age, vitamin C reported a general prevalence of inadequacy of 35.95% and most concerning: vitamin D reached 98.52% of inadequate intake.

According to IPAQ results, 61.93% of women have low physical activity (PA) levels, adolescents were the group with largest prevalence of inactivity or low levels of PA. Venezuelan adolescents were the most inactive, and the exception of Peruvian women who showed the highest prevalence of activity at all ages, particularly adolescents.

In conclusion, women of fertile age in LA showed a vulnerable nutritional status with inadequate intakes of key nutrients, that combined with high prevalence of inactivity constitute a profile of risk for embracing pregnancies in good condition; thus compromising a good start to life of the future generations.

CLIMATE CHANGE AND NUTRITION: CHALLENGES AND OPPORTUNITIES

CLIMATE CHANGE, AGRICULTURE AND HUMAN HEALTH

Springmann, Marco.

University of Oxford. United Kingdom.

Climate change and human health are related to each other by changes in agriculture. In this talk, I provide an overview of our group's work that analyses three such pathways.

First, I detail how climate change affects agriculture through changes in yields, which affects food consumption by changes in supply, which finally affects health by changes in food composition. Based on an coupled modelling framework, I present quantitative estimates of these climate-related health impacts.

Second, I detail how changes in food demand could impact both climate change and human health. I explore the climate change and health co-benefits of multiple dietary scenarios as estimated by a global comparative risk assessment paired with greenhouse-gas emissions.

Third, I detail how economic incentives could influence food consumption, as well as the health and climate change co-benefits associated with that. Using an agriculture-economic model coupled to a global health model, I present region-specific estimates of the impacts of levying emissions taxes on food commodities, with a special focus on designing tax designs that would result in both health and environmental co-benefits.

Keywords: Human health, climate change, agriculture, dietary change, global modelling

SHAPING GLOBAL FOOD SYSTEMS FOR BETTER NUTRITION

ENHANCING MICRONUTRIENT DENSITY OF STAPLE CROPS OF FOOD SYSTEMS IN DEVELOPING COUNTRY

Boy, Erick.

PhD, Head of Nutrition/HarvestPlus, International Food Policy Research Institute, Washington, DC, USA.

In general terms, biofortification comprises the application of genetic engineering, agronomic and plant breeding technologies to enhance the contents of nutrients and phytochemicals in the edible tissues of living organisms. More specifically, biofortification via selective plant breeding for higher iron, zinc and provitamin-A (pVA) carotenoids in staple crops has made most progress insofar as crop development, varietal releases in middle and low income countries with high burden of these micronutrient deficiencies, and deployment of the biofortified varieties through a variety of demand push and pull strategies. Today, biofortified crops, including pVA-rich orange sweet potato, iron beans, iron pearl millet, pVA yellow cassava, pVA orange maize, zinc rice, and zinc wheat, have been released in more than 30 countries and are being tested and grown in more than 40 countries. More than 160 varieties of 10 major and minor staples have been released. Crop improvement continues to develop varieties with higher levels of vitamins and minerals that are adapted to a wide range of agro-ecological conditions. Ensuring that the best germplasm for climate-adaptive and consumer-preferred traits remains a basic criterion in breeding biofortified crops. To make significant headway in contributing to solve the global public health problem

of hidden hunger, biofortified crops must become the norm rather than the exception in staple food markets. To reach a billion people effectively in developing countries by 2030 will require 1) enhancing the knowledge base to develop and deliver more efficient technologies to accelerate plant breeding and hit the highest micronutrient levels possible successfully without sacrificing preferred agronomic and culinary traits; 2) mainstreaming plant breeding for nutritional traits at regional and national agricultural research centers; 3) improving the stability of provitamin A carotenoids post-harvest in maize, cassava, and sweet potato; 4) improve the bioavailability of iron and zinc when the increase in mineral density is insufficient to improve nutritional status; and 5) partnering with implementing agents in agriculture and nutrition in high burden countries. Certainly, serious consideration must be given to assessing the cost-benefit of crop genome editing and other genetic engineering technologies, and to working within the regulatory environment and with consumer education long before any GM product reaches an advanced development stage. But more importantly, each national and regional government must address micronutrient malnutrition disorders holistically and in responding to context-specific requirements and opportunities. There are no magic bullets but there are many interventions, including biofortification, that are already available and waiting to be deployed in an integrated fashion.

Keywords: Biofortification, crops, food, micronutrients, mainstreaming

SHAPING MARKETS FOR BETTER NUTRITION: INSIGHTS FROM THE ASSESSMENT OF THE MARKETPLACE FOR NUTRITIOUS FOODS

[1]*Toure, Djeinam;* [2]*McClafferty, Bonnie;* [3]*Neufeld, Lynnette M.*

[1]PhD. Senior Associate. Global Alliance for Improved Nutrition. United States of America.; [2]Director of Agriculture and Nutrition Programs; [3]Director of Monitoring, Learning, and Research.

Today, poor quality diets are the leading contributor to the global burden of disease and are in large part the result of the failure of the food system to support the accessibility (i.e., availability and affordability) of nutritious foods to all segments of the population. The world's poor are net buyers of food, yet there have been few efforts to leverage markets as an entry point to improving diets. Private-sector actors involved in processing, distributing, and retailing foods influence the availability, affordability, safety, and nutritional content of foods in the marketplace and hence in part govern access to nutritious diets.

In sub-Saharan Africa, the vast majority of businesses are small and medium enterprises (SME) and these entities provide a sizable share of foods purchased by low-income populations. These businesses face many challenges in establishing sustainable, profitable operations and it is recognized that support is necessary to foster their establishment. Supporting SMEs to improve the nutritional quality and safety of their products in ways that are inclusive of low-income communities and to overcome barriers to growth has

the potential to sustainably improve access. However, a knowledge gap exists around ways to effectively engage the private sector, and measures of the food environment that are appropriate to assess the impact of private-sector investments on consumer access to nutritious foods in markets are sparse.

The Marketplace for Nutritious Foods (MNF), a program implemented by GAIN since 2013, has helped companies in Kenya, Rwanda, and Mozambique identify ways to improve the nutritional quality of their foods and overcome barriers to expand into new and existing markets through technical and financial support. This presentation will share insights from a case study assessment of MNF aiming to (i) develop and test novel measures of the food environment appropriate for impact evaluations of market interventions aiming to improve access to nutritious foods and (ii) document lessons in engaging the private sector for nutrition.

PHYSICAL ACTIVITY AND HEALTH: NEW KNOWLEDGE IN RESEARCH AND TECHNOLOGIES

INTRODUCTORY REMARKS: STATE OF THE SCIENCE ON THE BIOLOGICAL IMPORTANCE OF DIET AND PHYSICAL ACTIVITY IN DISEASE RISK REDUCTION AND HEALTH MAINTENANCE

Gil, Ángel.

PhD. Prof. Department of Biochemistry and Molecular Biology. Institute of Nutrition and Food Technology. Centre of Biomedical Research. University of Granada. CIBERobn. Spain.

Non-communicable chronic diseases (NCDs), also known as chronic diseases, are the main cause of disease in the world. According to the WHO, NCDs kill 40 million people each year, equivalent to 70% of all deaths globally, affecting not only developed but also developing countries. Each year, 17 million people die from a NCD before the age of 70 and 87% of these "premature" deaths occur in low- and middle-income countries. Cardiovascular (CDV) diseases account for most NCD deaths, or 17.7 million people annually, followed by cancers (8.8 million), respiratory diseases (3.9 million), and diabetes (1.6 million). These 4 groups of diseases account for 81% of all NCDs deaths.

Tobacco use, physical inactivity, the harmful use of alcohol and unhealthy diets all increase the risk of dying from a NCD. Indeed, an important way to control NCDs is to focus on reducing the risk factors associated with these diseases. Hence, the authentic way for preventing NCDs is linked to healthy lifestyles with a multidisciplinary focus addressed to the individuals and their environments.

A varied and moderate diet, with small food size portions and low-energy density, as well as generous in vegetable and fruits, and low in free added sugars, salt and trans fatty acids, have been demonstrated to have a role in the prevention of NCDs. In addition, physically active persons show a reduced risk of developing CDV diseases as well as other NCDs. Decreasing the risk of CDV diseases requires the participation of subjects in programs of regular physical activity (PA) for a number of years. However, there are significant benefits for the individuals derived of PA in only a few weeks, namely improvement of CDV response, decrease of blood pressure, increase of muscle mass, and decrease of moods and anxiety, and those effects are independent of the genre, age and race.

People affected of type 2 diabetes, who usually are obese (80%), hypertensive (60-80%) and dilipidemics (40-50%), benefit from regular PA as, independently of the weight loss, it contributes to the improvement of the cardiovascular response, glucaemia control, blood pressure, and plasma lipids. In addition, numerous studies have demonstrated that there is an inverse relationship between the level of PA and insulin resistance, not only in adults but also in adolescent and children, particularly in those obese.

A number of changes in lifestyle habits seem to have a key role in the starting and progression of neurodegenerative diseases. In fact, longitudinal studies followed up for periods of 5-7 years have shown that physically active persons have a lower decreased risk (20-50%) of having dementia as compared to less active persons. Based on animal studies, the reasons behind those beneficial effects of PA appear to be related to the increased cerebral plasticity that favours the regenerative and adaptive processes, which are mediated by neurotrophic factors, augmented expression of neuron growth factors, which are important for the neurogenesis and neurotransmitters production, an improvement of the immune response associated with a reduction of neurotoxic citokines, and increased elimination of β-amyloid in brain.

DIET AND PHYSICAL ACTIVITY: USING CONTEXTUAL DATA TO IMPROVE ASSESSMENT

[1]Boushey, Carol

[1]PhD. Associate Research Professor, Epidemiology Program, University of Hawaii Cancer Center, Honolulu, HI, USA; [2]PhD, Nutritionist, Epidemiology Program, University of Hawaii Cancer Center, Honolulu, HI.

Access to methods to enhance objective data collection of physical activity and dietary intake are becoming more available. Use of accelerometers have enhanced knowledge regarding the benefits of physical activity. For diet, use of images from mobile phones or video have improved objective data capture with regard to foods, time of eating, and location of eating. Associations with accelerometer data and health outcomes are stronger than those observed with self-reports. The benefits of physical activity timing have been elucidated as a result of time-stamped accelerometer data. On the other hand, mixing self-reported physical activities with an objective accelerometer can provide specific information

about best activities to achieve 5 minute bouts. Examples of these advancements in physical activity assessment and its associated outcomes will be shared. For dietary intake, subjective or cultural terms (e.g., supper) for eating occasions have had mixed results with regard to overall diet quality. The use of objective time measures have revealed distinct temporal dietary patterns with significant differences in diet quality. Examples will be shared to demonstrate the improvement in dietary assessment that can accrue from objectively documenting time of eating, the environment of eating, and other contextual data. The new methods available to implement these data collection activities will be summarized.

Keywords: Physical activity, bouts, dietary assessment, temporal dietary patterns.

THE EXERCISE IS MEDICINE (EIM) IN CHINA

(1)Zhao, Wenhua; (2)Yang, Zhengxiong; (3)Chen, Junshi.

(1)PhD. Professor. National Institute for Nutrition and Health. Chinese Center for Disease Control and Prevention; (2)Associate Professor. International Life Sciences Institute Focal Point in China.; (3)PhD. Professor. International Life Sciences Institute Focal Point in China.

Background and objectives: A third of the world's population does not meet the recommended levels of physical activity, which lead to substantial health and economic burdens. Over the past several decades, along with the changes of lifestyle in Chinese population, the physical activity and fitness of Chinese has decreased, where as physical inactivity becomes a major causal risk factor for the rapid increase of overweight and obesity and many of their associated co-morbidities have increased. In China, 86% of deaths due to non-communicable diseases and 8.3% of deaths related to physical inactivity already occur, but where a large gap in research and implementation of PA strategies exists.

Methods and Results: 'Exercise Is Medicine' (EIM) is a global health initiative managed by the American College of Sports Medicine (ACSM) that is focused on encouraging primary care physicians and other health care providers to include physical activity when designing treatment plans for patients and referring their patients to EIM Credentialed Exercise Professionals.

ILSI Focal Point in China signed the Memorandum with ACSM for the Cooperation in Exercise is Medicine (EIM) in China in 2012. The main objective is working on promoting the EIM solution and physical activity in China by holding EIM training courses, setting up EIM website and other projects.

To provide advices for clinicians to offer patients with exercise prescription, and to provide guidelines on scientific exercises and non-communicable diseases prevention, ILSI Focal Point in China has organized more than 10 training courses on EIM in collaborating with relevant organizations, and totally 1500 of clinicians have been trained by the end of May 31 2017.

Conclusions: To train the trainers and increase public aware is the key to the success of EIM in China. In this presentation, we describe the evolution and Chinese expansion of the EIM initiative, the implementation and future directions.

MINI SALTEN: A CASE STUDY ON LEARNINGS FROM ARGENTINA ON OUTCOMES AND CHALLENGES

(1)Kovalskys, Irina; (2)Indart Rougier, Paula; (2)Luciana, Luciana; (3)Rauch Herscovici, Cecile; (4)De Gregorio, Maria Jose.

(1)MD. ILSI Argentina; (2)BSc. Nutritionist. Nutrition and Health Area. International Life Science Institute. ILSI Argentina; (3)PHD. Psycologyst. Nutrition and Health Area. International Life Science Institute. ILSI Argentina; (4)BCS. Sociologist. University of Buenos Aires.

Global Recommendations on Physical Activity for 5-17 years old, of the World Health Organization (WHO), are to invest at least 60 minutes a day in moderate to vigorous physical activity (MVPA).

Mini SALTEN is a program developed to improve eating habits and increase moderate to vigorous physical activity at home and school in first grade children. It aims to assess the effects of a technology family-based and physical activity (PA) school-based intervention.

The design of the protocol was based in a cluster-randomized controlled trial designed to run from July 2015 to November 2016 in twelve public schools of the city of Buenos Aires, matched for socio-demographic characteristics. The intervention was based on two main components: a) virtual (V): web-based presentations delivered to the mothers via a multiplatform application; b) active breaks (AB): implemented during school breaks by a PA instructor. V: Especially designed web-based contents, targeting families and children aimed at encouraging the improvement of eating habits of the whole family both at home and at school, and increasing mothers' knowledge of the benefits of PA and consequences of sedentary behaviour, and proposing pleasurable movement entailing activities for the children. AB: included activities comprising movement during school breaks that were promoted with motivation as a backbone and devoid of a competitive strive; active play in which fun, pleasure, and sharing were emphasized. PA instructor guided activities with the goal of promoting active play for a minimum of 20-30 min/day, depending on each school. Using a computer generated random sequence participants were allocated to one of four intervention conditions resulting in 4 clusters: (AB), (V), (AB) + (V), and control (C). Outcomes are measured at baseline and 12 months post intervention, and included data collected from the dyad (child and her/his mother).. The levels of PA were measured using ActiGraph wGT3X-BT accelerometers for 7 consecutive days (24 hours). Outcomes were: time in light, moderate and vigorous PA and sedentary time (minutes/day). Family socio-economic level, home environment, and school environment were also assessed. This study provides objective information regarding dietary and PA patterns of first grade children of public schools of Buenos Aires. It is a pioneer assessment of the impact of a technology-based virtual intervention, involving the parents, designed to prevent obesity. planning public health policies.

NEW COMBINATION METHODS FOR ADVANCING PHYSICAL ACTIVITY AND FOOD INTAKE ASSESSMENT FOR BETTER ADHERENCE TO PUBLIC HEALTH RECOMMENDATIONS

Pratt, Michael.

Professor and Director. Institute for Public Health.University of California San Diego.

Measurement of dietary intake and physical activity has become increasingly important for health monitoring, and providing interventions that optimize population health. Advances in technology have been useful for reducing survey or study participant burden and have increased objectivity and accuracy for some measures. A plethora of tools, applications and systems have been developed and although significant advances have been made, several limitations at the level of the individual measure limit the ability to capture information that is accurate. In November 2016 a group of experts on diet, physical activity, and the use of technology for health purposes gathered at the University of California, San Diego to examine current experience with the use of technology for research on physical activity and diet. This unique forum investigated current and emerging challenges related to improving energy balance behavior assessment and intervention via technology, and focused on how the research community might embrace and apply innovative new tools. The assembled experts made a number of recommendations that will be summarized in this presentation. To be able to fully take advantage of recent technological advancements for the measure of diet and physical activity:

1) A consensus is needed regarding current methodology and needs with regards to each area of assessment. This will foster inter-disciplinary collaborations among experts from technology, nutrition, public health, epidemiology, and medicine to address the gaps in this direction.

2) Additionally, a focus on assessing the validity and reliability of the available methods for dietary intake and physical activity assessment in adult, youth, and older adult populations ratified by expert researchers in the field will help guide investigators to obtain high quality measures.

3) Increasing efforts that are directed to facilitate a plug-and-play open architecture systems that allows for modular systems to be assembled for specific assessments. Success would include smartphone links with various software applications.

4) Establishing a committee or international working group to evaluate, manage or channel the huge influx of new apps and emerging technologies to measure dietary intake and physical activity, so that there is a focused and effective effort in this direction.

5) Development of novel biomarkers using the technological capabilities to increase objectivity of the measures.

6) Bridging between technology developed for research and consumer wearable technology will be important if research on diet and physical activity is to be optimized at the population level.

While there are still many limitations and challenges in the measurement of dietary intake and physical activity, there is much progress and even more promise for using technology to improve measuring diet, physical activity, and sedentary time. Managing the current knowledge base and facilitating a resource center for sharing measurement technology and analytic approaches are keys for success in obtaining accurate dietary intake and physical activity measures and contributing to higher quality research that can turn improve population health.

DIET, NUTRITION, PHYSICAL ACTIVITY AND CANCER: TOWARDS THE 2017 WCRF CONTINUOUS UPDATE PROJECT UPDATE

EVIDENCE FROM THE LAST DECADE: WHAT HAS CHANGED?

Wiseman, Martin.

World Cancer Research Fund International, UK and University of Southampton, UK.

This talk will focus on new findings and substantive changes compared to the CUP Panel's conclusions of 2007 report arisen from recent evidence. Although there are changes in the specific conclusions relating nutritional exposures to risk of cancer, the most important changes are changes in emphasis across the overall relation between diet and activity, and cancer. There is a greater emphasis on nutritional state marked by body composition, and markers of growth and maturation, than of specific dietary factors. In particular the combination of adiposity and physical inactivity seems a key determinant of cancers common in high income countries. Within diet, there is greater emphasis on foods than on specific nutrients, and to a greater extent, on patterns of diet as opposed to single foods. In general, the strength of existing conclusions has been strengthened, but in some cases has reduced, while there are also new findings.Selected examples include that both vigorous physical activity and body fatness in young adulthood decrease risk of breast cancer. Possible reasons for these changes will be discussed, as well as possible mechanisms underpinning the changed or new findings. The updated CUP findings will be used to inform a review of WCRF International's Cancer Prevention Recommendations, expected in early 2018.

The University of Texas Health Science Center at Houston. School of Public Health. Austin.TX.USA.; [10]PhD. Hubert Department of Global Health of the Rollins School of Public Health. Emory University. Atlanta, GA. USA.

Introduction: Over the last decades, Latin American (LA) has observed marked improvements in the control of under-nutrition but at the same time, the prevalence of overweight and obesity is increasing among LA children. Childhood obesity epidemic is a matter of concern given its association with earlier development of chronic diseases such as diabetes, cardiovascular disease, and some forms of cancers; it also increases economic and health-care burden.

Objective: to describe the current nutrition, dietary, and physical activity situation of LA children, the disparities between and within countries, and the potential challenges for ensuring adequate nutrition and physical activity in the region.

Methods: non-systematic review of articles, reports, and demographic surveys.

Results: across the region, children face a dual burden of under-nutrition and excess weight with important heterogeneity between and within countries. Nonetheless, in almost all groups overweight is rapidly increasing because of important changes taking place in the food and the physical environments. Rapid urbanization combined with greater penetration of the retail food and food service sector has promoted diets that rely on energy-dense, nutrient-poor foods and away-from-home foods. At the same time, sedentary behaviors have become the norm among children.

Conclusions: overweight and obesity are rapidly increasing in LA children because of recent changes in socioeconomic conditions, increase urbanization, growth of the retail food sector, and decrease in public transportation. If no action is taken, the rates of overweight and obese children will continue to rise in the region. Additional research and research capacity is needed to address this growing epidemic, particularly with respect to design, implementation, and impact evaluation of evidence-based obesity prevention interventions.

Keywords: Childhood obesity, nutrition transition, Latin-America, nutrition and physical activity status children.

PREVENTION OF CHILDHOOD OBESITY AND FOOD POLICIES IN LATIN AMERICA: FROM RESEARCH TO PRACTICE

Perez-Escamilla, Rafael.

PhD. Professor. Yale School of Public Health. New Haven CT. USA.

Evidence-based policies are needed to enable environments to prevent childhood obesity through lifestyle modification including diet and physical activity. The objective of this study was to document the process of translating research into obesity prevention policies in Latin America. Policies examined were selected based on their progress with implementation, awareness, and potential impact in the region. As a first step the following four case studies were developed excise taxes on sugar sweetened beverages (SSBs) and ultra processed foods (Mexico), front-of-package food label (FOP) legislation (Chile and Ecuador), industrial trans fatty acids (TFAs) removal from processed foods (Argentina) - even though not an anti-obesity policy per se, it represents a case study on product reformulation with important lessons to offer to the obesity prevention arena, and Ciclovías recreativas or "open streets" (Latin America). Each case was developed by a team formed by at least two individuals who collectively had strong experience involvement with the specific policy or program. The second step involved coding the case studies to identify implementation as well as sustainability theme sand sub-themes. The conceptual framework used was the complex adaptive systems (CAS) developed by the health care system sector and a consensus iterative process was followed to agree on the final coding and interpretation scheme. Findings showed that a series of negative and corresponding positive feedback loops led to the emergence, implementation, and sustainability of for effective anti-obesity policies. The following enabling factors were identified as being common across case study for successful policy implementation: strong evidence supporting policy; evidence-based advocacy driven by civil society; political will; legislation and strategic coordination across key sectors including government, private sector, and civil society. Scientific evidence and adequate program monitoring and evaluation played a key role in reaching the tuning points triggering the successful implementation of the policies examined. Prospective CAS policy research is needed to better understand how the complex web of negative and positive feedback loops detected in this analysis develop and interact across key sectors and stakeholders. This research is crucial to enable the successful emergence, implementation an sustainability of effective anti-obesity prevention policies in Latin America and beyond.

RESEARCH CAPACITY FOR CHILDHOOD OBESITY PREVENTION IN LATIN AMERICA

Pratt, Michael.

Professor and Director. Institute for Public Health.University of California San Diego.

As Latin America passed through the epidemiologic and lifestyle transitions in recent decades, obesity prevalence among children and adolescents increased markedly. However, in many countries the evolution of obesity is poorly documented and understood, in part, because of a lack of research support and training. Public health effort to build research capacity in the region over the past decades have focused largely on child survival and communicable disease prevention and the capacity for research and translation of that research related to chronic diseases, obesity, and physical activity promotion seems to be much less developed. In this presentation, we report on current research capacity in Latin America related to childhood obesity, nutrition, and physical activity. In addition, we identify key gaps and suggest priorities to further develop research capacity and apply it to public health policies and programs that can address obesity prevention in the region. We conducted a search of peer-reviewed articles on childhood obesity in Latin America with at least one Latin American author from 2010 to 2015. We coded 484 published articles for author affiliation, study subjects nationality, research topic, and study design and extracted a series of networks for each research topic, study design, and collaborating country. Obesity was the most frequently studied topic. Nutrition and obesity were somewhat better developed compared to physical activity and sedentary behavior. There were numerous observational and cross-sectional studies, indicating either a lack of capacity required for more complex research or that the extent of the problem and associated factors remain relatively unexplored. The low number of intervention studies and the near absence of policy articles suggest a void in research capacity in these areas and/or limited funding to support these types of studies. Given the growing concern for the increasing prevalence of childhood obesity in Latin America and the need to document the current state of the problem and design successful prevention and intervention efforts, there is a clear demand for increasing research capacity and extending studies from the merely observational to intervention and policy analyses. While adequate research funding and generating well-trained investigators are fundamental conditions for capacity building, our data show that there is still limited interaction among existing groups with-

in and across countries. Efforts to foster data sharing and scholar exchange can be started immediately and should be a component of any strategic capacity building plan. This interaction is also essential to permit smaller countries, with limited resources, to participate in multi-country studies and develop their own team of qualified scientists.

FRONT OF THE PACKAGE PROFILING EMERGES AS A MAJOR REGULATORY TOOL GLOBALLY: NEW IMPACT RESEARCH

BRIEF OVERVIEW OF FRONT-OF-PACK LABELLING SYSTEMS

[1]Uauy, Ricardo; [2]Popkin, Barry M.

[1]PhD. Professor. INTA. University of Chile. Chile; [2]Phd. Nutrition. Department of Nutrition. University of North Carolina. United States.

Background and objectives: Across Europe, the Americas, Asia and Africa countries are increasingly using Front of the Package (FOP) food labelling systems to identify either healthy or unhealthy food products. This presentation introduces the topic and provides background context for the other presentations.

Methods: A review of front-of-the-package profiling purposes and approaches.

Results: Detailed on-pack nutrition information is necessary, but not suitable for daily shopping decisions by consumers. These front-of-pack labelling systems are organized and implemented at the national level. They are based on different nutrient profiling methods, that all adhere to the basic idea of reducing sodium, added sugar, unhealthy saturated fats, encouraging whole grains,

fruits, vegetables and legumes/pulses. Some like the PAHO system focus on removing the least healthful foods and do not encourage a focus on the healthiest foods. While all FOP systems share the goal of helping consumers in facilitating healthier choices in relation to non-communicable diseases, they differ in many aspects. WHO and many others demand regional and global coherence.

The four FOP labelling systems with strongest international presence are:

1. Voluntary positive logos, to indicate the best in class in each food category. The role of governments is strong in most cases and is complemented with cooperation by the food industry.

2. Mixed positive and negative indications, based on colour coding. The underlying nutrient profiling systems do not differentiate between product categories.

3. Health Star ratings on a scale from 1 to 5, on a voluntary basis

4. Warning labels to indicate products that are high in fat, sugar, salt and energy

The different labelling systems show a clear geographical difference. While positive logos have a strong presence in Asia, Africa and Northern Europe, the color coding is present in several Western European countries. The star system is in use in Australia, New Zealand and Canada, while Latin American countries tend to opt for warning labels. A regional coherence across these lines might be an intermediate goal to achieve. International food companies are not univocal in their preference and implement different systems in practice. When it comes to guidance for product reformulation, the product group specific nutrient profiling systems appear to be most suitable.

Conclusions: Research has now moved beyond consumer knowledge and attitude studies to explore the impact of the systems on food purchasing patterns. Many studies are on-going but preliminary results will be presented in this session.

Keywords: Front-of-the-package labelling. nutrient profiling. geographical difference

THE IMPACT ON FOOD PURCHASES OF THE DUTCH CHOICES AND THE DANISH KEYHOLE FOP SYSTEMS

[1]Smed, Sinne; [2]Jansen, Leon; [3]Edenbrandt, Anna.

[1]PhD. Associate Professor. Department of Food and Resource Economics. University of Copenhagen. Denmark; [2]PhD. Schuttelaar & Partners. Denmark; [3]PhD Student. Department of Food and Resource Economics. University of Copenhagen. Denmark.

Background/Objective: The costs associated with diet-related health problems are increasing. Information provision in terms of mandatory nutrition facts sheets placed at (the back of) pre-packaged food is one of the strategies that public authorities use to counteract this development. However the level of understanding and use of the information has been proved to be inadequate as consumers have limited information processing capability, and it requires time, effort and knowledge to understand such detailed information. The use of FOP nutrition symbols aims to make the information provided easier for consumers to access, however the overall effect of FOP nutrition symbols is still questioned. In a range of studies we aim at accessing how these symbols are valued by consumers, and whether they contribute to healthier food choices at the point of purchase, taking into account both individual differences in needs and wants, and country-specific differences.

Subjects/methods: Contrary to most previous research, these studies are based on real market data in the form of household scanner data from the Netherlands and Denmark. The data spans the period from one year before the introduction of the Dutch Choices and the Danish keyhole respectively to three years after. The data includes a range of different products, enabling comparison across product categories as well as across countries. Because of the unique characteristics of these data (large scale, brand level, longitudinal and with socio demographic characteristics of panel members), the sophisticated econometric models used allow us to control for a range of for confounding factors affecting the valuation and use of nutrition symbols.

Results: We find that consumers value products with the symbol higher than products without, hence the provision of the nutrition symbol constitutes additional value to the consumers for the majority of the products we have analyzed. The consumer's valuation of the Choices symbol is larger three months after the product obtained the symbol than immediately after which indicates that there may be a delay before the consumers notice the label, recognize it and potentially take it into account when making decisions on which product to purchase. Furthermore we find that the FOP labels increase purchases for most of products analyzed, hence displaying the label on the package lead to an increased market-share for the products doing so. There seem not to be any complementing behavior as overall healthiness of the households' food purchases, covering all food categories, is for most product categories positively correlated with the share of Keyhole products.

Conclusion: Credible nutrition symbols have value for the consumer and increase market shares for products that display the label. We therefor conclude that nutrition symbols are relevant tools to combat diet-related diseases by guiding consumers towards healthier diets.

IMPACT OF THE NEW ZEALAND HEALTH STAR RATING SYSTEM: RCT RESULTS AND EVALUATION OF ROLL-OUT

[1]Ni Mhurchu, Cliona; [2]Eyles, Helen; [3]Volkova, Ekaterina; [4]Jiang, Yannan; [5]Neal, Bruce; [6]Blakely, Tony; [7]Swinburn, Boyd; [8]Rayner, Michael; [9]Choi, Yeun-Hyang.

[1]PhD. National Institute for Health Innovation. University of Auckland. New Zealand; [2]PhD. Senior Lecturer. University of Auckland. New Zealand; [3]PhD. Research Fellow. University of Auckland. New Zealand; [4]PhD. Biostatistician. University of Auckland. New Zealand; [5]PhD. Professor. The George Institute for Global Health. Australia; [6]PhD. Professor. University of Otago. New Zealand; [7]PhD. Professor. University of Auckland. New Zealand; [8]PhD. Professor. University of Oxford. UK; [9]MSc. Data Analyst. University of Auckland. New Zealand.

Background: Interpretive, front-of-pack (FOP) nutrition labels may encourage healthier food choices by consumers and healthier reformulation of foods by industry.

Objective: We aimed to evaluate the effects of the Health Star Rating (HSR), a voluntary interpretive FOP labelling system on (1) consumer food choices, and (2) industry food reformulation.

Design: Study 1. In a parallel-group randomized controlled trial, we enrolled household shoppers across New Zealand who owned smartphones and were aged >18 y. Participants were randomly assigned to receive either Traffic Light Labels (TLL), HSR, or a control [Nutrition Information Panel (NIP)]. Smartphone technology allowed participants to scan barcodes of packaged foods and receive allocated labels on their smartphone screens. The primary outcome was the mean healthiness of all packaged food purchases, measured using the Food Standards Australia New Zealand Nutrient Profiling Scoring Criterion (NPSC). Study 2. Annual surveys of packaged food labelling and composition were undertaken in supermarkets before and after adoption of HSR in New Zealand i.e. 2014 to 2016. Product data were linked with nationally representative household food purchasing data to obtain estimates of effects weighted by annual purchasing volumes. Outcomes assessed were uptake HSR by food group; composition of products displaying HSR compared with unlabelled products; and composition of products displaying HSR labels in 2016 compared with their composition prior to the introduction of HSR.

Results: Study 1. 1357 eligible shoppers were randomly assigned to TLL (n = 459), HSR (n = 443), or NIP (n = 455) labels. There was no significant difference in the mean transformed NPSC scores (healthiness) for the TLL group compared with the NIP group (P = 0.60), or for HSR group compared with NIP (P = 0.12). However, in a per-protocol analysis of participants who used the labelling intervention more often than average (n = 423, 31%), those assigned to TLL and HSR had significantly better NPSC scores than those assigned to NIP (P = 0.04 and 0.01 respectively). Study 2. Two years after adoption of the voluntary system, 5.3% of packaged foods surveyed displayed HSR labels (7.2% weighted by annual purchase volumes). Food groups with highest rates of uptake were cereals, convenience foods, packaged fruit and vegetables, sauces and spreads, and 'other' products (predominantly breakfast beverages). Products displaying HSR labels had significantly lower mean saturated fat, total sugar and sodium contents, and higher fibre contents than unlabelled products (all p-values <0.001). Small but statistically significant changes were observed between 2014 and 2016 in the mean energy (-29 KJ/100g, p=0.002), sodium (-49 mg/100g, p=0.03) and fibre (+0.3 g/100g, p=0.02) contents of products displaying an HSR label in 2016. Reformulation was greater for products carrying an HSR label than for unlabelled products.

Conclusions: In a randomised controlled trial, interpretive nutrition labels had no significant effect on consumer food purchases, though regular use of interpretive FOP labels may result in healthier food purchases. Roll-out of the voluntary HSR labelling system is driving healthier reformulation of some products. Greater uptake of the HSR system across the full food supply should improve population diets.

THE IMPACT OF THE UK TRAFFIC-LIGHT LABELLING SYSTEM ON DIETS

Rayner, Michael; [2]Harrington, Richie; [3]Scarborough, Peter.

[1]DPhil. Professor. Nuffield Department of Population Health. University of Oxford. UK; [2]PhD. Researcher. Nuffield Department of Population Health. University of Oxford. UK; [3]DPhil. Associate Professor. Nuffield Department of Population Health, University of Oxford, UK.

Background: Front-of-pack nutrition labelling involving traffic-light color coding to indicate levels of fat, saturated fat, sugar and salt was first recommended by the UK Government in 2006 and is now found on an estimated 60% of packaged foods and non-alcoholic beverages sold in the UK. A considerable amount of research was carried out to inform the choice of nutrient criteria and format for the system but considerably less research has been carried out into the impact of traffic-light labelling on consumer and producer behavior. Such research that has been carried out is generally of low-methodological quality (e.g. very little is experimental and/or ecologically valid). It is difficult to draw conclusions about the impact of traffic-light labelling from such studies.

This presentation reports the preliminary, and as yet mostly unpublished, findings of the Front of pack food Labelling: Impact on Consumer Choice (FLICC) project. The main FLICC project study was of a web-based intervention designed to increase consumer use of traffic-light labelling to encourage healthier purchase decisions.

Methods: The main FLICC project study was a pilot two-arm randomized controlled trial of an intervention that incorporated a number of behavior change techniques and used super-market loyalty cared data to recruit participants (n=496), provide tailored

feedback as part of the intervention and to measure outcomes. The primary outcome measure was the healthiness of ready meals and pizzas that had traffic-light labelling purchased before (T1) and after (T2) the intervention

Results: There was no difference in the main outcome measure between intervention group and control group during period T1 (p=0.315) and T2 (p=0.594).

Conclusions: This study is the only example, known to us, of a trial of a behavior change intervention that utilized supermarket loyalty care data for recruitment, the intervention itself and outcome measurement. The trial did not provide evidence to suggest the specific intervention tested would be effective at changing purchasing behavior, but the process of conducting the trail has provided much information about using supermarket loyalty card data for future trials and delivery of public health interventions. It adds to the literature on the impact of interventions involving traffic-light labelling. It demonstrates some of the difficulties of finding effects on health-related outcomes of interventions involving front-of-pack labelling.

Keywords: Front-of-pack nutrition labelling

THE CHILEAN EXPERIENCE OF FOP DEVELOPMENT, IMPLEMENTATION AND IMPACT

[1]*Reyes, Marcela;* [2]*Corvalan, Camila;* [3]*Correa, Teresa;* [4]*Dillman, Francesca;* [4]*Mediano, Fernanda;* [5]*Popkin, Barry M.;* [4]*Smith-Taillie, Lindsey.*

[1]PhD. Assistant Professor Institute of Nutrition and Food Technology, University of Chile; Santiago, Chile.; [2]INTA, University of Chile, Chile.; [3]University Diego Portales, Chile; [4]University of North Carolina, USA.; [5]Phd. Nutrition. Department of Nutrition. University of North Carolina. United States.

Applies to foods and beverages with high density of energy, sugars, saturated fats, and sodium. Such food must include a front-of-package (FOP) warning label (if packaged), cannot be marketed to children under 14y, and cannot be sold/offered to children at preschools and schools. This work discusses the process of development, implementation and initial impact of the Chilean FOP.

Methods: The FOP development was based on different steps: i) literature review on food labeling and warning labels, ii) qualitative study to assess the consumers and experts' opinions regarding food warning labels, iii) a 2-phase quantitative study in which low-middle income women (n=700) and adolescents (n=350) preselect 2 FOP alternatives out of 15 options (first phase) and then selected a final FOP (second phase) in terms of visibility, comprehension, and intention-to-buy. The initial impact evaluation is part of a larger study evaluating the Chilean regulation (2016-2020) and includes a survey on food knowledge and perceptions collected in 700+ adolescents and 900+ preschoolers' mothers from low-middle income background.

Results: The literature review revealed scarce information on the use of warning labels on foods, but helped defining the wording, design (use of symbols, position, size, colors) and the need of a neutral (without conflict of interest) and trusted source (i.e. Ministry of Health). The qualitative studies on consumers provided general information on the understanding on topics associated with foods/nutrients, on the wording preferred and most understood by Chileans, preferred colors (black & white, and red & yellow), and preferred symbols (triangles and stop signs), among other aspects; experts' opinions helped narrowing the designs options developed to that point. In the first phase of the quantitative study, 2 designs were selected by the interviewee: (i) a hand stating 'excess of sugars, it can cause diabetes', and (ii) a stop sign only stating 'excess of sugars'; both designs in black & white. In the second phase the stop sign had significant best performance in terms of visibility, comprehension, and intention-to-buy in women, and visibility among adolescents (with no differences in the other 2 items). Finally, the government decided to use a black & white stop sign with the phrase "High in…". Baseline data showed that prior to the law implementation 83% of adolescents and 94% of preschoolers' mothers belonging to the study understood correctly the FOP warning label and over 90% of both groups approved that the Ministry of Health helps identifying foods that are less healthy.

Conclusion: The Chilean FOP warning label was defined based on literature review and visibility, comprehension and behavior of a sample of Chilean mothers and adolescents. Baseline data indicates that the FOP implemented is well understood and received by the consumers. Post-implementation data will allow evaluating the impact of the FOP warning label and other aspects of the Chilean Law of Labeling and Marketing.

SEVEN-COUNTRY STUDY ON ULTRA-PROCESSED FOOD INTAKE AND OVERALL DIETARY NUTRIENT PROFILE: FINDINGS AND GLOBAL POLICY IMPLICATIONS

ULTRA-PROCESSED FOODS AND NUTRIENT PROFILE OF DIETS CONSUMED IN CHILE AND COLOMBIA

[1]Uauy, Ricardo; [2]Cediel, Gustavo; [3]Parra, Diana C.; [2]Khandpur, Neha; [4]da Costa Louzada, Maria Laura; [5]Moubarac, Jean-Claude; [6]Bertazzi Levy, Renata; [7]Reyes, Marcela; [7]Corvalan, Camila; [8]Monteiro, Carlos.

Brazil; [3]Asssitant Professor. Program in Physical Therapy. Washington University in St. Louis, US; [4]Associate Professor. UNIFESP. Campus Baixada Santista. Brazil; [5]Associate Professor. Department of Nutrition. University of Montreal. Canada; [6]Researcher, Department of Preventive Medicine. University of São Paulo. Brazil; [7]Assistant Professor. Institute of Nutrition and Food Technology. University of Chile. Chile; [8]Professor. Department of Nutrition. University of São Paulo. Brazil.

Background and Objective: A rapid simultaneous increase in sales of ultra-processed foods and prevalence of obesity and other diet-related non-communicable chronic diseases (NCDs) has been observed in Latin America over the past decades. Our study describes the consumption of ultra-processed foods and its association with the nutrient profile of diets in Chile and Colombia.

Methods: Data from probabilistic samples studied by cross-sectional dietary studies carried out in Chile (Chi) in 2010 (n=4920 individuals >2y) and Colombia (Col) in 2005 (n= 38643 individuals 2-64 y) were analyzed. Food consumption data were obtained by 24-hour diet recalls and food items were classified into the four NOVA food groups (unprocessed or minimal processed foods/ processed culinary ingredients/ processed foods/ and ultra-processed foods). In each country, the mean dietary nutrient content of total fat, saturated fat, trans fat and free sugars (as % of total energy intake), and the mean diet energy density (kcal/g) and fiber density (g/1000 kcal) were calculated across quintiles of the dietary share of ultra-processed foods (as % of total energy intake). Gaussian regression analyses and regression coefficients (β) adjusted for potential confounding factors (sex, age, location (urban/rural), region, socioeconomic status and years of education) were used to estimate the association between quintiles of the dietary share of ultra-processed foods and dietary nutrient content.

Results: In Chile and Colombia, 28.6% and 15.9% of total daily energy intake came from ultra-processed foods, respectively. In both countries, after adjustment for sociodemographic variables, a positive and statistically significant linear trend was found between quintiles of the dietary share of ultra-processed foods and the dietary content in total fat [β (95%CI): Chi: 1.2 (0.9, 1.5); Col: 0.7 (0.5, 0.9)], saturated fat [β: Chi: 0.5 (0.4, 0.6); Col: 0.5 (0.4, 0.6)], trans fat [β: Chi: 0.02 (0.005, 0.03)], free sugars [β: Chi: 2.8 (2.5, 3.1); Col: 1.1 (0.8, 1.3)], and the diet energy density [β: Chi: 0.09 (0.07, 0.1); Col: 0.07 (0.06, 0.07]. In contrast, a negative and statistically significant linear trend was observed for protein content [β: Chi: -1.1 (-1.2, -0.9); Col: -0.2 (-0.3, -0.1)] and fiber density [β: Chi: -0.9 (-1.0, -0.7); Col: -0.9 (-1.0, -0.8)].

Conclusions: Almost 30% of total calories consumed by the Chilean population were derived from ultra-processed foods while those foods represented less than 20% of energy intake in Colombia. However, in both countries, the consumption of ultra-processed foods was strongly associated with dietary nutrient profiles predictive of increased incidence of obesity and other diet-related NCDs. Actions aimed at reducing the intake of ultra-processed foods and increasing the consumption of unprocessed or minimally processed foods and freshly prepared home-cooked dishes made with these foods plus processed culinary ingredients and appropriately processed foods emerge as potentially effective to achieve a healthy diet.

Keywords: Chile, Colombia, ultra-processed foods, nutrients.

ULTRA-PROCESSED FOODS AND NUTRIENT PROFILE OF DIETS IN UK AND AUSTRALIA

[1]Scrinis, Gyorgy Scrinis; [2]Machado, Priscila Pereira; [3]Rauber, Fernanda; [4]Levy, Renata; [5]Steele, Euridice Martínez; [6]Millett, Christopher; [7]Monteiro, Carlos.

[1]School of Agriculture and Food. University of Melbourne; [2]PhD student. Department of Nutrition. University of São Paulo. Brazil; [3]Post-doctoral fellow. Center for Epidemiological Studies in Health and Nutrition. University of São Paulo. Brazil; [4]Researcher. Department of Preventive Medicine. University of São Paulo. Brazil; [5]Reseracher. Department of Nutrition. University of São Paulo. Brazil; [6]Public Health Policy Evaluation Unit. School of Public Health. Imperial College London. United Kingdom; [7]Professor. Department of Nutrition. University of São Paulo. Brazil.

Background and Objective: A rapid simultaneous worldwide increase in sales of ultra-processed foods and obesity prevalence has been observed in the last decade. This study describes the consumption of ultra-processed foods and its association with the nutrient profile of diets in UK and Australia.

Methods: Data from national probabilistic samples studied by cross-sectional dietary studies carried out in UK in 2008-2012

(n=4,125 individuals ≥1.5y) and Australia (Aus) in 2011-2012 (n= 12,153 individuals ≥2 y) were analyzed. Food consumption data were obtained through 24-hour recall/unweighted food diary. Food items were classified into the four NOVA food groups. In each country, the mean dietary nutrient content in total fat, saturated fat, trans fat and free sugars (% of total energy intake), and the mean fiber density (g/1000 kcal), sodium density (mg/1000kcal) and potassium density (mg/1000kcal) were calculated across quintiles of the dietary share of ultra-processed foods (% of total energy intake). Gaussian regression analyses and regression coefficients (β) adjusted for potential confounding factors (sex, age, location, region, and socioeconomic status) were used to estimate the association between quintiles of the dietary share of ultra-processed foods and dietary nutrient content.

Results: In UK and Australia, 56.8% and 36.6% of total daily energy intake came from ultra-processed foods, respectively. In both countries, after adjustment for sociodemographic variables, a positive and statistically significant linear trend was found between quintiles of the dietary share of ultra-processed foods and the dietary content in total fat [β (95%CI): UK: 0.5 (0.3, 0.7); Aus: 0.6 (0.4, 0.7)], free sugars [UK: 1.0 (0.7, 1.2); Aus: 2.6 (2.5, 2.8)], and the sodium density [UK: 55 (46, 65); Aus: 70 (50, 71)]. Positive and statistically significant linear trend was observed only in Australia for saturated fat [β: 0.7 (0.6, 0.8)] and trans fat [0.03 (0.02, 0.35)]. In both countries, negative and statistically significant linear trend was observed for the dietary content in protein [β: UK: -0.8 (-0,9, -0.7); Aus: -1.2 (-1.3, -1.1)], fiber density [β: UK: -0.3 (-0.4, -0.2); Aus: -0.8 (-0.9, -0.7)], and potassium density [β: UK: -93 (-104, -83); Aus: -102 (-114, -88)].

Conclusions: Almost 60% of total calories consumed by the UK population came from ultra-processed foods while in Australia they represented about 40%. However, in both countries, the consumption of ultra-processed foods was strongly associated with dietary nutrient profiles predictive of increased incidence of epidemiologically relevant non-communicable diseases. Actions aimed at lowering the dietary share of ultra-processed foods and raising consumption of unprocessed or minimally processed foods and hand-made dishes made with these foods plus processed culinary ingredients and processed foods emerge as useful tools for achieving a healthy diet.

[1]Professor. Department of Nutrition. University of São Paulo. Brazil; [2]Associate Professor. Department of Nutrition. University of Montreal. Canada; [3]Professor. Institute of Nutrition and Food Technology. University of Chile. Chile; [4]Assistant professor. Program in Physical Therapy. Washington University in St. Louis. US; [5]Senior Lecturer. Faculty of Veterinary and Agricultural Sciences. University of Melbourne; [6]Professor, Imperial College. London. UK; [7]Associate Professor. UNIFESP. Campus Baixada Santista. Brazil; [8]Post-doctoral fellow. Center for Epidemiological Studies in Health and Nutrition. University of São Paulo. Brazil; [9]PhD student. Department of Nutrition. University of Sao Paulo. Brazil.

Background and Objective: Ultra-processed food and drink products, such as sugared beverages, sweet or savory packaged snacks, confectionery, reconstituted meat products, and pre-prepared frozen or shelf-stable dishes, are industrial formulations of refined sources of dietary energy and nutrients, additives and little if any intact food, using a series of processes (hence 'ultra-processed'). A rapid simultaneous increase in the sales of these products and in obesity prevalence has been observed in lower-middle, upper-middle, and high income countries. This study describes the consumption of ultra-processed food and drink products and its association with the overall nutrient profile of diets in Australia, Brazil, Canada, Chile, Colombia, UK and US.

Methods: Data from probabilistic samples studied by cross-sectional dietary studies carried out in Australia in 2011-2012 (n= 12,153 ≥2 y) , Brazil in 2008/9 (n= 34003; ≥10 y), Canada in 2004 (n= 33694; ≥2 y), Chile in 2010 (n=38643; 2-64 y), Colombia in 2005 (n= 38643; 2-64 y), UK in 2008-2012 (n= 4,125; ≥1.5 y), and US in 2009-2010 (n= 9317; ≥1 y) were analyzed. Food consumption data were obtained through 24-hour recalls/food diaries and food items were classified into the four NOVA food groups (unprocessed or minimal processed foods, processed culinary ingredients, processed foods and ultra-processed foods). In each country, the mean dietary nutrient content in total fat, saturated fat, trans fat and free sugars (% of total energy intake), and the mean diet energy density (kcal/g) and fiber density (g/1000 kcal) were calculated across quintiles of the dietary share of ultra-processed foods (% of total energy intake). Gaussian regression analyses and standardized regression coefficients (β) adjusted for sociodemographic variables were used to estimate the association between quintiles of the dietary share of ultra-processed foods and dietary nutrient content.

Results: The dietary share of ultra-processed foods ranged from 15.9% of total daily energy intake in Colombia to 57.9 % in the US. In Brazil, after adjustment for sociodemographic variables, a positive and statistically significant linear trend was found between quintiles of the dietary share of ultra-processed foods and the dietary content in total fat (β: 0.30), saturated fat (β: 0.31),

trans fat (β: 0.29), free sugars (β: 0.28), and the diet energy density (β: 0.39). Negative and statistically significant linear trend was observed for the dietary content in protein (β: -0.32) and the diet fiber density (β: -0.28). Similar findings were observed in each of the other six countries.

Conclusions: In the seven countries, the consumption of ultra-processed foods was strongly associated with dietary nutrient profiles predictive of increased incidence of obesity and other epidemiologically relevant non-communicable diseases. In these countries, actions aimed at reducing the intake of ultra-processed foods and raising the consumption of unprocessed or minimally processed foods and freshly-prepared dishes made with these foods plus processed culinary ingredients and processed foods emerge as useful tools for achieving a healthy diet.

WHO/CDC SYMPOSIUM ON NEW TOOLS AND RESOURCES FOR MONITORING AND EVALUATING MICRONUTRIENT PUBLIC HEALTH PROGRAMS

THE MICRONUTRIENT SURVEY ELECTRONIC MANUAL AND THE MICRONUTRIENT SURVEY TOOLKIT – NEW TOOLS TO IMPROVE THE DESIGN AND QUALITY OF MICRONUTRIENT SURVEYS

[1]Tripp, Katherine; [1]Whitehead, Jr., Ralph D.; [1]Mapango, Carine; [1]Anne, Williams; [1]Ruth, Laird; [2]Knowles, Jacky; [3]De Regil Velez, Luz Maria; [4]Kupka, Roland; [5]Roger, Lisa; [1]Jefferds, Maria.

[1]Centers for Disease Control and Prevention. USA.; [2]Consultant.; [3]Nutrition International. Canada.; [4]UNICEF; [5]WHO.

High quality, representative data are needed to manage nutrition programs effectively and to make evidence based nutrition policies. Population-based cross-sectional surveys of micronutrient status and coverage of interventions within populations are important for designing and managing nutrition programs. Updated tools are available to support survey planning, implementation, analysis and dissemination.

The Micronutrient Survey Electronic Manual and Micronutrient Survey Toolkit are integrated tools that provide users with a set of resources to design and carry out micronutrient surveys. They are available for download at http://surveytoolkit.micronutrient.org/. The Toolkit includes 15 modules following the main phases of a survey from planning through dissemination. Each module contains a chapter of the e-Manual providing step-by-step instructions and key considerations, as well as useful tools, country examples and resources. The Toolkit provides a compilation of tools such as sample size calculators, lists of equipment and supplies, budget templates, specimen collection procedures, training materials, form templates, and report outlines.

The e-Manual and Toolkit provide practical information on how to plan and implement a cross-sectional micronutrient status and coverage survey. The updated tools, resources and e-manual chapters are revised and expanded to include new sections on topics such as the assessment of zinc and folate status and considerations for electronic data collection.

The e-Manual and Toolkit are based on practical field experience in a range of settings, expert group discussions and documents from a variety of organizations. Together, they can help survey managers improve the quality, validity and efficiency of micronutrient surveys.

NEW RESOURCES FOR THE MONITORING AND EVALUATION OF PUBLIC HEALTH POGRAMMES TO IMPROVE MICRONUTRIENT STATUS

Rogers, Lisa Marie.

PhD. Technical Officer. Department of Nutrition for Health and Development. World Health Organization. Geneva, Switzerland.

The World Health Organization Vitamin and Mineral Nutrition Information System (VMNIS), previously known as the Micronutrient Deficiency Information System, is a collection of tools aimed at assisting WHO Member States and their partners in the assessment of micronutrient status and in the monitoring and evaluation of micronutrient intervention programmes in public health. This system has been in the process of undergoing expansion in the last several years. The main components of VMNIS include: 1) Micronutrients database; 2) summary documents of key clinical and biochemical indicators for assessing micronutrient status; 3) Global laboratory directory for the assessment of micronutrient status; and 4) eCatalogue of indicators for micronutrient programmes. The WHO Micronutrients database tracks the micronutrient status of populations at the national, regional or first administrative level . This database has expanded from collecting data on five key indicators of micronutrient status to over 40. Periodically, some of this data is used to develop global estimates of the prevalence of deficiency for key micronutrients. Summaries of WHO recommendations on the use of eight indicators of micronutrient status and one indicator of inflammation are currently available. These documents summarize the currently recognized cut-offs for defining deficiencies and severity of deficiencies at the population level, and the chronology of their establishment. The WHO Global laboratory directory for the assessment of micronutrient status has recently been developed to collect information on laboratories that are capable of assessing biomarkers of micronutrient status for health and nutrition surveys. The ultimate goal of

this directory is to help Member States and their partners identify laboratories measuring biomarkers of vitamin and mineral status at the population level so that they may be able to further evaluate the laboratory for possible participation in their nutrition surveys. Finally, the eCatalogue of indicators for micronutrient programmes contains a non-comprehensive register of standard process and impact indicators for tracking the performance of public health programmes implementing micronutrient interventions.

INTEGRATING PREVENTIVE STRATEGIES INTO COMMUNITY-BASED MANAGEMENT OF ACUTE MALNUTRITION: WHAT WORKS?

THE IMPACT OF ADDING A HOUSEHOLD WASH PACKAGE TO CMAM PROGRAM: A CLUSTER–RANDOMIZED CONTROLLED TRIAL IN CHAD

[1]Altmann, Mathias; [2]Altare, Chiara; [3]van der Spek, Nanette; [4]Barbiche, Jean-Christophe; [5]Dodos, Jovana; [6]Bechir, Mahamat; [7]Ait Aissa, Myriam; [8]Kolsteren, Patrick.

[1]PharmDr, MPH, Operational Research Advisor, Action Contre la Faim; [2]PhD. Impact assessment advisor. Action Contre la Faim. France; [3]MPH. Nutritionist. The Institute of Tropical Medicine in Antwerp; [4]Msc. WASH Technical Advisor. Action Contre la Faim. France; [5]Msc. WASH & Nutrition consultant; [6]PhD. Nutritionist. ASRADD; [7]MSc. Reseach Senior Advisor. ACtion Contre la Faim. France; [8]MD. scientific staff / director MSc. NuRuDe programme. Department of Food Safety and Food Quality. Ghent University.

Water, Sanitation and Hygiene (WASH) interventions have been reported to have a small but measurable benefit on stunting, but not on wasting. In order to increase synergies in the fight against acute malnutrition, WASH and nutrition actors agreed in 2012 upon a "WASH in Nut" strategy for the Sahel region that includes the provision of a household WASH package (provision of chlorine, soap, water storage container and sensitisation on its use), designed to protect children against new episodes of diarrhoea and aiming at improving nutritional outcomes. The aim of our study was to assess the effectiveness of this household WASH package on the performance of an Outpatient Therapeutic feeding Programme (OTP) for severe acute malnutrition in Mao and Mondo health districts in Chad.

We conducted a cluster randomized controlled trial embedded in a routine OTP. The study population included 20 health centres (clusters). Both arms received the routine nutritional programme. The intervention arm received the additional household WASH package, delivered to the child's caretaker upon admission in the OTP. Primary outcomes were recovery and relapse rates.

Secondary outcome included time-to-recovery, daily weight gain and morbidity longitudinal prevalence. The trial is registered with ClinicalTrials.gov, number NCT02486523.

The recruitment phase lasted from April to December 2015 and the follow-up phase ended in May 2016. Among the 1603 recruited children, 845 were in the intervention group and 758 in the control group. The WASH package was well accepted and used. The intervention decreased infectious diseases longitudinal prevalence (-1·6%; 95% CI [-3·2; -0·05]; p=0·043), decreased the time-to-recovery (-4·4 days; 95% CI [-8·6; -0·2]; p=0·038), improved the recovery rate (10·5%; 95% CI [6·7; 19·8]; p=0.034) and decreased the non-responder rate (-9·7%; 95% CI [-16·9; -2·4]; p=0·009). No statistical difference was noticed between the groups in term of relapse rates, both at 2 and 6 months after discharge.

In the Sahel context, the provision of a household WASH package increased the recovery rate among children treated for non-complicated SAM and decreased their time-to-recovery. This study shows that the integrated wash-in-nut approach has the potential to increase programme performance. We recommend this strategy for the wider Sahel context.

Keywords: Severe Acute Malnutrition, Water and Hygiene

NUTRITIONAL PROFILING – SCIENTIFIC BASIS, USES AND IMPACT ON PUBLIC HEALTH

RECENT DEVELOPMENTS IN NUTRIENT PROFILING

Rayner, Michael.

DPhil. Director. Centre on Population Approaches for Non-Communicable Disease Prevention. Nuffield Department of Population Health. University of Oxford. United Kingdom.

In this presentation I first provide definitions of nutrient profiling and of a nutrient profile model. I set out the purposes of nutrient profiling: both general and specific. I give two examples of nutrient profile models that have been developed for the regulation of marketing of foods to children: by the Food Standards Agency in the United Kingdom and the World Health Organisation for its European Region – the UK FSA/Ofcom and the WHO-Euro models. I compare the way the models are constructed and function, how they have been developed and adapted for different regulatory uses. I examine the extent to which the models have been tested and validated. Finally I draw some conclusions about the future use of nutrient profiling. I argue that its full potential has yet to be realised and give some reasons why. I pose some urgent research questions with respect to nutrient profiling.

Keywords: Nutrient profiling, regulation, food marketing, food labelling

Conflict of Interest disclosure: The author was closely involved in the development of the UK FSA/Ofcom and WHO-Euro nutrient profile models and his research centre received funding from the UK Food Standards Agency to carry out analyses in connection with the development of the UK FSA/Ofcom model.

THE DEVELOPMENT OF THE NUTRIENT RICH FOODS (NRF) FAMILY OF NUTRIENT PROFILE MODELS AND THEIR APPLICATIONS

Drewnowski, Adam.

Center for Public Health Nutrition, University of Washington, USA.

The goal of nutrient profiling (NP) models is to distinguish foods that are energy-dense from those that are nutrient-rich. Typically, NP methods calculate the amount of nutrients per reference amount of food: 100 kcal, 100g, or serving size. Some NP models merely calculate energy density of foods: kcal/100g.

Originally intended as the scientific basis for nutrition and health claims, NP has been used for a variety of food taxation purposes. For example, Mexico has imposed a tax on nonessential snacks with energy density >275 kcal/100g. NP models have also been used to create front-of-pack (FOP) logos to convey nutrition information to the consumer at point of sale. Here, Chile has developed food warning labels based on excessive energy, sugar, or fat content. The food industry has also used NP tools to assess and (re)formulate product portfolios.

NP models can be based on nutrients to limit only (generally fat, sugar and salt) or they can also include some nutrients to encourage, usually protein, fiber, and selected vitamins and minerals. One methodological challenge is to ensure that NP models do not merely track energy density and do not favor the more expensive foods. The Nutrient Rich Foods (NRF 9.3) index used 9 positive or qualifying nutrients (protein, fiber, vitamins A, C, and E, calcium, iron, potassium and magnesium) and 3 nutrients to limit: saturated fat, added sugar, and sodium. The NRF algorithm was the sum of percentage daily values (DVs) for the 9 qualifying nutrients, minus the sum of %DVs for 3 disqualifying nutrients, each calculated per 100 kcal and capped at 100% DV. The NRF score was validated in regression models against the Healthy Eating Index, an independent measure of a healthy diet.

The French SAIN/LIM nutrient density score, was the mean of %DVs for five qualifying nutrients (protein, fiber, vitamin C, calcium and iron) minus the mean of percent daily values for the three disqualifying nutrients (saturated fat, added sugar, sodium). Unlike the continuous NRF score, SAIN/LIM has assigned foods into one of four categories [3]. A continuous version – Le SENS score was developed only recently. The SAIN/LIM score was validated using sophisticated linear programming. One advance in NP modeling has been at apply NP methods to complex meals, menus, or the total diet.

NP models can be adapted to assess nutrient cost, as obtained from different food groups. On a per calorie basis, vegetables, fruit and meat poultry and fish cost more, whereas grains and fats cost less. NP models can show that some food groups are very low cost sources of a particular nutrient: Milk and milk products were the lowest cost calcium source, whereas potatoes and beans delivered most fiber per penny. Analogous calculations have addressed the environmental cost of different nutrients as measured through lifecycle analysis and greenhouse gas emissions (GHGE). Although animal products did have a higher carbon footprint, their environmental cost had to be balanced against their higher nutritional value.

NUTRIENT PROFILING: SCIENTIFIC AIMS VS. ACTUAL IMPACT ON PUBLIC HEALTH

[1]*Gil, Ángel;* [2]*Soto-Méndez, María José.*

[1]PhD. Prof. Department of Biochemistry and Molecular Biology. Institute of Nutrition and Food Technology. Centre of Biomedical Research. University of Granada. CIBERobn. Spain.; [2]Ph.D. Scientific Coordinator. Fundacion Iberoamericana de Nutrición, Granada, Spain.

Populations are constantly modifying their diet due to globalization, the access to food undergoing several technological processes, and the modification of our lifestyles. The Global Strategy on Diet, Physical Activity, and Health, published by WHO in 2004, included as a strategy the action of generating comprehensible, suitable, accurate and standardized information on the content of food products. In order to allow the consumer to make healthier choices, Nutrient Profiling was the response to this action request.

Nutrient Profiling has been described as a scientific method to classify foods and drinks based on their nutritional quality by national authorities of different countries to promote public health and to achieve the nutritional goals proposed for the population. The WHO has proposed, as recently as 2015, the definition of Nutrient Profiling as "the science of classifying or ranking foods according to their nutritional composition for reasons related to preventing disease and promoting health".

Nutrient Profiling Models using the threshold or scoring approaches, and based on food groups or for food in general, have been developed during the last 20 years; sometimes, with no clear conscience of that. The models have been used in regulation for nutritional claims, front-of-package food labeling, policies on subsides or taxation to different food groups, reformulation of processed foods, regulations for school cafeterias, etc. These models have been developed by more than 16 countries and more than 4 regions, with specific aims and according to the local or regional public health situation.

The nutrient profiling models represent useful tools for taking measures and making decisions, such as the regulation of marketing, front-of-package food labeling and policies on subsides or taxation to different food groups based on their role, positive or negative, in public health.

For the particular case of processed food, the main target of nutrient profiling, the continuous review of the nutrient profiling is justified by the emergence of new foods, new formulations and new processing techniques that affect their nutrients composition and bioavailability.

One of the main disadvantages of the Nutrient Profiling Models is the inconsistency found when the same product is analyzed under different models. Heterogeneity of individual responses and disagreement regarding basic foods has been found. The lack of standardized methods to validate Nutrient Profiling models represents another disadvantage.

There is still a long way to go regarding the definition, implementation and evaluation of nutrient profiling. The creation of nutrient profiling should respond to a systematic, transparent and logic methodological process, ideally agreed between the different sectors of each country or region involved (governmental organizations, public bodies, food industry and consumers' organizations).

Keywords: Nutrient Profiling. Public health. Nutrient information. Nutritional claims.

SODIUM REDUCTION AND CONSIDERATIONS WITH MINERAL INTAKES

OVERVIEW OF ACTIVITIES TO REDUCE SODIUM INTAKE IN THE UNITED STATES

Taylor, Christine.

PhD. Retired. Center for Food Safety and Applied Nutrition. Food and Drug Administration. United States.

Reduction in sodium intake has been a public health goal in the US for more than 40 years. Efforts to reduce intake have ranged from consumer education to calls for voluntary reduction on the part of the food industry. These activities have not proven very effective, and the average sodium intake in the US continues to be more than 3,400 mg of sodium per day.

In the past several years government agencies, public health professionals, the food industry, and consumer groups have focused on dialogues, public meetings and research to clarify and focus the key considerations in reducing sodium in the food supply. In June 2016 in response to a 2010 Institute of Medicine report as well as other factors, the US Food and Drug Administration (FDA) issued draft guidance for industry to support a voluntary sodium reduction in foods. The guidance specifies target mean and upper bound concentrations for sodium in commercially processed, packaged and prepared foods. Its goal is a small initial reduction as a first step in a long-term process to gradually lower intake levels consistent with current and future targets as they emerge. The activities are to be carried out concomitant with up-front research, special studies and technological exchanges and workshops. Change is to be introduced slowly and gradually. Approximately 200 comments were submitted concerning the FDA guidance. Topics included technical challenges, definitions for food categories, and strategies for measuring changes in sodium intake as well as sodium levels in the food supply. FDA is currently considering these comments in light of possible future revisions

to the guidance. As a voluntary program, a number of companies have begun implementation of activities consistent with the guidance. Monitoring industry participation and impact will be important.

Some scientists have questioned the goal of reducing sodium intake below 2,300 mg/day, arguing that data for benefit are unclear and expressing concern about possible harm. While these debates will need to be resolved, it is noteworthy that the US government has put in place a systematic evidence review – Effects of Dietary Sodium and Potassium Intake on Chronic Disease Outcomes and Related Risk Factors – to be completed in mid-2017 by the Agency for Healthcare Research and Quality. This report will be available for an anticipated review of Dietary Reference Intakes for sodium and potassium to be conducted by the National Academy of Medicine beginning in late-2017. In any case, sodium research should continue with particular focus on the interaction between sodium and taste preference, technological work-arounds for sodium's role in food, the impact of reduced sodium on food safety, and strategies for monitoring and quantifying sodium intake and presence in the food supply.

PROGRESS ON SODIUM REDUCTION IN CANADA AND IN LATIN AMERICA

[1]*L'Abbé, Mary;* [2]*Arcand, JoAnne;* [3]*Schermel, Alyssa.*

[1]PhD. Earle W McHenry Professor and Chair. Dept of Nutritional Sciences. University of Toronto. Canada; [2]RD. PhD. Assistant Professor. Faculty of Health Sciences. University of Ontario Institute of Technology. Canada; [3]MSc. Department of Nutritional Sciences. University of Toronto. Canada.

Reducing dietary salt is recommended by the 2011 United Nations Summit Declaration on Prevention of Non communicable Diseases and the World Health Organization Global Action plan for Prevention and Control of Noncommunicable Diseases, where one of the 9 global targets is a relative reduction of sodium intake by 30% by 2025. High blood pressure is a contributory factor in at least 40% of all heart disease and strokes which represent approximately 45% of NCDs. In the Americas, hypertension is a major health risk, as between 15-35% of the adult population has elevated blood pressure. This evidence led many governments in the Americas, including Argentina, Brazil, Canada, Chile, and the National Salt Reduction Initiative in the US to set salt reduction targets. These national level targets formed the basis of the Pan American Health Organization (PAHO) regional targets for the Americas for 12 major food categories and several sub-categories.

In Canada, the targets for salt reduction (for 2010-2016) were used to assess interim progress in monitoring changes in sodium levels in foods between 2010 and 2013. Overall, 58% of foods met at least 1 of the 3 phases of the sodium reduction benchmark targets and the proportion exceeding maximum benchmark levels decreased from 25.2% to 20.8%. The greatest reductions in sodium were seen in imitation seafood (26%), condiments (20%),

breakfast cereals (20%), canned vegetables/legumes (19%), plain chips (19%), hot cereals (15%), canned condensed soup (14%), and sausages and wieners (11%), (all p<0.01), although significant reductions were not yet seen in many food categories.

In 2015, PAHO in collaboration with representatives of the LatinFoods network in Argentina, Brazil, Barbados, Chile, Costa Rica, Cuba, Ecuador, Guatemala, Jamaica, Mexico, Paraguay, Panama, Peru and Trinidad and Tobago, conducted a baseline survey of packaged foods in 14 countries in the region in order to be able to assess progress in meeting the PAHO regional targets during the upcoming years for: 1) breads; 2) soups, wet and dry, noodles in broth; 3) mayonnaise; 4) cookies and biscuits; 5) cakes; 6) meat; 7) breakfast cereals; 8) dairy (cheese and processed cheese products); 9) butter/dairy spreads; 10) snacks; 11) pasta; 12) seasonings and condiments. These baseline results will be presented per food category and by country.

Together these results can help with monitoring progress to reduce sodium levels in packaged foods in the Americas and will also provide information for development of enhanced sodium reduction targets and in a broader range of foods in the upcoming years. Monitoring progress in sodium reduction is an important component of national and regional efforts to reach the sodium reduction goals set by the WHO.

SODIUM AND POTASSIUM INTAKE AND THEIR RATIO IN THE U.S. DIET

[1]Bailey, Regan; [2]Parker, Elizabeth A.; [3]Rhodes, Donna G.; [3]Goldman, Joseph D.; [3]Clemens, John C.; [3]Moshfegh, Alanna J.; [1]Thuppal, Sowmyanarayanan V.; [1]Weaver, Connie.

[1]Department of Nutrition Science, Purdue University, United States; [2]University of Maryland, School of Medicine, United State; [3]Agricultural Research Service, United States Department of Agriculture, United States.

The dietary ratio of sodium to potassium (Na:K) has been more strongly associated with increased risk of cardiovascular (CVD) disease and CVD-mortality than either sodium or potassium alone.

Objective: To estimate the usual sodium and potassium intakes, the dietary Na:K ratio, energy-adjusted sodium and potassium intakes (per 1,000 kcal), and the percentage of individuals with a dietary Na:K ratio of <1.0 by age, sex, and race/ethnicity among non-pregnant, non-lactating U.S. adults ([3]20 y; 2,393 men and 2,337 women) from What We Eat In America, NHANES 2011-2012.

NHANES is a nationally representative, cross-sectional survey that samples noninstitutionalized, civilian U.S. residents using a complex, stratified, multistage probability cluster sampling design. Two 24-hour dietary recalls are collected, weighted for day of the week of collection to assure equal distribution across each day of the week, using the USDA's Automated Multiple-Pass Method. The National Cancer Institute method was used to estimate usual dietary intakes. Multiple pairwise t-tests were used for all comparisons between population groups, statistical significance was set at $P \leq 0.01$.

U.S. adults consumed approximately 2000 kcal/d, 3600 mg/d sodium, and 2800 mg/d potassium. Most adults (90% ± 0.8%) had sodium intakes of >2300 mg/d, whereas <3% had potassium intakes of > 4700 mg/d. Asians had the highest sodium intakes (per 1,000kcal) when compared to all other race/ethnic groups. Women had a significantly lower dietary Na:K ratio than men (1.32 ± 0.0 versus 1.45 ± 0.02). Non-Hispanic whites had a significantly lower Na:K ratio than non-Hispanic blacks and non-Hispanic Asians (1.34±0.02 compared with 1.54 ± 0.03 and 1.49 ± 0.04, respectively). Only 12.2% ± 1.5% of U.S. adults had an Na:K ratio of <1.0. More women (18%) than men (7%) met the recommended Na:K ratio. A significantly higher proportion of whites had an Na:K ratio of <1.0 than did all other racial/ethnic groups. Among men and women, the dietary Na:K ratio decreased linearly as age increased. Mixed dishes (e.g., combinations of foods consumed together) contributed the most sodium (34 ±1%) and potassium (19% ± 1%) to the American diet. However, grains and vegetables were among the highest contributors to sodium intakes of individuals with Na:K ratios of <1.0, compared with protein foods and grains for those with Na:K ratios of ≥1.0. Vegetables as well as milk and dairy products constituted the primary dietary sources of potassium for individuals with dietary Na:K ratios of <1.0, whereas mixed dishes and protein foods contributed the most potassium for individuals with dietary ratios of ≥1.0. Individuals with an Na:K <1.0 were less likely to consume mixed dishes and condiments and were more likely to consume vegetables, milk and dairy products, and fruit compared to those with a Na:K ≥ 1.0.

Only about one-tenth of U.S. adults have a dietary Na:K ratio consistent with the World Health Organization guidelines for reduced risk of mortality. Our data suggest that blacks and Asians have the most unfavorable dietary Na:K ratio in the U.S. Continued efforts to reduce sodium intake in tandem with novel strategies to increase potassium intake are warranted.

Keywords: Sodium, potassium, ratio, NHANES

MODELING THE RELATIONSHIP OF SODIUM, PO-TASSIUM, CALCIUM, AND MAGNESIUM INTAKES AND RATIOS TO BLOOD PRESSURE

[1]Weaver, Connie; [2]Weaver, Connie; [3]McCabe, George; [4]McCabe, Linda; [5]Bailey, Regan.

[1]PhD. Distinguished Professor. Dept of Nutrition Science. Purdue University. West Lafayette. IN.; [2]PhD. Distinguished Professor. Dept Nutrition Science. Purdue University. West Lafayette. IN. USA.; [3]PhD. Statistician. Dept Statistics. Purdue University. West Lafayette. IN. USA.; [4]MS. Statistician. Dept Nutrition Science. Purdue University. West Lafayette. IN. USA.; [5]PhD. Nutritionist. Dept Nutrition Science. Purdue University. West Lafayette. IN. USA.

Background: Intakes of sodium, potassium, and their ratios have been associated with modifying systolic and diastolic blood pressure (SBP and DBP). Dietary patterns associated with blood pressure reduction are high in calcium and magnesium as well as potassium.

Methods: We estimated sodium, potassium, calcium, and magnesium intakes from food and dietary supplements including their ratios and evaluated the role of these nutrients in predicting blood pressure in U.S. adults from 2011-2014 NHANES (n=2266 men and n= 2454 women after excluding 5404 who were pregnant or lactating, taking hypertension medications, smoked, had GFR <30 mL/min, or had missing or implausible data). Non-normal data were transformed prior to analysis. Models were stratified by sex.

Results: The target mineral ratios for most adults based on recommended intakes of the single nutrients according to the NAM and (% adults achieving those) were less than 0.49 for Na:K (0.54%), less than 2.3 for Na:Ca (15.63%), less than 5.75 for women (7.23%) and 7.42 for men (13.63%) for Na:Mg, and 2.5 for women (31.02%) and 3.22 for men (53.69%) for Ca:Mg. Among women, age and race/ethnicity explained 20% of the variation in SBP. When added to this model, statistically significant positive relationships were found with Na, Na:K, Na:Mg, Ca:Mg, Na:Ca and statistically significant negative relationships were found with K and Mg. For each of these, the increase in the percent of variation explained was ≤ 2%. Addition of BMI and the Poverty-to-In-come-Ratio explained an additional 5%. Among females, age and race/ethnicity explained 8% of the variation in DBP. When added to this model, statistically significant positive relationships were found with Na:K, Na:Mg, and Ca:Mg and statistically significant negative relationships were found with K and Mg. For each of these, the increase in the percent of variation explained was 1% or less. Addition of BMI explained an additional 2%. For males, age, and race/ethnicity explained 10% of the variation in SBP. When added to this model statistically significant negative relationships were found with Ca and Mg. For each of these, the increase in the percent of variation explained was less than 1%. Addition of BMI explained an additional 8%. Among men, age , and race/ethnicity explained 11% of the variation in DBP with an additional 4% variance explained by BMI %. No statistically significant effects of minerals or their ratios were found in men for DBP.

Conclusions: Our findings suggest that dietary patterns, which favor lower intakes of sodium, higher intakes of K, and Mg, and lower Na:K, Na:Mg, Ca:Mg, Na:Ca should be encouraged for protection against hypertension, especially among women

Keywords: Blood pressure, sodium, potassium, calcium, magnesium

PS_144/1050
ADDRESSING THE CHILDHOOD OBESITY CHALLENGE: WHERE ARE WE?

ADDRESSING SOCIAL AND ECONOMIC CONSEQUENCES OF CHILDHOOD OBESITY

Sassi, Franco.

Imperial College London.

Childhood obesity is a key dimension of the global obesity epidemic, linked with a significant rise in metabolic disorders and detrimental long-term health and social outcomes. Tackling childhood obesity means addressing the complexity of behaviour change within an "obesogenic" environment (including the built environment and modes of transportation, the availability, prices and nutritional content of foods, the exposure to commercial advertising, the technology supporting children's study and play, as well as adults' work and leisure). This obesogenic environment, combined with a host of cognitive and behavioural biases, provides a powerful drive towards unhealthy behaviours with significant health and economic consequences.

Established links between child and adult obesity, and between these and non-communicable diseases, are such that detrimental health impacts and an increased demand for health care must be expected as new generations age. However, obesity can also have major consequences on children's psychology, social life, and school performance. Obesity is a hindrance to social capital formation through lower educational attainment, translating into reduced employment opportunities.

The presentation will explore the social and economic dimensions of childhood obesity and how governments can prevent and address these consequences through appropriate intersectoral policies. The presentation will also discuss the key outcomes of those policies In a range of settings at different levels of income and development.

Keywords: Childhood obesity; economics; social impacts; government policies

CHILDHOOD OBESITY IN MEXICO: PREVENTION PROGRAMS FOR SCHOOL AGE CHILDREN

[1]*Solis-Pérez, Elizabeth;* [2]*Villarreal-Pérez, Jesus Zacarías;* [3]*López-Cabanillas Lomelí, Manuel;* [4]*González-Garza, Raquel;* [5]*Lavalle-González, Fernando J.*

[1]PhD. Public Health and Nutrition School. Autonomous University of Nuevo Leon. Mexico. ICDA; [2]MD. Endocrinology Service.University Hospital. Autonomous University of Nuevo Leon. México; [3]MSc. Public Health and Nutrition School. Autonomous University of Nuevo León. México; [4]BSc in Nutrition. Public Health and Nutrition School. Graduate Program of Master of Science in Nutrition. UANL; [5]MD.Endocrinology Service.University Hospital. Autonomous University of Nuevo Leon. México.

Childhood obesity is a public health problem in México. A 33.2% combined prevalence of obesity in school age children (5-11 years) was reported in the last national survey. The government of Nuevo León implemented a primary prevention obesity program for school age children through multiple components and adapted to the local context.

The aim of this lecture is to present the impact and strategies of an obesity prevention program for elementary school children in the state of Nuevo León México.

The primary intervention consisted in a structured public policy and a program based in evidence, with three components: nutrition education and health promotion; integrated resources from the ministries of health and education; assurance of safe and healthy environments. For the nutrition education and health promotion was elaborated a state catalog with food, beverages and snacks guidance. In addition, an intense training for teachers, parents and educative community was performed. Physical activity routines during the time in the schools (6000 elementary schools) were implemented (to assure 30 minutes during the school time). Weight and height were measured and body mass index (BMI) was interpreted by the WHO 2007 reference. During three consecutive years was recorded the measurements of three different cohorts of school children (year 1= 197, 586 children; year 2= 257,576 children; year 3 = 286, 238 children. Legal and standard measures that meet healthy nutrition guidelines for school stores (2100 establishments) were included.

The combined prevalence of obesity during the three consecutives school years was 32.5%, 30.1% (p value ≤ 0.02) and third year 30.9% (p value ≤ 0.01). More than 30,000 teachers were trained, and one million of food catalogs were distributed to the parents. A didactic collection for health promotion was delivered to school age children. The program was recognized as a successful practice in México because the significant decrease or containment of the obesity prevalence, the high level strategic leadership of the government authorities, the inclusion of health in education policies, the monitoring system (evolutionary chart of health), the coordination, the alliances with the food and beverages industry, and the implementation of a social marketing campaign.

Monitoring, evaluation and surveillance are key strategies related to obesity prevention. It is necessary to assure the sustainability of the childhood obesity programs in Mexico.

AN INVESTMENT FRAMEWORK IN NUTRITION: CURRENT PROGRESS IN COSTING AND FINANCING THE SCALE-UP OF EVIDENCE-BASED NUTRITION INTERVENTIONS

AN INVESTMENT FRAMEWORK FOR NUTRITION

Shekar, Meera; Dayton Eberwein, Julia; Kakietek, Jakub.

World Bank.

The analytical framework established in Scaling Up Nutrition: What will it Cost? provided the foundation for the World Bank, with support from the Bill & Melinda Gates Foundation (BMGF), to undertake a series of country-level analyses to determine resources needed to scale up high-impact interventions to improve early childhood nutrition. These studies use country-level costs and other data to provide country-tailored guidance on resources needed to scale up cost-effective scenarios which depend on cost-effectiveness considerations, financing constraints and country-specific priorities. In 2016, the World Bank, Results for Development Institute, and 1,000 Days, with support from BMGF and the Children's Investment Fund Foundation (CIFF) released innovative, in-depth costing analyses and developed a global investment framework for achieving four of the six global nutrition targets. While the global and country-based findings are extremely useful in setting nutrition agendas, they are limited by the inability to identify the optimal allocation across intervention of a given 'purse' of resources. To address this constraint, a new optimization tool, Optima Nutrition, has been developed and piloted through a partnership between the World Bank and the Burnett Institute, with financing from BMGF. The tool allows the user to determine allocative efficiency across nutrition interventions within a given country and to better understand existing costing structures of nutrition interventions. These advances will help to catalyze domestic and external investments for nutrition results. This session will present analytical innovations, as described above, to determine the costing and financing needs for scaling up evidence-based nutrition interventions. The panel discussion will address issues of feasibility, smart scale-up and ways to leverage the additional financing needed.

LESSONS FROM INVESTMENT FRAMEWORKS FOR NUTRITION IN SELECTED COUNTRIES

Dayton Eberwein, Julia.

PhD. Health Economist. World Bank, Washington, DC. USA.

The World Bank, in the partnership with the Bill and Melinda Gates Foundation, has undertaken a series of country-level analyses to determine resources needed to scale up high-impact nutrition-specific interventions in countries with high burden of malnutrition in Sub-Saharan Africa and South Asia. These studies offer an analysis of the common trends as well as factors explaining the variation in estimated cost-effectiveness and economic benefits of different interventions and intervention packages. Estimates of the costs and benefits of scaling up a package of nutrition-specific interventions to improve nutrition outcomes during the critical 1,000 day window take into account country-specific factors such as the current coverage of interventions, the available delivery platforms, and the local costs for commodities, monitoring and evaluation, and capacity building. In addition, the studies provide policymakers with several context-specific scale-up scenarios, designed to maximize allocative efficiency in situations where available resources for investments in nutrition are limited. The proposed scale up scenarios are evaluated based on their cost-effectiveness (in terms of cost per DALY averted, life saved, and case of stunting averted), as well as their potential contribution to future economic productivity (estimated based on increases in adult wages resulting from childhood stunting averted and/or on improved IQ scores and consequent increases in wages resulting from reductions in other forms of malnutrition [e.g. iodine deficiency]). This presentation provides a synthesis of country studies and their potential to drive political commitment and action and to enhance allocative efficiency of nutrition resources.

Keywords: Stunting; cost-effectiveness; nutrition interventions; economic productivity

A TOOL FOR OPTIMIZING EFFICIENCY: OPTIMA FOR NUTRITION OPTIMA TOOL

Kakietek, Jakub.

PhD. Economist. World Bank Group. Washington DC USA.

The recent increase in the attention given to issues related to nutrition has been precipitated partially by the growing body of knowledge related to the economic impact of malnutrition as well as the cost and benefits of scaling up key nutrition actions. One key and persistent question asked by policy makers and nutrition and health program managers which has not been addressed to-date is: what allocation of funding across different interventions would allow us to maximize nutrition and health impact while minimizing costs? The existing analytic tools do not address this critical question. A few existing ones, including LiST, OneHealth, Profiles, the World Breastfeeding Costing Initiative tool, and the FANTA CMAM costing tool, estimate either costs or impacts of different nutrition interventions. Each has its strengths but none offers the analytical capability to integrate all of the following features: (i) combine the estimates of cost, health impacts, and economic impacts of scaling up nutrition interventions; (ii) compare cost-effectiveness of different intervention and scale-up options; (iii) systematically assess allocative efficiency of different scale-up options (iv) use a formal mathematical optimization model to identify the optimal allocation of a given level of resources to reach specific nutrition and/or health outcomes. This session introduces Optima nutrition, a mathematical model that uses an integrated analysis of nutrition status, program, and cost data to determine an optimal distribution of investment at different funding levels to better serve the needs of decision-makers and planners. An initial pilot application for Optima nutrition has been developed through a partnership between the World Bank, the Bill and Melinda Gates Foundation, and the Burnett Institute. Currently, the application is focusing on child stunting and the plan is to incorporate other outcomes such as anemia and wasting over time. The application allows the user to 1) estimate the impact an intervention scale-up will have on stunting prevalence and child mortality; 2) calculate the cost of scale up under different cost function assumptions; 3) for a given budget, calculate the optimal allocation of resources among the seven interventions (that is, identify an allocation that will produce maximum reductions in stunting or/and mortality); 4) for a given budget, calculate the optimal allocation of resources among different geographic regions in a given country. This session presents the structure of the model, and illustrates how the model can be used with preliminary application in two countries.

Keywords: Allocative efficiency, Nutrition, Stunting, Cost-effectiveness, Optimization.

EVIDENCE-BASED INTEGRATION OF NUTRITION ACROSS MULTIPLE SECTOR PROGRAMS: HOW CAN THIS BE DONE?

EFFECTIVE INTEGRATION OF NUTRITION INTO OTHER SECTORS – OPPORTUNITIES AND CHALLENGES

Menon, Purmina.

PhD. Senior Research Fellow. International Food Policy Research Institute. Washington DC, USA.

Since the Lancet Series on Maternal and Child Nutrition was published in 2013, and the launch of the global Scaling Up Nutrition (SUN) movement, there has been a strong resurgence of multisectoral programming to improve nutrition outcomes. Multisectoral plans are being launched globally to address the multiple determinants of poor nutrition and across the globe, poli-

cymakers, program implementers and researchers are grappling with the complexity that multisectoral programs unleash. Many multisectoral programs, especially those planned as part of national programs, have focused on coordination of sectoral actions and identification of nutrition-focused actions that specific sectors can undertake. Smaller multisectoral programs, often designed and implemented by non-governmental organizations, may take a more focused approach of delivering multiple streams of programming to targeted households.

Ruel and Alderman (2013) laid out three approaches for actions in other sectors to strengthen impact on nutrition: improving nutrition by improving critical underlying determinants [e.g., sanitation, education, food security, poverty]; reframing sector-specific programs to incorporate nutrition goals and actions [e.g., incorporating nutrition goals and specific actions into social protection or other programs]; or delivering nutrition-specific interventions via other sectoral program platforms. It is important to inquire which of the three pathways to improving nutrition is most deployed in the current wave of multisectoral programs. It is also important to examine whether program planners are actively considering each of these potential approaches. Not doing so can run the risk of deploying actions in other sectors that are ineffective (in the best case) or have negative spillover effects (in the worst case).

Multisectoral programs can place a significant burden on program planners, implementers, evaluators, and potentially even on households. It is critical therefore, that program planners reflect adequately on whether interventions in other sectors do what they are ultimately tasked with – i.e., that they close gaps in the multiple determinants of poor nutrition in ways that support families most effectively and without negative side effects.

In this talk, I will draw on policy and program evaluation experiences in South Asia to reflect on some of the operating models of multisectoral programs, and the opportunities and challenges that face policymakers, program planners and researchers.

MAKING COLLABORATION THE DEFAULT TO ACHIEVE GENUINE MULTISECTOR NUTRITION PROGRAMMING – A NEW APPROACH IN TIMOR-LESTE

[1]*Grieve, Heather;* [2]*De Sousa, Erkulanu;* [3]*Arakelian, Meghan.*

[1]MND MPH Senior Nutrition Advisor. Department of Foreign Affairs and Trade. Timor-Leste; [2]Technical Lead- Nutrition. Partnership for Human Development -Timor-Leste; [3]Project Manager Catalpa International Timor-Leste.

Despite significant progress being made to combat malnutrition in Timor-Leste, preliminary data from the 2016 Demographic and Health Survey indicates that undernutrition (in particular, wasting, stunting and anaemia) in women and children continues to be a major development issue, across all municipalities and wealth quintiles and in urban and rural areas. On the contrary, the prevalence of overweight and obesity is increasing raising concerns of the emerging double burden of malnutrition.

Global evidence suggests that no single policy, approach or intervention can create sustained reductions in malnutrition. Instead, a mix of coordinated interventions, across sectors is required to address all causes of malnutrition across the lifecycle .

While integrated cross-sector programming presents great potential, the evidence-base on which to achieve this is still weak. In practice, poor program targeting, design, implementation and evaluation has limited the evidence of impact. Similarly as m nutrition interventions and mobile technology tools targeting behaviour change are still emerging, very few impact evaluations are available to draw lessons from. .

Building on a political commitment to combat malnutrition through the National Action Plan for a Hunger and Malnutrition Free Timor-Leste (2014- 2025), in partnership with the National Council for Food Security, Sovereignty and Nutrition (KONSSANTIL) the Australian Government is supporting partners to develop a cross-sector collective nutrition impact pilot 'Hamutuk'. Hamutuk is developing a mobile technology tools including a custom-made application to strengthen traditional behaviour change communication strategies, to ensure multi-sector collaboration is 'default' and existing delivery platforms are used effectively to target nutrition promoting messages to households.

End of program outcomes include improving household nutrition promoting behaviours improving active collaboration between partners and ensuring uptake of the model by the Government.

Hamutuk will allow the Government to measure the collective impact of nutrition specific and nutrition sensitive interventions and support their endeavors to end hunger and malnutrition through effective multisector nutrition programming

LINKING AGRICULTURE, GENDER, NUTRITION AND MICROCREDIT INTERVENTIONS IN BANGLADESH: WHAT ARE WE LEARNING ABOUT CONVERGING AND INTEGRATING TO REACH HOUSEHOLDS WITH MULTIPLE INTERVENTION STREAMS

[1]Siraj, Saiqa; [2]Kumar, Neha; [3]Ruel, Marie; [4]Menon, Purnima; [5]Avula, Rasmi; [2]Quisumbing, Agnes; [6]Afsana, Kaosar; [7]Miah, Mohammad Mamun; [8]Haque, Raisul; [9]Hossan, Belayet; [10]Begum, Anjuman Ara; [11]Hoddinott, John.

[1]Sr. Project Manager. TRAIN Project. International Food Policy Research Institute (IFPRI). Bangladesh; [2]PhD, Senior Research Fellow, International Food Policy Research Institute (IFPRI), USA; [3]PhD, Division Director, Poverty, Health and Nutrition Division, International Food Policy Research Institute (IFPRI), USA; [4]PhD, Senior Research Fellow, International Food Policy Research Institute (IFPRI), India; [5]PhD, Research Fellow, International Food Policy Research Institute (IFPRI), India; [6]PhD, Director Health Nutrition and Population Program, BRAC, Bangladesh; [7]Senior Sector Specialist, Health Nutrition and Population Program, BRAC, Bangladesh; [8]PhD, Program Head, Health Nutrition and Population Program, BRAC, Bangladesh; [9]Sr. Manager, Dabi Operation, Microfinance Program, BRAC, Bangladesh; [10]Manager, Gender Justice & Diversity Division, BRAC, Bangladesh; [11]D. Phil, Babcock Professor of Food & Nutrition Economics and Policy, Division of Nutritional Sciences, Cornell University, USA.

It is recognized that leveraging agriculture to address nutrition must also address gender-related challenges. However, program experiences and the literature are limited on the types of integrated intervention models that can do this most effectively and efficiently. IFPRI, in collaboration with BRAC, launched the TRAIN (Targeting and Realigning Agriculture for Improved Nutrition) study in Bangladesh to test different combinations of interventions for strengthening agriculture-nutrition linkages. The four components combined in an additive manner across the intervention arms are (1) credit offered to women, (2) behaviour change communication related to health and nutrition, (3) nutrition-sensitive agriculture extension services and (4) gender sensitization and community mobilization.

In the context of designing the interventions to be tested, we identified several opportunities and challenges within existing platforms or specific programs implemented by BRAC.

Opportunities:

BRAC's existing microcredit platform 'Dabi' works through a unique 'credit plus' approach, addressing the special needs of poor populations. Dabi provides loan only to women for investment in any productive sector, thus bringing a gender-lens to the credit program by design

BRAC's Gender Quality Action Learning (GQAL) program has developed and implemented an established a set of interventions to target specific social issues, and was open to exploring opportunities to integrate nutrition-related gender concerns.

BRAC's vast experience in implementing intensive behaviour change counselling programs for infant feeding and maternal nutrition through their health worker network BRAC's experience in implementing large scale programs on crop cultivation, fisheries, and poultry & livestock for horizontal & vertical production

Challenges:

Different sector-specific BRAC programs deliver their interventions at scale and with focused intensity to deliver impact. While aiming to reach households with each stream in an integrated manner, it is unclear whether it will still be possible to ensure integration at the same intensity as is possible with more vertical programs. Identifying ways in which the delivery of the integrated package will be as effective as the individual streams is a key challenge, therefore.

The initial vision for the TRAIN interventions was that specific services would be offered free of cost to beneficiaries. At the same time, as BRAC moves towards a broader institutional entrepreneurship/business model, there are likely to be challenges to this initial vision.

The GQAL gender platform has not yet been used specifically to address issues of intrahousehold allocation of work, food and resources in relation to agriculture and nutrition. Although there are natural linkages between gender issues and nutrition, the integration of new specific topics into a gender platform that is focused on broader social issues may pose challenges.

Overall, however, our experience to date suggests that the vision for improving nutrition has high-level support in BRAC, as does the understanding that improving nutrition will take multiple streams of programming to come together on the same vulnerable households. Our study will examine the potential for integrating three significant streams – agriculture, gender and nutrition behaviour change communications, while other efforts at BRAC will also examine the integration of additional sectors.

INTEGRATION AND SCALING UP NUTRITION WITHIN NGO PROGRAMS – CHALLENGES AND OPPORTUNITIES IN BANGLADESH

[1]Afsana, Kaosar; [2]Rifat, Mahfuza; [3]Ara, Riffat.

[1]PhD. Director. Health Nutrition & Population. BRAC. Dhaka. Bangladesh.; [2]PhD. Programme Head. Health Nutrition & Population. BRAC. Dhaka. Bangladesh; [3]Msc. Nutritionist. Health Nutrition & Population. BRAC. Dhaka. Bangladesh.

BRAC, the largest non-governmental organization (NGO) in the world born in Bangladesh has been implementing interventions through multidimensional approach. Nutrition is one prime focus of BRAC along with micro-finance, agriculture, education, health care services, water, sanitation & hygiene, social protection, climate change, human rights, community empowerment and so on. Nutrition programme addresses improved infant and young child feeding (IYCF) practices of under-two children, enhances food diversity of pregnant and lactating women (PLW) and promotes healthy diets of adolescent girls including micro-nutrient

intake of under-five children, PLW and adolescents. Currently, nutrition interventions are being implemented in 233 rural sub-districts and 11 city corporations (nearly half of the country) reaching 7.2 million under two children, 3 million PLW and 9 million adolescent girls, and in 61 districts reaching 10 million under five children for micro-nutrient powder. The trained front-line community health workers demonstrate and counsel mothers of children and PLW, render health education to adolescents and sell micro-nutrients sachets for under-five children. Over the years, there has been significant improvement of behavior and practices in IYCF and maternal nutrition, and reduction of anemia among under-five children. Despite recognizing the importance of multi-sectoral approaches, BRAC is facing challenges of integrating all development programmes. Nutrition is integrated with health and population interventions with WASH being promoted. While designing all those development programmes (quite large in population and geographic coverage), integration is not considered due to different donors' requirements, and tendency to make direct and specific impact of individual programmes. With the support of Nutrition International (based in Canada) formerly Micro-Nutrient Initiative, BRAC is exploring pathways for integration in Bangladesh. The knowledge and evidence generated through this method will have wider impact not only on nutrition and health status but also on major socio-economic indicators if integration factored into design which will be easily usable.

EVIDENCE-INFORMED DESIGNING OF INTEGRATION OF NUTRITION INTO MULTIPLE-SECTOR BRAC PROGRAMS (INBP) – OVERVIEW OF THE RESEARCH DESIGN

[1]Jalal, Chowdhury Jalal; [2]Pelto, Gretel; [3]Lee, Jamie; [4]Bhuiyan, Muhammad Mahbub; [2]Habicht, Jean-Pierre.

[1]Senior Technical Advisor. Nutrition International; [2]Professor, Cornell University; [3]Independent Consultant; [4]Consultant, Nutrition International.

Establishing multi-sector, nutrition-specific and nutrition-sensitive interventions is critically important as a strategy to ensure sustainable interventions to improve nutrition of women, adolescents and children. Designing such strategies presents many challenges and, to date, there is insufficient evidence to provide guidance to the systematic design and integration of nutrition into multiple sectors. The Nutrition International has applied a series of interdependent research methods to identify these barriers particularly related to adolescent nutrition; understand in-depth the individual, household, and community factors affecting nutrition; and explore existing and potential service delivery options to inform the designing of integration of actionable nutrition packages (ANP) into multi-sector BRAC programs. BRAC is a Bang-

ladesh-based NGO known globally for its largest national-level programs. This presentation provides an example of systematic guidance on HOW nutrition can be integrated into at-scale multi-sector programs and HOW its application can further inform policy makers on their efforts directed to sustainably improve nutritional status of the vulnerable populations.

Keywords: Multi-sector, Integration, Program, Adolescent

STRATEGY FOR INTEGRATED LINKAGES BETWEEN SERVICE DELIVERY AND HOUSEHOLD UTILIZATION ACROSS PROGRAMS

[1]Lee, James; [2]Jalal, Chowdhury Jalal; [3]Bhuiyan, Muhammad Mahbub; [4]Habicht, Jean-Pierre; [4]Pelto, Gretel.

[1]independent consultant; [2]Senior Technical Advisor, Nutrition International; [3]Consultant, Nutrition International; [4]Professor, Cornell University, USA.

Large multi-sectoral service delivery platforms offer an opportunity to integrate nutrition across a broader range of activities than the Health sector alone. Yet identifying the optimum points for intervention in complex programmes presents a challenge. Using the example of rural Bangladesh, this presentation describes a sequence of project design research steps to map the contact points and interventions that could address anaemia in adolescent girls. Steps discussed include the mapping of Project Impact Pathways (PIPs) for existing services; formative research to describe the operational issues affecting household utilization of these same services; systematic data collection to identify nodes and networks through which health and nutrition information is routinely passed; and focused ethnographic investigation of adolescent consumption and common food proscriptions and prescriptions with a bearing on consumption of iron-rich foods. The presentation concludes by demonstrating the contribution of these steps to the identification of both a set of service "offerings" that can impact adolescent nutrition and the optimum means to deliver them.

Keywords: Adolescent, iron, integration, qualitative, Bangladesh.

TRANSITION FOOD SYSTEMS AND SHIFTING DIETS IN LOW- AND MIDDLE-INCOME COUNTRIES: WHAT DO THEY LOOK LIKE NOW, AND WHERE ARE THEY HEADED?

THE CASE OF PASTORALISM IN NORTHERN KENYA: FOOD, WATER, LAND AND LIVELIHOODS

[1]Fox, Elizabeth; [2]Fanzo, Jessica.

[1]PhD. Hecht-Levi Postdoctoral Fellow. Berman Institute of Bioethics. Johns Hopkins University. USA.; [2]PhD. Bloomberg Distinguished Associate Professor of Global Food and Agriculture Policy and Ethics. Director, Global Food Ethics and Policy Program. Johns Hopkins University. USA.

Pastoralists in northeastern Kenya are experiencing significant difficulties in preserving their traditional livelihoods due to various factors including population pressures and environmental stresses induced by climate change. These challenges affect their ability to access key resources, such as food and water. Government policies promoting alternative livelihoods for pastoralists, including sedentarization and modernization, often diverge from traditional pastoralists' culture, values and practices. There are questions as to whether such policies should be embraced in the long-term. In this study, we identified the dilemmas and challenges faced by pastoralists in the context of sedentarisation, modernization, and traditional practices of transhumance. We also explored coping mechanisms pastoralists use to adapt to those challenges. We completed semi-structured interviews and a Photovoice project with nomadic and sedentarized pastoralists from the Borana Oromo and Turkana ethnic groups in Isiolo, Kenya. The interviews were coded for key themes using grounded theory. Both sedentarized and nomadic pastoralists lacked access to key resources essential for survival; lack of water and sanitation were highly salient themes. There was a disconnect between development plans and priorities of pastoralist communities, and sedentarization programs and policies often did not improve pastoralists' access to food or water. Additionally, sedentarized pastoralists indicated high levels of unemployment, and identified a number of microbusinesses that could be used as alternative livelihoods, such as charcoal burning, and fruit and vegetable stands. Nomadic pastoralists expressed concern of the reliability of these alternative livelihoods. Both nomadic and sedentarized pastoralists recognized the tradeoffs of alternative livelihoods to environmental degradation and deforestation. Traditional coping mechanisms were mentioned by both pastoralist groups, but were exceedingly hard to implement in the wake of more severe climate change and of increased conflict between ethnic groups (as a result of competition for scarce resources). As opposed to top-down strategies that assume modernization as an appropriate transition for pastoralist communities, integration of the traditional and cultural needs, knowledge and practices of pastoralist communities could be essential to informing how pastoralists transition their livelihoods in the future.

FROM MILITARY REGIME TO MARKET LIBERALIZATION: EXPLORING FOOD ENVIRONMENT TRANSFORMATIONS IN MYANMAR

[1]Downs, Shauna; [2]Fanzo, Jessica.

[1]PhD. Department of Health Systems and Policy. Rutgers University. USA.; [2]PhD. Berman Institute of Bioethics. Johns Hopkins University. USA.

After decades of military rule, in 2011 Myanmar made significant reforms towards a demographic government. While the military still has a strong presence in the country, the reforms have led to the removal of sanctions and market liberalization including increased trade and foreign investment. These economic reforms have undoubtedly led to significant changes within Myanmar, including to the local food environment. This has implications for the burden of malnutrition in the country. Undernutrition continues to persist in the country with 8% of Burmese children acutely malnourished and 40% stunted. At the same time, overweight/obesity levels are increasing in the country – 30.8% of women are overweight/obese and 11.8% have been diagnosed with Type 2 Diabetes. The Burmese are experiencing both nutritional and epidemiological transitions. However, there are gaps in knowledge about how those transitions are related to the local food environment. To address this gap, this study uses food environment mapping, market and consumer surveys, as well as focus group discussions to describe the changing food environment in both urban and rural townships in Myanmar. The food environments in the study settings examined were dynamic and largely dominated by the informal food sector, particularly in rural settings. Urban food environments had greater diversity in the types of food outlets (e.g., supermarkets, street foods, etc.), as well as the types of foods sold, as compared to rural food environments. Although rural settings still have access to packaged processed foods, these foods are much more accessible in urban settings. By characterizing the food environment in rural and urban settings in Myanmar, this study will help inform the identification of potential points for intervening to simultaneously tackle the multiple burdens of malnutrition within the context of different food environment typologies. It is likely that different policy and programmatic approaches will be needed in rural and urban settings in the country.

HEALTH IMPACTS OF FOOD SYSTEMS: IDENTIFY-ING LEVERAGE POINTS FOR CHANGE

Rocha, Cecilia.

PhD. Economist. Centre for Studies in Food Security. Ryerson University. Canada.

The presentation discusses a recent report prepared by the International Panel of Experts on Sustainable Food Systems (IP-ES-Food). The report is primarily concerned with the political economy of evidence, where food systems intersect with health. It looks at how underlying dynamics and power relations shape the health impacts of those systems, and shape our understandings of those impacts. The report takes a public health perspective, which entails a focus on primary disease prevention, management of chronic conditions, and the general promotion of health, aiming to identify how the root causes of harm could be addressed. It therefore emphasizes the need for detecting social, structural, and environmental determinants of health associated with food systems, and interventions that can potentially benefit many people at a time, ensuring and enhancing conditions for population health. Furthermore, it is hoped that this report can contribute towards a better valuation of the health impacts of food systems and their consideration in policy making.

The discussion of health impacts in food systems is grouped into five channels of impact -- Occupational Hazards; Environmental Contamination, Compromised & Contaminated Foods; Unhealthy Dietary Patterns; and Insufficient Diets. The analysis is focused on health impacts which: a) appear to be most serious; b) have an impact on large numbers of people; and c) have the strongest associations with the food system. Compounding factors in the analysis include: i) systemic blind spots in the evidence base; ii) the ability of powerful actors (e.g., the food industry) to shape the evidence and frame the discussion; and iii) the complexity created by interconnected and mutually reinforcing problems. The report concludes with suggestions on systemic leverage points for change.

Keywords: Health impacts; food systems; food policy; food industry; public health.

WHY SHOULD GOVERNMENTS FOCUS ON THE LINKAGES BETWEEN NUTRITION EDUCATION AND FOOD POLICIES?

IMPLEMENTING FOOD-BASED DIETARY GUIDE-LINES TO GUIDE POLICIES, PROGRAMMES AND CONSUMER FOOD AND NUTRITION EDUCATION

[1]*Wijesinha Bettoni, Ramani;* [2]*Khosravi, Ashraf;* [3]*Hernandez-Garbanzo, Yenory;* [4]*Sherman, Jane;* [5]*Vargas, Melissa;* [6]*Islas Ramos, Ana.*

[1]PhD. Nutrition Officer. Food and Agriculture Organization of the United Nations; [2]Metropolitan University College, Copenhagen, Denmark; [3]PhD. International Consultant. Food and Agriculture Organization of the United Nations, Rome, Italy; [4]MSc. Nutrition education consultant; [5]MSc. International Consultant. Food and Agriculture Organization of the United Nations, Rome, Italy; [6]Ed.D. Nutrition Officer. Food and Agriculture Organization of the United Nations, Rome, Italy.

The need for food-based dietary guidelines (FBDGs) to guide national food-related policies and programmes including food and nutrition education programmes is increasingly recognized. However, there has been a lack of information on how FBDGs are implemented by national entities, and a lack of guidance on carrying out implementation beyond dissemination. This presentation will describe the findings of a study conducted to obtain a snapshot of country actions of FBDGs implementation. A literature review and key informant interviews with staff and researchers in government ministries, national nutrition organizations and academia in 27 countries were used. The inquiry was based on the social-ecological model. Results obtained will be presented; and some preliminary recommendations on how to maximize the impact of FBDGs are given, which include the need for a consumer-centred approach; an implementation plan with built-in monitoring, evaluation, and funding; the need to target all policies/programmes that influence food, and the need to target policymakers as well as educators and the general public.

Keywords: Food-based dietary guidelines; implementation; food.

STRENGTHENING CROSS–SECTORAL COUNTRY CAPACITY FOR EVIDENCE–INFORMED DECISION–MAKING TO SCALE

SUPPORTING POLICIES, PROGRAMS, AND ENABLING ACTION THROUGH RESEARCH: THE WAY FORWARD

Gillespie, Stuart.

International Food Policy Research Institute (IFPRI). United Kingdom.

Strengthening cross-sectoral country capacity for evidence-informed decision-making to scale-up nutrition

Over the last decade, nutrition has moved from a neglected development challenge to one that is centre stage in many high-level speeches and country plans. This rise in political commitment has to be matched by large-scale and effective action on the ground that accelerates positive change. If not, the bubble will burst....or deflate slowly....as other development challenges come to the forefront. Within the nutrition community, the focus is now squarely on implementation and impact. Decision-makers, wherever they are, have to make judgements based on knowledge. Knowledge of the problem and potential solutions -- and the way it's framed and communicated -- is one of the fundamental drivers and pre-requisites of an "enabling environment" for nutrition. Knowledge derives from evidence and from experience. Evidence of what works, in different contexts, is growing and there's an increasing focus on why certain programs work or don't work; more and more evaluations are opening up the black box of implementation to shine a light on the pathways of impact. And increasing attention is being paid to "stories of change" which capture real-world experiences of decision-makers as they come to terms with the complex multi-sectorality of nutrition. This short presentation seeks to bring together lessons learnt in the management and development of large research programs or consortia which attempt to strengthen and expand the knowledge base on nutrition. Transform Nutrition, LANSA, Stories of Change and now the SPEAR (Supporting Policies, Programs and Enabling Actions through Research) flagship of the Agriculture for Nutrition and Health (A4NH) program have all operated in this knowledge arena in recent years. What has been learnt about the way in which evidential and experiential knowledge can be effectively brought to bear in different contexts. What types of evidence can turn keys, open doors, and change minds? Why is it so important to properly document experiences of nutrition champions and decision-makers in navigating real-world roadblocks and hurdles to drive an agenda forward? How do we learn from success, or from failure?

Keywords: Decision-makers, nutrition, research

THE STATE OF EVIDENCE GENERATION TO SUPPORT NUTRITION PROGRESS IN THE COMPREHENSIVE AFRICA AGRICULTURE DEVELOPMENT PROGRAMME (CAADP)

Covic, Namukolo.

PhD. Senior Research Coordinator. Poverty health and Nutrition Division and Agriculture for Nutrition and health Programme. International Food Policy Research Institute. Ethiopia.

The African Union's Comprehensive Africa Agriculture Development Programme (CAADP) seeks to accelerate economic development through agriculture in recognition of agriculture being a key economic livelihood for the continent. Over 75% of Africa's population depend on agriculture for their source of income and livelihoods. From inception of CAADP, through the Maputo Declaration in 2003, African Heads of State committed to spending at least 10% of national GDP on Agriculture and aim for at least 6% annual growth in the sector. Although addressing hunger was one of the goals there were no specific nutrition targets stated. In 2011 NEPAD and FAO commenced a capacity strengthening programme towards mainstreaming nutrition in national agriculture investment plans. In 2014 under the Malabo Declarations African Heads of State reaffirmed the 2003 commitments but in addition included specific nutrition targets within the broader objective of ending hunger and malnutrition. The Malabo targets are to reduce stunting to 10% and wasting to 5% by 2025. As a result, the CAADP results framework now has some nutrition related indicators: undernourishment, underweight, stunting, wasting, minimum acceptable diet for children 6-23 months, and Minimum Diet Diversity for women. There is now an agreed biennial review of CAADP starting in 2017. There is, therefore, an opportunity to address diet quality and nutrition within CAADP calling for greater attention to related evidence generation and the challenges this presents.

The CAADP monitoring platform is the Regional Strategic Analysis and Knowledge Support System (ReSAKSS) led by IFPRI for the NEPAD Coordination Agency of the African Union. It is structured to take place through Joint Sector Reviews at country level with reporting at country, regional and continental levels through ReSAKSS structures. Like SUN, the country level process encourages multisectorality presenting opportunities for synergy if greater alignment takes place. There are significant challenges relating to generation of the needed data/evidence. For nutrition, most African countries have relied heavily on DHS and UNICEF MICS data but these are only collected every 3-5 years and limited resources and capacity may lead to some surveys not being administered timeously. Some countries are now implementing annual SMART surveys but these too have depended on external resources from development partners. An advantage of DHS data is that it is collected in collaboration with National Statistics Offices who also collect agriculture data but this needs to be better leveraged for nutrition. It is important to take cognisance that effectively monitoring nutrition to inform progress and policy decisions goes beyond tracking trends. It also requires continued generation of programme implementation data and evidence both quantitative and qualitative to improve programme contextualization and quality for subnational situations given the diverse contexts. It

further requires that evaluators and researchers can be candid in reporting and that decision makers become receptive to such reporting to develop genuine synergy among all relevant processes. The state of evidence, challenges and opportunities for evidence generation within CAADP will be presented.

STRENGTHENING CAPACITY FOR EVIDENCE–INFORMED DECISION–MAKING IN AFRICA: EVIDENT LESSONS AND OPPORTUNITIES

[1]Aryeetey, Richmond; [2]Colecraft, Esi; [3]Hailu, Tesfaye; [4]Kolsteren, Patrick; [4]Lachat, Carl; [5]Taljaard, Christine; [6]Verstraeten, Roosmarijn.

PhD. Senior Lecturer. University of Ghana School of Public Health. Legon. Ghana; [2]DrPH. Nutritionist. Nutrition and Food Science Department. University of Ghana, Legon, Ghana; [3]MSc. Nutritionist. Ethiopian Public Health Institute (EPHI). Addis Ababa. Ethiopia; [4]Department of food safety and food quality. Ghent University. Belgium; [5]PhD. Nutritionist. Centre of Excellence for Nutrition, North-West University, Potchefstroom Campus, South Africa; [6]PhD. Nutritionist, Independent Researcher, Belgium.

Background and objectives: Unacceptably high rates of malnutrition in Africa persists, despite considerable knowledge and technology to address its determinants. A missing link is the access to and use of quality evidence. In the African context, there is disconnect between evidence generators and users, effectively limiting uptake of knowledge for better policies and programs. The EVIDENT (Evidence-informed Decision-making in Nutrition and Health) partnership was established in 2014 to address this gap. EVIDENT aims to enhance Evidence-informed Decision-making (EIDM) by bridging linking researchers and decision-makers and strengthening their capacity to co-create solutions to address local needs. EVIDENT's EIDM framework proposes to identify and prioritize information needs, systematically appraise existing evidence, and translate it into concrete recommendations actionable by responsible bodies. We present the findings of a project evaluation, conducted in 2016 to determine stakeholders' perception of the added value and quality of EVIDENT, and lessons learned regarding drivers, barriers, and opportunities for EIDM in Africa.

Methodology: The evaluation used mixed methods including in-depth interviews of EVIDENT partners and stakeholders; project documentation including partner meeting minutes, protocols, and annual reports; and an online survey administered to partners and stakeholders. The evaluation focused on i) the implementation of activities with regard to EVIDENT's goal, expected outputs, and milestones; ii) barriers, challenges and opportunities for a future EVIDENT; and iii) lessons learnt for EIDM.

Results: EVIDENT achieved the goals of championing EIDM in Africa through: capacity strengthening (delivering courses in evidence synthesis and contextualisation; n=70 persons), tool development (Evidence synthesis guidance and process tools devel-

oped), understanding EIDM landscape in different contexts (four country case-studies explored current country-specific EIDM procedures), and responded to local priorities (5 systematic reviews on various topics currently being conducted). EVIDENT has also recognized the need to ensure good Africa-based leadership and coordination; Ghana and South Africa are currently sharing coordination role in EVIDENT. EVIDENT's challenges included insufficient funding arrangements, leading to inadequate time commitment by partners, feeling of disconnectedness while working virtually, and initial lack of experience in EIDM. Despite these, EVIDENT was well received, globally. Lessons learnt from implementing EVIDENT includes: existence of high demand for EIDM at both regional and country levels, need to establish partnerships with existing regional/global platforms (e.g. SUN, CAADP, etc.) for sustainability, EIDM needs to adapt processes to individual settings rather than a one-size-fits-all approach, and realization that evidence synthesis (e.g. systematic reviews) takes more time to achieve results than often expected.

Conclusion and recommendations: EVIDENT has become a champion of EIDM in nutrition in Africa. Continued efforts focusing on leadership, creation of demand for evidence in nutrition policy and programming in Africa, are needed to capitalize on the investment made in capacity throughout EVIDENT's lifetime. The lessons from the evaluation can contribute to future perspectives on EIDM in Africa and elsewhere.

THE CHANGING NUTRITION LANDSCAPE: IMPLICATIONS FOR RESEARCH

UNSCN TRACKING EMERGING ISSUES AND BROKERING KNOWLEDGE

Oenema, Christine Hendrika.

Coordinator. United Systems Standing Committee on Nutrition.

The United Nations Standing Committee on Nutrition was renewed in 2016, resulting in a new Strategic Plan for the period 2016-2020. Its main task is to maximize coherence of nutrition policy and advocacy in the UN system as well as to support the consistent and accountable delivery by the UN system at country level. The achievement of these objectives is supported by among others, the exploration of new and emerging nutrition related issues and the active brokerage of new knowledge and insights

Since early 2016 UNSCN has participated in several academic fora and conferences. It has inquired among its members about emerging issues that are related to their work or impacting on it. Also in 2016, the UN General Assembly launched the UN Decade of Action on Nutrition. The Decade is organized around 6 action areas:

• Sustainable and resilient food systems for healthy diets;

• Aligned health systems providing universal coverage of essential nutrition actions;

• Social protection and nutrition education;
• Trade and investment for improved nutrition;
• Safe and supportive environments for nutrition at all ages and;
• Strengthened governance and accountability for nutrition

Since the finalization of the work program for the Decade, governments have started to make SMART commitments to support the success of the Decade. In addition action networks are being formed and shaped in an organic way to support the delivery of results in the 6 action areas.

The current challenge is if we know enough to deliver sustainable results? Are the current areas of interest that are covered by knowledge platforms and current research by academia sufficient to support the intensification of sustainable actions and results, ultimately leading to the elimination of all forms of malnutrition in 2030? In addition: do we know enough about the large range of actors and their respective contributions? How do we ensure good governance for nutrition?

During this seminar UNSCN will present some emerging issues related to nutrition and explore how well they are being covered by current research as well as where questions remain to be answered.

Keywords: Emerging issues, research

SUSTAINABLE FOOD SYSTEMS? EXPLORING THE CROSS ROAD BETWEEN POLICIES AND RESEARCH IN THE COMMITTEE ON WORLD FOOD SECURITY

Caron, Patrick.

PhD. HDR. in Geography. CIRAD, Montpellier, France. Chaiperson of the High Level Panel of Experts on Food Security and Nutrition of the CFS.

The Committee on World Food Security (CFS) is the foremost inclusive and evidence-based international and intergovernmental platform for food security and nutrition (FSN), where policies can be designed, interventions can be coordinated, options can be shared and decisions at different levels can be prepared.

The High Level Panel of Experts on FSN (HLPE), science-policy interface of the CFS, was created in October 2009, as an essential element of the reform of the CFS, with three key functions: (i) assess and analyze the current state of FSN and its underlying causes; (ii) provide scientific analysis on specific policy-relevant issues; and (iii) identify critical and emerging issues for FSN. All the HLPE reports are available online: http://www.fao.org/cfs/cfs-hlpe/en/.

The HLPE organizes an inclusive scientific dialogue, building upon the diversity of disciplines, backgrounds and knowledge systems. It thrives to propose a common language, clarify contradictory information and knowledge, elicit the backgrounds and rationales of controversies: "One of the key roles of the HLPE reports is to help members and participants in CFS to understand why they disagree" (MS Swaminathan, 1st HLPE Chairperson).

In 2014, in its first note on critical and emerging issues for FSN, the HLPE highlighted the importance of healthy nutrition in changing food systems. Globally, one person in three today is malnourished. If current trends continue, this figure will reach one in two by 2030. The human health, environmental, economic and social consequences of malnutrition are crippling and the burdens created by malnutrition are transmitted across generations. Understanding the causes of this situation is key to any action to improve nutrition. It requires considering recent evolutions of diets and food systems and their drivers: how and why do diets change? What are the links between diets, consumption and consumer habits and food systems? How do changes in food systems affect changes of diets, and therefore health and nutritional outcomes?

Building on the momentum of the International Conference on Nutrition (ICN2) in 2014, the UN Decade of Action for Nutrition and the SDGs, the CFS requested the HLPE to produce a report on Nutrition and food systems. The purpose of this report is two-fold: (i) to analyse the ways in which food systems and dietary patterns interact and result in nutritional outcomes for individuals; and (ii) to highlight effective policies and programmes that shape food systems in order to contribute more effectively to improved nutrition and ensure the right to healthy food for all in a sustainable way.

The report identifies three main elements of food systems (food value chain, food environment, and consumer behaviour) on which policies can act to improve diets and nutrition outcomes. It provides examples of successful policies and programmes and concrete recommendations to different stakeholders on how to progress towards this objective. It also points out to the need for further interdisciplinary and inter-sectorial research covering all the aspects of food systems, from production to consumption, to help design more effective nutrition-sensitive policies and programmes adapted to different contexts.

Keywords: CFS, HLPE, nutrition, food systems

WHY AREN'T WE DOING MORE RESEARCH INTO THE ROLE OF BUSINESS IN NUTRITION?

Haddad, Lawrence.

Executive Director, GAIN.

There is precious little research into the impacts of public private partnerships in nutrition. Is this due to the lack of such PPPs in nutrition or is it due to systemic factors in the research infrastructure? If the latter, what are they and how can they be transformed? The presentation addresses these questions.

Keywords: Business research

NUTRITION, RESEARCH AND THE SDGS: LESSONS GARNERED FROM THE GLOBAL NUTRITION REPORT ON CATALYZING PROGRESS TOWARDS 2030

[1]Fanzo, Jessica; [2]Hawkes, Corinna; [3]Udomkesmalee, Emorn.

[1]Johns Hopkins University and the Global Nutrition Report; [2]City University of London and Centre for Food Policy; [3]Institute of Nutrition of the Mahidol University in Thailand.

In 2015, UN Member States adopted 17 ambitious Sustainable Development Goals, with the aim of transforming our world. Countries are currently working out how to make progress on these goals a reality on the ground.

Two specific targets are directly relevant to nutrition: SDG Target 2.2. is to end malnutrition in all its forms; target 3.4 is to reduce by 30% premature mortality from NCDs, which includes obesity as an indicator. Decades of evidence show that ending malnutrition will take much more than just specific actions designed to prevent or treat it; it will take actions that address its underlying causes, such as poverty reduction, education, gender equality, and water and sanitation. At the same time, investing in nutrition can deliver dividends for these sectors. The potential exists for an integrated approach to deliver not just nutrition but other targets as well.

If we are to fully realise the ambition of the nutrition SDGs, research will play a critical role. The 2017 Global Nutrition Report (GNR) shows that all 189 countries for which data are available are off course to meet obesity targets if current trends in continue unabated. For the diabetes indicator, 8 countries had a probability of ≥0.50 of meeting the 2025 target among men, and 26 countries are likely to meet the target for women. 19 countries are on course to meet the stunting target, 30 for wasting, 31 for overweight, and 20 for exclusive breastfeeding. The figures highlight the lack of frequent data to make robust assessments of progress, and a lack of evidence on how interventions can integrate and work best to tackle multiple burdens of malnutrition.

The 2017 GNR will highlight a number of key research gaps which need to be filled, from adolescent nutrition to 'double duty' actions which tackle malnutrition and other development challenges simultaneously. In this symposium, Professor Jessica Fanzo will give a preview of some of the findings of the 2017 GNR, and how research can help countries accelerate progress and ensure accountability towards the SDGs – and improved nutrition outcomes.

Keywords: SDGs, double duty, burdens of malnutrition, accountability

SCALING UP, SUSTAINING, AND SPINNING OFF: ALIVE & THRIVE'S LESSONS ON INFANT AND YOUNG CHILD FEEDING IN THREE COUNTRIES, AND IMPLICATIONS FOR BEYOND

IMPACT: INTERVENTION RESULTS FROM ALIVE & THRIVE

[1]Menon, Purmina; [2]Nguyen, Phuong; [2]Kim, Sunny; [3]Saha, Kuntal K; [4]Frongillo, Edward; [5]Ruel, Marie.; [6]Rawat, Rahul.

[1]International Food Policy Research Institute; [2]PhD. Research Fellow. International Food Policy Research Institute; [3]World Health Organization; [4]Professor. University of South Carolina; [5]Division Director. Poverty Health and Nutrition Division. International Food Policy Research Institute.; [6]Program Officer. Bill & Melinda Gates Foundation.

An evidence-based package of maternal, infant and young child nutrition (MIYCN) interventions can contribute to optimal maternal and child nutrition and long-term human capital benefits. Several MIYCN interventions recommended for global scale-up are dependent on successful behavior change to strengthen dietary practices and support the use of supplements. Although evidence exists that behavior change interventions (BCI) using interpersonal communications (IPC) work, lessons on effectiveness at large-scale are limited. In a set of impact and process evaluations of large-scale BCI that included IPC, mass media (MM) and policy advocacy (PA) in Bangladesh, Viet Nam, and Ethiopia, we examined impact on breastfeeding and complementary feeding practices (in all three countries) and maternal nutrition behaviors (in Bangladesh).

We used cluster-randomized impact evaluations in Bangladesh and Viet Nam, and a before-after adequacy evaluation design in Ethiopia. All evaluations used repeated cross-sectional surveys of women with children in the appropriate age-group for the results examined (0-6 months, 6-23 months). Statistical analyses examined differences in change over time between intervention and comparison areas, adjusting for clustering and confounders (as needed).

Intervention impacts on infant feeding were predominantly positive in all three countries. In Bangladesh, impacts were seen on breastfeeding and complementary feeding practices (exclusive breastfeeding, dietary diversity and minimum acceptable diet). In Vietnam, impacts were seen on breastfeeding practices (exclusive breastfeeding). In Ethiopia, although the adequacy evaluation design limits attribution, positive change was seen in several behaviors. The maternal nutrition study in Bangladesh found significant impacts on a range of maternal nutrition behaviors, including uptake of supplements and dietary diversity.

The type of delivery platform used for the IPC was related to the achieved exposure to interventions among client populations. Exposure was high in Bangladesh for the IYCF support interventions and the maternal nutrition interventions; both used a large-scale non-governmental outreach platform that included nutrition-focused workers. In Vietnam, where the delivery plat-

form was through government health facilities that clients had to access, exposure was moderate. In Ethiopia, exposure was lower given delivery through a government health system platform and multipurpose health workers.

Analyses of behaviour uptake in intervention areas in Bangladesh and Vietnam showed that Caesarian-section births, lack of breastfeeding support at birth, and poor knowledge were associated with lower early initiation of breastfeeding. Return to work before the child was 6 months old and maternal stress were associated with lower EBF in Vietnam; in both countries, low maternal knowledge made EBF less likely. In Bangladesh, babies of mothers in the lowest tertile of SES were less likely to achieve minimum dietary diversity.

In conclusion, we demonstrate the feasibility and impact of delivering a set of MIYCN behaviour change interventions in multiple contexts. Our results highlight the range of opportunities and challenges offered by diverse intervention delivery platforms and the contexts for intervention uptake. Looking forward, coupling high quality and large scale BCI interventions with policies and programs that address contextual behaviour-specific constraints can deliver further substantial impact.

ALIVE & THRIVE GENERATION 2: EXPANDING OUR LEARNINGS TO NEW GEOGRAPHIES; NEXT STEPS AND SUSTAINABILITY

[1]Lapping, Karin; [2]Hajeebhoy, Nemat; [3]Alayon, Silvia; [4]Sanghvi, Tina.

[1]Project Director, Alive & Thrive, FHI 360; [2]Bill and Melinda Gates Foundation; [3]Alive& Thrive, FHI 360 & Save the Children; [4]Alive & Thrive, FHI360.

Delivering Maternal, Infant and Young Child (MIYCN) solutions sustainably and on a large scale remains a challenge. High intensity, short duration programs result in fewer lives saved than efforts that build MIYCN capacity and strengthen systems. Embedding programs and critical services within government policy and regulatory guidelines has been effective across development sectors, including MIYCN. Phase 1 (2009-2014) of A&T was designed as a proof of concept to illustrate whether infant feeding practices could be changed at scale, with sustainability incorporated to varying degrees. In phase 2, one of the key learning objectives was to gain a better understanding of the extent to which programs and behaviors are sustained after grant funding ends. A sustainability assessment is examining the determinants of phase 1 program sustainability in Bangladesh and Viet Nam. These determinants may be related to program activities or approaches A&T used during phase 1 operations, or the result of organizational or contextual factors. We will share preliminary results from these assessments. We will share implications on our current and future efforts.

Keywords: Sustainability, behavior change, replication, breastfeeding, complementary feeding

Track 4: Nutrition and Management of Diseases

PREVENTION OF TYPE-2 DIABETES IN OVERWEIGHT AND OBESE SUBJECTS. ACHIEVEMENTS AND RESULTS FROM THE LARGE EU-PROJECT, PREVIEW

THE PREVIEW INTERVENTION STUDY-PRELIMINARY RESULTS FROM > 2,000 SUBJECTS ON BODY WEIGHT AND RISK FACTORS FOR TYPE-2 DIABETES

Raben, Anne.

Professor. Dep Nutrition, Exercise and Sports. University of Copenhagen.

Type-2 diabetes (T2D) is one of the fastest growing chronic diseases worldwide. The relative risk of T2D rises exponentially with increasing body mass index (BMI) and people with diabetes have a 2-4 times higher risk of dying from heart disease compared to non-diabetics. Previous diabetes prevention studies have mainly used the officially recommend diet. However, the FP6 EU project "DiOGenes" showed that participants assigned to an ad libitum diet with higher protein and lower glycemic index (GI) had a significantly better weight maintenance and completion rate after an 8 weeks weight loss diet compared with the official dietary guidelines. Whether such a diet is also efficient in diabetes prevention has not yet been investigated.

The main objective of PREVIEW (PREVention of diabetes through lifestyle Intervention and population studies in Europe and around the World) is to determine if a high-protein, low-glycaemic index (GI) diet in combination with moderate or high intensity physical activity can prevent the development of type-2 diabetes in pre-diabetic, overweight individuals, compared with a moderate protein and GI diet. Furthermore, the interaction with the lifestyle factors, habitual stress and sleeping pattern as well as behavioural, environmental, cultural, and socioeconomic variables is also investigated.

The objectives are achieved from two lines of evidence: 1) A worldwide, multicentre, 3-y randomised controlled trial (RCT) in 2,500 overweight and obese pre-diabetic participants from 9 intervention centres and

2) Longitudinal population studies using data from 5 different cohorts (about 130,000 subjects). The RCT in adults starts with an 8-wk weight loss phase (Cambridge Weight Plan®) followed by a 4-arm weight maintenance phase.

In the randomized controlled trial 2,326 adults (2/3 women) were eligible after pre-screening > 15,600 and screening > 5,400 volunteers over a period of 1.5 years. A total of 1,856 (80%) participants completed the weight loss phase successfully ($\geq$ 8% weight loss). Mean (+/-SE) body weight decreased by 10.7 $\pm$ 0.4 kg (~11%), fasting glucose by 0.4 $\pm$ 0.1 mmol/L, HbA1c by 2.1 $\pm$ 0.2 mmol/

mol, and insulin by 4.5 ± 0.4 mU/L (p< 0.001). Based on fasting glucose >1/3 were no longer pre-diabetic after the weight loss phase. After 1.5 years of ad libitum diet and exercise programs, preliminary data analyses showed that weight loss was still ~10% of initial body weight (completer analyses, n ≈ 1,200).

The project is still in its active phase. In the RCT, large decreases in body weight, glucose and insulin were seen after the initial 8 wk weight loss. In those still participating after 1.5 y, weight loss was well maintained. The effect of changing protein, GI and exercise in the RCT will be disclosed when the 3 year intervention has been completed. The first results on sleep and stress from the RCT, as well as main analyses from the population studies are presented in the other PREVIEW conference abstracts.

Keywords: Weight loss, diabetes prevention, diet, exercise

Department of Nutrition, Exercise and Sports. Faculty of Science. University of Copenhagen. Denmark.

Diabetes mellitus is one of the most common emerging diseases of the 21st century. A healthy lifestyle, including diet, physical activity and sleep, is a factor in a type 2-diabetes (T2D) prevention strategy. Within the PREVention of diabetes through lifestyle Intervention and population studies in Europe and around the World (PREVIEW) project, we studied cross-sectional and prospective associations between lifestyle factors and diabetes in five population studies.

From the Lifelines Cohort study (Netherlands), NQplus study (Netherlands), Cardiovascular Risk in Young Finns Study (YFS; Finland), New Zealand Adult Nutrition Survey 2008/09 (NZANS), and the Quebec Family Study (QFS; Canada), data of about 130,000 subjects were included. Follow-up information was available for almost 71,000 subjects. Diabetes at baseline and follow-up was ascertained using fasting glucose, HbA1c, and self-reported diagnosis or medication use. Dietary intake was assessed with food frequency questionnaires, 24-hour dietary recall, or a 3-day dietary record. Physical activity and sleep duration were assessed with a self-reported questionnaire or a 3-day activity record. Prevalence and Incidence Ratios (PR and IR) were estimated for abnormal glucose tolerance (AGT; pre-diabetes and diabetes combined) and diabetes by Cox regression. Risk estimates were pooled using random-effects meta-analysis. Multiple adjustments were made for energy, age, sex, education, medical history, and other lifestyle factors.

A higher energy-adjusted total protein intake (g/day) was associated with a higher prevalence of diabetes: pooled PR of 1-STD increase 1.39 (95%CI 1.15, 1.67). Total protein was also prospectively related to a higher risk of diabetes: pooled IR from four population studies for 1-STD increase was 1.13 (95%CI 1.05, 1.21). Total protein was not associated with AGT. Additional adjustment for BMI and waist attenuated the associations. A 1-STD higher GI was not related to diabetes prevalence, but to a higher diabetes incidence; pooled IR was 1.06 (95% CI 1.02-1.10). A 1-STD higher GL was associated with a lower diabetes prevalence, pooled PR was 0.53 (95% CI 0.35, 0.81), but not with AGT prevalence. Also, the protective association between GL and diabetes did not persist in the prospective analyses. Furthermore, higher levels of moderate and intense physical activity and a longer sleep duration were associated with a lower risk of diabetes.

These analyses of five global population studies, comprising >125,000 participants, showed that a higher protein intake was weakly related to a higher diabetes prevalence and incidence. High GI was related to diabetes incidence. Higher levels of physical activity as well as a longer sleep duration were related to a lower diabetes risk, independent of energy intake.

Lifestyle factors such as sleep, stress, diet and its rewarding value, and physical activity have been shown to be associated with insulin sensitivity. Within PREVIEW, the role of these factors in prevention of insulin resistance is being assessed. At baseline, i.e. Clinical Investigation Day 1 (CID1) the number of adult subjects was 2,224; mean (±SD) age was 51.6±11.6 years, BMI 35.3±6.5 kg/m. After weight loss, at CID2, their number was 1,856; BMI 31.40 ± 6.0 kg/m, and at CID3, six months after the start, their number was 1,571 BMI 30,67 ± 5,52 kg/m. Insulin resistance assessed by HOMA-IR (HOmeostasis Model Assessment; estimated Insulin Resistance) was determined as 3,75±2,43 at CID1, 2,27±1,61 at CID2, and 2,28±1,32 at CID3. At baseline, no associations with sleep assessment (Epworth Sleepiness Scale (ESS) and the Pittsburgh Sleep Quality Index (PSQI)), or with chronic stress perception (Perceived Stress Scale (PSS) were observed. Insulin resistance was related to perception of fatigue in women and vigour in men (Profile of Mood Status), possibly representing limited substrate availability, thus limiting glucose availability in the cells. The impact of insulin resistance, weight status, and lifestyle factors to brain reward activation in response to visual food cues was investigated in a sub-population of the PREVIEW study, at baseline. In 39 obese, pre-diabetic subjects (m22/f17; BMI: 32.3±0.6 kg/m2; fasting glucose: 6.3±0.1 mmol/l; fasting insulin: 13.6±1.0 mU/l; HOMA-IR: 3.9± 0.3) brain reward activity was assessed by functional magnetic resonance imaging while viewing randomized blocks of food and non-food images. Brain activation (food vs non-food) was extracted in a priori defined food reward regions-of-interest (ROIs). Contribution of eating behavior (TFEQ), habitual physical activity (Baecke), HOMA-IR, BMI or body fat percentage were determined utilizing multiple regression analysis. In the nucleus accumbens (R2=0.3; p=0.003), insula (R2=0.3; p=0.010), prefrontal cortex (R2=0.3; p=0.015) and putamen (R2=0.2; p=0.034), brain activation was predicted by HOMA-IR, independent of BMI and body fat percentage (P<0.05). Brain activation was inversely related to restraint scores and habitual physical activity in multiple food reward ROIs, after adjusting for HOMA-IR, BMI and body fat percentage (P<0.05). Six months after the start, in the complete group of subjects, at CID3, the increased magnitude of the behavioural factor cognitive restraint TFEQ (F1) contributed significantly to the reduction in insulin resistance, controlled for loss of body weight and body fat, and no further associations between changes in insulin resistance and in sleep, stress, or physical activity scores were observed. In conclusion, individuals with prediabetes showed at baseline, independently of BMI and body fat percentage more activity to food cues in brain reward regions. In addition, independently of insulin resistance, both dietary restraint and habitual physical activity appeared to be associated with decreased reactivity to food cues in brain reward regions. The intervention induced change in insulin resistance after six months was related to the behavioural factor cognitive restraint, independently of loss of body weight and body fat. No further associations between changes in insulin resistance and in sleep, stress, or physical activity scores were observed.

Keywords: Dietary restraint, physical activity, stress, brain signaling.

HOW STARCH CHANGED OUR GENES: AMY1 COPY NUMBER VARIATION AMONG PEOPLE AT RISK OF DIABETES. A PREVIEW SUB-STUDY

[1]Brand-Miller, Jennie; [2]Atkinson, Fiona.

[1]PhD. Nutrition Scientist. Charles Perkins Centre. University of Sydney. Australia.; [2]PhD. Nutrition Scientist. Charles Perkins Centre, University of Sydney. Sydney. Australia.

In humans, but not other primates, the salivary amylase gene (AMY1) shows remarkable variation in copy number. Like lactase enzyme persistence, it represents one of the best examples of gene expression adaptation due to diet during human evolution. Populations with traditionally low starch diets show lower average AMY1 CN compared to populations consuming starch-rich diets, independent of geographical region or shared ancestry. AMY1 copy number correlates with the amount of salivary alpha-amylase, but beyond this, the phenotypic and physiological significance is uncertain.

To test the hypothesis that AMY1 copy number increases the rate and extent of starch digestion in healthy subjects and influences risk factors for obesity and diabetes.

We used real-time quantitative PCR with AMY1-specific primers to estimate AMY1 copy number in 201 healthy individuals and

160 overweight and obese participants with pre-diabetes in the Sydney-based cohort of the PREVIEW intervention study.

Copy number (CN) varied from 1 – 16 copies (mean ± SD = 6.5 ± 2.6) in the healthy cohort, correlating positively with salivary amylase activity (r = 0.62, p < 0.0001) but not with BMI, glucose tolerance or insulin sensitivity. In individuals with pre-diabetes, mean CN was higher (7.4 ± 2.9, p = 0.005) and weakly related to measures of body fat. In a pool of 114 healthy individuals with the full range of variation, CN was a strong predictor of normalized glycemic responses to potato (n = 45, r = 0.78, p = 0.0001), white bread (n = 98, r = 0.67, p = 0.0001), rice (n = 56, r = 0.66, p = 0.0001), rolled oats (n = 42, r = 0.63, p = 0.0001), pasta (n = 95, r = 0.51, p = 0.0001) and a mixed meal (n = 24, r = 0.60, p = 0.0021), explaining 26-61% of the inter-individual variation in glycaemia. In contrast, CN was not significantly related to normalized glycemic responses to sucrose (table sugar, n = 60, r = 0.08, p = 0.54) or fruit (n = 29, r = 0.20, p = 0.30). Using genotype-based recall, healthy individuals in the highest vs lowest decile of CN produced modestly higher glycaemia (+15%) and substantially higher peak insulin responses (+38%) to starchy foods, suggesting earlier first phase insulin secretion. In the fasting state and in response to meals of white rice, with and without resistant starch, low CN individuals with and without pre-diabetes displayed 6-fold higher breath methane levels than high CN individuals (n = 30, p = 0.001) but similar levels of hydrogen.

Taken together, the findings imply that the ability to digest starch faster and more completely was a strong selective force during human evolution, with relevance to the risk of diabetes and obesity today. The distinct differences in breath methane in those with low vs high CN imply not only differences in the amount of carbohydrate reaching the large bowel, but also in the microbiome itself.

EXPLOITING PREVIEW FINDINGS: A FOOD INDUSTRY PERSPECTIVE

Brand-Miller, Jennie.

PhD. Nutrition Scientist. Charles Perkins Centre. University of Sydney. Australia.

Dissemination and exploitation of the findings of PREVIEW is the focus of a specific work package within the EU-funded PREVIEW project. Previous diabetes prevention studies have proven that type 2 diabetes can be prevented or delayed by lifestyle interventions that focus on diet, exercise and weight loss. However, the composition of the optimal diet for maintenance of weight loss is still debated. The PREVIEW project will determine whether a modestly higher protein-lower glycemic index (GI) improves weight maintenance compared with official dietary guidelines. The findings will have important implications for the food industry.

To communicate and exploit the findings of PREVIEW in order to convert new knowledge into socio-economic benefits, including more effective strategies in public health, products and services that reduce the risk of obesity and type 2 diabetes. A sub-objective is to secure and manage the transfer of exploitable knowledge and intellectual property generated by PREVIEW to the food industry and service providers in the area of health and diet.

PREVIEW's research programme is highly likely to produce outcomes which have the potential for commercial exploitation. This is especially true for the food industry and manufacturers, but also for other sectors delivering services and policies which can aim to treat and prevent overweight and obesity, and type-2 diabetes in people at risk. We have established a pro-active approach to identifying exploitable outputs, including training in basic IPR principles and creation of a patent advisory group. License agreements will be managed by the Consortium when the findings of the intervention study become available in the middle of 2018.

Potential agreements based on the work and findings of PREViEW include 1) professional software incorporating an international glycaemic index and glycaemic load database, 2) lifestyle change manuals for health professionals with new tools to reduce weight re-gain, 3) online weight loss and diabetes prevention programs, 4) identification of novel biomarkers (genomic/proteomic/metabolomics) to predict weight loss and improved insulin sensitivity taking into account the genetic and environmental background 5) identification of novel food ingredient systems to induce satiety without adverse sensory effects, 6) tools to randomise study participants into 2 or more study groups and 7) cookbooks based on different diet compositions.

Commercial slimming companies, weight loss providers, diabetes-suitable home delivery meal providers, members of the food industry, including food and health ingredient companies, food retailers, supermarkets, food and agriculture organisations, policy makers and obesity-related non-government organisations, individual scientists and their IPR advisors, are encouraged to investigate exploitable outcomes of the PREVIEW project.

PREVIEW (www.previewstudy.com) (2013-2018) is funded by EU FP7 grant # 312057 and national funds in NZ, AUS, and CAN. The Cambridge Weight Plan® generously donated the formula diets for all centres.

MOODFOOD: PREVENTING DEPRESSION THROUGH FOOD

INFLAMMATORY DIETARY PATTERNS AND DEPRESSIVE SYMPTOMS IN ITALIAN OLDER ADULTS

[1]Vermeulen, Esther; [2]Brouwer, Ingeborg; [3]Stronks, Karien; [4]Bandinelli, Stefania; [5]Ferrucci, Luigi; [6]Visser, Marjolein; [7]Nicolaou, Mary.

Background: Older adults are more susceptible to higher inflammatory levels and depression. Moreover, diet may influence inflammation as well as depression but no previous study examined whether inflammatory dietary patterns are related to depression in an older population. Objective: To investigate the longitudinal association between inflammatory dietary patterns (using reduced rank regression (RRR)) and depressive symptoms in Italian older adults. Methods: We included 827 participants (aged ≥65 years) at baseline in 1998. Follow-up measurements were collected after 3, 6 and 9 years. We used RRR to identify inflammatory dietary patterns at baseline. The Centre for Epidemiologic Studies Depression (CES-D) scale was used to assess depressive symptoms by using continuous scores and depression by using a cut-off point (CES-D ≥20). Results: We identified two inflammatory dietary patterns using different sets of response variables. Dietary pattern I was related to inflammatory markers C-reactive protein (CRP), interleukin (IL)-6, tumor necrosis factor α and was characterized by high intakes of refined grains, sweet snacks, pasta and rice. After full adjustment for confounders, no longitudinal association was found when comparing extreme quartiles of this dietary pattern and depressive symptoms (Q1 vs Q4, model 4: B=0.01, 95% CI: -0.06, 0.08) or depression (Q1 vs Q4, model 4: OR= 0.89, 95% CI: 0.59, 1.36). Dietary pattern II was related to inflammatory markers CRP, IL-18, IL-1β, IL-1 receptor antagonist and was characterized by high intakes of pasta, sugar-sweetened beverages, processed meat and chocolate and sweets. When comparing extreme quartiles, this dietary pattern was not longitudinally associated with depressive symptoms (Q1 vs Q4, model 4: B= -0.04, 95% CI: -0.10, 0.03) but an inverse association was found for depression (Q1 vs Q4, model 4: OR= 0.63, 95% CI: 0.40, 0.98). Conclusion: Our study does not support the hypothesis that dietary patterns linked to inflammatory markers are associated with higher depressive symptoms and higher depression incidence. However, dietary intake in our population of older adults was quite homogeneous which makes it difficult to show clear associations.

ROLE OF SUGAR INTAKE IN THE PREVENTION OF DEPRESSION: PROSPECTIVE FINDINGS FROM THE WHITEHALL II COHORT STUDY

[1]Knüppel, Anika; [1]Shipley, Martin J.; [2]Llewellyn, Clare; [2]Brunner, Eric J.

[1]MSc. Department of Epidemiology and Public Health. Institute of Epidemiology and Health Care. University College London. UK; [2]PhD. Department of Epidemiology and Public Health. Institute of Epidemiology and Health Care. University College London. UK.

Reduction of sugar intake has become a key target in public health action across the world. Overconsumption of sweet food, sugar-sweetened drinks and added sugars has been linked with depressive symptoms in several populations. It remains unclear whether this association is causal. Such evidence is needed to support interventions to prevent disease.

The aim of this study is to investigate cross-sectional and prospective associations of sugar intake from sweet food/beverages with common mental disorder (CMD) and depression, and to examine the role of the reverse effect, of CMD on sugar intake, for the observed association.

We analysed repeated measures (23,245 person-observations) from the Whitehall II cohort study. Prospective analysis included 2-, 5- and 10-year follow-up periods. CMD was measured with the 30-item General Health Questionnaire and depression with the Center for Epidemiologic Studies Depression scale. Clinical depression was assessed once with the Revised Clinical Interview Schedule. Dietary assessment was based on food frequency questionnaires. We modelled associations using random effects regression.

Direct cross-sectional associations were confirmed. Prospective analyses revealed a direct association of sugar intake from sweet food/beverages with incident CMD in men and with recurrent depression for both sexes. Men in the highest tertile of sugar intake had increased odds of incident CMD after 5 years (OR=1.24; 95% CI: 1.02, 1.48) after multiple adjustment including adiposity. Odds of recurrent depression were increased when sugar intake from sweet food/beverages was modelled continuously (per 30g per day

increment, OR 1.18; 95% CI 1.01, 1.37) but not when analysed in thirds of intake. Notably, neither CMD nor depression predicted changes in sugar intake from sweet food/beverages.

An adverse effect of sugar intake from sweet food/beverages on long-term psychological health was confirmed in repeated measures follow-up data over 22 years in men and women. Our findings suggest public health interventions which promote reduced sugar intake could support primary and secondary prevention of mood disorders.

LONGITUDINAL ASSOCIATIONS BETWEEN VITAMIN D STATUS AND DEPRESSIVE SYMPTOMS IN OLDER ADULTS

[1]Elstgeest, Liset; [2]de Koning, E.J.; [3]Brouwer, Ingeborg; [2]van Schoor, N.M.; [4]Comijs, H.C.; [5]Lips, P.; [6]van Marwijk, H.W.J.; [4]Beekman, A.T.F.; [4]Penninx, Brenda; [7]Visser, Marjolein.

Depressive symptoms and low vitamin D status are common in older persons and may be associated, but findings are inconsistent. More prospective studies on the association between vitamin D status and depression are needed, as well as studies that use multiple intra-individual 25-hydroxyvitamin D (25(OH)D) measurements.

We investigated associations of serum 25(OH)D concentrations with the severity (cross-sectionally) and course (prospectively) of depressive symptoms in Dutch older adults. Furthermore, we investigated whether changes in 25(OH)D over time are associated with parallel changes in depressive symptoms.

In the Longitudinal Aging Study Amsterdam, serum 25(OH)D concentrations were determined at baseline in an older cohort in 1995/1996 (≥65 years, n=1282) and in a younger cohort in 2002/2003 (55-65 years, n=737). Depressive symptoms were measured at baseline, after three and after six years with the Center of Epidemiological Studies Depression scale (CES-D). Linear regression and linear mixed models analyses were used to examine the cross-sectional and prospective associations, respectively, between baseline 25(OH)D and depressive symptoms. Serum 25(OH)D and depressive symptoms were also measured 13 years after baseline in the older cohort (n=173) and 6 years after baseline in the younger cohort (n=450). Associations between change in 25(OH)D and change in CES-D score were analysed by linear regression analyses. All analyses were adjusted for relevant confounders, and effect modification by sex and baseline 25(OH)D was examined.

Cross-sectionally, associations between 25(OH)D and depressive symptoms were not statistically significant. Prospectively, women in the older cohort with baseline 25(OH)D concentrations up to 75 nmol/l experienced 17-26% more depressive symptoms in the following six years, compared to women with 25(OH)D concentrations >75 nmol/l (P=0.01 to 0.06). In older men and in the younger cohort, no significant associations were observed. In participants with two 25(OH)D measurements, serum 25(OH)D increased during follow-up in 32.4% of the older cohort and in 69.8% of the younger cohort. Change in 25(OH)D was not significantly associated with change in CES-D score in the older cohort or in participants of the younger cohort with higher baseline 25(OH)D concentrations (>58.6 nmol/l). However, in persons with lower baseline 25(OH)D concentrations, an increase in 25(OH)D was associated with a decrease in CES-D score (adjusted B: -0.62, 95% CI: -1.17, -0.07, P=0.028).

Older women showed an inverse relationship between serum 25(OH)D and depressive symptoms over time. In addition, an increase in serum 25(OH)D over six years was associated with a small decrease in depressive symptoms in young older adults with lower baseline 25(OH)D.

Keywords: Serum 25-hydroxyvitamin D, depression, intra-individual change, elderly, cohort study

Conflict of Interest disclosure: The analyses of the present study were entirely independent, with no industry association. None of the authors had a conflict of interest.

THE LINK BETWEEN MINDFUL EATING AND DE-PRESSIVE SYMPTOMS AND POSSIBLE UNDERLY-ING MECHANISMS

[1]Winkens, Laura; [2]Van Strien, Tatjana; [3]Brouwer, Ingeborg; [4]Penninx, Brenda; [5]Visser, Marjolein; [6]Lähteenmäki., Liisa.

Mindful eating is eating with attention and awareness. Mindful eating might be related to depression, both directly and indirectly. Possible underlying mechanisms are obesity-related eating styles.

Objective. To examine associations of mindful eating domains with depressive symptoms and depression cross-sectionally, and to examine whether eating styles (emotional, external and restrained eating) are mediating variables in these associations.

Data were collected in Denmark (n=1522), Spain (n=1512) and the Netherlands (n=1439) as part of the MooDFOOD project. The four mindful eating domains were measured by the Mindful Eating Behaviour Scale. Depressive symptoms was defined as the continuous score on the Center for Epidemiological Studies Depression Scale (CES-D) and depression as scoring above the clinically relevant cut-off score on the CES-D and/or current use of antidepressants and/or current psychological treatment. Eating styles were measured using the Dutch Eating Behaviour Questionnaire (DEBQ). Multiple linear and logistic regression analyses were used to test the associations of the mindful eating domains with depressive symptoms and depression for the three countries separately. Furthermore, in the Dutch sample, multiple mediation of the eating styles was tested with bias-corrected bootstrap confidence intervals using the Process macro of Hayes. All analyses were adjusted for socio-demographic characteristics and lifestyle factors.

The domains Focused Eating, Eating with Awareness and Eating without Distraction were all significantly negatively associated with depressive symptoms and depression in all three countries (e.g. Focused Eating Denmark: B=-0.71, 95%CI: -0.87, -0.54 and OR=0.89, 95%CI: 0.86, 0.93). Hunger and Satiety Cues (only measured in the Netherlands) was significantly positively associated with depressive symptoms (B=0.09, 95%CI: 0.02, 0.16), but not with depression (OR=1.01, 95%CI: 0.98, 1.05). No mediation by the eating styles was found for Hunger and Satiety Cues. Emotional eating was a mediator in the associations of Focused Eating, Eating with Awareness and Eating without Distraction with depression (e.g. Eating with Awareness: B=-0.03 (SE=0.01), 95%CI: -0.06, -0.008).

The results indicate that higher scores on three mindful eating domains are consistently associated with lower levels of depressive symptoms and a lower likelihood of having depression in three European countries. Emotional eating was found to be a mediator in the associations between these three mindful eating domains and depression. Mindful eating may benefit people's mental well-being both directly and indirectly through emotional eating.

Keywords: Mindful eating; depression; eating styles; emotional eating; European countries.

Conflict of Interest disclosure: Tatjana van Strien has a copyright and royalty interest in the Dutch Eating Behavior Questionnaire (DEBQ) and manual. There are no other conflicts of interest.

BARIATRIC AND METABOLIC SURGERY. STRATEGIES FOR SUCCESS: AN INTEGRATED APPROACH TO OBESITY AND T2DM PATIENT MANAGEMENT

BARIATRIC AND METABOLIC SURGERY. STRATEGIES FOR SUCCESS: AN INTEGRATED APPROACH TO OBESITY AND T2DM PATIENT MANAGEMENT

Aguirre Ackermann, Marianela.

Phd. Nutrition and Diabetes. Center for Obesity and Diabetes CIEN (Corrientes-Misiones-Buenos Aires, Argentina).

The alarming escalation in the incidence of obesity and diabetes presents significant challenges for healthcare practitioners, health systems, payer groups, and the government, not to mention the impact on the health of the individual. The epidemic increases in both of these chronic conditions requires the replacement of reactive management strategies that employ extreme diets, diets that do not work, minimalist pharmacologic support, and delayed or lack of implementation of bariatric surgery in patients who require it, with more proactive and assertive efforts that focus on the achievement of a new lifestyle to obtein weight management and in this way achieve glycemic targets, blood pressure and lipids control, cardiovascular risk reduction, and the multiple proven benefits of weight loss on health, including of course improvement in quality of life.

As healthcare practitioners, we should provide individualized and integrated medical care, assess therapeutic effectiveness, and provide the best options for each patient. We are challenged to stay current with the escalating volume of new therapies, devices, and lifestyle recommendations and to understand the nuances of treatment strategies while balancing the realities of the world within which we practice.

The approaches in which it is performed only recommendations result in very limited weight loss, which may frustrate both patients and their physicians. Healthcare practices must become more assertive, replacing generic directives to patients such as "eat less" and "exercise more" with more progressive interventions that combine lifestyle modifications, risk evaluation, risk reduction, and disease prevention, while attending to disease management. The morbidity associated with obesity, and the close association of obesity with diabetes and cardiovascular disease, necessitates the development and implementation of integrated treatment strategies.

The cornerstone for the treatment of an obese patient is an intervention with interdisciplinary strategies that involve multiple components, to achieve a better integral lifestyle. Within the treatment options available for obesity and type 2 diabetes, with the evidence currently available, bariatric surgery should be present.

Today we know that it is not about medical treatment versus surgery: the evidence shows that it is about medical treatment plus surgical treatment. Even in the field of metabolic surgery, today we talk about surgery more drugs for diabetes and not surgery to stop taking drugs for diabetes.

In patients with moderate obesity associated with comorbidities or morbid obesity, bariatric surgery is the only available therapeutic modality associated with clinically significant and relatively sustained weight loss. Well-performed bariatric surgery, in carefully selected patients and with a good multidisciplinary support team, substantially ameliorates the morbidities associated with obesity.

The use of bariatric surgery in the clinical management of type 2 diabetes in obese subjects has been included in the clinical practice recommendations released by the most influential diabetologic associations. However, the timing during the diabetic course in which this use may have the better benefit/risk ratio remains debated. Today we know that is better to use surgery very early in the course of the disease in order to anticipate clinical deterioration.

Keywords: Obesity ; type 2 Diabetes; Medical management; Bariatric Surgery; Metabolic surgery

FROM BARIATRIC TO METABOLIC SURGERY. DEFINITION OF A NEW DISCIPLINE

Serra, Edgardo.

Center for Obesity and Diabetes CIEN (Corrientes-Misiones-Buenos Aires, Argentina).

It is well known the impact of bariatric surgery as the best treatment in morbid obese patients. These results and the increase of the epidemic did this procedure as one of the most common surgery worldwide. The obesity surgery beyond its effect on weight loss has entailed a change in the way of regarding it. But, success was defined only by excess weight loss. In spite of were reported others markers of resolutions of metabolic comorbidities, they were relegated to a secondary place. Meanwhile, type 2 Diabetes is accepted as a global world health crisis. Diabetes is one of the most common major diseases that impact the health, quality of life, costs, and survival of obese persons. Besides, several commu-

nications have reported that regardless of body mass index (BMI), complete or partial remission of type 2 diabetes mellitus (T2DM) is possible. Because of this, The American Diabetes Association's (ADA) Standards of Medical Care in Diabetes 2009 states, "Bariatric surgery should be considered for adults with BMI 35 kg/m2 and type 2 diabetes, especially whether the diabetes is difficult to control with lifestyle and pharmacologic therapy." This was the first time the ADA declared bariatric surgery as a treatment option that should be considered for a population of diabetic patients. The metabolic surgery effect over metabolic syndrome, mostly occur before weight loss, positioning metabolic surgery as a good tool for controlling the current T2DM epidemic. The term "metabolic surgery" has become more popular to designate those interventions focused mainly at resolving diseases as diabetes and not specifically weight loss. Metabolic surgery has been proven to be safe and effective. And, it is unquestionable that a new discipline has been founded. Metabolic surgery can effectively treat T2DM in individuals with any BMI, including that below 35 kg/m2. In patients with type 2 diabetes and obesity, metabolic surgery has a greater role in metabolic improvement, beyond the weight loss obtained. It is necessary to understand the objectives of each Surgery to indicate in each patient the best Surgery available.

Keywords: Obisity; Type 2 diabetes; Bariatric surgery; Metabolic Surgery

WHICH IS THE BEST TECHNIQUE FOR YOUR PATIENT?

Cohen, Ricardo.

MD. Director of The Center for Obesity and Diabetes, Oswaldo Cruz German Hospital, Sao Paulo-Brazil.

Metabolic surgery is a very efficient option to treat uncontrolled T2D patients in spite of the best medical treatment. The Diabetes Surgery Summitt 2, held in 2015, with the support from over 50 medical Societies worldwide did put gastrointestinal surgery in the algorithm for the treatment of T2D in patients with BMI from 30 kg/m2 and over. Among the surgical options, the Roux-en-Y gastric bypass (RYGB) has the best risk profile, with better-known mechanisms of action and good long term outcomes regarding weight loss and T2D control. The sleeve gastrectomy may be an option, but it carries a non-optimal weight and glycemic control in long term (10 years)prospective and randomized controlled trials with up to 5 years, besides the ongoing risk of gastroesophageal reflux and even Barret's esophagus. In uncontrolled T2D, it may be indicated when there is any RYGB contraindication. The malabsorptive operations have unquestionably better outcomes, glycemic and weight loss, but carry ongoing risks of malnutrition and its undesirable consequences. Currently, RYGB offers a safe, better known and powerful tool for obese patients with uncontrolled T2D.

Keywords: Roux-en-Y gastric bypass; metabolic surgery; type 2 diabetes

BUILDING CAPACITY TO PREVENT AND TREAT MALNUTRITION

EXPERIENCE OF THE NEEP PROJECT IN GUATEMALA AND EL SALVADOR

[1]Monroy Valle, Michele; [2]Velasquez, Carmen; [3]Portillo, Carmen; [4]Choi, Sunhea.

[1]MEd, MPH. Nutritionist. Nutrition Degree. Faculty of Health Sciences. Universidad Rafael Landívar. Guatemala; [2]MA. Nutritionist. Nutrition Degree. Faculty of Health Sciences. Universidad Rafael Landívar. Guatemala.; [3]Nutritionist. Nutrition Department. Hospital Nacional Zacamil. El Salvador.; [4]PhD. Global eHealth Education Lead. Faculty of Medicine. University of Southampton.

Severe Acute Malnutrition has a low prevalence among under 5 population in Central America; Guatemala has 0.7% and El Salvador 2%. Important nutrition-health politics have been implemented in the past years. Guatemala, the growth child survey system implemented in 2009 is capable of screening, assessing and treat, in the community, moderate acute malnourished children reducing inpatient treatment needs. El Salvador´s Health System improved overall health access decreasing stunting rate 13 percental points.

In this scenario, SAM treatment has dropped its importance, building skills in health personnel is out of sight; but for those that work with the poorest population is a necessity missed by the in-service and pre-service trainers. The aim of the project was to identify if the Malnutrition eLearning course could cover this training gap among health professionals and improve the quality of treatment of SAM children.

Nutrition Embedding Evaluation Program (NEEP), PATH supported a Malnutrition eLearning course evaluation in Guatemala, El Salvador, Ghana and online from overall world. We will describe Central America´s results. Using a mixed methods, evaluation was conducted for existing users and for new users and trainers. Online Malnutrition eLearning course is in English, contents include 3 units about screening, assessing, managing malnutrition

Phase 1

Participants were former users in Guatemala students and professionals. Online questionnaires, interviews and Focus groups were conducted.

Phase 2 new users

We enrolled 143 participants from 6 institutions: Rafael Landivar University, Nutrition Degree in Guatemala and Quetzaltenango; Juan Pablo II Hospital (paediatricians); Guatemala´s Health Ministry Nutritionist; University Evangelica de El Salvador (nutritionist); Hospital Nacional Zacamil (paediatricians). In June 2015 pre-test, questionnaires, focus groups, medical records (one year before) and hospital observations. eLearning was done in September to comply with the programme contents, post intervention evaluation was in October. 21 trainers were selected from institutional survey for a workshop where they made an action plan to implement the course.

A post-6-months test was conducted to verify knowledge gain in longer term. 6 and 12 months' interviews, focus groups and questionnaires were conducted for individuals and for the hospital's medical records and observations.

We had 47 participants, pre-test scores average percentage was 16.83 and post-test were 28.62. Despite the significant change, scores were low, but all the sample reported Language barrier as main reason they were not able to answer properly. Participants that reported skills gain compare course contents to national SAM managing guidelines while eLearning. Implementing the course with credit gains was more successful than the ones that didn´t, learning in English resulted a double burden. For Guatemala, course represented the technical background, that few had, for implementing the national SAM treating guidelines. At the 6 and 12 months' follow-up participants reported they use course contents in their daily work, particularly the assessment and 10 steps.

We generated two needs in SAM control: a tool to support science and technical background in managing SAM children available online for all health workers, and the need of Malnutrition eLearning course in Spanish.

Keywords: Malnutrition, eLearning, prevention, control, training

Further collaborators: As part of the International Malnutrition Task Force we will continue efforts for capacity building in malnutrition assessment, screening, managing, promotion and prevention. The next step is to translate course to Spanish.

LOW-CALORIE SWEETENERS – UPDATE ON HEALTH & SAFETY

LOW-CALORIE SWEETENERS AND WEIGHT – A SYSTEMATIC REVIEW OF HUMAN AND ANIMAL STUDIES

Rogers, Peter.

PhD. Psychologist. School of Experimental Psychology. University of Bristol. United Kingdom.

The major potential benefits for public health of low-calorie sweeteners (LCS) are a reduction in sugar intake and consequent reduction in overweight and obesity. However, the usefulness of LCS for weight management has been challenged on several grounds. First, there is the possibility that food intake increases to compensate for the energy dilution achieved with LCS, second is the suggestion that LCS weaken the relationship between sweet taste and food energy content and thereby disrupt the learned control of appetite, and third is the argument that exposure to sweetness increases desire for sweetness which escalates sweet food intake. There is partial but, importantly, not full energy intake compensation after consumption of LCS versus sugar. Separately, results of animal studies used to support the disruption of dietary learning by LCS hypothesis have been demonstrated to be explained by a procedural artefact. In any case, this hypoth-

esis is irrelevant to the human diet because sweetness and sugar content do not reliably predict energy density, even within and across categories of minimally processed foods. In relation to the 'sweet tooth' hypothesis, consumption of LCS versus water has not been found to increase energy intake in the short-term, with other evidence showing a decrease in sweet food intake when a LCS drink is consumed with a meal. The latter is consistent with the phenomenon of 'sensory-specific satiety.' There is rather little evidence on the effects of longer-term exposure to sweetness. In one recent study, consumption of a diet low in sweetness for 3 months increased perceived sweetness intensity of sucrose in a pudding and a drink, but it did not affect rated pleasantness of the same test products. Together, these various results largely refute claims about counterproductive effects of LCS and predict that consumption of LCS in place of (some) sugar in the diet should help reduce overall energy intake and body weight. Recent meta-analyses of intervention studies in adults and children, fully support this prediction. The duration of these studies ranged from 1-40 months. Furthermore, if anything, body weight was lower for LCS drinks compared with water, perhaps because, as suggested above, consumption of LCS may help satisfy the desire for sweetness within a meal. Overall, LCS appear to be helpful for weight management. There are nonetheless obviously limits to the extent to which dietary energy content can be reduced (diluted) by replacing sugar with LCS. These include consumers' current level of free sugars intake and their willingness to consume LCS, and technical constraints on how much sugar can be substituted, especially in foods.

Keywords: Low-calorie sweeteners, sugars, appetite, obesity, weight management.

Conflict of Interest disclosure: Peter Rogers has received funding for research from Sugar Nutrition UK, provided consultancy services for Coca-Cola Great Britain and received speaker's fees from the International Sweeteners Association and the Global Stevia Institute.

NON-CALORIC SWEETENERS AND GLYCEMIC RESPONSE

Pi-Sunyer, Xavier.

Columbia University. New York, USA.

Non-caloric artificial sweeteners (NAS) are widely used globally. Since they came on the market, they have generally been considered metabolically inactive and safe with regard to glucose homeostasis by the FDA and other regulatory agencies. Numerous safety trials with the various products in the market have been done through the years and most have shown little impact on glucose levels during both short-term and longer-term trials. However, there have been a few that have reported small alterations in glucose and insulin levels.

Recently, three new important issues have emerged: taste receptors in the gut, the impact of microbiota, and interference with learned ingestive responses.

It is evident now that taste receptors, once thought to reside only in the mouth, are also present in the intestinal lumen. NAS can therefore bind to these receptors and can initiate signals that may be relayed to the blood, brain, pancreas, liver, etc and could modify glucose homeostasis.

The importance of the gut microbiota in modifying the glucose homeostasis of an organism is unclear and is being explored. Most studies to date have been done in rodents generally utilizing high doses of NAS. With these models, perturbations in the microbiota have been shown and an impact on glucose has been reported.

It has been hypothesized that NAS can alter the ability to predict the energy ingested and evoke a learned response that is faulty, leading to metabolic changes in the organism..

The strength of the available evidence base regarding these three potential mechanisms for altering glucose homeostasis will be reviewed and evaluated.

Keywords: Non-caloric sweeteners, glucose homeostasis, microbiota, taste receptors, learner responses

SWEET TASTE AND IMPLICATIONS WITH LOW-CALORIE SWEETENER USE

Bellisle, France.

PhD. Psychologist. Nutritional Epidemiology. Universtie Paris 13. France.

The World Health Organisation (WHO) recommends that adults and children reduce their intake of free sugars to less than 10% of the daily energy intake. This recommendation is based on the potential adverse effect of a high intake of sugar on body weight control and metabolic health. If dental health is taken into consideration, then the WHO recommends a further reduction of free sugar intake below 5% of the daily energy intake. Such recommendations are challenging for many individuals and more so in certain parts of the world where the culturally accepted levels of sweetness in the diet are high.

Sweetness is a potent psychobiological stimulus in many animal species, including humans of all ages. Human newborns display an innate attraction to sweet substances, manifested by eager acceptance and a stereotyped gusto-facial reflex of relaxation and smile. Such innate responses present a survival advantage in the context of Natural Selection, facilitating the acceptance of energy and nutrient sources by the young organism. Indeed, the appetite for sweetness is high in infants and children. As it does in other species, the human appetite for sweetness spontaneously decreases during growth. Adults vary largely in their preferred intensity of sweetness in a broad range of beverages and foods. Genetic influences and personal experiences with sweetness shape the adult responses. Cultures as well as individuals show large differences in the consumption of sweet tasting products.

Sugar brings 4 kcalories per gram and it is easy to see how its pleasant taste could stimulate overeating and weight gain, as suggested by the WHO. Observational studies in many countries, however, show little correlation between the body adiposity status and individual liking or consumption of sweet tasting products. Overweight and obese individuals often display an enhanced appetite for dietary fats (that bring 9 kcalories per gram) rather than sugar.

How can a reduction of sugar intake be achieved? Should all sweet tasting substances be limited or can low-calorie sweeteners (LCS) contribute to a decrease in sugar intake (and the associated energy load) while retaining the palatable sweet taste of many favorite foods and drinks? Numerous scientific studies have addressed this issue. Experimental reports confirm that the use of LCS is associated with lower energy and sugar intake in the context of weight loss programs. LCS also facilitate the maintenance of the reduced weight after the end of a diet. Disproving early suggestions that LCS may enhance the natural appetite for sweetness and paradoxically stimulate the consumption of other sweet (sugar-containing) products, experimental trials show that LCS satiate rather than enhance the appetite for sweet tasting products and facilitate the reduction of sugar intake. More research is needed to assess the role of LCS in the management of sweetness appetite over the life span, in the prevention of weight gain, particularly in individuals at risk of overweight and in cultures where the traditional level of sweetness in the diet is high.

STRATEGIES FOR INCORPORATION OF SUITABLE CARBOHYDRATES IN THE PREVENTION OF CHRONIC DISEASES

CARBOHYDRATES AND HEALTH

Katz, Mónica.

Nutrition. Favaloro University. Buenos Aires Argentina.

Dr. Mónica Katz
Favaloro University. Buenos Aires. Argentina.

Carbohydrates are ubiquitous in nature and fundamental to life. They include grains, legumes, vegetables and fruits; have diverse structures with different functions. This group of macronutrients contributes not only to the nutritional status but also to the pleasure and enjoyment of food. The percentage of carbohydrates established by important nutrition and health institutions varies. It is between 55–75% in the last document published by WHO in 2007. In the case of the Scientific Advisory Committee on Nutrition (UK), it proposed a lower limit of 50%. Finally the Dietary Guidelines for Americans (2015-2030) recommended the same amount as WHO but recommended that half of all carbohydrates be whole grains.

Unfortunately starting in the second half of the 1990s, carbohydrates became "bad". A strong carbophobia was born after a long stage of lipo phobia. Various theories halfway between science and ideology

led this phenomenon. In the first place, there was the high prevalence of dieting caused by the presence of a disease o a simple cultural obsession. Second, it was the insulin theory. Although science has tear down the apparent efficacy in the long term to produce sustainable weight loss, has pointed the hazards inherent to its use and there is strong evidence that de novo lipogenesis under normal conditions is not very relevant in humans, low carb/high protein diets became very popular to lose weight.

Simultaneously, to facilitate the process, it began a demonization process of carbohydrates based erroneously in part, by the confusion generated by dissemination of knowledge about celiac disease.

Fortunately, in the last years, the medical view of carbohydrates is becoming more balanced. The nature of dietary carbohydrates appears to be a more important determinant of health outcomes than the proportion of total energy intake. It began to be emphasized that a high content of dietary fiber is associated with low energy density, promotion of satiety and beneficial influences on the microbiota.

Finally an important pending debt of nutrition science is to redefine what constitutes a healthy diet. We propose it might be sufficient, complete, varied, balanced, adequate, shared, tasty and pleasant, suitable to be adopted as a lifestyle and sustainable for the planet and carbohydrates should be at least, half of it.

Keywords: Carbohydrates, carbophobia, healthy diet, nutrition, low carb/high protein diets

THE COLON MATTERS IN BLOOD SUGAR MANAGEMENT: HOW PREBIOTIC FIBERS CAN WORK IN GUT MICROBIOTA, GLUCOSE METABOLISM AND METABOLIC DISORDERS

Cani, Patrice D.

RD. MBSc. MHS. PhD. Professor. Research Associate FRS-FNRS. Université catholique de Louvain. Louvain Drug Research Institute. WELBIO (Walloon Excellence in Life sciences and BIOtechnology). Metabolism and Nutrition research group. 1200 Brussels. Belgium.

Obesity is characterized by a cluster of metabolic disorders involved in the development of cardiometabolic disorders such as insulin resistance, diabetes, hepatic steatosis and inflammation.

We and others have shown that gut microbes are dialoguing with the host cells via several mechanisms and thereby contribute to the regulation of energy, glucose and lipid homeostasis. Changes in the gut microbiota composition and/or the activity of specific microbes may be obtained by using specific dietary compounds such as prebiotics.

Over the last 20 years, we have contributed to the demonstration that prebiotics such as oligofructose and/or inulin modulate host metabolism in both pre-clinical and clinical studies. Their potential relevance in the management of obesity and related metabolic disturbances will be discussed.

Among the key mechanisms, it has been shown that the production of bioactive compounds (including short-chain fatty acids or lipid metabolites) directly interact with host cellular targets to control energy metabolism and immunity.

For example, prebiotic fibers increase satiety, reduce food intake, fat mass development and improve glucose metabolism. The prebiotic-induced microbiota modulation changes gut peptides involved in appetite regulation, glucose metabolism, energy homeostasis and gut barrier function (e.g., GLP-1, PYY, or GLP-2). Other mechanisms such as metabolic endotoxemia, changes in gut barrier function (e.g., antimicrobial peptides production, mucus layer thickness, immune system) or altered endocannabinoid system tone contribute to reduce inflammation.

Finally, the role of prebiotics on Akkermansia muciniphila, a key bacteria playing a major role upon obesity, diabetes and inflammation, will be discussed.

In conclusion, prebiotic fibers are useful tools with accumulating scientific evidence further supporting their use for human health.

CARBOHYDRATE QUALITY MATTERS: THE MEANING OF SLOWLY DIGESTIBLE CARBOHYDRATES FOR BLOOD SUGAR MANAGEMENT AND BEYOND

Henry, Jeyakumar.

PhD, Director, Clinical Nutrition Research Centre, Singapore Institutes for Clinical Sciences, Singapore.

Asia and the Middle East are in the grip of a pandemic in type 2 diabetes and metabolic syndrome. They are also the unenviable epicenters of type 2 diabetes. Of the 450 million type 2 diabetics diagnosed worldwide, approximately 50% live in this region. The prevalence of type 2 diabetes has been partly ascribed to the high carbohydrate (CHO) content of the diet that people in this region consume. Recent evidence also suggests that they are susceptible to type 2 diabetes due to their phenotype. The concept of the glycaemia index (GI) of food has emerged as an important nutritional concept. The GI is a classification of the blood glucose-raising potential of carbohydrates in foods. High GI foods are characterized by fast-release carbohydrates and higher blood glucose levels. Low GI foods are absorbed at slower rates which in turn results in a lower rise in blood glucose. Paradoxically, most CHO-rich foods

we consume notably bread, rice and noodles are high GI foods. Diet based interventions have been promoted as a complimentary strategy to manage, prevent and treat diabetes. One of the earliest food based ingredients used to reduce glycaemia was beta-glucan. Since then a series of natural ingredients have been identified and used to reduce the glycaemic impact of carbohydrates. This presentation will highlight the important role that isomaltulose may play in reducing and modulating the glycaemic excursion of carbohydrate rich foods. Using a series of studies the presentation will display how the addition of isomaltulose to a high GI meal can also reduce the glycaemic response over a 24hr period. Finally, the simultaneous measurement of 24hrs blood glucose using a continuous glucose monitor and measurement of energy expenditure demonstrated conclusively that the inclusion of isomaltulose can not only reduce glycaemia but also increase fat oxidation. In our "war on diabetes" the use of isomaltulose may be a useful weapon to combat this worldwide threat. The study also endorses the claim that food is the new medicine.

COMPREHENSIVE MANAGEMENT OF OBESE PATIENTS

RELATIONS BETWEEN THE UNDERWEIGHT OF CHILDREN FROM 6 TO 59 MONTHS AND THE FEEDING OF THEIR MOTHER, BAMAKO

[1]*Djeneba, Coulibaly;* [2]*Djeneba, Coulibaly;* [3]*Ag Iknane, Akory;* [4]*Fatou, Diawara.*

[1]Médecin, MPH Nutrition, Faculté de Pharmacie; [2]Médecin Nutritionniste, Faculté de Pharmacie; [3]Maître de conférences, Santé Publique Nutrition, faculté de Pharmacie; [4]Médecin Epidemiologiste, Faculté de Pharmacie.

Abstract

Malnutrition is a public health problem in Mali. It is within this framework that the present study on the relationship between the nutritional status of children aged 6 to 59 months and the feeding of their mothers was carried out in a first level health facility in the Bamako district of Mali.

A cross-sectional study involving 151 children aged 6 to 59 months and 149 mothers using the Expanded Program on Immunization and the Consultation of Healthy Children was conducted at the Niamakoro Community Health Center (ANIASCO) in the District of Bamako, Mali from 28 September 2015 to 28 January 2016. Socio-demographic data, feeding patterns and anthropometric measurements of mothers and children were collected. Pearson's Chi2 was used for comparison of means with a significance level of 95%. The bi and multi varied logistic regression was used to calculate the OR.

The mean age of the children was 7.89 months [7.57 - 8.20] and that of the mothers of 24.79 years [23.87-25.56]. Among the children, the female sex predominated with 55%. Only 2.6% of the children were exclusively breastfed. The prevalence of underweight was 15.2%, and the chronic energy deficit rate for mothers was 6.7%. The dietary diversity score (SDA) was 27.5% for mothers and 86.1% for children.

Multivariate analysis revealed that underweight was significantly associated with mothers' dietary diversity (SDA) score (p-value = 0.03). The nutritional status of mothers, on the other hand, had no influence on that of children. A statistically significant relationship was observed between maternal nutrition and underweight children.

Adequate feeding of mothers would improve their nutritional status, which could reduce the prevalence of underweight.

Obesity is a chronic disease, most chronic illnesses require treatment based on the pyramid of treatment of chronic diseases: balanced diet based on guidelines, physical activity, cognitive and behavioral changes, medications and at the apex of the pyramid is surgery or other procedure more intensive. Chronic diseases are almost always treated with diet, physical activity and behavior modification , drugs and drug combinations and bariatric surgery. Obesity drugs are generally safe.Average weight loss with current obesity drugs is modest (5%-10% of initial weight).Some people respond to drugs with great weight loss.If a drug doesn't work, stop it!Drugs must be used long term – if you stop an effective treatment, it stops working. Drugs are generally a lot cheaper than behavior modification programs.Drugs are the future of obesity treatment. Combinations of treatments are generally more successful in producing weight loss and maintaining weight loss than single treatments. Drug combinations are the future of obesity treatment. Obesity surgery is the most effective single treatment, but weight regain may be treated with obestiy drugs. Thus the focus of my presentation will be based on antiobesity pharmacology therapy showing the different antiobesity medications and the

challenges in their use in function of popular and scientific myths related to the medical prescription of antiobesity drugs.

UPGRADE IN DIETS FOR OBESITY

[1]*Suen, Vivian;* [2]*Ribas-Filho, Durval.*

[1]MD. PhD. Ribeirao Preto Medical School University of Sao Paulo. Brazilian Association of Nutrology. Brazil.; [2]MD. PhD. Brazilian Association of Nutrology. School of Medicine of Catanduva. Brazil.

Obesity is a significant medical and social problem due to its severity and high and growing worldwide prevalence. The medical management of obesity includes lifestyle modification, with/without support from medications. A variety of dietary approaches that can produce weight loss are described, such as limiting the daily calorie intake to 800-1500 kcal/day or reducing the daily caloric intake by 500-750 kcal/day. With respect to pharmacotherapy, it is indicated as an adjunct to a reduced-calorie diet and increased activity for long-term weight management. Results from a meta-analysis showed that the weight loss with orlistat, lorcaserin, and liraglutide used as monotherapy ranged from 5.8 to 8.8 kg (5.8 to 8.8%) of initial body weight. The weight loss with placebo ranged from 2.6 to 5.3 kg. It is important to note that a moderate weight loss can result in improved health and quality of life. Besides, a high-intensity behavioral counseling during the medical treatment with regular recording of food intake and physical activity is of utmost importance to increase patient´s adherence to treatment. However, the greatest challenge of obesity treatment is the long-term maintenance of the reduced weight. There is an urgent need to develop new strategies for weight loss maintenance in the long-term.

PHARMACOTHERAPY ANTI OBESITY: PRESENT AND FUTURE

[1]*Giorelli, Paulo;* [2]*Giorelli, Paulo;* [3]*Giorelli, Guilherme;* [4]*sartoretto, Silvia.*

[1]Medical Doctor. Master Science. Associação Brasileira de Nutrologia; [2]Medical Doctor. Master Science. Director of Obesity Department of Associação Brasileira de Nutrologia. Brasil; [3]Medical Doctor, Master Science, Affiliated Professor of Associação Brasileira de Nutrologia, Brasil; [4]Medical Doctor. Specialist in Endocrinolgy. IEDE Brasil.

The authors will show the Brazil's experience with the anti obesity drugs like Diethylpropion, Fenproporex and Mazindol and they will present their research with the Diethylpropion's use in 3800 obesity patients. They will discuss about the impact of the

banishment of these medicine drugs in Brazil's public health, with the increase of the obesity's patients in Brazil.

At the same time, we will show the aggravation of the comorbidities of obesity in Brazil's population after the banishment of these anti obesity drugs.

They will show the current Brazil's scenario of anti obesity drugs with Orlistate, Sibutramine, Liraglutide and Lorcaserin.

Finally we will discuss about the use of off-label medicine drugs in the obesity's treatment in Brazil

Keywords: Pharmacotherapy of Obesity, Diethylpropion, Liraglutide, Lorcaserin.

HEALTH CONSEQUENCES OF OBESITY IN CHILDHOOD

Nogueira-de-Almeida, Carlos Alberto.

PhD. Medical Professor. University of Ribeirao Preto. Associação Brasileira de Nutrologia.

In Brazil, nowadays, almost 50% of boys and girls with ages between 5 and 9 years old are overweight or obese. And these children frequently have one or more comorbidities. We have been studying some of these comorbidities from the last 5 years. First of all, we studied dyslipidemia and insulin resistance. We found that 69.4% of the children had high cholesterol, 45.2% high LDL, 54.8% low HDL and 53.2% high triglycerides. It is consensual that we have a vicious circle including obesity and insulin resistance and we evaluated 383 children with ages between 7 and 10 years using fasting insulinemia and Homa as indicators of insulin resistance. The prevalence was very high, independently of the method: 33.1% using fasting insulin > 15 and 37.8% using HOMA > 3.5. We also looked at blood pressure and we showed high blood pressure values among obese children, when compared to eutrophic children. Regarding the heart, we investigated if obese children, with ages between 6 and 9 years, has detectable modifications of the heart anatomy, specially regarding to the left ventricle, and we found that, among 5 index evaluated, two of then (the LV mass and the LV3 index) showed differences, with greater thickness of the ventricle among obese children. The intima-media complex of common carotid artery can be accessed using ultrasonography. This is a very safe and accurate method to evaluate the onset appearance of atherosclerosis. We evaluated 59 children of both genders, between 7 and 10 years old. The average thickness of the intima-media complex in the group overweight / obese was 0.49mm; in the non-obese group, the measurement was 0.41mm. There was a significant difference between groups (p <0.01). And, also, we showed a correlation between the increase of the z-score of BMI and the increase of the intima-media complex. We evaluated the abdominal adiposity distribution. Results from 59 children of both genders, between 7 and 10 years old showed high correlation of fat deposits between each other and the two compartments of abdominal fat deposition increased together. And, even more important, both subcutaneous fat and visceral fat showed almost the same correlation with abdominal circumference. This means

that, at this age, when we measure the abdomen, we are measuring both visceral and subcutaneous fat and this two measurements increase together with the increase of the abdominal circumference. At this same study, we evaluated the liver and an hiperechoic image is an indicator of the presence of Non Alcoholic fat Liver Disease (NAFLD). Children with normal liver tend to have less subcutaneous fat then children with more echoic liver. And, similarly, children with normal liver tend to have less visceral fat then children with more echoic liver. In conclusion, even among school children, we could find a lot of obesity comorbidities, as: dyslipidemia, insulin resistance, high blood pressure, left ventricle hypertrophy, carotid intima hypertrophy, visceral fat accumulation and NAFLD.

EATING BEHAVIORS DISORDERS OF OBESE PATIENTS

Zariategui de Alonso, Maria del Rosário.

MD. Physician. Department of Eating Disorders. Associação Brasileira de Nutrologia. ABRAN.Brazil.

Eating behavior disorders appeared more often in patients with overweight and obesity than patients with normal weight. Binge eating and other disordered eating patterns are also more commoom in overweight youth.

Binge eating disorder (BED) recognized as a formal diagnosis in Feeding and Eating Disorders in the last version of Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition (DSM-5) and Night eating syndrome (NES) are associate with obesity.

Research has shown eating pathology is commonly seen in bariatric surgery patients before surgery, and may persist or emerge after surgery. BED and other eating disorders that NES have been fairly consistently linked to greater weight regain post-surgery

Behavioral modification, nutritional education and cognitive behavioral therapy (CBT) are necessary in .eating behaviors disorders of obese patients. Binge eating and other disordered eating patterns are important to asses because they may directly contribute to overweight and addressing these behaviors will directly affect weight management goals. CBT is effective in reducing eating episodes in patients with BED but is not sufficiently effective for reduction of excess body weight..Nutritional deficiênces, therapies and drugs are also discussed

Keywords: Eating Behavior Disorder Obesity Patients

SARCOPENIC OBESITY

Lucif Jr., Nelson.

PhD.MD. University of Ribeirão Preto. Brazil.

The world's population is aging. One of the most dramatic body changes with aging is the loss of muscle mass. Although the peak of muscle mass and the beginning and the intensity of the loss all

varies among people, this loss may reach a state called sarcopenia, which compromises the function, quality of life and life itself. Although there is no agreement on the definition of sarcopenia, its concept is well established. In addition, the world increase incidence of obesity also has reached the elderly people , with aggravating factors pertinent to this age group like metabolic disorders and other. The confluence of these two phenomena , called sarcopenic obesity, results in individuals with fragility, greater vulnerability and increased mortality from all causes. Efforts should be concentrated to prevent and treat individuals of these conditions. Adequate food intake, with the provision of energy and protein for weight adjustment and optimize muscle synthesis, in addition to the micronutrientes, is essential. This, along with the regular practice of exercises are the basis of this approach. Some supplementation may be necessary.

PS_144/116
NEW STRATEGIES IN THE CONTROL OF ENERGY BALANCE

GENOMICS OF BODY COMPOSITION, FROM SEVERE OBESITY TO EXTREME THINNESS: LEPTIN-MELANOCORTIN SYSTEM

Santos, José Luis.

Department of Nutrition, Diabetes and Metabolism. School of Medicine. Pontificia Universidad Católica de Chile. Santiago, Chile.

Although near to eighty obesity genetic syndromes have been described, most cases diagnosed with monogenic obesity are caused by disruption of genes belonging to the leptin-melanocortin pathway such as LEP (encoding leptin), LEPR (leptin receptor), MC4R (melanocortin-4 receptor), POMC (proopiomelanocortin) and PCSK1 (proprotein convertase subtilisin/kexin type 1), among others. Mutations of MC4R are considered as the most frequent cause of rare monogenic forms of human obesity, which may be responsible of up to 5% of severe childhood obesity and approximately to 1% of adult cases of severe obesity. Apart from the roles of MC4R in the regulation of food intake, this receptor also regulates blood pressure, lipolysis and insulin secretion through its reciprocal action on the two divisions of the autonomic nervous system (sympathetic and parasympathetic). The use of MC4R agonists has been proposed as a therapeutic strategy for treating obesity. However, most of the reported MC4R agonists show the undesirable property of increasing blood pressure, although a new MC4R agonist lacking such side-effects (setmelanotide) leads to reduction in body weight and energy intake in patients with mutations in POMC gene. After the identification of the genetic leptin deficiency in mice and humans, it was reported that subcutaneous leptin ad-

ministration to obese patients carrying mutations in the leptin gene reduced dramatically their energy intake and body weight. However, administration of human recombinant leptin as a monotherapy to patients with common obesity (with high circulating leptin and insulin levels) does not seem to reduce energy intake or body fat, indicating a resistance to leptin action in multifactorial obesity. Recently, it has been shown that the administration of leptin-sensitizers such as celastrol to mice with diet-induce obesity generated a reduction in body weight and energy intake, leading also to improved indexes of glucose homeostasis. On the other hand, the study of human leanness represents a complementary approach for ascertaining genes related to body weight regulation. Obesity/leanness are not only opposite phenotypes but also may behave as mirror traits. An interesting example of this phenomenon is provided by structural variations of chromosome 16p11.2, in which large deletions in this region containing SH2B1 gene (involved in leptin and insulin signalling) are strongly associated with obesity, while duplications are associated with leanness. Another example is Type 1 Generalised Congenital Lipodystrophy which is caused by mutations in AGPAT2 gene. Affected patients are characterised by extreme leanness, very low leptin and adiponectin plasma levels, as well as severe insulin resistance. In patients affected with this disease, administration of human recombinant leptin results in a remarkable improvement of glycaemic control, indicating the insulin-sensitizing effects of this hormone. The evaluation of obesity/leanness as opposite phenotypes remarks the usefulness of assessing the role of leptin in different pathophysiological contexts, revealing new aspects of adipose tissue biology.

Keywords: Obesity, thinness, leptin, melanocortin, lipodystrophy.

BROWN ADIPOSE TISSUE AND BROWNING OF WHITE ADIPOSE TISSUE

Gil, Ángel.

PhD. Prof. Department of Biochemistry and Molecular Biology. Institute of Nutrition and Food Technology. Centre of Biomedical Research. University of Granada. CIBERobn. Spain.

Adipose tissue is composed of various cell types, which include adipocytes and other cells of the stromal vascular fraction such as preadipocytes, blood cells, endothelial cells and macrophages. Mammals have two main types of adipose tissue: white adipose tissue (WAT), and brown adipose tissue (BAT), each of which possesses unique cell autonomous properties. WAT and BAT differ at the functional, as well as the morphological and molecular levels. Brown adipocytes have a primary function in heat generation as they uniquely express the uncoupling protein 1 (UCP1) and were considered to be at most a minor component of human adipose tissue. However, he presence of BAT close to the neck and supraclavicular areas in adult humans was discovered in 2007, and later there has been an explosion of knowledge about BAT, both at the molecular, cell and clinical levels.

While the function of BAT located in discrete depots in the thorax is well-established, recent findings suggests that brown adipocyte progenitor cells, and possibly differentiated brown adipocytes, exist as scattered individual cells and small cell clusters distributed diffusely within WAT and possibly skeletal muscle tissue. Indeed, a new kind of adipocytes called BRITE (BRown-like adipocytes in whITE adipose tissue) or beige adipocytes has been identified within WAT; these cells arise from the same origin as white adipocytes, but they also share characteristics with those of brown adipocytes as the expression of UCP-1. Overexpression of the PRDM16 in white fat depots induces the formation of brown adipocytes, a process called "browning". The presence of brown adipocyte progenitor cells in WAT and the ability to induce brown adipocyte differentiation both in vitro and in vivo, suggest the possibility of a therapeutic approach for obesity based on brown adipocyte-mediated energy expenditure.

As BAT dissipates energy, due to its ability to oxidize glucose and lipids, recruitment and activation of BAT i.e. browning might be a therapeutic target for treating metabolic disorders such as obesity and type 2 diabetes. BAT is stimulated by the sympathetic nervous system (SNS); however, there are some novel BAT activators, some of them myokines, which act independently of the SNS, such as cardiac natriuretic peptides, irisin, interleukin-6, β-aminoisobutyric acid and fibroblast growth factor 21, that could influence BAT metabolism. Recently, we have postulated that exercise might activate and recruit human BAT through activation of SNS, heart and skeletal muscle. Thus, exercise could induce browning of the WAT and activate BAT, which in turn would results in increased thermogenesis and energy expenditure with concomitant loss of fat mass. We are currently carrying out a study (ACTIBATE) to evaluate the effect of long-term exercise training (24 weeks) on BAT activity and quantity in young overweight and obese adults.

MICROBIOTA AND OBESITY

Marcos, Ascensión.

Research Professor at the Spanish National Research Council (CSIC). Treasurer of the Spanish Nutrition Society (SEÑ).

Both the microbiota and the human host maintain a symbiotic association. Nowadays, metagenomic analyses are providing valuable knowledge on the diversity and functionality of the gut microbiota. However, with regard to the definition of a "healthy microbiota" and the characterization of the dysbiosis linked to obesity or other metabolism and inflammation-related disorders, there is still not a clear answer. Obviously, genes have an important role on the microbiota characteristics of an individual, but also lifestyle habits, such as diet, eating behaviour, body composition, physical activity, stress, as well as sleep profile, have been shown to be responsible of the type and diversity of bacteria in the gut. In addition, a new association has been recently discovered, such as the gut microbiota-brain axis that opens the perception that microbiota can act not only at an intestinal level, but also at several sites of the organism, no matter how far they are from. Therefore, attempts have been made to counteract obesity through including different foods to be consumed into the diet. To this end, prebiotic and probiotic supplementation have been the former compounds used with the purpose to ameliorate and achieve a healthy microbiota. In the scientific literature, there are several experimental studies in animal models relevant to this topic. So far, evidence of an anti-obesity effect of different lactobacilli and bifidobacteria has been mainly obtained from animal models submitted to dietary-induced obesity. Using these experimental models, a substantial number of studies have reported reductions in weight gain and, particularly, in fat tissue mass at different locations following administration of beneficial bacteria, as compared with controls. Antiatherogenic and anti-inflammatory effects—including regulation of expression of lipogenic and lipolytic genes in the liver, reduction in liver steatosis, improvement of blood lipid profile and glucose tolerance, decreased endotoxemia, and regulation of inflammatory pathways—are also reported in many studies. The number of human studies focused on prebiotic or probiotic administration for obesity management is still very scarce, and it is too soon to judge their potential efficacy, especially when considering the fact that the actions of prebiotics and probiotics depend on the doses, the time and the period of administration, as well as the metabolism of the subject. In addition, the efficacy of probiotics is always strain-specific and the individual response varies according to intrinsic factors, the overall composition of the diet, and the interactions with the rest of lifestyle-related factors.

INTEGRATION TO IMPLEMENTATION (I TO I) ON VITAMIN A INTERVENTIONS

RELATIVE STRENGTHS AND WEAKNESSES OF AVAILABLE INTERVENTIONS/PROGRAM STRATEGIES TO PREVENT DEFICIENCY OR IMPROVE VITAMIN A STATUS IN INDIVIDUALS OR POPULATIONS

Udomkesmalee, Emorn.

PhD. Senior Advisor. Institute of Nutrition Mahidol University. Thailand.

Addressing vitamin A deficiency (VAD) as a public health problem in developing countries requires a mix of interventions. The most widely-implemented program is the universal vitamin A supplementation (VAS) among children 6-59 months of age which began in 1990s in response to the evidence of risk reduction of childhood mortality, primarily due to

infectious diseases. The program can be scaled nationwide and achieved desirable coverage cost-effectively through joint implementation with existing child health services. However, VAS is not able to sustain improvement of VA status beyond 3 months

and, therefore, requires complementary interventions to effectively control VAD. Over the past decade, large-scale fortification of VA in sugar (success story in Central America), vegetable oil and staple grains expanded across Africa and Asia. While the approach is efficacious and cost-effective, monitoring quality production to consumption as well as evaluating public health impact remains a challenge in many settings. For dietary diversification to promote consumption of VA foods, data are scarce on efficacy and effectiveness of such interventions. Of interest, provitamin A carotenoids in foods offer a double opportunity to fill the gap of VA intake as well as enhance functional benefits within the healthy diet scheme. Recently, studies on bio-fortified crops especially orange-fleshed sweet potato and maize showed improvement on VA intake and status. Further efforts are required to scale up bio-fortification in target areas. Other VA containing programs include home-fortification micronutrient powder and lipid-based multi-nutrient supplements. In countries where VAS is implemented together with one or more other VA interventions, data gap exists regarding assessment of intakes for inadequate or excess levels as well as program impact on VAD control. For the past two decades, the global progress of nearly 50% reduction in the under-5 mortality, marked decline in undernutrition and burden of infection coupled with emerging data on no effect of VAS on child mortality, raises questions on the relevance and proper scaling of VAS to fit the country profile. Recent reviews identified the need to update magnitude and severity of VAD at national and sub-national levels to guide policy decision. With a co-existence of undernutrition, obesity and non-communicable diseases in low- and middle-income countries, the time is right to redesign the next generation of interventions that address VAD together with other nutritional targets.

Keywords: Vitamin A deficiency, supplementation, food fortification, dietary diversity, program impact

Guatemala is the first country in the world to implement and maintain sugar fortification with vitamin A as a successful public health intervention for decades, with monitoring and surveillance systems in place. Monitoring activities have provided information on the quality and coverage of the program and epidemiological surveillance confirms that universal sugar fortification with vitamin A has been a sustainable cost-effective strategy to drastically reduce vitamin A deficiency. Other strategies implemented in Guatemala include mega dose supplements for children and micronutrient powder provision, but with variable coverage. Efforts to adjust supplementation program according to a sufficient amount of VA provided by sugar have resulted in reducing the age group targeted by supplementation, from 6-59 months-old children to the 6-23 months-old.

Recent national health and nutritional surveys and local nutritional surveillance systems have evidenced that in Guatemala there is also availability of additional dietary sources of VA that can be provided by focal nutritional interventions, bought, as well as voluntarily fortified foods such as cereals, milk and juices. This suggests that a potential excess of VA intake is possible in the Guatemalan context. The lessons learned through has been useful to guide public policies and establish inter-sectoral alliances as in the National Commission of Food Fortification.

This presentation will present data available on national level and how those have influenced national policies. Discussion will be issued on how national food fortification programs can achieve sustainable adequate levels of Vitamin A without carrying out excessive intakes in vulnerable groups.

COUNTRY PERSPECTIVE. WHAT ARE THE IMPLICATIONS OF THE CURRENT CONCERN/DEBATE ON NATIONAL EFFORTS TO PREVENT VITAMIN A DEFICIENCY IN GUATEMALA

[1]*Mazariegos, Dora Inés;* [2]*Martinez, Carolina;* [3]*Melgar, Paul.*

[1]MsSc Biochemist Human Nutrition. Nutrition and Micronutrient Unit. Institute of Nutrition of Central America and Panama. INCAP. Guatemala; [2]Chemical Biologist. Nutrition and Micronutrient Unit. Institute of Nutrition of Central America and Panama. INCAP. Guatemala.; [3]MD. Planification Unit. Institute of Nutrition of Central America and Panama. INCAP. Guatemala.

During the 1960s the vitamin A deficiency (VAD) in Guatemala was consequence of a cereal-based diet poor in both animal and vegetable sources of vitamin A. After designing and implementing a program to fortify sugar with cold-water soluble retinyl palmitate, a longitudinal evaluation demonstrated the effectiveness of the strategy. Follow-up biochemical assessments based on national health and micronutrient surveys showed a decline of VAD from 26.0% to 15.8% during 1965—1995 in children aged 0-59 months, and in 2008, the prevalence of low serum retinol values was 0.3%.

WHAT DOES IT ALL MEAN AND HOW MIGHT WE MOVE AN AGENDA FORWARD TO ADDRESS THESE CHALLENGES? C. ENABLING AGENCIES

Kraemer, Klaus.

Managing Director. Sight and Life. Switzerland. Adjunct Associate Professor. International Health Johns Hopkins Bloomberg School of Public Health. USA.

At the World Summit for Children in 1990, it was agreed to 'virtually eliminate vitamin A deficiency (VAD) and its consequences.' However, VAD indicated by serum retinol levels <0.70 µmol/L still affects approximately 190 million preschool-age children. VAD is the most prominent cause of preventable childhood blindness, and increases the risk of childhood death from diseases such as diarrhea and measles. Biannual high-dose vitamin A supplementation (VAS) has been the most successful child survival intervention, which can reduce all-cause mortality rate by 12-24%, and is implemented by 84 countries. In 2014, 17 sub-Saharan countries reached effective coverage >80%. The integration of VAS in national polio campaigns allowed countries to reach high coverage rates. With progress towards the eradication of polio and im-

proved access to vitamin A-rich food, there has been considerable discussion about phasing out VAS. It is conceivable that effective VAS coverage is likely to decline once VAS is solely under the control of the health system. Nonetheless, a successful public health intervention such as VAS cannot be abandoned without assurance that vulnerable groups have access to and consume sufficient vitamin A-rich foods, such as liver, eggs, milk, fruit, vegetables, and fortified foods. Sugar fortification in Guatemala and Nicaragua, for instance, could demonstrate a continuous decline in VAD in different population groups, including preschool-age children. In a recent assessment of sugar fortification with vitamin A in Zambia, however, almost 90% of retail sugar samples analyzed did not meet the legal requirements of 10 mg/kg. This clearly indicates that, before scale-back of VAS can be justified, effective regulatory monitoring of fortification programs and regular assessment of the vitamin A status of the target population must be in place.

Multiple exposures from VAS, micronutrient powder, and fortification have raised concerns about preschool-age children exceeding the Tolerable Upper Intake Level (UL) for vitamin A. However, the UL is not a threshold for adverse effects, and for this age group it is even extrapolated from adults. In addition, vitamin A plasma concentration is not suitable for monitoring, as it is homeostatically controlled and influenced by inflammation. There is a need for reliable biomarkers of excess, because the narrow margin between the Estimated Average Requirement (EAR) and UL could, most notably, disenfranchise vulnerable children. Recent developments addressing the limitations of intake and plasma vitamin A for monitoring for both fortification and supplementation include the application of stable isotope dilution techniques.

Neonatal vitamin A supplementation (NVAS) in the first few days of life has been proposed as an intervention to reduce infant mortality. The evidence for mortality reduction from NVAS in South Asia is overwhelming and, if implemented adequately, could save the lives of as many as 250,000 children annually. No effect of NVAS on mortality was found in studies from Africa in areas with little vitamin A deficiency and low mortality, however. We therefore need policies that support NVAS in settings with high vitamin A deficiency and early infant mortality, including South Asian countries.

NEW ADVANCES ON KETOGENIC THERAPIES

DIETARY VARIATIONS: CLASSICAL KETOGENIC DIET, MODIFIED ATKINS DIET, LOW GLYCEMIC INDEX TREATMENT

Pfeifer, Heidi.

RD LDN. Clinical Nutrition Specialist. Massachusetts General Hospital for Children. Boston. USA.

Dietary therapies have been utilized as treatment modalities of epilepsy for centuries. The classic ketogenic diet (KD) has been used in clinical practice since the 1920s. Although it has been proven to be an efficacious treatment option, compliance with the rigidity of this treatment has led to continued elevated discontinuation rates. Therefore over the past few decades more liberalized versions of the KD such as the the low glycemic index treatment (LGIT) and the modified Atkins diet (MAD) were developed. These liberalized diets do not require the exact weighing and measuring of foods consumed as is required by the classic diet, allowing for a more flexibility in meal planning, including the ability to eat out at restaurants.

The LGIT and MAD are being utilized globally and are demonstrating similar efficacy rates to the classic KD. The backgrounds of the diets are similar in that they contain higher amounts of fat and limit the amount of carbohydrate consumed daily to transition the body to utilizing fat as it's primary energy source. Due to the metabolic changes occurring during treatment it remains important for those utilizing these treatments to be monitored closely for any untoward side effects by a team familiar with intricacies of dietary therapies.

NOVEL FUNCTIONS AND USES OF AMINO ACIDS

THE INFLUENCE OF NUTRITION ON TUMOR METABOLISM AND GROWTH

Vander Heiden, Matthew G.

Koch Institute at Massachusetts Institute of Technology.

Cells adapt metabolism to meet distinct physiological needs, and metabolic regulation influences tumor initiation and progression. To proliferate, cancer cells must adapt metabolism to support anabolic processes that allow the accumulation of biomass. This includes producing those metabolites that are most limiting for tumor growth in physiological tissue contexts. We find that nucleotide synthesis is often limiting, and how cells generate nucleotides is influenced by diet, tissue environment, and tumor type. For many tumors, access to oxygen or other electron acceptors limits the production of purines and pyrimidines. Analysis of metabolism in animal cancer models suggests that tumors can use different nutrients to allow tumor growth. Diet and whole body metabolism affects nutrient availability and influence tumor progression, and also contributes to tissue wasting that this commonly observed in cancer.

BCAA FUNCTION AND INSULIN RESISTANCE FROM THE STUDIES USING GENETICALLY ENGINEERED MICE IN BCAA CATABOLISM

Kitaura, Yasuyuki; Shimomura, Yoshiharu.

PhD, Nagoya University. Japan.

Branched-chain amino acids (BCAAs) (leucine, isoleucine, and valine) are essential amino acids as ingredients for proteins in mammals. BCAAs also play as a nutrient signal for protein synthesis, and recently, their concentrations in blood are highly correlated with insulin resistance. So far, however, whether increased BCAAs would be responsible for insulin resistance or consequences of insulin resistance remains unclear. In fact, impaired BCAA catabolism that leads to increase BCAAs have been associated with insulin resistance, so that the genes related with BCAA catab-

olism are thought to be potential targets for the treatment of insulin resistance. The first two steps of BCAA catabolism are common for these three amino acids. The first reversible transamination reaction is catalyzed by BCAA aminotransferase (BCAT) isozymes, BCATm (mitochondria-type) and BCATc (cytosol-type), which form branched-chain alpha-keto acids (BCKAs) from BCAAs. The second step is an irreversible oxidative decarboxylation reaction by BCKA dehydrogenase (BCKDH) to produce branched-chain acyl-CoAs, which are eventually catalyzed to either acetyl-CoA or succinyl-CoA by each three individual pathways. The BCKDH activity is suppressed by phosphorylation of the dehydrogenase by BCKDH kinase (BDK) and activated by dephosphorylation by PP2Cm. BCATm-deficient mice with blocked BCAA catabolism at the first step showed high BCAA levels in blood, increased energy expenditure and improved insulin resistance by diet-induced obesity, however low exercise capacity. On the other hand, BDK-deficient mice with defect in negative regulation of the second step of BCAA catabolism showed low BCAA concentrations in blood and developed neurological disorder, however the insulin sensitivity of BDK-deficient mice are still unknown. Recently, we have generated the mice with BDK defect either in whole body (BDK-KO mice) or specifically in skeletal muscle and heart (BDK-mKO mice). Although BDK-KO mice showed the phenotype with neurological defects as the previous report, BDK-mKO mice were healthy without any obvious defects when feeding a protein-rich diet, and the concentration of myofibrillar protein was significantly decreased during protein undernutrition. We will discuss the role of BCAAs in insulin resistance with the results we observed using our animal models. This tissue-specific BDK deficient mouse model is very useful for further investigation to find out the importance of BCAAs in any interest tissues or cells.

Keywords: BCAA, insulin resistance, animal model

QUANTITATIVE PROTEOMICS REVEAL OVERALL AMINO ACID TRANSPORT SYSTEMS AND THE RELATED SIGNALING

Nagamori, Shushi.

Ph.D. Associate Professor. Department of Bio-system Pharmacology. Osaka University Graduate School of Medicine. Japan.

Amino acids are known as building blocks of proteins and substrates of metabolic and biosynthetic reactions. However amino acids are also recognized as the signaling molecules to regulate cellular metabolism and cell growth. Among amino acids, leucine is the most effective signaling molecule to regulate cell growth and metabolism by activating mechanistic target of rapamycin complex 1 (mTORC1) which is one of the well-recognized cellular signaling pathways mobilized by amino acids. Since leucine is one of essential amino acids, cell needs to take it up from outside by using transporters. It has been reported that Na+-dependent or Na+-independent plasma membrane transporters are able to transport leucine.

Normal cells control nutrient uptake and metabolic activities to prevent aberrant cell proliferation. On the other hand, in cancer cells, nutrient transporters are constitutively activated to facilitate the nutrient uptake for robust cell growth. Several studies have reported the overexpression of some amino acid transporters. However, there have been no report about comprehensive expression profile of amino acid transporters in cancer cells due to the problematic nature of transporter proteins. Thus, we have exploited comprehensive and quantitative proteomics to review the functional profiles of amino acid transporters in many cell lines. In our study, we found that cancer cell lines selectively expressed one transporter from each transporter family. Expressions of SLC1A5, LAT1/SLC7A5, SLC7A1 and SLC7A6 were conserved in most cell lines. These results strongly indicate that these transporters are the common transporters to supply amino acids for cancer cells.

Of the transporters, LAT1/SLC7A5 transports several large neutral essential amino acids including leucine. By addition of an LAT1-inhibitor BCH, leucine uptake by LAT1 was blocked, and then the phosphorylation of mTORC1 pathway was also suppressed. Therefore, we have applied quantitative phosphoproteomics to analyze the cellular responses to leucine transported via LAT1 comprehensively. Cells were stimulated by leucine in the presence or absence of BCH. Thus, the phosphorylation induced by LAT1-mediated leucine uptake was able to be distinguished. Our result shows that leucine-uptake by LAT1 regulated phosphoproteins involved in multiple cellular processes and revealed the linkage of signaling pathways and cellular responses. These data open a door let us explore the whole picture of signaling stimulated by leucine uptake. Moreover, this approach is not limited to investigate a particular amino acid or a cell type but applicable to various cases of studies.

METHIONINE METABOLISM REGULATES THE FUNCTIONS OF HUMAN PLURIPOTENT STEM CELLS

Shiraki, Nobuaki.

PhD. Tokyo Institute of Technology. School of Life Science and Technology. Japan.

Recent evidence suggests that metabolic pathways are important for the establishment of pluripotency as well as the regulation of cell proliferation and differentiation in pluripotent stem cells (PSCs). Embryonic stem cells (ESCs) and induced pluripotent stem cells (iPSCs) have an unlimited ability to replicate and the potential to differentiate into any cell type. PSCs constitute a promising model for self-renewal and differentiation and may facilitate research about early development. They possess a unique transcriptional circuit that sustains the pluripotent state. These cells are in a specific epigenetic state that enables rapid cell fate decisions.

Furthermore, PSCs possess a characteristically high rate of proliferation as well as an abbreviated G1 phase. Recent reports have shown that metabolism is tightly linked to cellular signaling, and these two processes reciprocally regulate each other to modulate cell activities, such as survival, proliferation, and stem cell function. We and other groups have demonstrated that the universal methyl donor S-adenosyl methionine (SAM) is a key regulator for the maintaining undifferentiated PSCs and regulating their differentiation. In mouse PSCs, SAM is dependent on glycine converted from threonine by threonine dehydrogenase (Tdh). Threonine uptake and Tdh activity are required to maintain high levels of SAM. The human TDH gene is a nonfunctional pseudogene; accordingly, threonine cannot be used for SAM production in human cells. Therefore, human PSCs depend on extracellular methionine for SAM synthesis, and short-term methionine deprivation results in a loss of histone methylation, triggering the reducing NANOG expression, and promoting human PSC differentiation into all three germ layers (Shiraki et al., Cell metabolism 2014). Based on a gene expression analysis and the quantification of methionine metabolites, undifferentiated human PSCs are in a high-flux methionine metabolic state. In contrast, differentiated endoderm cells require a low amount of methionine for growth and are therefore not affected by methionine deprivation. This metabolic difference between undifferentiated PSCs and differentiated cells prompted us to test whether methionine deprivation eliminates the remaining undifferentiated cells. After prolonged (48 hr) methionine deprivation during mid-stage endoderm differentiation, residual undifferentiated cells were eliminated, and the overall differentiation efficiency increased. These results have implications for the elimination of variability in differentiation efficiency among cell lines and for the promotion of differentiation into specific cell lineages. Here I show methionine metabolism, which regulates the maintenance and differentiation of human PSCs, summarize the roles of SAM and epigenetic crosstalk in these processes, and compare these mechanisms in mouse and human PSCs.

FOOD CONSUMPTION SURVEYS: RESULTS AND USES

LATIN AMERICAN SURVEY OF NUTRITION AND HEALTH (ELANS). PRELIMINARY RESULTS

Kovalskys, Irina.

MD. Nutrition and Health Area. International Life Science Institute (ILSI). Buenos Aires. Argentina.

Determinations of total energy intake, diets nutrient composition and dietary patterns of Latin American countries are critical to address the epidemic of non-communicable diseases and the health consequences of physical inactivity. This information

would be of the greatest actionable value for developing dietary recommendations and policies for governments, and scientists

ELANS Protocol

The Latin American Study of Nutrition and Health/Estudio Latinoamericano de Nutrición y Salud (ELANS), is a randomized cross-sectional multicenter research designed to address the nutritional profile of Latin American (LA) people in eight LA countries (Argentina, Brazil, Peru, Colombia, Costa Rica, Ecuador and Venezuela),. The study provides comparable data of dietary intake, physical activity, and anthropometric profile among representative urban populations of the eight countries; analyzed by socioeconomic status, age and gender. A sample of 9218 adolescents and adults aged 15.0-65.0 years, stratified by geographical location, gender, age and socioeconomic status was performed. The ELANS standardized protocol was followed by the eight countries and performed simultaneously. Intake data was collected by two 24 hs recall and physical activity information by both the Mexican (Spanish) version of International Physical Activity Questionnaire (IPAQ) and accelerometers in 2 household visits. Five anthropometric measurements were performed by the exact methods and instruments.

ELANS included 9,218 individuals (48% men and 52% women) with validated data. The age distribution of the sample was 13%, 38%, 28% and 21% for 15-19, 20-34, 35-49 and 50-65 years old, respectively. Mean body mass index (BMI) was 26 kg/m2 with higher values from women (27.5 kg/m2) than men (26.3 kg/m2). Overall, only 37% of the ELANS sample had normal body weight, while 3% exhibited underweight, 34% were overweight and 26% were obese. ELANS results show high rates of overweight and obesity in the region, coexistent with high prevalence of inadequate micro-nutrients intake. Despite different rates between countries were found, a shared pattern where the vulnerable age groups are mainly the adolescents and older adults, was found. Analyzing LA diets distribution of macro-nutrients but they are well balanced, differences in food sources, culture and meal habits were observed from one country to another expressing the cultural imprinting of each diet composition. The ELANS overall sample reported a higher level of active people at the transport dimension of IPAQ for men than for women. Men in 20-34 age range reported the highest (59%) level of active PA at leisure time while for female adolescents it was the lowest (29%). This is congruent with the sedentary time (hours/week) collected with the accelerometers where the highest levels were reported by adolescents 10 hours/ week for both genders.

ELANS provides a unique dataset for Latin America, enabling cross-country comparisons of energy, macro- and micro-nutrients intake and physical activity as well as establishing associations between these lifestyle components and nutritional status within this region. In this symposium, the main results obtained in this study will be reported.

NUTRITION SCIENCE AT A CROSS-ROAD

BEST PRACTICES FROM THE ASN COMMITTEE ON PUBLIC TRUST

[1]*Stover, Patrick;* [2]*Ohlhorst, Sarah;* [3]*Field, Martha;* [3]*Garza, Cutberto.*

[1]CornelL University and American Society for Nutrition. USA.; [2]American Society For Nutrition, 9211 Corporate Blvd., Suite 300 Rockville, Maryland, 20850, USA; [3]Cornell University, Division of Nutritional Sciences, Ithaca, NY 14850 USA.

The American Society for Nutrition (ASN) created an Advisory Committee on Ensuring Trust in Nutrition Science. The ASN charged the committee with recommending best practices for sustaining public trust in all of ASN's collaborative undertakings with stakeholders across sectors and disciplines. Assuring transparency and rigor in those activities was stressed. Implementation of best practices is expected to uphold trust in nutritional science among all stakeholders, i.e., the public, industry, government, academia, and other nonprofit, nongovernmental organizations pertinent to the field of nutrition science. Their implementation also should help ensure objectivity, and comprehensiveness, achieve the best nutrition science, and assure required accountability and the realization of anticipated benefits to public and individual health.

REDUCTIONIST VERSUS HOLISTIC PARADIGMS IN NUTRITION SCIENCE

Fardet, Anthony.

PhD. Researcher in preventive and holistic nutrition. French National Institute for Agricultural Research (INRA). Unit of Human Nutrition. France.

Up today nutrition science, in Western countries, has been mainly experimented according to the reductionist paradigm. Reductionism is based on the assumption that since reality is too complex to be studied as such it needs to be fragmented into isolated entities that are studied according to the view that the whole is equal to the sum of the part (2 = 1+1) on the basis of a linear

cause-effect relationship. As a result foods are considered as only sums of nutrients and calories ; and one nutrient is generally associated with one deregulated metabolism then one chronic disease (e.g., relationship between saturated fats, dyslipidemia and atherosclerosis whereas it is a reducing association). Reductionism can be considered as the main deep cause at the roots of diet-related chronic diseases that are encountered in populations consuming the most fractionated/recombined and refined ultra-processed foods, the ultimate consequence of reductionism. Indeed, if foods are only sums of nutrients why not cracking them in a multitude of nutrients and to recombine them. Nutritional supplements, functional foods and ultra-processed foods are therefore the consequences of our modern reductionist science. They are also based on the assumption that food health potential is based on its composition only.

On the contrary, holism views whole foods as more than a sum of nutrients because of synergy of action of nutrients and food matrix effect. Holistic nutrition science defines food health potential as combination of both matrix and compositional effects. Food is more than the only sum of nutrients (2 > 1+1). Matrix effect is crucial because it impacts satiety potential and nutrient bioavailability, both playing a crucial role to maintain a good health. Therefore two foods of identical composition but with a different matrix have not the same health potential.

Therefore to fight against the increasing prevalence of diet-related chronic diseases we need today to base more nutrition science on the holistic paradigm. Whereas recombined/refined ultra-processed foods are the fruit of reductionism whole and complex foods participate more of the holistic paradigm which should encourage technologists to less process foods to preserve their matrix, and public authorities to lay emphasis on minimally-processed foods as a basis of a healthy diet.

In addition to food science and technology the holistic paradigm may find other important applications in the study of diets on human health. Randomized controlled studies are coming from reductionist and pharmacologist designs, very far from real life, and cannot yield long-term and effective applicable results. Nutrition science is not pharmacology and foods are not drugs: therefore application of holism should prompt nutritionists to carry out intervention studies in complex real life conditions (taking into account all aspects of dietary lifestyles), and not to control only one.

Finally reductionist and holistic paradigms are both necessary: however more importance to holism should be given. Reductionism only becomes meaningful when it is embedded and circumscribed in a thorough and holistic reflection. If not, reductionism turns around, and only produces partial scientific truths devoted to agro food industry benefits.

Keywords: Holism, Reductionism, Nutrition, Food matrix, Processing

IS THE RCT THE BEST WE CAN DO?

Martínez-González, Miguel Ángel.

Universidad de Navarra. CIBEROBN. Spain. Harvard T.H. Chan School of Public Health. Boston, USA.

Large randomized controlled trials (RCTs) are apparently the only way to circumventing the methodological problems of observational research, such as misclassification, reverse causation and residual confounding.

But small, short-term RCTs with surrogate markers of disease as the outcome are clearly not the solution. To give a high value to changes in any single surrogate biomarker is a mistaken approach, given that there are multiple pathways leading from diet to disease. Moreover, the induction period can vary for the different pathways in which diverse biomarkers are involved, thus limiting the possibility of assessing multiple biomarker combinations at any time point. Furthermore, other lesser-known pathways could account for a substantial proportion of clinical events. Therefore, the gold standard should be long-term RCTs with hard clinical events. In them, participants should be willing for a long period (usually at least 5-6 years) to eat what the investigators decided that they should eat, not what they like to eat. This is very problematic.

A highly prevalent tenet in the current nutrition literature is that "prospective cohort studies provide evidence only of statistical associations ("mere correlations") but not causation whatsoever, because only RCTs can answer causal questions". Under that assertion, most of the current practices and policies in public health would lack sufficient scientific foundation. The truth is that sound and effective public health actions have been based in well-designed, conducted and analyzed observational epidemiologic studies. They do provide valid answers to causal questions in nutrition.

The criteria for causality established by Bradford Hill long time ago are the leading principles to obtain causal inferences from observational studies. They keep their validity nowadays. Cause and effect associations can be drawn when most of these criteria are met, especially when there is consistency among many well conducted observational studies.

Conversely, methodological challenges in designing RCTs in nutrition can frequently induce biases. They speak against any "fundamentalism" for the RCTs. They include the intensity of the "intervention" to be delivered to the control group, selection biases due to selective attritions, deficient adherence to the prescribed diet (suboptimal compliance is the rule and not the exception), contamination of the control group with the intervention protocol, erroneous assumptions about the induction period or potential effect modifiers, and, very especially a small and insufficient contrast in the diets of the intervention and control groups. These biases tend to operate towards the null and several RCTs in nutrition ended as non-informative, after astronomic expenses and many years of work. The PREDIMED trial, showing the benefits of the Mediterranean diet was an exception. But the results of PREDIMED were highly consistent with those of observational cohorts.

Therefore, very often, RCTs are not the best design to answer causal questions regarding long-term effects of dietary exposures. Because a well-conducted cohort study can simulate an RCT when the most important confounders have been controlled for, the

combination of RCTs with well-conducted and analyzed cohort studies should be the optimal approach to draw causal inferences in nutrition.

NUTRITION IN TRANSITION, THOUGHTS AND ACTIONS OF A MULTIDISCIPLINARY WORKING GROUP

[1]de Vries, Jan; [2]Feskens, Edith.

[1]De Vries Nutrition Solutions. The Netherlands.; [2]Division Human Nutrition, Wageningen University. The Netherlands.

In the past decades valuable knowledge has been produced about the interaction of nutrients, food and the human body. The mostly multidisciplinary approach in nutrition science has accomplished a lot, both scientifically and socially. Despite this, nutrition sciences appear to be in a crisis. Public reluctance to trust nutritional insights creates space for many authors with nutrition messages that are not aligned with general views of nutrition and health.

In the Netherlands, recently a multidisciplinary discussion group was formed to start a structured discussion about the capabilities and credibility of nutrition sciences. The group consists of scientists with a background in nutrition, epidemiology, physiology, medical sciences, behavioral sciences, philosophy, ethics and statistics. Since 2015 we organized several discussions about the limitations recognized in nutrition sciences, such as discussions about "health", causation", "evidence" etc. In 2016 we organized a dedicated workshop with scientists from a diversity of disciplines invited on a personal title.

We diagnosed that nutrition science is meeting its inherent boundaries, which hampers conceptual and methodological progress and the translation of novel insights into societal benefit and trust. The methods in nutrition sciences need to change to accommodate the questions that arise from the major upcoming societal challenges.

The benefits of nutrition interventions aiming at prevention of chronic diseases cannot be related to one single cause. Despite the multifactorial causation of chronic diseases the pharmacological model of double blind placebo controlled intervention studies, usually called clinical studies, is considered as the method to prove causation. We think that this approach to prove causation needs to be reconsidered.

Ingestion of complex molecular foods interact with complex body function aiming at life-long prevention. In general a reductionist approach cannot be translated into benefits. Medicinal interventions readdress an unhealthy to a healthy condition in the shortest time span possible. The different employments of nutrition and medicines make the paradigms of sciences almost oppositional.

Nutrition sciences is strongly influenced by a reductionist focus. Due to political choices scientists need to search for private funding. That research focusses on products and nutrients instead of food patterns, generating beliefs of quick wins. These myths need objective evaluation.

Such critical assessment is not the first. Concerns have been raised immediately after the landmark publication on Evidence Based Medicine in 1992. We have not been able to identify a structured discussion about the limitations of the capability and credibility of nutrition sciences.

The evidence we seek, the questions we ask, the funding and organisation threaten our credibility. A discussion is needed to agree on different ways of working and knowing. A new nutrition science agenda may provide plenty of potential for excitement and includes reaching out to multiple disciplines that are important to create answers needed on future questions. In parallel to and based on the outcomes of our discussions we aim at developing research projects creating new generation nutrition sciences that is incorporating as many as possible scientific disciplines. New partnerships, activities and agendas are the cornerstones for a more capable and credible nutrition science.

Keywords: Credibility, Magic bullets and myths, paradigms, Multidisciplinary science.

LINKING AGRICULTURE AND NUTRITION EDUCATION TO IMPROVE ACCESS TO QUALITY FOODS FOR YOUNG CHILDREN

[1]Wijesinha Bettoni, Ramani; [2]Muehlhoff, Ellen; [3]Westaway, Elizabeth; [4]Jeremias, Theresa; [5]Nordin, Stacia; [6]Garz, Julia.

[1]PhD. Nutrition Officer. Food and Agriculture Organization of the United Nations. Rome, Italy.; [2](Formerly FAO Rome); [3](PhD. Formerly FAO Rome); [4]CARE Germany-Luxembourg, Bonn, Germany; [5]University of Illinois at Urbana-Champaign, Champaign, USA and Feed the Future Malawi.Strengthening Agricultural and Nutrition Extension , Lilongwe, Malawi (formerly FAO Malawi); [6]Plan International, Hamburg, Germany.

Agriculture has a central role to play in nutrition by supplying nutritious, healthy and affordable foods in a sustainable manner. When integrated with nutrition education for behaviour change, agricultural interventions have the ability to improve young child and family diets. Process reviews were conducted in Cambodia and Malawi of food security projects carried out by the Food and Agriculture Organization of the United Nations (FAO) that provided agricultural support and community-based nutrition education on improved infant and young child feeding (IYCF). In both countries, household visits were carried out with mothers/caregivers, and interviews and Focus Group Discussions (FGD) were conducted with purposively selected project stakeholders (53 in Cambodia, 170 in Malawi). Results showed that adoption of improved IYCF practices

were facilitated by participation in nutrition education and practical cooking sessions, with supportive family and community structures playing an important role. Barriers faced by families and caregivers included women's workload and lack of access to high quality foods, such as fruits, vegetables, legumes, nuts and animal source foods. Implementation challenges included coordination issues in regard to cross-sectoral targeting strategies and ineffective capacities of extension services to deliver a community-based IYCF nutrition education programme. Lessons learned from the project can guide future integrated agriculture-IYCF nutrition education programmes to help ensure better young child nutrition outcomes.

TRENDS AND PRACTICE IN CLINICAL NUTRITION

EFFECT OF PROBIOTICS ON HUMAN BLOOD UREA LEVELS IN PATIENTS WITH CHRONIC RENAL FAILURE

[1]*Espinosa Cuevas, María de los Angeles;* [2]*Atilano-Carsi, Ximena;* [2]*Miranda Alatriste, Paola.*

[1]PhD. Nutritionist. Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubirán. Departamento de Nefrología y Metabolismo Mineral; [2]PhD. Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubirán. Departamento de Nefrología y Metabolismo Mineral.

Chronic Kidney Disease (CKD) accelerates cardiovascular disease (CVD), predisposes to infectious diseases and numerous other morbidities that increase mortality, that shortens the life span and impairs the patient's quality of life. Most of these abnormalities are mediated by systemic inflammation, that is common in CKD. Uremic toxins retained as a result of altered kidney function contribute significantly to this inflammatory state and the derangement in many body organs. Dysbiosis (a aquantitative and qualitative alteration of intestinal microflora), is a consecuence of changes in intestinal transit, decreased protein absorption, decrease in dietary fibre intake, treatment with oral iron and frequent use of antibiotics that are very common in CKD.

The human gastrointestinal microbiota represents the largest body microbial load. This bacterial load and its products have been shown to contribute to both the progression of CKD and activation of the inflammatory cascade in CKD. Thus, gut dysbiosis characterized by a disruption of the homeostatic balance in gastrointestinal tract in CKD is associated with the production of nephrotoxins (mainly urea, indoxyl sulfate, p-cresil sulfate, etc), which are introduced to the systemic circulation, contributing to systemic inflammation, and possibly to the progression of CKD

Systemic inflammation and uraemic toxins play a central role in the pathophysiology of atherosclerosis, as well as in other complications associated with CKD, and it is suggested a role of bacterial metabolites (from probiotics) in the gut, as potential uremic toxins modulators, reducing the progression of CKD and associated uremia.

Probiotics are defined as "living micro-organisms" that, being administered in adequate amounts, provide a health benefit to the host. Recently, it has ben demostranted the potential benefits of probiotics in CKD. They have been shown to be associated with a change in small bowel pathobiology by modifying the metabolic actions of small bowel bacterial overgrowth, reducing the generation of toxins and carcinogens and promoting nutrition with no adverse side effects

The efficacy of using different types of probiotics at different doses with the aim to reduce levels of uraemic toxins and to delay the progression of CKD has been investigated in in vitro models, animal models and in patients with CKD. However, to date, there are no large-scale intervention studies and studies on clinical events to support their widespread use. There are only small studies, most of which, observe a decrease in uraemic toxin levels like urea.

We recently demonstrated in a randomised trial in 30 patients KDIGO 3 and 4 stages of CKD, that there was a decrease in serum urea level greater than 10% after a conventional dietetic treatment plus a probiotic (lactobacillus casei shirota) in a dose of 6 x 109 CFU.

Based on the results obtained to date, it can be concluded that further investigations on the effects and adequate doses are necessary to prevent and help minimize the production of uremic toxins in CKD patients.

FODMAP, SIBO and gut microbiome

Knight, Karina.

MBA. MS. RD. Nutritionist. University of Miami. California Nutrition Group. USA.

The gut ecosystem is complex and contingent upon multiple factors, diet is of relevance because it can induce rapid changes within 1-2 weeks in gut microbiota composition and function. Production of gut derived metabolites from diet is limited by the composition of the gut microbiota. Fermentable oligosaccharides, disaccharides, monosaccharides and polyols (FODMAPs), short-chain carbohydrates that are poorly absorbed by the small intestines. An increasing body of research shows that these food molecules trigger symptoms of IBS and some other digestive disorders such as small intestine bacterial overgrowth (SIBO). Because these food molecules are not properly absorbed, they transpire in the large intestine, where bacteria that live in the gut feed on them and then produce gas byproducts, namely hydrogen and methane. However, a diet low in FODMAPs appears to alleviate many of these problems. Plant based fiber, undigested protein, fat and carbohydrates influence the composition and metabolic activity of the microbiome. Agrarian diets high in fruit/legume fiber associated with increase in microbial diversity, whereas Western diet is associated with a decrease of beneficial Firmucutes and increase of Proteobacteria. Diet plays a role in microbiota but may be constrained by other factors: Gut microbiota likely differs in globally distinct populations. Low-FODMAP diet reduces beneficial probiotic microbiota and increases fecal pH, long-term impact is unknown.

Keywords: Gut microbiome, Small intestinal bacterial overgrowth, Irritable bowel syndrome, Low-FODMAP diet, probiotics.

PRACTICAL ISSUES IN NUTRITION INTERVENTION IN CANCER PATIENTS

Fuchs-Tarlovsky, Vanessa.

PhD. Nutritionist. Hospital General de México. Servicio de Oncología.

Cancer is a public health problem that leads to malnutrition. There is enough evidence to show that 40% of hospitalized patients with cancer are malnourished or with high risk of becoming malnourished, because of the tumor itself and symptoms like nausea, vomiting, decreased appetite, and early satiety that leads to unintentional weight loss.

This specific type of malnutrition is known as cancer-cachexia. This is a concept that has evolved over the years, however it is not until 2011 that K Fearon et al. published an expert consensus that standardized the definition and classification of this condition. The consensus defined cachexia as a "multifactorial syndrome defined by an ongoing loss of skeletal muscle mass (with or without loss of fat mass) that cannot be reversed by conventional nutritional support and leads to progressive functional impairment".

Cachexia was divided also into stages ranging from the early weight loss to death. These stages are known as precachexia. Cachexia and refractory cachexia. It is necessary to know the definitions of each stage because it has been observed in recent studies that if nutritional support is provided until advanced stages of cachexia, there is no nutritional therapy. On the other hand, early nutritional interventions are the best choice of nutritional support in cancer patients. Because of this, early nutritional risk detection is required at the time of cancer diagnosis or from hospital admission to prevent the development of cachexia.

With this background, we have developed many research studies in Mexico City General Hospital, that are aimed to: determining nutritional and body composition in cancer patients at the diagnosis, before and after surgical treatments; to detect patients at nutritional risk; to know the effect of some specific nutrient therapies on inflammatory processes and oxidative stress in cancer patients; as well as the effects of standardized and specialized nutritional therapies and its effect on survival. All the strategies above are daily focused on the detection of nutritional risk and nutritional treatment of patients with cancer in the clinical nutrition service that we have also developed tertiary level in a public hospital in Mexico City.

More specifically, our studies showed that malnutrition is still highly prevalent in oncology patients. We found that cancer patients that started nutritional treatment on time had better outcomes and tolerance to oncology treatments. Supplementation with antioxidants in cervical cancer patients showed a significant effect on hemoglobin levels conservation, quality of life and it had not effect cancer recurrence. On the other hand, omega-3 fatty acids supplementation with EPA can regulate inflammation in head and neck cancer patients and leads to maintain their body composition and weight until the end of the antineoplastic treatment.

ADVANCES IN DIABETES NUTRITION THERAPY

[1]*Ruiz Cervantes, Gloria Marcela;* [2]*Melgarejo Hernández, Marco;* [3]*Landa Anell, Victoria.*

[1]MCN. Nutritionist. Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubirán. Centro de Atención Integral del Paciente con Diabetes; [2]Nutritionist. Nutritionist. Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubirán. Centro de Atención Integral del Paciente con Diabetes; [3]Nutritionist. Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubirán. Centro de Atención Integral del Paciente con Diabetes.

Medical nutrition therapy (MNT) is essential for the optimal management of people living with diabetes (PWD). MNT is associated with the improvement of values of HbA1c 0.3-1% for patients with type 1 diabetes and 0.5-2% for type 2 diabetes, particularly in newly diagnosed patients or those who had HbA1c levels greater than 8%.

Different percentages of macronutrient distribution have been evaluated for diabetes prevention and treatment, however, there is

no consensus of an ideal percentage for PWD. Therefore macronutrient distribution should be individualized, based on preferences, weight and metabolic goals. In a systematic review, non-significant differences were found in HbA1c and other metabolic parameters between a different amount of carbohydrate (from 39% to 57%), protein (0.8-2.0 g/kg/d) and fat (from 27% to 40%) intake. PWD taking MNT alone or those who do not follow an intensive insulin therapy should be encouraged to comply to a consistent pattern of carbohydate intake with respect to time and amount (basic carbohydrate counting). On the other hand, patients on intensive insulin therapy or with insulin pump therapy should be trained on advanced carbohydrate counting, since this strategy has been effective for lowering HbA1c levels on a long-term follow-up (12 months), besides increasing the quality of life despite more insulin injections. Refined carbohydrates and added sugars should be replaced with whole grains, vegetables, legumes, fruits and non-fat dairy. Non-nutritive sweeteners could be utilized instead of caloric sweeteners to reduce overall calories, as long as the total daily intake is not affected. Regarding protein intake, there was a non-significant difference in the glomerular filtration rate reduction with an ingestion of 0.7 to 2 g/kg/day in PWD. In terms of fat intake, a diet rich in monounsaturated fats may reduce cardiovascular risk on a long term basis, replacing a low fat/high carbohydrate diet. N-3 fatty acids showed nonsignificant benefits on metabolic levels, particulary on glucose, however there was a significant reduction in tryglycerides in patients with hypertrygliceridemia. The promotion of adequate eating patterns, like Mediterranean, DASH or plant-based diets, has a greater impact than the prescription of particular food or nutrients.

Nutritional strategies, such as portion control, the plate method, sample menus, carbohydrate counting, exchange list, food lists, simplify plan and goal establishment should be used based on patient´s needs, preferences, food access, health literacy and numeracy, motivation and barriers to change. Identifying and reducing this barriers is essential for the implementation of a more accurate educational strategy. At the Center for Comprehensive Care of the Patient with Diabetes (CAIPaDi) the identification of barriers to MNT adherence at baseline, the use of a nutritional simplified plan and baby steps strategies based on the identified barriers have shown statistical significance in the reduction of calorie consumption, weight and waist circumference after 3 months.

Keywords: Diabetes, medical nutrition therapy, CAIPaDi, barriers

TRENDS AND PRACTICE IN CLINICAL NUTRITION

Nava-González, Edna Judith.

PhD. Certified Nutritionist. School of Public Health and Nutrition. Autonomous University of Nuevo Leon. President of the Mexican College of Nutrition.

Nutritional Sciences include nutrition processes as well as food components, their actions, interaction and balance in conjunction with health and disease. The applications of nutrition science relate to integrated human biology systems that gradually become adjusted in the way a person changes qualitatively or quantitatively over time.

The advance in the knowledge about the role of nutrients in different clinical pictures is continuous and not exempt from controversies (glutamine, arginine, fatty acids, antioxidants), which opens an enriching debate in search of a closer approximation to its functions, beyond the solely fact of offering a nutrition approach. This situation forces the professional in nutrition sciences to be prepared in depth in various fields such as modulation of inflammation and immunity, control of oxidative stress, and aging among others.

If we focus our knowledge on metabolic diseases related to nutrition, it is necessary to take into account the environment to provide a specific and individualized nutritional therapy. It has been insufficient to only intervene on the main conventional environmental factors that contribute to the development of these chronic diseases (obesity, type 2 diabetes, many cancers) which include lack of physical activity, a sedentary lifestyle, unhealthy eating habits, availability of very cheap foods, large portion sizes, high levels of refined carbohydrates, calorically dense foods, and consumption of saturated fats.

A broader view of environmental exposure is needed beyond conventional risk behaviors to discover the main causes of chronic diseases, not only the ones occurring in the external environment, but also those that impact internally, integrating a conceptual framework of a series of measurable biological events secondary to the environment, which directly cause inflammation, oxidative stress, lipid peroxidation, infections, alterations in the gut microbiota, causally associated with prominent classes of endocrine disruptors, immune response modulators, and agents that bind to cellular receptors.

Exposures to these agents can be monitored in the blood either by direct measurement or by looking for their effects on physiological processes such as metabolism. These processes influenced by the external environment generate products that serve as molecular signatures and biomarkers in the blood. Therefore, an extension of the current generation of biomarkers could have a crucial role to play in a specific diagnostic profile from the internal environment that would be causally associated with the external environment.

On the other hand, the functional components of foods may have a great impact on the incidence and treatment of multiple diseases. The nutritional message must be widely communicated: we need extensive research on phytochemicals and chemoprotective functional food ingredients that can regulate inflammation, oxidative stress and lipid peroxidation.

In conclusion, it is our responsibility to deepen the knowledge of areas related to nutrition in order to offer in the near future a more precise and individualized preventive care.

VITAMIN C – ARE CURRENT RECOMMENDATIONS SUFFICIENT?

WHAT IS THE OPTIMUM INTAKE OF VITAMIN C?

Carr, Anitra.

PhD. Senior Research Fellow. Department of Pathology. University of Otago, Christchurch. New Zealand.

Historically, recommended dietary allowances (RDAs) for vitamin C were based on prevention of the deficiency disease scurvy. Now, more countries are basing their recommended intakes on antioxidant and other putative health effects of vitamin C as well as on biochemical markers of these. However, whether these recommendations provide optimal intakes of vitamin C is uncertain because of the difficulty in defining the 'optimal intake'. Vitamin C intakes which provide plasma saturation (i.e. ~200 mg/d) are considered optimal by some researchers. Although intakes of ~100 mg/d are sufficient to saturate white blood cells, we have found that muscle tissue vitamin C levels continue to rise with increasing intakes up to plasma saturation. Large population-based surveys in Europe and North America have provided insights into the normal dietary intakes and plasma levels of these cohorts, as well as the prevalence of hypovitaminosis C (i.e. <23 μmol/L) and deficiency (i.e. <11 μmol/L). Some countries have higher recommended dietary intakes for smokers and pregnant women due to their increased requirements for vitamin C. We, and others, have also shown that individuals with hypovitaminosis C have higher requirements for vitamin C, likely due to depleted tissue status. Clearly a 'one size fits all' intake recommendation is complicated by numerous confounding factors. This talk outlines various ways of determining the optimum intake of vitamin C.

Keywords: Vitamin C, hypovitaminosis C, dietary intakes, plasma status, RDAs

BIOMARKERS FOR VITAMIN C REQUIREMENT

[1]*Elste, Volker;* [2]*Troesch, Barbara;* [3]*Eggersdorfer, Manfred;* [4]*Weber, Peter.*

[1]PhD. Dr. med vet. DSM Nutritional Products AG. Switzerland; [2]Dr. sc. ETH. DSM Nutritional Products AG. Switzerland; [3]Prof. Dr. DSM Nutritional Products AG. Switzerland; [4]Prof. Dr. med. DSM Nutritional Products AG. Switzerland.

Intake recommendations for vitamin C are currently defined using markers for status, as no suitable functional biomarker has as yet been identified. There are different functional biomarkers for Vitamin C but up to now, no one was identified that could be used as a basis to define dietary intake recommendations for vitamin C. Emerging evidence support neutrophil motility as such a functional biomarker. A recent in vitro study showed that adequate levels of vitamin C were needed for this function to work optimally when measured as chemotaxis and chemokinesis. Furthermore, in a human intervention study with healthy subjects, neutrophil motility was optimal at intakes at ~250 mg/d.

These findings are supported by established knowledge including a Cochrane review which showed a significant reduction in the duration of episodes of common cold in children as well as in adults with regular vitamin C intakes in a similar range. This is in line with human kinetic studies where plasma saturation was reached with 200 mg/ day and also the related vitamin C transporters reached their maximum at this dose. Additionally, in observational studies it was shown that at plasma level of 75 μmol/L, which can be reached with vitamin C intakes of ≥200 mg/d, incidences of cardiovascular disease were lowest. A relationship between vitamin C concentration, severity of atherosclerosis and inflammation in peripheral artery disease patients could be shown.

However, additional studies are needed to investigate further the reliability and accuracy of neutrophil motility as a functional marker of vitamin C dependent immune function. Given the number of people affected by common cold, cardiovascular disease and others, defining recommendations with the highest risk reduction for these diseases is of paramount importance.

The evidence would suggest that daily intakes of 200 mg vitamin C might be advisable for the general adult population, which can be achieved by means of a diverse diet.

THE PHARMACOKINETICS OF VITAMIN C

Lykkesfeldt, Jens.

Professor at University of Copenhagen, Denmark.

Vitamin C is a low molecular weight water soluble antioxidant vital to human health. Vitamin C homeostasis is tightly controlled by the body and sophisticated ways of preserving and allocating the body's ascorbate resources to organs in need has evolved including ascorbate recycling and tissue specific accumulation and retainment. Vitamin C pharmacokinetics differs markedly from that of an average drug in that vitamin C e.g. follows complex saturation kinetics and is subjected to active reabsorption in the kidneys at physiological levels. The lack of acknowledgment of these and other factors have led to poorly designed and misinterpreted human intervention studies that expectedly have shown no effect of vitamin C supplementation. The present talk outlines the pharmacokinetics of vitamin C and how it impacts the proper design of intervention studies with vitamin C.

Vitamin C (ascorbic acid) Recommended Dietary Allowances have two foundations: pharmacokinetics, and function in relation to in vivo concentration. Human pharmacokinetics data for ascorbic acid are more detailed than for nearly all other vitamins. Such pharmacokinetics data have substantial value. For ascorbic acid, pharmacokinetics data reveal that with oral dosing ascorbic acid plasma concentrations are tightly controlled. At least four mechanisms are responsible: intestinal absorption, or bioavailability; tissue transport: renal reabsorption/excretion; and utilization in vivo. At doses between 100-200 mg daily: intestinal absorption is near maximum; tissue transport is close to saturation; and renal excretion is close to estimated threshold. Utilization data, though often indirect, suggest that accelerated ascorbate utilization occurs in some diseases such as sepsis or in critically ill patients. Pharmacokinetics data also show that tight control is by-passed with intravenous administration of ascorbic acid as a drug. Intravenous ascorbic acid administration, as a function of dose given, produces pharmacologic concentrations. These concentrations have promising efficacy in cancer treatment, including studies in humans, with minimal side effects. Applicability of pharmacologic ascorbate in cancer therapy and in critically ill patients would not have been apparent without the foundation of pharmacokinetics. To date, there are few datasets linking ascorbate function in vivo to its concentration in vivo. For this reason, in vitro functional data with human neutrophils are used to characterize ascorbate function in relation to its concentration. These data have limitations. In vivo functional assessments, endpoints, or validated biomarkers are needed to improve accuracy of recommended dietary allowance recommendations for ascorbate, and for other vitamins.

MEANING OF LINEAR GROWTH: APPROPRIATE USE OF GROWTH AS A MEASURE IN DEVELOPMENT

BIOLOGY OF LINEAR GROWTH: PROCESSES AND NUTRITIONAL, HORMONAL, AND INFLAMMATORY DETERMINANTS

Lampl, Michelle.

Nutrition Department. Emory University. USA

Longitudinal studies of humans document that suboptimal nutrition during early life has long-term consequences on skeletal size. This outcome is highly dependent on the developmental age when the insult is experienced. Nutrition acts at the individual's cellular level: individuals consume nutrients and these translate to growth through a system of cell-level processes. Understanding the specific cellular events responsible for skeletal growth and development is essential in order to identify the critical periods during which the organism is at- risk for growth perturbation and intervention. Skeletal growth regulation takes place within distinctive anatomical sites during individually-specific time frames. This involves molecular mechanisms acting at sequential life cycle stages of the cells responsible for bone elongation at the site of long bone growth, the endochondral growth plate. Extracellular cues regarding energetic status and constituent availability are translated by intracellular signaling pathways to influence regulatory networks at cellular control points governing bone elongation and maturation. Nutrients influence this cascade as the source of both the necessary substrates and extracellular cues which regulate the signal transduction pathways that control anabolic processes. Moreover, while the limiting resource for growth is generally viewed to be a direct reflection of energy availability, other mechanisms that reflect nutritional influences include the allocation of common precursor cells to the chondrocytic lineage, osteoblast-specific cellular bioenergetics, and downstream hormonal and cytokine effects. When these developmental phases are perturbed, skeletal growth deficits occur that may or may not be entirely recoverable.

Keywords: Bone growth, endochondral bone, critical period

HISTORY OF USING OF GROWTH AS A MEASURE OF HEALTHY CHILD DEVELOPMENT

(1)Krasevec, Julia; (2)Krasevec, Julia.

*(1)*UNICEF; *(2)*Statistics and Monitoring Specialist. UNICEF. New York.

The growth curve is a fundamental tool that allows length and height measures to be used to ascertain whether healthy child growth and thus development is occurring at an individual or population level. The growth curve displays the size of a child over time while also visualizing how the growth velocity varies at different stages based on the steepness of the curve along different parts of

the trajectory. The first child height curve was published in the 18th century in George Buffon's Histoire Naturelle, using a chart developed by Count Philibert de Montbeillard who plotted his son's height every six months from birth to age 18 years. Since then, growth charts have expanded in scope to cover growth patterns of groups of children, becoming an important tool in child health screening. The United States developed growth reference charts using data from their National Health and Nutrition Examination Surveys that could be used to establish whether the growth of other individuals or groups of individuals were typical of the reference group. This growth reference was adopted by WHO in 1977 and used to monitor child growth and health globally for the next 30 years at regional, sub-regional, and national levels. As the US-based growth reference had a number of technical and biological limitations, including a large percentage of non-breastfed and formula-fed infants, WHO embarked on development of growth standards of children 0-5 years of age which represents how children should grow if exposed to optimal conditions while in utero and after birth. Data were collected from 6 countries (Brazil, Ghana, India, Norway, Oman, and the United States), for the development of the sex-specific growth standards and were published in 2006.

Since their publication, over 150 countries have adopted the WHO Growth Standards and use them as the basis for clinical screening of an individual child's growth and also to summarize the proportion of children in a population suffering from suboptimal growth. The use of one set of standards helps compare prevalence of malnutrition across countries, highlight populations at greatest need of intervention, and assess progress towards global goals such as the Sustainable Development Goals. The availability of standards for growth velocity has provided an additional way of assessing how well children are growing.

The standard tool for measuring child length and height has been a stadiometer, and while it serves the purpose of a calibrated piece of equipment, measurement error has been found in both clinical- and population-based applications, largely related to the proper positioning of small children who can be reluctant subjects. Looking forward, as various groups are working on the development of alternative tools to assess length and height, many of which are tablet-based and do not require any specific positioning of the child, there is potential for minimizing error and also for improved usability of the data.

Keywords: Height, length, measurement, growth standards

THE MEANING OF LINEAR GROWTH: DIFFERENTIATING GROWTH AS A CAUSE VS. A MARKER OF OTHER OUTCOMES

Leroy, Jef.

Senior Research Fellow. Povery, Health and Nutrition Division. International Food Policy Research Institute. Washington, DC. USA.

The prevention of undernutrition is receiving unprecedented global attention. Undernutrition during early life has severe con-sequences, not only in infancy and childhood, but also during adulthood. Malnourished infants and young children are at increased risk of illness and death, and are also more likely to experience physical, cognitive, educational, and productivity deficits as adults. Much of the focus of this global effort is on reducing the prevalence of stunted linear growth (target 2.2 of the Sustainable Development Goals). Linear growth retardation is associated with a number of undesirable short-term (such as delays in cognitive development), medium-term (lower school achievement), and long-term outcomes (lower earnings and a higher probability of non-communicable chronic diseases at adulthood).

Our presentation will explain how these associations in combination with the focus on linear growth as a development target has created the impression that short stature is causally linked to these physical, cognitive, educational, and productivity outcomes and how it has created the false expectation that any intervention aimed at improving linear growth retardation (or reducing stunting) will subsequently lead to improvements in these outcomes. We will show how this misunderstanding appears to have contributed to two recent developments: the focus on aflatoxin exposure as a determinant of linear growth retardation and the renewed interest in catch-up growth. We will conclude with a framework that clearly differentiates between two key uses of linear growth: as an indicator or marker (reflective of the past or predicting future outcomes) and as an outcome in its own right.

Keywords: Child growth; stunting; marker; catch-up; aflatoxin

APPROPRIATE USE OF LINEAR GROWTH AS A MEASURE IN DEVELOPMENT

Frongillo, Edward.

Department of Health Promotion, Education, and Behavior, University of South Carolina, United States.

Early undernutrition results in risk of illness and death as well as physical, cognitive, educational, and productivity deficits later in life. Much of the current attention on undernutrition focuses on reducing stunting. This focus on linear growth in development reinforces the view that short stature is causally linked to both short- and long-term physical, cognitive, educational, and productivity outcomes, leading in turn to expectations that interventions aimed at reducing stunting through prevention of linear growth deficits will lead to improvements in negative consequences of undernutrition.

The nutrition development community has been confronting two related challenges. First, many studies report small or no intervention effects on reducing stunting, while sometimes reporting noticeable secular changes in linear growth over time. Second, the emphasis on nutrition-sensitive as well as nutrition-specific interventions leads to questioning whether linear growth is an appropriate primary outcome to measure.

About forty years ago it was established that well-nourished children throughout the world grew similarly on average. This equivalence provided a basis for using the assessment of children's

growth status for global and national monitoring of population well-being. The 1987 First Report of the World Nutrition Situation by the United Nations Subcommittee on Nutrition used child underweight prevalence, and ten years later sufficient data were available for the Third Report to use stunting prevalence. Use of stunting prevalence is appropriate for the purpose of monitoring changes in child growth status at the population level, but not necessarily for other purposes such as assessing whether interventions have made a difference. Nutrition interventions may reach and impact children, but may not impact length growth deficits in a short period.

Child linear growth depends on both the prenatal and post-natal environment, with the post-natal environment influencing growth through nutritional intake and exposure to infection, which in turn result from food security, care of children, and health services and environment. Child growth status is thus associated with child nutritional status, but it is not the same as nutritional status. That is, length growth is a marker of nutrition useful for some purposes, but is not nutrition. Furthermore, children grow through complex biological mechanisms that unfold daily and are only partially understood. Partial restoration of lost growth is sometimes possible when constraints are removed, but it is not clear if this is important. Some claims made that catch-up growth of children can occur are based on misunderstanding of both the concept of catch-up growth and analytic inference.

Interventions intended to have impact on one domain may have positive or negative impact on others, so impact evaluations should use a broad set of health, nutrition, and development measures and indicators. Furthermore, measures for immediate and underlying determinants should be included, e.g., breastfeeding, complementary feeding, and food processing; caregiving; and hygiene and home health. There is need to develop, refine, and validate measures and indicators for evaluation purposes, e.g., validation of child-development measures in low- and middle-income countries and development of innovative markers of child development.

IMMUNONUTRITION IN HEALTH AND DISEASE: ROLE OF BIOACTIVE COMPOUNDS

FATTY ACIDS: MASTER CONTROLLERS OF INFLAMMATION

Calder, Philip C.

Faculty of Medicine, University of Southampton, Southampton, UK.

Inflammation is a normal response being part of host defence and initiating tissue repair. However, where inflammation is excessive or uncontrolled, tissue damage, metabolic changes and pathology can result. Indeed, chronic inflammation is the central component of many human diseases including rheumatoid arthritis, inflammatory bowel disease and asthma. Chronic low grade inflammation is now recognised to be a component of lifestyle diseases like obesity, type 2 diabetes and atherosclerosis. Both high and low grade inflammation may result from failure of resolution mechanisms. Fatty acids can regulate inflammatory processes, including resolution. Some saturated fatty acids have been shown to trigger inflammation by stimulating known pro-inflammatory receptors like toll-like receptor 4. Cells involved in inflammation typically contain a relatively high amount of the omega-6 fatty acid arachidonic acid, which is a precursor of pro-inflammatory eicosanoids like prostaglandin E2 and leukotriene B4. The omega-3 fatty acids EPA and DHA are readily incorporated into inflammatory cells in a dose dependent manner. They can modify the function of inflammatory cells through multiple mechanisms that ultimately involve altered patterns of gene expression and altered patterns of production of lipid and peptide mediators. These include decreased production of pro-inflammatory eicosanoids and cytokines and increased production of pro-resolving mediators like resolvins and protectins. Through these effects, EPA and DHA can affect inflammatory cell responses and inflammatory processes and they act to counter the effects of saturated fatty acids, omega-6 fatty acids, and classic inflammatory stimuli (e.g. LPS). The anti-inflammatory and inflammation resolving effects of EPA and DHA are clinically relevant.

Keywords: Omega-3, Inflammation, Lipid mediator, Cytokine

INMUNOMODULATION BY PROBIOTICS AND FERMENTED MILKS IN HEALTHY AND SICK SUBJECTS

Perdigón, Gabriela; Maldonado Galdeano, Carolina.

Researcher CONICET -CERELA ; Tucumán University.

The immune stimulation by probiotics and fermented milk containing probiotic bacteria(PFM) administered to healthy host, induce a network of signals: a) stimulation of the intestinal epithelial cells(IEC) and the immune cells associated to the lamina propria, these facts are, induced by bacteria adhesion or by their cell wall fragments stimulating the epithelial and the immune cells to activate mainly the innate response b) The IEC induce the production of different cytokines and chemokines able to send signals to the immune cells of the lamina propria inducing an increase in different markers of activation with the release of cytokines, which will contribute to the Mucosal Immune System(MIS) activation c) induce also activation of the adaptative response at local and systemic levels, with an increase in the specific secretory IgA (S-IgA) and specific IgG antibody respectively .

In sick host we demonstrated their effectiveness in the anti-inflammatory process such as enteric infections, and in allergy. In malnutrition models (under nutrition and obesity) we observed an improvement in the histology of intestine and thymus with an improvements in the Immune System functionality. We demon-

strated the anti-inflammatory effect of yogurt in IBD model, where we observed a decrease mainly in the inflammatory cytokine IL17. We also analyze the effect of yogurt in another model of chronic inflammation as obesity .In this study, we compared the effect of conventional yogurt and one containing probiotic bifidobacteria. We demonstrate the anti-inflammatory effect of both yogurts by decreasing of proinflammatory cytokines

What would be the biological significance of these observations: 1) that the innate response that is key in host defense is able to be influenced by probiotics and fermented milk 2) that probiotic strains, LFP or yogurt have an important role in the mechanisms of the immune surveillance

We conclude that probiotic strains, PFM and yogurt have an important role in the functionality of the MIS and in the immune surveillance, through the mechanisms of immunoregulation

Keywords: Immunomodulation , Probiotic ,Fermented Milk

DO DIETARY PATTERNS INFLUENCE PRO-INFLAMMATORY-DERIVED CYTOKINES LEVELS IN HEALTHY ADOLESCENTS? FINDINGS FROM A POPULATION-BASED STUDY OF ADOLESCENTS IN MALAYSIA

Foo, Leng Huat.

Universiti Sains Malaysia.

Background and objectives: The aims of the present study was to investigate the influence of dietary patterns on blood pro-Inflammatory-derived cytokines of tumor necrosis factor-alpha levels (TNF-a) and also to examine whether such influence was mediated by adiposity levels, assessed by anthropometry and dual-energy X-ray absorptiometry (DXA) device assessments, among 413 apparently healthy adolescent boys and girls aged 12 to 19 y. Methods: A validated food frequency questionnaire was used to assess dietary food patterns, in which three dietary food patterns were identified based on the principal component analysis method. Blood pro-inflammatory-derived cytokines of TNF-a was assessed by the ELISA assay method. Results: Three dietary patterns were identified namely, healthy-based food pattern, western-based and local-based food pattern. Higher scores of healthy-based dietary pattern, characterised by high intakes of vegetables, fruit, dairy products, nut and cereal-based foods, was significantly associated with lower concentrations of serum TNF-a after adjustment for age, race, gender, pubertal growth status, and moderate-to-vigorous physical activity levels. Even further adjustment for DXA-derived adiposity indices in the analysis models, adolescents with higher intakes of healthy-based food pattern had significantly lower serum blood pro-Inflammatory of TNF-a levels. On the contrary, neither western-based food pattern nor local-based food pattern was significantly associated with serum TNF-a levels. Conclusion: Intakes of healthy-based food pattern that is characterised by higher levels of vegetables, fruit, dairy products, nut and cereal-based foods was independently associated with lowering pro-inflammatory marker of TNF-a levels in the blood. This find-ing suggests that lower intakes of healthy-based food pattern may contribute directly to the development of low-grade inflammation in these adolescents during these critical years of growth.

Keywords: Dietary patterns, pro-Inflammatory-derived cytokines, inflammation, Adolescents

PS_144/147
THE IMPORTANCE OF PROTEIN FOR SUPPORTING HEALTH IN AN AGING SOCIETY

HOW TO TACKLE PROTEIN AND ENERGY MALNUTRITION IN THE ELDERLY

Kido, Yasuhiro.

PhD, Dietitian, Faculty of Human Health Science, Kanazawa Gakuin University, Japan.

Now in Japan, we have seen an increase in the life expectancy, and the number of aged citizens is still increasing. In order to promote a society where the citizens can maintain an independent lifestyle even at an advanced age and expect a healthy life expectancy, without the need for nursing care due to physical dysfunction, attention has been focused recently on the importance of the relationship between physical dysfunction in the future and the prevention of frailty and sarcopenia. The target of these preventive measures is the skeletal muscle, and the goal is the maintenance of the skeletal muscle and structure. Due to the strong relationship between the skeletal muscle mass, muscular strength and physical functions with protein intake, attention has been drawn to the importance of protein. Compared with normal adults, in the elderly the protein synthesis in the skeletal muscle induced after a meal (after protein intake), shows a relatively reduced reactivity and some reports have indicated the presence of synthesis-resistant properties. Furthermore, some reports have indicated that, even if the essential amino acids required by the skeletal muscle in the elderly existed in the blood stream, the mammalian/mechanistic target of the rapamycin complex (mTORC) and the downstream signal activation were suppressed. In addition, some recent reports have indicated that the actual situation in the elderly is that the intake of protein is insufficient to maintain health.

Up to the present, estimates of the protein requirement have been obtained using the nitrogen balance method, which derives the final estimate of the protein requirement through a step by step method where the intake of protein in changed in each step. However, the estimates of the protein requirement calculated using the nitrogen balance method showed a tendency for underestimated values. In 2007, a new method for estimates of the protein requirement was reported, called the indicator amino acid oxidation method. According to this new estimation method, the estimated protein requirement was 1.3 - 1.5 times that obtained by the previous method. Especially, for the elderly, the new estimates were almost the same as the estimates for the protein requirement for schoolchildren. Thus, for the elderly, we consider that it is im-

portant to promote "more protein intake and the intake of good protein."

Keywords: Protein requirement, nitrogen balance method, indicator amino acid oxidation method, frailty, elderly

DELICIOUSNESS, A STRATEGY FOR COMPLIANCE OF HIGH PROTEIN DIETS

Nishimura, Toshihide.

Ph. D., Professor, Kagawa Nutrition University. Professor emeritus, Hiroshima University. Japan.

It is well known that there are more than 10, 000 kinds of proteins in our body which are parts of tissues such as muscle, liver, heart, bone, hair, skin and brain, and lots of enzymes and hormones and so on. These body proteins are periodically renewed as protein metabolism to keep our health. Food proteins are resources for the newly synthesized protein in metabolism. Therefore, the taking food protein in daily meal plays an important role in keeping our health. In Japan, 60 grams and 50 grams of proteins are recommended to take from foods every day for male and female in adults (over 18 years old), respectively. Recently, old people over 65 years old are also recommended to take the same amount of proteins as young adults to prevent from sarcopenia caused by deficiency of muscle proteins. Especially, the essential amino acids are required for protein syntheses in body. Since these amino acids are not able to be synthesized in our body, they are supplied from food proteins.

It is well known that meats, fishes, milk products, eggs and soy bean in foods contains high amount of proteins. For example, roast beef loin, roast pork loin, roast chicken breast meat, and boiled soy bean 20.4, 26.7, 34.7 and 14.8 grams of protein in 100 grams of foods, respectively. Furthermore, these foods also have the well-balanced essential amino acids. Therefore, these stuffs should be supplied in daily meal.

Among these foods, meats are very popular as a delicious food. Although there are many factors to decide deliciousness of foods, taste, aroma and texture play a very important role in deliciousness of meats. In general, more-flavored and tender meats are recommended to be delicious ones. These qualities of meats are generated during post-mortem aging after slaughter. The meats immediately after slaughter are tough because of rigor mortis, and have less meat flavor. However, during storage, meats become tenderer, because structure of meats has loose by the action of proteases such as calpain and cathepsins. The more flavor in stored meats is generated by Maillard reaction between free amino acids and sugars, leading that in general, the conditioned meats are more delicious. Recently, it has been found that umami substances such as glutamic acid and inosinate that increase during storage of meats play an important role in improvement of deliciousness in meats. They can enhance the intensity of retronasal aroma sensation of meats after putting meats into mouth. This effect leads to the deliciousness of the conditioned meats. The fat of meat has also been found to play an important role in deliciousness, because fats can hold aroma compounds of meats and give us continuity of aroma sensation. This is one of the reasons why the meat of Japanese black cattle is so delicious.

In this presentation, I would like to explain the importance of taking meats in daily meal to keep health and the deliciousness of meats.

Keywords: Meat, protein, health, deliciousness

LIFE STAGE MANAGEMENT OF AMINO ACID NUTRITION

Tontisirin, Kraisid.

Professor and Senior Advisor, Institute of Nutrition, Mahidol University, Thailand.

Amino acids (AA) are structural and functional units of proteins. Based on nitrogen balance and growth, AAs have been classified into 9 indispensable (IAA) and 11 dispensable AAs which can be synthesized from IAA via various metabolic pathways. The latest FAO/WHO/UNU Expert's report in 2007 on protein and AA in human nutrition has estimated AAs requirement for infants during the first six months of life based on breast milk contents of protein and AAs. For older infants up to adolescents the AA requirements are based on the combination of AAs required for maintenance and for growth. For adults, the main criteria used is the AA oxidation resulting in higher requirement recommendations for all indispensable AAs with noticeable 2-3 times higher in lysine, threonine, isoleucine, leucine and valine requirements compared to the previous recommendation in 1985 which was based on N-balance criteria. It is recommended that the AA requirement pattern and also protein need of 0.8 g protein kg/day for elderly people are the same as that for adults.

Protein intake to fulfil requirement and de novo formation of AAs will provide adequate "Amino acid pool" for metabolic and other functions of AAs for good nutrition and wellbeing. Those functions include: protein synthesis and maintenance of protein synthesis machinery, DNA and RNA synthesis, taste and appetite, hormonal functions, neurological and immune functions, regulations of various metabolic functions, and source of energy such as branch chain AAs and alanine. With better understanding of AA requirements, roles of AAs in metabolism and body functions in both normal and illness conditions and the ability to produce industrially of various AAs, the AAs have been used for enteral and parenteral products for treatment of several inherited metabolic diseases and seriously ill patients who need nutritional support. Specific AA has been used for food fortification such as lysine and threonine to improve protein quality in food and feed, glutamate

for taste enhancement, BCAA for athlete and sport. Nutritionally it is quite remarkable to witness the progress in AA science, metabolism, production and utilization to fulfil AA requirements and functions in human life course.

Keywords: Amino acid nutrition

THE ROLE OF LEUCINE IN OBESITY-INDUCED METABOLIC DISORDERS

[1]Wu, Guoyao; [2]Bazer, Fuller W.; [3]Meininger, Cynthia J.

[1]Texas A&M University, College Station, Texas, USA.; [2]Texas A&M University, College Station, Texas. USA.; [3]Texas A&M University, College Station, Texas, USA.

The prevalence of obesity (body mass index ≥30 kg/m2) has increased in many regions of the world over the past decade because of multiple factors, including individual genotypes, excessive energy intake, sedentary lifestyles, and reduced energy expenditure. Obesity, especially the central or visceral type, is a predisposing factor for the development of type 2 diabetes mellitus. This disease manifests as insulin resistance and multiple metabolic disorders, including hyperinsulinemia, impaired glucose tolerance, and dyslipidemia as risk factors for the development of cardiovascular diseases. In both humans and animals, a common characteristic of obesity is a marked elevation in the concentrations of leucine, one of the branched-chain amino acids (BCAAs), in plasma. Of interest, a 22% increase in the concentration of leucine in plasma is associated with insulin resistance and cardiovascular dysfunction in obese subjects. Reduced rates of leucine degradation via multiple organs including skeletal muscle, heart, adipose tissue and kidneys, may contribute to hyperleucinemia in obesity. Leucine is an activator of glutamine:fructose-6-phosphate aminotransferase (GFAT), which is the first and a rate-controlling enzyme in catalyzing the synthesis of glucosamine (an inhibitor of endothelial NO synthesis) in endothelial cells. In addition, through stimulating the mammalian target of rapamycin signaling pathway and thus protein synthesis, leucine may enhance GFAT protein expression. Thus, among BCAAs, leucine is unique in inhibiting the synthesis of nitric oxide (NO, a major vasodilator and a mediator of insulin actions in skeletal muscle) from arginine in endothelial cells, and may modulate cardiovascular homeostasis via insulin resistance. In support of this view, dietary supplementation with BCAAs has been reported to promote the development of insulin resistance in both rats and humans. Conversely, reducing the circulating levels of L-leucine or endothelial GFAT activity may provide a potentially novel strategy for preventing and/or treating cardiovascular disease in obese and diabetic subjects. Such means may include: (1) dietary supplementation with (a) α-ketoglutarate to enhance BCAA catabolism in the small intestine and other tissues, (b) N-ethyl-L-glutamine to inhibit GFAT activity in endothelial cells, and (c) arginine to overcome the inhibitory effect of leucine on endothelial NO synthesis; and (2) oral administration of interferon tau, an inhibitor of oxidative stress. Preventing leucine-induced activation and expression of GFAT by nutritional supplements or pharmaceutical drugs may help to ameliorate the metabolic syndrome in obese subjects. In conclusion, leucine is a biomarker of metabolic defects in obesity, and lowering its concentrations in blood may improve NO generation by the vasculature and enhance the sensitivity of tissues (such as skeletal muscle, heart, liver, and adipose tissue) to insulin. (Supported by AHA and NIH grants).

NEW TOOLS FOR NUTRITIONAL ASSESSMENT IN EARLY LIFE: HOW TO MANAGE THEM

GESTATIONAL WEIGHT GAIN STANDARDS IN THE INTERGROWTH 21ST PROJECT: IMPLICATION TO POLICY MAKERS

Kac, Gilberto.

Professor, Institute of Nutrition, Federal University of Rio de Janeiro. Brazil.

The aim of this abstract is to describe the methodology of the INTERGROWTH-21st gestational weight gain (GWG) standard implementation on the Brazilian Health Unified System. This is a work in progress. The Intergrowth 21st GWG standard was constructed based on a prospective, longitudinal, multi-center study. The study was conducted on eight diverse urban regions in Brazil, China, India, Italy, Kenya, Oman, United Kingdom and United States. The sample comprised healthy, well-nourished women, enrolled in the Fetal Growth Longitudinal Study, a component of the INTERGROWTH-21st Study. Maternal weight was measured every 5 weeks starting with <14 weeks of gestation until delivery. A multi-level, mixed effect, linear regression analysis for repeated measures, adjusted for gestational age was employed to produce the GWG values. The standard was constructed for women with normal weight (body mass index (BMI) ≥18.50-24.99 kg/m2 at the first trimester. doi: https://doi.org/10.1136/bmj.i555. BMJ 2016;352:i555). A reference was also constructed for overweight women (25.0-29.99 kg/m2, not published yet). Smoothed GWG centiles were fitted for the 3rd, 10th, 25th, 50th, 75th, 90th, and 97th for each week of gestation. Additionally, equations for the mean and standard deviation to calculate any desired centiles according to gestational age can be found on the INTERGROWTH-21st dedicated website. The implementation of the INTERGROWTH-21st GWG standard on the Brazilian Health Unified System will be conducted in steps and has been organized as several sub-studies aimed to surpass several difficulties initially identified when the INTERGROWTH-21st GWG standard was released. The main technical issues comprise the lack of GWG data for the first trimester and for the extremes of the pre-gestational weight gain BMI distribution (<18.5 and ≥30 kg/m2). The first sub-study will comprise an extensive literature review dealing with (i) manuscripts that have tested the use of the INTERGROWTH-21st

GWG standard; (ii) manuscripts that have compared measured versus reported pre-gestational weight and (iii) manuscripts that discusses the first trimester GWG estimates. The second sub-study will comprise the validation of the INTERGROWTH-21st GWG standard. This component will focus on testing different cut-off points and ranges of GWG to predict selected maternal and infant outcomes, such as small for gestational age; large for gestational age, postpartum weight retention among others. A third sub-study will seek strategies to evaluate GWG on the extremes of the body mass index distribution. This component will look into for particular prospective cohort studies during pregnancy that may be meta-analyzed to produce GWG estimated for those BMIs not included on the INTERGROWTH-21st. A fourth sub-study will have as objective a reliability study between reported and measured pre-gestational weight. Finally, a fifth sub-study will deal with issues related to the first trimester GWG gain estimates. As a final product, we expect to be able to evaluate INTERGROWTH-21st validity and to assess how useful it can be as a tool to monitor GWG at the Brazilian Health Unified System and if this standard can be used as a substitute of the actual GWG monitoring system in place.

INTERGROWTH 21 ST PROJECT: WHAT IS NEW FOR NEWBORN ANTHROPOMETRIC ASSESSMENT?

Medina, Mercedes

MSc. Nutritionist. Interdisciplinary Group of Family Studies, Universidad de la República. Uruguay.

The impact of different situations in the early stages of life on infant development, cognitive development and the consequences of life, which is not enough to consider only the size of the child, but requires a broader assessment of the result of pregnancy. According to the need to optimize fetal development, the concept encompasses a broad set of considerations, such as: maternal health before and during pregnancy, duration of this, size of the neonate for gestational age and The possibility that fetal development has been disturbed or that the nutritional, physical and emotional factors of the infant's environment exist that maximize their ability to grow, develop and have a healthy life (WHO 2006)

INTERGROWTH-21st is an international, multicentre, population-based project consisting of a number of components, including the Fetal Growth Longitudinal Study (FGLS) and INTER-BIO- 21st Fetal Study (FS).

The INTERGROWTH-21st Project provides standards for early human growth based on populations that conform to the prescriptive approach recommended by WHO 21,52. By prescriptive, we mean we have observed a cohort of prospectively enrolled women whose risk of adverse maternal and perinatal outcomes (including fetal growth restriction) was low based on their individual clinical profiles and the socioeconomic and demographic characteristics of the underlying geographically diverse popula-

tions. In fact, the INTERGROWTH-21st Project is unique because it has produced, for the first time, fetal ultrasound, newborn size and preterm postnatal growth data set that have all been collected from the same underlying populations using the same rigorously applied methodologies.

Objective:To evaluate the birth weight of the Uruguayan children who participated in the National Survey of health, nutrition and development(ENDIS) in 2011 with Intergrowth project.

The information on weight and height of newborns in Uruguay extracted from a representative sample of 3000 children under 4 years old was processed by the information from the 21 st intergrowth Project. This project used information from the same countries of the new anthropometric references of children under 6 years of WHO. And the exclusion criteria in that Project were :

- women under 18 and over 35 y.o
- Mother´s height under 1,53 m.
- BMI < 18.5 ó >30
- Somokers
- History of children with <2500 g. Ó> 4500 g., Or children born dead.
- Less than 14 weeks gestation

Birth weight was analyzed below the 10th percentile with a lower than expected value of 4.5%, while children born with a weight above the 90th percentile exceeded 9% (19%), As for birth size, children below the 10th percentile were 11.5% and above the 90th percentile, 7.8%

The difference in gramas terms were from 100 to 220 gs. < P10, and > P90 from 130 to 300 gs. All evaluated by the gestational age.

The difference in centimeters of heigth were from 110 to 225 cm. < P10, and > P90 from 120 to 350 cm, all evaluated by the gestational age.

Keywords: Birth weight, birht height, intergrowth Project.

EPIDEMIOLOGICAL IMPLICATIONS OF THE NEW WHO ANTHROPOMETRIC REFERENCES AND THEIR LIMIT VALUES AND THE IMPLEMENTATION PROCESS IN ARGENTINE

Abeyá Gilardon, Enrique O.

MD. MPH. Nutrition Area Coordinator. Mother & Child Health. Ministry of Health. Argentina.

Since 1982 in Argentina, Ministry of Health used local references to evaluate children growth, to select food programs beneficiaries and estimate prevalences of malnutrition (stunting and ematiation). In 2007, Ministry of Health adopted the Multicenter Growth Reference Study curves (launched by WHO in 2006) for weight for age, length/height for age, head circumference for age and body mass index for age for all children less than five years replacing local references. By September 2012 all 23 country prov-

inces and Buenos Aires Autonomous City had adopted the WHO standards (10 before 2009; 9 from September 2009 to March 2010; 3 from April 2010 to September 2010; 2 from October 2010 to September 2012). Time delay from adoption to implementation was partially due to existing stock of printed material (mainly, growth charts and sanitary booklets).

Implementation of new curves was performed in coordination with Sociedad Argentina de Pediatría through local seminars and training workshops. This process was supported by providing an ad-hoc handbook and growth charts.

Ministry of Health selected 8 graph: weight for age (first semester, birth to 24 months and birth to 5 years), height for age (birth to 24 months and birth to 5 years), BMI for age (1 to 5 years), head circumference (first trimester and birth to 5 years). All curves are for percentiles 3, 10, 25, 50, 75, 90 y 97 except BMI for percentiles 85 instead of 90. Also it were included three tables of weight increments for first two years.

The weakness of the MGRS is that all programs include children up to 6 years, therefore it was necessary to include a handed curve for this temporal segment from WHO growth curves not included in MGRS.

Keywords: Children Growth, Implementation, Argentina, Nutrition Policy, MGRS WHO

ADVANCEMENT OF GLOBAL FOOD COMPOSITION DATABASES

FOOD COMPOSITION DATABASES ACROSS THE GLOBE: AN OVERVIEW

[1]*McLean, Morven;* [2]*Christianson, Karin;* [3]*Leet, Whitney;* [4]*Bennett, Laurie.*

[1]PhD. Executive Director. International Life Sciences Institute Research Foundation. Washington. DC. USA.; [2]MS MPH. Program Associate. International Life Sciences Institute Research Foundation. Washington. DC. USA; [3]MS RD. PhD Student. Nutrition and Health Sciences. Emory University. Atlanta. Georgia. USA; [4]Program Manager. International Life Sciences Institute Research Foundation. Washington. DC. USA.

In 2017, the ILSI Research Foundation launched the Catalogue of Food Composition Databases and Tables (or CatFCDB), a curated clearinghouse of information about food composition databases and tables. Designed with researchers, dietitians, students, government officials, and database managers in mind, CatFCDB serves to aide users in their initial assessment of the scope and depth of nutritional composition data available for certain countries and regions. It is displayed as an interactive map that enables users to explore, analyze and filter 90 FCDBs from 92 countries and regions. CatFCDB is meant to be a starting platform for users to learn about available food composition databases and tables to determine which may suit their needs, and it provides hyperlinks to direct the user to the source databases and tables (when these are available). An overview of CatFCDB demonstrating its functionality will be provided.

The ILSI Research Foundation also maintains the ILSI Crop Composition Database (ILSI-CCDB), an open-access source of comprehensive nutritional composition data for eight conventionally bred crops: canola, cotton, field corn, potato, rice, sorghum, soybean, and sweet corn. Data in the CCDB are derived from numerous samples of hybrids and/or varieties cultivated in controlled field trials using standard commercial cultivation practices at various locations throughout the world. Representative plant samples are obtained from field-grown crops with known production locations and dates. The analytical methods used to generate the composition data must be indicated, validated, and use certified or historically verified standards. Users can query the database to generate mean levels and ranges of nutritional components in various crop species. Environmental factors such as soil type and temperature can impact the levels of important nutrients in plants, and the moisture content can vary based on field conditions at harvest and when samples are handled. The database includes features that allow the user to retrieve a subset of data for samples produced in a specific year or location, and the analyte search filter can be applied to retrieve a pre-determined subset of data. Version 6 of the ILSI-CCDB was released in October 2016, and Version 7, which will include apple for the first time, is targeted for release before the end of 2017.

One of the strengths of the ILSI-CCDB is the completeness and quality of the data sets for each crop. However, the analytical rigor required for data submitted to the ILSI-CCDB means that sample testing is expensive, and so it is not surprising that most data have been donated by the private sector, and for a very limited range of crops. The ILSI Research Foundation is committed to including data for other crop species, particularly important staple foods. For such data to become available, public sector breeding programs, as well as breeding programs run by small and medium enterprises, must be able to submit data, but it is also essential to ensure that data for new crops are verifiable and robust. Resolving how to balance these imperatives remains a significant challenge.

Keywords: Food composition, crop composition, open data

NEW DEVELOPMENTS IN FOOD COMPOSITION PROGRAMMES IN SOUTH-EAST ASIA: ASEANFOODS

[1]*Tee, E-Siong;* [2]*Judprasong, Kunchit;* [3]*Puwastien, Prapasri.*

[1]PhD. ASEANFOODS Advisor. President. Nutrition Society of Malaysia. c/o Institute for Medical Research. Kuala Lumpur. Malaysia; [2]PhD. Assoc Prof. ASEANFOODS coordinator. Institute of Nutrition. Mahidol University. Nakhon Pathom. Thailand; [3]PhD. Assoc Prof. ASEANFOODS Advisor. Institute of Nutrition. Mahidol University. Nakhon Pathom. Thailand.

The Association of Southeast Asian Network of Food Data systems (ASEANFOODS) was established in 1986 consisting of 10 member countries, namely Brunei Darussalam, Cambodia,

Indonesia, Laos, Malaysia, Philippines, Singapore, Thailand, and Vietnam. To coordinate the ASEANFOODS activities, the Institute of Nutrition, Mahidol University (INMU) was chosen as the Regional Centre in 1986 and INFOODS Regional Database Centre in 1991. The goal and objectives are to strengthening the development of national and regional food composition data (FCD) with high quality, adequate quantity and accessibility to the users. The first ASEAN FCTs was published in 2000 and was available in ASEANFOODS website. A number of proficiency testing schemes for laboratories were organised and few reference materials for food analysis were developed.

During 2015-2016, ASEANFOODS collaborated with and supported by International Life Sciences Institute South East Asia (ILSI-SEA) Region in organising two workshops in Thailand. The specific objectives of the first workshop, from 17-18 December 2015, were to develop a quality evaluation system (draft guideline) for assessing the quality of published national FCTs in ASEAN countries and to develop action plan for succeeding workshop and future activities. The specific objectives of the second workshop, 30-31 March 2016, were 1) to review the proposed plan/strategies for updating of ASEAN FCTs/FCDBs and organising Food-Comp-ASEAN course, 2) to discuss the feasibility of incorporating nutrient data of pre-packaged foods (branded food products) into national FCDBs. The latter activity has commenced in Thailand, to be followed by Malaysia and Philippines.

At the national level, most ASEAN countries have been actively working on generating new data. Recent activities are as follows: Malaysia continued with its new phase of compilation and documentation of the laboratory analyses of nutrients by participating institutions through a web-based system for data generators, data compilers and data users. This online FCDB publishes partial releases of the Malaysian FCD websites since 2015. Facilitated by ILSI-SEAR, a project to analyse the sugar content of commonly consumed foods and beverages is being planned. Philippines: Current activities are on updating FCTs and web-based PhilFCT. New food data, focusing on indigenous fruits and vegetables, are being generated, compiled, checked and evaluated until the end of the 3rd quarter of 2017. Thailand: The hard copy of the new version Thai FCT was published in September 2015. The on-line Thai FCDB is available since April 2016 at the INMU website. Food composition data for new food items and missing data are being developed. Vietnam: Activity on updating the Vietnam FCDB is at the final preparation and is expected to be published by 2017. A strategic plan for updating the ASEAN FCDB has been developed for possible implementation in 2018 when there is sufficient progress of FCDB in the main member countries.

The main activity of the ASEANFOODS Regional Centre in 2017 will be to strengthen the competence of young staffs in ASEANFOODS member countries by collaborating with the area experts in organising the FoodComp–ASEAN 2017 in Thailand.

ILSI North America. Washington.D.C. USA.

Many current and important public health challenges are linked to food and nutrition. Obesity and associated co-morbidities, a primary public health concern, is diet/food related. The risks for some cancers may be decreased by dietary patterns and cardiovascular disease is associated with many specific nutrients as well as dietary patterns. The USDA is the primary department with farm-to-fork oversight of the U.S. Food Supply, and the USDA conducts much work in the areas of nutrition and dietary guidance. Central to accomplishing this task is tracking the nutritional status of Americans, and this requires knowledge of the composition of the food system. Although the USDA has maintained food composition records since the early twentieth century, the task today is greatly complicated by the volume and fluidity of the food supply. Today there are more than 25,000 food manufacturers in the US who produce more than 20,000 new food and beverage products each year. The average grocery store has more than 36,000 individual items and there are more than 400,000 items in the food supply additionally, meals away from home are increasing and now account for over 50% of total food spending in the United States. All these factors results in limited knowledge of current intake of calories and nutrients by the America people.

The USDA Agricultural Research Service (ARS) maintains a program for monitoring food composition and nutrient intake of the nation; this program has two components: Provide U.S. food composition data and Determine food consumption and dietary patterns of Americans as part of the National Health and Nutrition Examination Survey (NHANES). Electronic records and databases are essential to this mission. For over thirty years this program has maintained the National Nutrient Database for Standard Reference (SR). Until October, 2016, this database contained information on approximately 9,000 foods and many of the items have complete analyses (of up to 146 nutrients) conducted by analytical laboratories. More recently, however, a public-private partnership between the USDA, the International Life Sciences Institute – North America (ILSI-NA), GS-1, One World Sync and LabelInsight has resulted in creation of the Branded Food Products Database (BFPD). This partnership enables the flow of manufacturers label data into the ARS Nutrient Database significantly increasing the database to more than 170,000 foods within 4 months, with the anticipation of many more to be placed in the system. These data represent a tremendous increase in the amount of knowledge but

many gaps remain before the full potential of the Branded Foods Products Data can be realized.

PS_144/163

WHO/CDC SYMPOSIUM ON THE ASSESSMENT OF VITAMIN A STATUS IN POPULATIONS

WHO PROCESS FOR DEVELOPING GUIDELINES FOR VITAMIN A INDICATORS RETRIEVAL, SUMMARIZING AND ASSESSING THE EVIDENCE

Rogers, Lisa Marie.

PhD. Technical Officer. World Health Organization. Geneva, Switzerland.

Indicators to assess the micronutrient status in populations are important for determining the magnitude and distribution of deficiency as a public health problem, for choosing the most appropriate intervention, and for monitoring and evaluating the impact and safety of public health programmes. The assessment of micronutrient status is often complex, as indicators can be affected by other conditions such as age, sex, disease, smoking, infection and inflammation; and the use of appropriate indicators must feasible at the population level. The World Health Organization (WHO) previously convened a meeting on Priorities in the assessment of vitamin A and iron status in populations to discuss and initiate the work of updating WHO guidelines on indicators for the assessment of vitamin A and iron status. With regard to the assessment of vitamin A status, indicators considered to be of highest priority to undergo review were: 1) retinol (serum or plasma obtained from venous or capillary blood); 2) retinol-binding protein (RBP; serum or plasma obtained from venous or capillary blood); 3) breast milk retinol; 4) relative dose response (RDR) tests; and 5) modified RDR (MRDR) tests. Additional indicators identified since the previous consultation are retinyl esters and isotope dilution for use in select populations. As guidance on the use of specific biomarkers of vitamin A status and redefinition of thresholds for vitamin A deficiency will have implications for public health and research around the world, this work must be consultative, transparent, methodical, and use the best available scientific and statistical methods. WHO has adopted internationally recognized methods and standards for guideline development to ensure that its guidelines are of the highest quality. The general process includes: (i) identification of key questions and critical outcomes; (ii) retrieval of the evidence; (iii) assessment and synthesis of the evidence; (iv) formulation of the recommendations; and (v) planning for dissemination, implementation, impact evaluation and updating of the guideline.

Keywords: Vitamin A, retinol, status, assessment, indicators

BIOLOGICAL EVIDENCE FOR OR AGAINST HIGH DOSE SUPPLEMENTATION

Tanumihardjo, Sherry.

University of Wisconsin-Madison. USA.

The World Health Organization (WHO) recommends high dose capsules of retinyl palmitate be orally administered to children between 6 and 59 months of age for the prevention of mortality. Infants less than 12 months are to receive 100,000 IU and those 12-59 months receive 200,000 IU. These capsules should be targeted in areas of the world that are at risk for vitamin A deficiency based on a variety of factors. Other high dose supplementation programs in different age- or vulnerable groups have been tested and sometimes implemented in many countries. However, currently evidence on their efficacy to improve infant and childhood mortality is not supported by reviews of randomized controlled trials. One of the most debated interventions is neonatal supplementation. Trials indicated mixed results on infant mortality, and a meta-analysis of human trials indicated no overall effect of neonatal supplementation on death within 6 mo of birth. High dose supplements have transient effects on serum retinol and tissue stores of vitamin A, with the exception of the liver where increases may last for several months on the background of low dietary intake in humans. In swine models, vitamin A is well-absorbed, appears in serum primarily as retinyl esters, and is taken up dose dependently in all tissues. Nonetheless, enhancement in piglets did not persist in serum, lung, kidney, spleen, or adrenal gland. It has long been considered that circulating retinyl esters disrupt membranes and are the major cause of symptoms of hypervitaminosis A or toxicity. After high-dose supplements, elevated esters persisted for approximately 12 hours before being sequestered in the liver for storage. Elevated circulating esters were associated with hypervitaminosis A in Zambian children at a cutoff of 5% of total vitamin A, but the current cutoff used in adults, i.e., 10% retinyl esters of total vitamin A, has not been validated.

In piglets, vitamin A storage was enhanced for more than 10 days after high-dose supplements compared with placebo. In the same study, once liver reserves reached 0.7 micromol/g liver, vitamin A concentrations plummeted. It is not known whether this was due to the high dose capsule administered 7 days prior or if it reflects a biological response at this liver reserve, which was referred to as excessive vitamin A status in the past. No group of piglets reached a mean concentration of >1 micromol/g liver, which currently defines hypervitaminosis. Short-term impacts of retinoid signaling and longer follow-up after high dose supplements need to be evaluated.

Keywords: Animal models, catabolism, circulating retinyl esters, hypervitaminosis, supplementation

---

SUMMARY OF INDICATORS OF VITAMIN A STATUS AND THEIR INTERPRETATION IN A POPULATION SETTING

Tanumihardjo, Sherry.

University of Wisconsin-Madison. USA.

Vitamin A, which includes circulating retinol, retinal in the eye, storage retinyl esters, and the hormone retinoic acid, is an essential nutrient because humans must consume it in the diet either in the preform or as provitamin A carotenoids. Provitamin A carotenoids are produced in plants and provide vitamin A after enzymatic cleavage. Vitamin A deficiency continues to burden the global diseases, particularly in resource-poor countries. The most severe indicator of vitamin A deficiency is xerophthalmia and increased risk of death from infectious diseases, especially in children. Serum retinol concentrations are under homeostatic control due to its essential role in growth and cellular differentiation, which requires constant levels. At high concentrations, the vitamin is toxic. Because retinol-binding protein is a negative acute phase reactant, serum retinol concentrations are depressed during inflammation. Therefore, population status assessment needs to account for inflammation using acute phase markers (C-reactive protein and alpha-acid-1-glycoprotein). A serum retinol concentration of <0.7 micromol/L is considered deficient. However, in some population groups, this concentration may be adequate on the background of inflammation. Other indicators that have been used include breast milk retinol, which is unique to lactating women, doses response tests, isotope dilution methodology, and serum retinyl esters. These biomarkers can be related to liver vitamin A concentrations, which are considered the gold standard for vitamin A status. Breast milk concentrations <1 micromol/L are inadequate. Breast milk has two sources of retinol, i.e., retinol bound to retinol-protein and chylomicra. Therefore, they have utility in defining vitamin A exposure. Dose response test require an analog of retinol be administered and a waiting time of 4 to 6 hours before blood drawing. If retinyl acetate is administered a baseline blood is also required and an increase of 20% is considered abnormal. If 3,4-didehydroretinyl acetate is given, a single blood sample is needed and a ratio of 3,4-didehydroretinol to retinol of >0.06 signifies inadequacy. In the past, the World Health Organization (WHO) considered a 20% prevalence of inadequacy as a severe public health problem. Isotope dilution testing also requires analog administration, blood draws, and a waiting period. However, they are usually considered good estimates of total body stores of vitamin A and have been validated against liver reserves of vitamin A in animals and humans. WHO has not considered a prevalence definition for public health significance when isotope dilution testing is used. This is likely because most studies are stratified across population cohorts. Vitamin A indicators are best used together to best define where along the vitamin A status continuum the population lies. Serum retinol concentrations alone have limited utility, yet other tests are more expensive to implement. The best scenario is likely that serum retinol be measure on the population and then randomly selected subsets of individuals be administered either the dose response or isotope dilution test.

This would allow a more informed interpretation of the serum retinol distribution.

Keywords: Biomarkers, dose response test, inflammation, isotope dilution, serum retinol.

EXPERIENCES AND LESSONS LEARNED WHEN THE MODIFIED RELATIVE DOSE RESPONSE TEST WAS INCLUDED IN POPULATION-BASED SURVEYS TO ASSESS VITAMIN A STATUS

WHO defines vitamin A deficiency (VAD) as serum retinol <0.70 μmol/L, but this indicator is homeostatically controlled, influenced by inflammation, costly to assess, and requires a venous blood specimen. Retinol binding protein (RBP) is often collected instead because it is less costly and can be collected with a capillary sample, but a standard cut-off for VAD using RBP is not defined. In each survey collecting RBP, a subsample of retinol should also be collected in order to calculate the RBP cut off equivalent to serum retinol <0.70 μmol/L. The modified relative dose-response (MRDR) test is a qualitative indicator of vitamin A liver stores. MRDR is not homeostatically controlled and less influenced by inflammation than retinol or RBP. During the analysis of MRDR, a value for serum retinol is also generated, which can be used to calibrate the RBP cut off values for defining VAD. MRDR requires consuming a small challenge dose of a vitamin A analog (A2) along with a fatty snack and collecting a blood sample 4-6 hours later, increasing the survey complexity. Using examples from Nepal, we describe experiences planning large scale population-based vitamin A assessments including subsamples of MRDR/retinol, determining RBP cut-offs for VAD, and prevalence estimates.

Describe planning and logistical implications for large scale surveys including young children. Use linear regression to examine the retinol-RBP relationship and determine the RBP cut-off that corresponds to the retinol cut-off of 0.70 μmol/L. Describe the RBP cut-offs calculated from the surveys for young children, including pre- and post-vitamin A2 dosing.

Vitamin A2 is not commercially available and must be synthesized. Data collection was planned to start 30 days after biannual vitamin A supplementation (VAS) campaigns because VAS influences circulating retinol. Among children 6-23 months, the

calculated RBP cut-off to define VAD was RBP<0.84 µmol/L and RBP<0.59 µmol/L, respectively, in two surveys collected four years apart.

Including a subsample of MRDR/retinol is feasible with planning. More information is needed to understand the factors influencing RBP calculated cut-offs equivalent to retinol <0.70 µmol/L and the best methods to assess vitamin A status.

PATHS TO NOURISHING MILLIONS WITH BIOFORTIFICATION

SCALING UP BIOFORTIFICATION: PROGRESS TO DATE, SUCCESS FACTORS AND THE CHALLENGES

[(1)]Mudyahoto, Bho; [(2)]Foley, Jen; [(2)]Boy, Erick; [(2)]Birol, Ekin; [(2)]Asare-Marfo, Dorene; [(2)]Lividini, Keith.

[(1)]HarvestPlus. International Food Policy Research Institute. Kampala, Uganda.; [(2)]HarvestPlus. International Food Policy Research Institute. Washington, D.C., USA.

During the past 15 years, HarvestPlus and its partners have made tremendous progress in the development, release and dissemination of biofortified crop varieties. Biofortification is the process of increasing the density of vitamins and minerals in a crop through conventional plant breeding or agronomic practices. Varietal development is jointly led by CGIAR centers in collaboration with National Agricultural Research Institutes, with support from donors and national governments. Over 140 varieties of 10 crops have been released as public goods in over 30 countries worldwide, and are being tested and grown in over 60 countries in Sub-Saharan Africa, Asia and Latin America. The adoption and consumption of biofortified crops is ever increasing. In 2016, over 7 million households (35 million people) were estimated to be growing and consuming biofortified crops. It is estimated that by 2030, about 1 billion people will be growing and consuming biofortified high pro-vitamin A maize, cassava, and sweet potato; high iron beans; sorghum and pearl millet; and high zinc wheat and rice, globally. While the pathways to develop, deploy and scale up biofortified crops are country and context specific, a robust evidence base of the effectiveness of biofortification, continued investment in product (varietal) development, standards for biofortification, strategic partnerships, relevant national policy instruments, private and public sector, and donor investment across the value chain of biofortified crops and, robust monitoring, evaluation and information sharing systems, are all crucial for sustainable scaling up of this technology, regardless of the context. There is robust evidence on the acceptability, efficacy and effectiveness of biofortification, and new research is published on an ongoing basis. For example, a recent systematic review of three randomized iron-biofortified efficacy trials further confirmed that iron-biofortified interventions significantly improve iron status—particularly among women and children under 5 (Finkelstein et al. 2017). Additionally, an effectiveness study carried out in Uganda showed that among recipients of Orange Sweet Potato (OSP) vines: (a) there was sustained adoption 2-4 seasons after delivery; (b) vitamin A intakes of children and women significantly increased, with OSP accounting for 53% of vitamin A intake for children under 5; and (c) the prevalence of low serum retinol was reduced by 9.5 percentage points among children under 5 (Hotz et al. 2012). In addition, a WHO Cochrane review committee was assembled in 2016 to review the scientific evidence and country experiences of scaling up biofortification. This paper summarizes the progress and challenges of scaling up biofortification and the existing evidence focusing on: varietal development and release; biofortification standards and enforcing compliance; HarvestPlus' scaling up strategy, priority countries and global targets; the entry points and strategies at national, regional and international levels; the role of strategic partnerships in scaling up biofortification; M&E systems for biofortification initiatives; lessons learned and challenges.

SCALING UP BIOFORTIFICATION: DELIVERY OF BIOFORTIFIED CROPS AND FOODS IN NIGERIA – PROGRESS AND LESSONS

[(1)]Ilona, Paul; [(2)]Pfeiffer, Wolfgang; [(3)]Boy, Erick; [(3)]Foley, Jen; [(1)]Umeze, Gerald; [(1)]Okonkwo, Ifeoma.

[(1)]HarvestPlus. International Institute of Tropical Agriculture. Ibadan, Nigeria.; [(2)]HarvestPlus. International Centre for Tropical Agriculture. Cali, Colombia.; [(3)]HarvestPlus. International Food Policy Research Institute. Washington, D.C., USA.

New agricultural technologies are seldom able to propagate themselves because adoption by farmers and consumers is often influenced by a myriad of factors other than the improved characteristics in the new technologies. Biofortification is one such new technology in Nigeria, with the primary objective to increase the levels of essential micronutrients in staple crops as a sustainable and complementary strategy to reduce micronutrient malnutrition among vulnerable populations. Seventeen biofortified varieties (six of pro-vitamin A cassava, seven of pro-vitamin A maize, two of orange sweet-potato and two of iron sorghum) have been officially released for production in Nigeria during the past six years. The journey of delivering biofortified varieties to farmers started in 2011, soon after the first set of three biofortified varieties of cassava were officially released to farmers by the government. HarvestPlus has since innovated and deployed several tools and channels that were initially slow but gradually picked up momentum to reach an estimated two million farmers by the end of 2016. This did not go without challenges considering the diversity in culture and agro-climatic conditions, initial need for evidence, confusion of our crops with GMO's, and socio-political and economic instability. There were shifts from: a single crop approach in the early years to multiple crop approach; social to commercial seed

delivery; single field demonstrations to model village concepts; specific component interventions to value chain models; conventional marketing to dedicated and online markets; single to multimedia communication including movies; direct to partner-led delivery; manual to electronic data collection; zero to three policy support documents; zero to over 2,000 small- and medium-sized enterprises; and, finally, special activities to mainstream biofortification such as quiz competitions, national nutrition platforms, educational curriculum and school feeding programs. This paper reviews the different strategies and channels employed in reaching Nigerians with more nutritious crop and food options. It presents coverage data and analyses the lessons learned, suggests new strategies for scaling and predicts the potential reach by 2020.

PRIVATE PUBLIC PARTNERSHIPS: A DELIVERY MODEL FOR BIOFORTIFIED IRON PEARL MILLET IN INDIA

Cherian, Binu.

HarvestPlus. International Center for Tropical Agriculture. c/o International Crop Research Institute for the Semi-Arid Tropics. Patancheru. Telangana. India.

Despite India's tremendous economic growth and agricultural production in recent decades, levels of iron deficiency anemia and zinc deficiency have not significantly improved. Yet, agriculture is a sustainable and affordable source of nutrition and through biofortification—the conventional breeding of food crops with higher micronutrient levels—a measurable impact on nutrition and food security is achievable in populations that consume these nutrient-rich foods daily. Pearl millet (Pennisetum glaucum (L) R. Br.) is a climate resilient crop and major source of food and nutrition security for millions in the semi-arid tropics. Biofortified iron pearl millets are not only high in iron and zinc content, but are higher yielding, more disease resistant, tolerant to drought, heat and soil salinity, and include other agronomical traits preferred by farmers. In India, strong pearl millet breeding programs exist in both the public and private sectors. Seed companies have a well-developed, vertically integrated research and development to distribution and retail chain. Therefore, to promote the scale-up of nutrient-dense biofortified crops, HarvestPlus established partnerships with public and private seed companies. This has facilitated the rapid commercialization of products and engagement of farmers in delivery activities by leveraging their efficient and extensive distribution touch points. For example, farmers' engagement during participatory variety selection informs them of biofortified product characteristics at an early stage and encourages adoption. Public-private partnerships have been a successful strategy to increase the reach of biofortified crops in India: by the end of 2016, an estimated 375,000 people were consuming iron pearl millet. Market research results helps to understand key consumer insights and motivations towards biofortified crops. Collaborative promotion campaigns are organized with partners, such as on-farm

product demonstrations, farmers' field days, mobile campaigns, and engagements at the point of sales, help create further demand. Product information regarding the nutritional and agricultural benefits of iron pearl millet are made available through training sales personnel, retailers, and distributors of seed companies who remain one of the first points of contact of farmers. Collectively, through these private-public partnerships and other market-based approaches, HarvestPlus aims to reach 3 million people in India by 2030 with biofortified pearl millet. In partnership, HarvestPlus' advocacy strategy shall focus on some of the challenges of linking biofortified pearl millet to existing public food programs in the country. These linkages may help to increase demand for biofortified pearl millets and add nutrition components to existing food interventions that reach pregnant and nursing mothers, children under the age of six, school children, and families above and below the poverty line.

IMMUNONUTRITION IN HEALTH AND DISEASE: EVALUATION OF BIOMARKERS

LIFESTYLE HABITS AND IMMUNONUTRITION

Marcos, Ascensión.

Research Professor at the Spanish National Research Council (CSIC). President of the International Society for Immunonutrition (ISIN).

Immunonutrition is the subject that studies the interrelationship between nutrition and the immune system. However, in the last decade, Immunonutrition also includes an interdisciplinary space in the research field, being related to other tissues and systems of the organism, such as the nervous, digestive and endocrine systems, as well as the gut microbiota that has been recently defined as a "new" organ. Therefore, the study of Immunonutrition acquires a great interest in the assessment of the nutritional status through the evaluation of certain biomarkers capable to detect situations of malnutrition and also the risk of suffering from eating disorders, metabolic syndrome, cardiovascular diseases, neurological disorders, allergies or infections. Lifestyle includes diet and other determinants, such as body fat composition, physical activity, sedentary habits, sleep profile, stress situations and psychological status, as well as tobacco and alcohol consumption. Although the Mediterranean diet (MD) has been promoted at an international level as a consequence of the scientific evidence about its benefits, especially for cardiovascular diseases, chronic degenerative diseases and some cancers, unfortunately, even in the Mediterranean countries, this type of diet is losing its leading role due to globalization effects across the world. The MD is mainly characterized by an elevated consumption of plant based foods, such as fruits and vegetables, a low intake of red meat and the use

of olive oil as the main source of fat food. Indeed, the studies on the adherence to the MD has been positively associated with performance in youth, independently of potential confounders, including body mass index, physical activity, fitness and sedentary behavior. In addition, there are several plausible mechanisms that can explain the protective effect of the adherence to the MD not only on cognition, but also including antioxidative and anti-inflammatory effects and the reduction of vascular comorbidities. In fact, the higher adherence to the MD is associated with lower levels of C-reactive protein and interleukins; thus, an underlying neuroprotective effect could be due to its vascular properties and its ability to reduce inflammation and oxidative stress, which are also associated with neurodegeneration. Regarding body fat composition, several biomarkers, such as leptin, cortisol and insulin have been confirmed as essentially included into the assessment of inflammation-related biomarkers. Fitness has also been confirmed as a useful tool to evaluate cardiometabolic profile. In addition, regular physical activity has been shown to develop a positive impact on the immune system by promoting mechanisms of action to defend the organism, in contrast with a high and intense physical exercise that can lead to immunosuppression with a high risk to suffer from infections. Moreover, the sleep profile has been defined as another important determinant to evaluate, due to its relationship with inflammatory patterns. In summary, the study of the different determinants included into the lifestyle habits and their relationship with the assessment of immunological biomarkers should be taken into account to evaluate the nutritional status in order to detect metabolic alterations and to prevent risk and development of diseases from the beginning of the onset.

Keywords: Mediterranean diet, physical activity, Fitness, sleep profile, immunological biomarkers

BIOCHEMICAL MARKERS IN IMMUNE-DEPRESSED SUBJECTS

Slobodianik, Nora H.

PhD. University of Buenos Aires, School of Pharmacy & Biochemistry. Dept. Nutrition & Food Science. Argentina.

The aim of this lecture is to show the most important preliminary results obtained in our laboratory, related to the nutritional status evaluated through the use of biochemical parameters in 19 children suffering from cystic fibrosis (CF). The patients were treated and recruited at the Nutrition Service of Pedro Elizalde Hospital, Buenos Aires, Argentina. The study was approved by the University of Buenos Aires Ethics Committee, and all participants' parents agreed to sign the written consent before recruitment. The results were compared with reference values obtained from healthy children matched by age and gender.

Lower plasma fractions related to the nutritional status (apoB, Transferrin, Transthyretine) meanwhile higher levels of CRP and Fibrinogen were found in CF children in comparison with the healthy group. In addition, 30% of the CF children showed CPR levels higher than 0.3 mg/dL, concomitant with Fibrinogen levels

higher than 288 mg/dL, and 78% showed HDL levels lower than 35 mg/dL, these values being associated with cardiovascular risk. Moreover, a significant reduction of complement factors (C3c and C4c) was found which is related to a higher plasma ceruloplasmin concentration and Adenosine Deaminase activity (T lymphocyte-associated enzyme). Moreover, changes in the plasma fatty acids profile were found. In conclusion, nutrition is a critical component of the management of cystic fibrosis, and nutritional status is directly associated with both pulmonary status and survival. The results obtained in this paediatric population point out the requirement to include biochemical and functional parameters in the evaluation of patients suffering from CF. Specific nutritional support should be established and adjusted to individual needs.

HEPCIDIN AND IRON IN INFLAMMATION

Solano, Liseti.

Professor. Nutrition Research Institute. Faculty of Health Sciences. Carabobo University. Valencia. Venezuela.

Hepcidin has emerged as the central regulatory molecule of systemic iron homeostasis. It is a 25-amino acid peptide hormone, produced and secreted predominantly by hepatocytes, circulates in the bloodstream, and excreted by kidneys. By binding to ferroportin and inducing its internalization and degradation, hepcidin regulates cellular iron efflux, controlling absorption of dietary iron from the intestine and release of recycled iron derived from senescent erythrocytes. Hepcidin levels are reduced in iron deficiency, and measurement of blood or urine hepcidin levels may enable evaluation of iron requirements providing a powerful indicator of physiological iron deficiency. Hepcidin measurement in patients have been proposed, as for anemia of chronic disease, anemia associated with chronic kidney disease and hemodialysis, genetic hemochromatosis, and iron deficiency diagnosis. Its concentrations are decreased in situations that require increased concentrations of circulating iron. In case of increased erythropoiesis, as in response to hypoxia, anemia, iron deficiency, or conditions of ineffective erythropoiesis, a decreased hepcidin concentration will result in the release of stored iron and in an increase in the dietary iron absorption. On the other hand, infection and inflammation cause an increase in hepcidin synthesis, resulting in decreased

availability of circulating iron, which is considered to represent a defense mechanism of the human body against extracellularly proliferating (irondependent) pathogens. In chronic (low-grade) inflammatory states, this ultimately leads to a deficiency of iron available for erythropoiesis called anemia of chronic disease, especially in obesity due to adipose tissue enlargement.

Keywords: Hepcidin, Iron concentration, Iron deficiency anemia, Chronic disease anemia, Inflammation

THE IMMUNOINFLAMMATORY PROCESS IN TYPE 2 DIABETES MELLITUS. HOW CAN WE HELP?

Valdes-Ramos, Roxana.

Faculty of Medicine, Universidad Autónoma del Estado de México.

Introduction: Type 2 diabetes mellitus (T2DM) is considered the epidemic of the 21st century, with more than 220 million sick people worldwide. It is calculated that this number will triplicate by 2030. It is present mainly in subjects over the age of 40, however, its association with obesity has increased its prevalence in younger subjects. The nutritional transition in which many countries are immersed, with a rapid change in family income, the adoption of inadequate lifestyles and very low levels of physical activity, have led to an increase in prevalence of diabetes. Its aetiology involves the immune system in a very important way. Obectives: To review the conditions in the immunoinflammatory process that lead to the development of T2DM and its complications, in search of ways to improve the condition. Development: T2DM is a pathology resulting from two main conditions in glucose metabolism, a decrease in the production of insulin or an increased resistance to it. Diabetes is closely related to an alteration of the innate immune system, with the production of pro-inflammatory cytokines and adipokines in a chronic way. Insulin resistance develops before the increase in some inflammatory markers such as C-reactive protein and plasminogen activator 1, among others. Tumor necrosis factor alfa, interleukins 1 alfa and beta, interleukin 6, interferon gamma, retinol binding protein and resistin are increased in type 2 diabetes mellitus. On the other hand, we can find decreases in adiponectin, leptin, ghrelin, visfatin and omentin production. The immunoinflammatory process is responsible for the complications such as retinopathy, nefropathy, neuropathy, cardiovascular and peripheral vascular diseases, as well as periodontal pathologies. There are several low-cost and widely available interventions that may be useful in decreasing or controlling the inflammatory process, such as supplementation with various vitamins, polyunsaturated fatty acids, etc. Conclusions: T2DM is a pathology, where cause and effect are related to the innate immune system, thus, by controlling this inflammatory process, we can avoid the consequent complications of the disease.

BIOMARKERS REFLECTING INFLAMMATION AND NUTRITION DETERMINANTS OF ANEMIA (BRINDA 2) PROJECT

OVERVIEW OF PHASE 2 OF THE BIOMARKERS REFLECTING INFLAMMATION AND NUTRITION DETERMINANTS OF ANEMIA (BRINDA) PROJECT

[1]*Suchdev, Parminder A.;* [2]*Young, Melissa;* [3]*Williams, Anne;* [4]*Addo, Yaw;* [5]*Engle-Stone, Reina;* [6]*McDonald, Christine;* [2]*Guo, Junjie;* [2]*Ismaily, Sanober;* [3]*Flores-Ayala, Rafael.*

[1]MD, MPH. Departments of Pediatrics and Global Health. Emory University. Nutrition Branch. Centers for Disease Control & Prevention; [2]Hubert Department of Global Health. Emory University; [3]Nutrition Branch. CDC; [4]Hubert Department of Global Health. Emory University. Nutrition Branch. CDC; [5]PhD Nutritionist. Department of Nutrition. University of California Davis; [6]Deputy Director of IZiNCG at Children's Hospital Oakland Research Institute.

The Biomarkers Reflecting Inflammation and Nutritional Determinants of Anemia (BRINDA) project is a multi-agency and multi-country collaboration formed in 2012 in an effort to improve micronutrient assessment and anemia characterization globally. BRINDA's overall goal is to refine approaches to estimate the prevalence of micronutrient deficiencies and thus improve the targeting, design and effectiveness of nutrition research and programs. BRINDA phase 1 was recently completed with key findings on approaches to adjust biomarkers of iron and vitamin A status

for inflammation, as well as factors associated with anemia in both high and low inflammation settings.

BRINDA phase 2 activities build on the success of BRINDA 1 by expanding the scope of countries included in analysis and answering new key research questions including: 1) approaches to address the association between inflammation and zinc in pre-school children (PSC) and women of reproductive age (WRA); 2) approaches to address the association between inflammation and vitamin B12 and folate in PSC and WRA; 3) role of stunting and inflammation on micronutrient deficiencies in PSC; and 4) relationships between the double burden of malnutrition (e.g., coexistence of undernutrition and overweight/obesity), inflammation and micronutrient status among PSC and WRA. To address these questions, an expanded harmonized dataset was created, containing 24 cross-sectional nutrition surveys, representing 36,360 PSC and 41,881 WRA from all six WHO geographic regions. Survey prevalence estimates took into account complex survey design and weights, where appropriate. Overall prevalence was defined using the median prevalence estimates across surveys.

The overall prevalence of inflammation in PSC was 30.8% (either CRP > 5mg/L or AGP >1 g/L), ranging from 6.0% (US) to 67.3% (Cote d'Ivoire). In WRA, the prevalence of inflammation was 15.3%, ranging from 6.6% (Vietnam) to 36.8% (Cambodia). In PSC, stunting prevalence (height-for-age z-score <-2) was 26.7%, ranging from 3.6% (US) to 50.8% (Laos), and overweight/obesity prevalence (BMI-for-age z-score >2) was 6.2%, ranging from 0.6% (Laos) to 19.5% (Georgia). In WRA, the prevalence of BMI > 25 kg/m2 was 48.3%, ranging from 8.0% (Vietnam) to 71.7% (Mexico), and BMI <18.5 kg/m2 was 6.0%, ranging from 1.4% (Mexico) to 20.5% (Vietnam). Zinc deficiency in PSC (serum zinc <57 ug/dL in afternoon or <65 ug/dL in morning) was 44.7% overall, ranging from 10.3% (Ecuador) to 78.7% (Cameroon). In WRA, zinc deficiency [serum zinc <59 ug/dL in afternoon or < 66 ug/dL in morning (non-fasting), <70 ug/dL in morning (fasting)] was 52.9%, ranging from 28.8% (Mexico) to 82.2% (Cameroon). The prevalence of zinc, B12 and folate deficiencies by inflammation adjustment approach will be analyzed.

Conclusions: Findings from BRINDA will be used to inform international guidelines on the appropriate interpretation of micronutrient biomarkers in settings of inflammation as well as approaches to address the double burden of malnutrition in various settings.

Keywords: Nutrition assessment, inflammation, zinc deficiency, folate deficiency, double burden

NUTRITIONAL CHALLENGES IN THE ELDERLY

INTRODUCTION TO THE WORK OF THE IAEA IN THE FIELD OF NUTRITION

Loechl, Cornelia.

PhD. Seciton Head. Nutritional and Health-Related Environmental Studies Section. International Atomic Energy Agency (IAEA). Austria.

The IAEA's programme in nutrition supports the use of stable (non-radioactive) techniques to combat malnutrition in all its forms. Stable isotope techniques play an important role in understanding the mechanisms of malnutrition and as a reliable tool in designing and evaluating the impact of nutrition interventions. They improve specificity and sensitivity of nutritional evaluations such as the assessment of fat and lean body composition, energy expenditure, breastfeeding patterns, body vitamin A stores, and factors affecting absorption and retention of essential minerals such as iron and zinc in the body. The IAEA fosters its use to generate evidence for informed nutrition programming across the life course, from infant and young child feeding, to maternal and adolescent nutrition, to healthy ageing, and to track progress towards achieving World Health Assembly targets. This complements the efforts of other UN agencies, NGO's and Government Institutions in nutrition. The IAEA provides support and training to build the capacity to use stable isotope techniques in nutrition through a) national and regional nutrition projects via its Technical Cooperation Programme with governments of Member States as well as b) coordinated research conducted by individual investigators to address specific problems. In the area of nutrition and aging, the IAEA supports the application of stable isotope and other nuclear techniques to measure changes in body composition (normally loss of muscle mass and increase in body fat) and physical activity, bone health, and micronutrient bioavailability. An example includes a regional project in 12 countries in Latin America and the Caribbean with the aim of standardizing techniques for the early diagnosis of sarcopenia (age-related loss of skeletal muscle mass and strength) and raising awareness of this important issue for the quality of life of older people in the region. Body composition by deuterium dilution technique in relation to the loss of functionality is assessed in the older population with the aim to determine cut-off values for the determination of sarcopenia in order to improve early diagnosis. A database of fat-free body mass will be compiled, which will allow the development of easier field methods to measure body composition based on anthropometry and bioelectrical impedance. As the basal metabolic rate and thus energy requirements decline with age, the doubly labeled water technique is used to measure total daily energy expenditure in older adults undergoing their normal daily activities in order to determine caloric needs with or without sarcopenia. The project will provide a tool for the health sector to allow for early detection of sarcopenia and ensure early interventions can delay physical disability and improve the quality of life in the elderly. This will also help to reduce health-related costs of the elderly population.

PREVALENCE AND FUNCTIONAL IMPACT OF SARCOPENIA

Ferriolli, Eduardo.

MD, PhD, Department of Internal Medicine, Ribeirao Preto Medical School, University of Sao Paulo.

The prevalence of sarcopenia in different studies varies significantly, depending on the population studied, definition adopted, method used for the measurement of muscle mass and function. It varies, in different populations, from 1 to 29% in the community and from 14 to 33% in institutions. Recently, a meta-analysis was published (Diz et al., 2016) showing a prevalence of 17% in Brazil. Another meta-analysis of general population studies found a prevalence of 10% in men and women worldwide (Shafiee et al., 2017). Sarcopenia has been associated with negative metabolic and clinical outcomes, including increased insulin resistance, lower energy expenditure, lower resistance for aerobic activities, increased number of falls, increased incidence of reduced mobility, disability, dependencies and death. Considering the ageing of the world population, and, especially, of the developing countries, these numbers show the importance of this condition as a serious public health problem. Being sarcopenia defined as low muscle mass associated with low muscle strength or function, the diagnosis is clearly dependent on cut-off points for the different assessments and these will vary depending on the population studied. Lourenço et al. (2015) verified the performance of the European Working Group on Sarcopenia in older people and their findings showed that the adoption of the original cut-off points in Spanish, Mexican and Brazilian cohorts would define 83.4% of the total cohort as suspects for having sarcopenia, indicating muscle mass assessment; assuming adapted cut-off values, this proportion decreased to 34.2%. In Brazil, the Frailty in Older People Study (FIBRA-BR) found cut-off points considerably lower than the ones originally proposed, considering the 20th percentile of the performance of the studied population. A Latin America Regional Project funded by the International Atomic Energy Agency (IAEA) is verifying the association between low muscularity and function in 12 Latin American and Caribbean countries, aiming to determine tools and standards for the diagnosis of sarcopenia and to increase awareness of this condition in this region. Body composition was measured by the deuterium dilution method, bioimpedance analysis, anthropometry and dual-energy X-ray absorptiometry when available; function and strength by the measurement of walking speed, handgrip strength, timed up-and-go test and six-minute walking test. A sub-group had energy expenditure measured by the doubly labelled water method and physical activity pattern by an accelerometry based physical activity recording system. New parameters for the association between muscularity and physical performance in the Latin America and Caribbean region will be defined and the results will be discussed during this symposium.

DIETARY FACTORS CONTRIBUTING TO SARCOPENIA SYNDROME

Aleman Mateo, Heliodoro.

PhD. Nutritionist. Nutrition and Metabolism Department, Coordination of Nutrition, Research Center for Food and Development. Carretera a La Victoria, Km 0.6 Hermosillo, Sonora, CP 83304. Mexico.

Sarcopenia is a progressive, chronic clinical condition associated with the aging process characterized by the loss of skeletal muscle mass, muscle strength and functionality. In older adult populations, this condition increases the risk of adverse outcomes, such as physical disability, poor quality of life, and increased morbidity and mortality rates. The concept of sarcopenia has evolved significantly from the original definition proposed by Irwin Rosenberg (1989). Recently, the European Working Group on Sarcopenia in Older People published a consensus on the definition of sarcopenia and the diagnostic criteria for sarcopenia syndrome. Regarding the factors that contribute to the of loss of skeletal muscle and development of sarcopenia syndrome, the literature now recognizes the role of such elements as pro-inflammatory cytokines, vitamin D deficiency, anabolic hormone deficiency, insulin resistance and hyperinsulinemia, anabolic resistance to nutrition and exercise, chronic illness, sedentarism, as well as other lifestyle factors, including low or poor dietary protein intake and the non-homogeneous distribution of protein at mealtimes. More recently, other dietary factors have been reported as contributing factors for sarcopenia and sarcopenia syndrome, though most current evidence highlights the role of low dietary protein intake as the main alimentary factor that exacerbates the loss of skeletal muscle mass in older adult populations. This presentation reviews cross-sectional and cohort studies on the association between high dietary protein intake and sarcopenia and analyzes the main results of some published studies of clinical trials on dietary protein supplementation. Finally, the main challenges involved in satisfying the current recommendations for dietary protein in older people in Latin American countries are discussed briefly.

DIAGNOSIS AND PREVENTION OF MUSCLE LOSS; CHALLENGES IN LATIN AMERICA

Márquez, Carlos.

MSc. Nutritionist. Public Nutrition Unit. Institute of Nutrition and Food Technology (INTA). University of Chile. Santiago. Chile.

Latin America (LA) is experiencing demographic, epidemiological and nutritional transitions. There is an increase in total aging population in LA which has an impact on many aspects of society. Aging is associated with important physiological changes that should be considered by health care systems. One of the highly relevant age-induced condition is the decline in neuromuscular performance. The loss of skeletal muscle mass and the changes in the structure and function associated to aging are clinically important because they are responsible for decreasing muscle strength and the capacity to perform physical activity. Therefore, it is necessary to be able to diagnose loss of muscle early and to implement effective interventions to prevent it. There are different techniques available to diagnose loss of muscle mass. Simple assessment methods to reflect muscle loss include weight loss and decrease in calf and mid-arm muscle circumference. More accurate estimations of muscle mass can be gained by bioelectrical impedance analysis (BIA), dual-energy X-ray absorptiometry (DXA), and the reference method of deuterium dilution technique to determine total body water (TBW) and calculate fat-free mass. Predictive models of appendicular skeletal muscle mass have also been developed in Chile, based on anthropometric measurements and functional tests in the elderly.

The prevention of the loss of muscle mass in the elderly will be influenced by socioeconomic factors such as income, education, existence of support networks and general health status (nutritional status, pathologies and integrity of their denture). Diet quality is important for the prevention of skeletal muscle loss. High quality, easy digestible protein in sufficient amounts is needed to maintain the muscle mass and vitamin D status and intake need to be considered. Physical activity also has positive effects on the overall health of the elderly and may prevent muscle loss. Studies have shown that the prescription of supervised muscle strength training for elderly people counteract or at least attenuate the decline in neuromuscular function.

The challenge for LA is to establish population specific cutoff points for muscle mass loss and to develop screening tools to identify early muscle loss in the elderly to ensure interventions can be implemented. A group of researchers is finalizing a project whose objectives are to develop an anthropometric model of prediction of skeletal appendicular muscle mass in Latin American elders and establish cutoff points for healthy muscle mass.

Keywords: Elderly, muscle loss, nutrition, physical activity.

VITAMIN D: NEW INSIGHTS FROM PHYSIOLOGY TO CLINICAL PRACTICE

VITAMIN D STATUS AROUND THE WORLD: EPIDEMIOLOGICAL DATA AND DIAGNOSIS

González-Gross, Marcela.

Pharm D. Professor. Department of Health and Human Performance. Universidad Politécnica de Madrid. Vice-President of the Spanish Nutrition Society. CIBERobn. Spain.

Low vitamin D concentration is an increasing public health problem around the world, contributing to the double burden of malnutrition as defined by WHO. Serum or plasma 25-hydroxyvitamin D [25(OH)D] continues to be the optimal marker of vitamin D status because its long half-life and because it reflects both D2 and D3 levels.

The debate regarding optimal cut-offs for diagnosis is still open. In the last years, and for better comparison among studies, international guidelines have been accepted to define sufficiency/optimal levels ≥75nmol/l (30ng/ml); insufficiency <75 nmol/l; deficiency <50 nmol/l (20 ng/ml) and severe deficiency <27.5 nmol/l (10.8 ng/mL). This last cut-off is the most controversial one, as some authors propose <30 nmol/l (12ng/ml) as deficient, and others go down to 20 nmol/l (8 ng/ml).

Identified risk factors include restricted diets, insufficient sunshine exposure, sunscreen use, darker skin pigmentation, high latitude, full-body clothing cover, season, air pollution, age, efficiency of absorption in the gut, liver and kidney disease, and medication use (notably anticonvulsants, corticosteroids).

Deficiency affects mainly all population groups and is present in all continents. In infants, highest prevalence of rickets, the clinical manifestation of vitamin D deficiency have been observed in North America, South America, Europe and parts of the Middle East. Concentrations <30nmol/l have been observed in Iran (86%), Kuwait (66%) or India (61%). Lowest prevalence in Argentina (3%) and China (0.4%). High prevalence of deficiency (<30 nmol/l) has been observed in children i.e. from Afghanistan (73%) and Malaysia (35%); in female adolescents from Saudi Arabia (81%). In fact, being a female is a risk factor in certain countries. Concentrations <50nmol/l were observed e.g. in adults from Jordan (14% of females vs. 2% males), Sri Lanka (59% vs. 34%) and Nigeria (34% vs. 5%). Elderly people are especially at risk because with aging there is an important change in lifestyle like less solar exposure and less outdoor activity. A high prevalence of concentrations <30nmol/l have been observed in Germany (67%), India (62%), Morocco (52%; females) or Australia (22-45%).

Within the EU-funded ODIN study, applying vitamin D Standardization Program (VDSP) protocols to serum 25(OH)D data from representative childhood/teenage and adult/older adult European populations, an overall pooled estimate, irrespective of age group, ethnic mix, and latitude of study populations, showed that 13.0% of the 55,844 European individuals had serum 25(OH)D concentrations <30 nmol/L l on average in the year, with 17.7% and 8.3% in those sampled during the extended winter (Octo-

ber-March) and summer (April-November) periods, respectively. The prevalence of <50 nmol/L l was 40.4%. In a study we performed on non-supplemented Spanish elite athletes, apart from seasonal variations, a significant difference was observed between those training indoor and outdoor, especially in winter around a mean 20nmol/l difference. Even sunny countries are at risk for vitamin D deficiency during the winter months.

VITAMIN D: CLASSIC AND NOVEL ACTIONS

Gil, Ángel.

PhD. Prof. Department of Biochemistry and Molecular Biology. Institute of Nutrition and Food Technology. Centre of Biomedical Research. University of Granada. CIBERobn. Spain.

Vitamin D has a key role in calcium homeostasis. Indeed, vitamin D participates actively in calcium intestinal absorption, renal excretion and bone synthesis and remodelling. In addition, vitamin D also affects the absorption and excretion of phosphate. Vitamin D is mainly produced by photobiogenesis at the skin by the action of ultraviolet radiation B on 7-dehydrocholesterol, but it can also be derived from a number of dietary sources i.e. ergocalciferol (vit D2) from plants and cholecalciferol (D3) from animal foods, mainly fatty fish, eggs, meats and dairy products. D3 is by far the most important source of vitamin D. Vitamin D requirements ranges from 400 to 600 IU/d (10-15 µg/d), depending on age, sex and lifecycle conditions.

Vitamin D is transported from the intestine to the liver and rapidly hydroxylated to 25(OH)D2 and 25(OH)D3 by a cytochrome P450 dependent enzyme. Those metabolites reach the systemic circulation and later are hydroxylated in the renal cortex to render calcitriol (1-25(OH)2D), the active vitamin D. Alternative 24-hydroxylation of 25(OH) D renders 24-25(OH)2D, which is inactive, this compound contributing to the regulation of calcitriol levels in plasma. Blood and adipose tissue are well known stores for vitamin D, and plasma 25(OH)D3 is recognised as the best biomarker of vitamin D status.

The regulation of calcitriol synthesis relies on the activity of both 1-α-hydroxylase (CYP27B1) and 24-hydroxylase (CYP24A1). Increased levels of parathormone (PTH) due to vitamin D insufficiency or hypocalcemia, lead to increased expression of 1-α-hydroxylase, which results into increased synthesis of calcitriol. Opposite, high levels of plasma calcitriol and calcium inhibit the secretion of PTH. In addition, calcitriol inhibits its own synthesis through the modulation of the renal hydroxylases. In addition, when calcium levels increase thyroid C cells produce calcitonin, blocking calcium bone mobilization and stimulating calcium and phosphorus renal excretion.

In addition to the classic roles of vitamin D in increasing intestinal calcium and phosphate absorption and increased bone synthesis and remodelling, novel roles of vitamin C affecting cell proliferation, differentiation and apoptosis, as well as increasing innate immunity and decreasing adaptive immunity have been recognised. Moreover, vitamin D is involved in the protection of cardiovascular system through the regulation of the renin-angiotensin system, PTH secretion, adipocyte apoptosis and insulin secretion.

The action of vitamin D in the immune system is mainly mediated by the increased phagocytic capacity of antigen presenting cells (dendritic cells and macrophages) against microbes. This action is due to calcitriol which enhances the expression of cathelicidins, one particular type of antimicrobial peptides. In addition calcitriol inhibits the production of the granulocyte and macrophage colony stimulating factor (GM-CSF). Moreover, calcitriol inhibits the expression of major proinflammatory cytokines e.g IL-1, IL-6. IL-12 and TNF-α, and the development of Th1 cells, differentiation of B lymphocytes and antibodies production.

VITAMIN D LEVELS DURING PREGNANCY AND FETAL IMPLICATIONS

[1]*Larqué, Elvira;* [2]*Blanco-Carnero, José Eliseo.*

University of Murcia. Spain.; [2]Hospital Virgen de la Arrixaca, University of Murcia, Spain.

Maternal vitamin D insufficiency during pregnancy is a common issue and a significant public health problem globally. The circulating 25(OH)D concentration sufficient to meet the physiological needs of humans is an ongoing subject of debate, which affects the prevalence of vitamin D deficiency/insufficiency estimated around the world. Since evidence is lacking regarding appropriate cut-points to define vitamin D status during pregnancy, levels used to establish intake recommendations and vitamin D content of prenatal vitamin supplements are quite conservative.

During pregnancy, maternal hemodilution is accompanied by a number of physiological changes to both vitamin D metabolism and maternal body composition; such adaptations might lead to differences in the determinants of response to vitamin D supplementation between pregnant and non-pregnant women. Maternal 1,25-dihydroxyvitamin D concentrations increase during the third trimester, and it can be synthesized by the placenta since it contains the enzyme 1-α-hydroxilase.1 Furthermore, it is possible that vitamin D increases the synthesis of various calcium-binding proteins in the placenta. Clinically, understanding how individuals respond could lead to individualized antenatal counselling regarding vitamin D supplementation to ensure vitamin D repletion without increasing the risk of vitamin D toxicity.

The importance of vitamin D in pregnancy for maintaining maternal calcium homeostasis and there for fetal bone development is well recognized; moreover, there is a large discussion on potential maternal detrimental effects of vitamin D deficiency on perinatal outcomes, fetal development and the long-term skeletal health of children. Recent studies are also evaluating its effects on asthma fetal programming.

Risk factors for vitamin D insufficiency are well described, and include ethnicity, extensive skin covering and liberal use of sun protection, overweight/obesity, low dietary vitamin D intake, and smoking, in addition to the seasonal variation that is observed at temperate latitudes. The increasing obesity rates in young women enhance the prevalence of vitamin D deficiency, due to vitamin D storage in adipose tissue, reducing its maternal blood levels and fetal availability. Moreover, gestational diabetes risk is higher in obese mothers which may affect the associations with vitamin D levels.

Pregnant women require at least 400-600 IU per day of vitamin D. It has been proposed by The Endocrine Society that at least 1500-2000 UI/ of vitamin D may be needed to maintain a blood level of 25(OH)D above 30 mg/dl. A recent randomized trial of 1000 IU of vitamin D supplementation during pregnancy found no effect on offspring bone health in infants born in the summer but did find enhanced fetal bone mineral accretion in infants born during the winter months.2 The benefits of vitamin D supplementation during pregnancy should be evaluated through rigorous intervention studies.

VITAMIN D AND OBESITY

Aguilera, Concepción María.

PhD. Department of Biochemistry and Molecular Biology, Institute of Nutrition and Food Technology, University of Granada. CIBERobn. Spain.

Vitamin D (vitD) adequate concentration is essential for growth, development and health. It plays a relevant role in the regulation of calcium levels and bone metabolism. In addition, recent studies indicate that hypovitaminosis D compromises long-term condition as a consequence of its non calciotropic effects, such as the implication/regulation of immune system, endocrine pancreas, liver, skeletal muscle and adipocytes. In fact, vitD insufficiency is associated with a wide range of chronic disease and conditions, including obesity, and several types of cancers. Suboptimal vitD status has also been associated with increasing severity of metabolic dysregulation (insulin resistance, hyperlipidemia, liver disease and hypertension) in children and adults with obesity. In the last years the prevalence of overweight and obesity in Spanish children and adolescents has highly increased. Therefore, the identification of associated factors and risk groups related to hypovitaminosis D is critical. In this context, we have characterized vitD status in 471 children and adolescents (2 to 18 years age) and analyzed its correlation with gender, pubertal period, age and Body Mass Index (BMI). An inverse lineal effect of BMI and age on 25(OH)D concentrations was observed in children, 39.6 % of vitD levels variability was explained by BMI. Therefore, understanding the underlying contribution of suboptimal vitD status to the metabolic dysregulation disorders in obese subjects is important.

Recently, several studies have attempted to establish the molecular mechanism of the relation between vitD levels and obesity. Some of these studies suggest that vitD, due to its fat-soluble characteristic, is retained by the adipose tissue. In addition, it has been described that adipose tissue has the capacity to metabolize vitD locally, and this can be dynamically altered during obesity. Considering the importance of low grade chronic inflammation in metabolic syndrome and obesity, many authors hypothesized the involvement of the vitD in the pathogenesis of these diseases altering the balance between pro and anti-inflammatory cytokines and thus affecting insulin action, lipid metabolism and adipose tissue function and structure. Indeed, VitD increases the production of some anti-inflammatory cytokines and reduces the release of some pro-inflammatory cytokines. The association of the vitD pathway gene variants with anthropometric measurements and lipid profile has also been investigated. Polymorphisms in the vitD receptor (VDR) gene have been shown to be associated with the components of metabolic syndrome, obesity and type 2 diabetes mellitus in different populations. There are some reports of associations between the retinoid X receptor gamma gene variants and lipid and anthropometric parameters. And polymorphisms at the vitD-binding protein gene have been associated with body-fat percentage and obesity.

VitD supplementation in obese subjects showed controversial effects: with some studies demonstrating improvements in insulin sensitivity, glucose and lipid metabolism while others showing no beneficial effect on glycemic control and on inflammation. In conclusion, despite of the evidences of a significant role of VitD in the pathogenesis of obesity, metabolic syndrome and type 2 diabetes, its potential function in treatment and prevention of these diseases is unclear.

NUTRITION DATA LIFE-COURSE: HARMONIZATION AND MANAGEMENT

CURRENT AND NEW INDICATORS FOR SMART SURVEYS, DEVELOPMENT AND APPLICATION

Sauveplane, Victoria.

Action Against Hunger.

According to recent global data from UNICEF, WHO and the World Bank, 50 million children are suffering from acute malnutrition and 159 million children are stunted. Availability of high quality nutrition data is essential in understanding the extent of nutritional needs and how to best develop programs to most ap-

propriately address those needs, especially during emergencies and large scale responses. The availability of timely and credible nutrition data, presented in accessible ways at national and sub-national levels, can help governments and other actors to be responsive to these challenging circumstances, guide nutrition and health programming in-country and help prioritize support globally. Valid nutrition data and evidence make the difference.

SMART (Standardised Monitoring and Assessment of Relief and Transitions) is recognised as the standard methodology for nutrition and mortality surveys at national and sub-national level by decision makers in the international nutrition community, including government ministries (e.g., national Ministries of Health), institutes of statistics, national and international NGOs organizations , , UN agencies , academia, and consultants. Endorsed by the Global Nutrition Cluster, most nutrition surveys in Sub-Saharan Africa are conducted using the SMART Methodology . The high quality data collected with SMART feed into national and regional nutrition information systems for effective and co-ordinated decision-making, particularly in times of emergencies when data is critical for resource allocation. SMART tools are also critical for the preparedness of governments and other actors gathering and utilizing data of various population groups, geographic levels and contexts allowing comparability across countries and over the course of multiple years.

Given the standardization of data collection tools, comparability across countries and contexts, adaptability with mobile technology, and data quality checks, Nutrition International approached the SMART team at Action Against Hunger to ultimately increase availability of consistent and reliable data for the monitoring of nutrition indicators based on the SMART tools for their cross-country nutrition and health programming.

NUTRITION INTERVENTION MONITORING SURVEYS (NIMS) – A STORY OF HARMONIZING DATA INDICATORS AND METHODS ACROSS MULTIPLE COUNTRIES

(1)Wuehler, Sara; (2)Rowe, Sarah; (3)Gupta, Payal; (4)Schmidt, Kasper; (5)Kung'u, Jacqueline; (6)Raut, Manoj Kumar; (7)De-Regil, Luz Maria.

(1)Senior Technical Advisor. Global Technical Services. Nutrition International. Ottawa. Canada; (2)Program Manager, Monitoring & Reporting. Program Operations Unit. Nutrition International. Ottawa. Canada; (3)Regional Senior Manager, Monitoring & Reporting. Program Operations Unit, Asia Regional Office. Nutrition International. Delhi. India; (4)Program Officer, Monitoring, Reporting and Knowledge Sharing. Program Operations Unit. Nutrition International. Ottawa. Canada; (5)Regional Advisor. Research and Monitoring & Evaluation, Africa Regional Office. Nutrition International. Nairobi. Kenya; (6)Regional Manager. Research & Evaluation, Asia Regional Office. Nutrition International. Delhi. India; (7)Director, Research and Evaluation/ CTA. Global Technical Services. Nutrition International. Ottawa. Canada.

Nutrition International (NI), formerly the Micronutrient Initiative, has been working to reduce malnutrition in vulnerable populations for 25 years. In part this has involved improving government monitoring and reporting to ensure that nutrition programs are reaching vulnerable populations with interventions that achieve desired results. In reviewing the multiple surveys and monitoring tools that NI has developed and implemented, NI recognized the need for harmonized surveillance methods and tools to (i) obtain and store uniformly collected data to facilitate quality assurance and cross-country analyses; (ii) ensure indicators are consistent across multiple interventions, (iii) establish harmonized electronic data collection tools to facilitate concurrent external survey monitoring and speed survey feedback and final reporting; (iv) potentially adapt these tools for use during supervisory visits to improve regular program monitoring and reporting; and (v) inform other similar global nutrition surveillance efforts.

NIMS tools were initiated in collaboration with Action Against Hunger (ACF) to build on their SMART approach of harmonized data collection for nutrition status indicators. NIMS collect indicators of program related knowledge, attitudes and practices (KAP) as well as facility stocks and provider KAP; related modules currently address maternal iron and folic acid (IFA) and antenatal care, intermittent IFA, infant and young child nutrition, micronutrient powders for young children, delivery and newborn care, zinc and oral rehydration for treating diarrhea, and facility-related issues for each of these topics. NIMS also include external monitoring tools, being developed and tested in collaboration with the University of Toronto, to provide simultaneous data-cleaning and related feedback to survey teams.

Based on NI's experience while implementing NIMS in four countries, this presentation will summarize the key discoveries and recommendations related to: 1) developing harmonized indicators, 2) ensuring consistency during contextualization, 2) optimizing training and implementation, 3) relative inputs compared

to individually developed surveys, 4) potential use for supervisory monitoring visits, and 5) implications for future updates.

EXTERNAL MONITORING OF NUTRITION SURVEYS – EXPERIENCES FROM DEVELOPING AND IMPLEMENTING MONITORING TOOLS IN TWO MULTI-COUNTRY SURVEY CONTEXTS

[1]*Sellen, Daniel;* [2]*Owais, Aatekah;* [3]*Begum, Khadija;* [4]*Kekre, Priya.*

[1]PhD. Director. The Joannah and Brian Lawson Centre for Child Nutrition. University of Toronto. Canada.; [2]PhD. Nutrition epidemiologist. University of Toronto. Toronto. Canada.; [3]MD, PhD. Nutritionist. University of Toronto. Toronto. Canada.; [4]MSc. Nutritionist. University of Toronto. Toronto. Canada.

The University of Toronto (UofT), like other academic institutions, partners with implementing agencies to develop scientifically rigorous methods for measuring nutrition-specific and nutrition-sensitive indicators at individual, household and population levels and robust study designs for effective, accurate and interpretable impact evaluation of large-scale interventions aimed at maternal, newborn and child nutrition and health. Recent external monitoring efforts have included: (a) a series of baseline assessments using a quasi-experimental design in four countries as part of Enhancing Nutrition Services to Improve Maternal and Child Health in Africa and Asia (ENRICH), a multi-country, broad-spectrum and integrated intervention program funded by Global Affairs Canada (GAC) and implemented by World Vision Canada (WVC), and partners; and (b) Nutrition International's (NI) Nutrition Intervention Monitoring Surveys (NIMS) conducted in several countries. Both sets of surveys employed SMART approaches and tools embedded within larger household survey (HHS) tools, which were developed to ensure consistency in target indicators, component variables and response sets across settings while accommodating local contextualization, adaptation and translation by in-country research partners (CRPs) in each of the participating countries.

Based on UofT's experiences in support of external monitoring of nutrition surveys in two multi-country survey contexts, this presentation will summarize the key discoveries and recommendations related to: (i) developing English and predominant local language Open Data Kit (ODK) templates for field-based data collection at multiple sites on android devices; (ii) remote coordination with in-country local teams to pre-test, correct and adapt draft tools on very short timelines; (iii) daily monitoring and quality assurance during data collection using rapid analysis and feedback on primary data uploaded to cloud servers. We focus on lessons learned from multiple challenges encountered and met across settings. We highlight the advantages of ODK approaches

when development is controlled centrally, and some specific difficulties that can arise when it is not. Our experience indicates that ODK can be highly effective and efficient when sufficient time and money is invested to make it work smoothly form the first day of data collection, and that it is also flexible, allowing rapid resolution of logistical and technical difficulties in the field when best approaches are applied.

PS_144/150

GLUTAMATE A SIMPLE MOLECULE WITH SEVERAL FACES

WHY DO WE LIKE THE UMAMI TASTE OF GLUTAMATE?

San Gabriel, Ana.

D.V.M. M.S. Nutrition. International Glutamate Information Service.

The answer to this question lies behind the understanding of glutamate (Glu) taste properties, its function by itself as an amino acid, and the cooking processes that make Glu so abundant in the foods we eat. Taste strongly determines our food choices and their utilization in the body. Our taste papillae in the tongue express different taste recep-tors responsible to informing the brain of the chemical background of foods. We are pro-grammed from birth to prefer certain tastes, sweet, umami, weak sour and moderate salty tastes, and avoid others such as very strong bitterness, sourness and saltiness. These innate behavioral responses ensures the intake of sufficient nutrients while pro-tecting us against the ingestion of an excess of sodium, spoiled foods or plant toxic me-tabolites. In the other hand, food habits and dietary patterns are learned from our mother throughout pregnancy and lactation, and through our life eating experiences. They are strongly determined by food and cultural environment.

Glu is the representative compound for umami taste, one of the tastes we are conditioned to prefer. Abundant in breast milk, soups stocks, fermented and cured foods, this amino acid serves multiple functions. As a nutrient, Glu is part of proteins such as meats, fish, eggs, legumes, and dairy products. By itself alone, when is not bound to proteins or peptides, Glu is metabolically active and can behave as a signaling molecule. It is rich inside cells as unbound Glu also known as free Glu (FGlu) where it ca be used to synthesize other amino acids or bioactive molecules like the antioxidant glutathione, to generate energy through the Krebs cycle,

or to communicate with neighboring cells. It also contributes to the nitrogen metabolism and detoxification of ammonia producing glu-tamine via glutamine synthetase. Each of these functions requires either metabolic en-zymes for synthesis and degradation of FGlu, transporters for carrying Glu through cell membranes, or Glu and taste receptors for rendering information about the cellular envi-ronment or the food we ingest.

It is important to emphasize that only FGlu has taste. The Glu bound to proteins cannot interact with taste receptors and consequently is not relevant to umami, but it is still significant to our body. Many cooking or food manipulation process from many tradi-tional cuisines such as extraction in soups, fermentation, maturation, curing or drying enhances the availability of FGlu. This is why soy or fish sauces, cheeses or soup stocks are very rich in umami. The enzymatic breakdown of proteins or cells in meats or beans releases large amounts of FGlu, which gives a very subtle, long lasting and coating sen-sation throughout the whole tongue characteristic of umami. At the end of the presenta-tion, I will describe how FGlu could function as a general marker of familiar foods or foods that are adequate for our ingestion.

Keywords: Umami, glutamate, MSG, taste receptors, signaling
Conflict of Interest disclosure: I am employee of Ajinomoto Company.

UMAMI TASTE: A TOOL TO REDUCE SODIUM IN-TAKE

Reyes, Felix.

Prof. Food Toxicology. Department of Food Science. University of Campinas. Brazil.

Sodium chloride (NaCl) has been the most commonly used ingredient to confer salty taste to foods. However, excess sodium in the bloodstream has been associated with the development of several chronic non-communicable diseases, mainly arterial hypertension a risk factor associated to cardiovascular and kidney diseases. In addition, excessive sodium intake has also been associated with stomach cancer, osteoporosis and obesity, among others. Thus, in order to limit sodium intake to levels considered safe, the World Health Organization (WHO) recommends for adults a daily intake of not more than 5 g of NaCl (less than 2 g of sodium). According to the country, most sodium could come from processed foods (USA), or added while eating, home cooking and foods from restaurants (Brazil). As an example, in Brazil, the mean intake of NaCl is 12 g per person per day (4.7 g sodium). The Pan American Health Organization (PAHO) recommends three strategic actions to reduce sodium intake: (1) promotion of healthy eating (particularly with regard to the rational use of salt); (2) implementation of educational actions for health professionals, manipulators and manufacturers of food, and the population; and (3) reformulation of processed foods. The last recommendation indicates there is an urgent need to find salt substitutes to reduce the sodium content in the foods. Among those substitutes umami compounds have been pointed as an alternative strategy, since

they have the ability to balance the taste and harmonize the total flavor of a dish. Umami can also improve the palatability of a wide variety of foods. The umami taste also depends on the amount of salt. It was verify that soups low in salt, but with umami, were tastier than those that did not contain umami. Like salty, umami is also a basic taste and the compounds associated to umami are monosodium glutamate (MSG), guanosine-5'-monophosphate (GMP) and inosine-5'-monophosphate (IMP), mainly. GMP and IMP act synergistically with MSG, and all of them are approved to be used as food additives. Those compounds has been evaluated by scientific committees and regulatory agencies, including the Joint FAO/WHO Expert Committee on Food Additives (JECFA), the Scientific Committee on Food (SCF) of the European Commission, the United States Food and Drug Administration (US FDA), and the Federation of American Societies for Experimental Biology (FASEB). JECFA and the SCF established an acceptable daily intake (ADI) "not specified", which indicated that the substance posed no health risk to consumers when used as a food additive in amounts necessary to obtain the desired technological effect. US FDA and FASEB confirmed both the safety of MSG when used as a food additive, and classified it as a Generally Recognized as Safe (GRAS) substance. In this lecture it will be presented an overview about the safety aspects of MSG as food additive, and the potential applications of its use to reduce sodium content in specific industrialized foods, such as soups, stocks and seasonings, instant noodles, meat products, snacks and milk products.

Keywords: Basic test, umami, monosodium glutamate, safety evaluation, industrialized foods.

HOW DOES GLUTAMATE WORK IN YOUR BRAIN?

Albarracín, Sonia Luz.

PhD. Chemistry. Department of Nutrition and Biochemistry. Faculty of Sciences. Pontificia Universidad Javeriana. Bogotá. Colombia.

One challenge of modern neurobiology is the identification of individual molecules that operate within neural circuits, regulating brain function and control synaptic plasticity. Neurotransmitters, the essential molecules for the transfer of information between neurons, are released from a presynaptic terminal into a synaptic cleft. The interaction of a neurotransmitter to its postsynaptic receptors induces an ionic flux that depolarizes or hyperpolarizes the neuron. Neurotransmitter binding also may cause metabolic changes such as the activation of second messenger systems or opening the ion channels.

The glutamate (Glu) in the central nervous system (CNS) is the main excitatory neurotransmitter, and its action depend the extracellular concentrations be kept low. Due to the blood–brain barrier essentially prevents the entry of glutamate into the CNS, most of the glutamate must be synthetize in the brain mainly from glucose. Essentially by transamination of α-ketoglutarate in both neurons and glia. Depending of the type of neuron, Glu can be used for excitatory synaptic transmission or decarboxilated by a glutamate descarboxilase for the synthesis of GABA, the main

inhibitory neurotransmitter in GABAergic neurons. In synaptic terminals, Glu is stored in vesicles and released via a calcium-dependent mechanism. Once in the synaptic cleft, Glu binds and activates postsynaptic glutamate receptors. The action of Glu is finished by removal from the synaptic cleft by neuronal presynaptic and glial high affinity reuptake systems. Given the critical role of Glu in neural function, it is not surprising that a greater level of regulation is required of brain L-glutamate concentration than that observed in most other tissues where important roles has in the intermediary metabolism and is present at millimolar concentrations.

Astrocytes are the most important cells for controlling both the biosynthesis and turnover of glutamate and GABA. In astrocytes, glutamate is used for the synthesis of glutamine, which is catalyzed by a glutamine synthetase as an inactivating mechanism of this neurotransmitter. Then, glutamine is released and recycled to regenerate glutamate by a phosphate-activated glutaminase. The uptake of glutamate and GABA and their transformation in glutamine by astrocytes give origin to the Glutamate-GABA-Glutamine cycle operating between the nerve endings of glutamatergic or GABAergic neurons and surrounding astrocytes. In addition, the coupling between excitatory and inhibitory neurotransmission is key for maintaining the synaptic function and convert the Glutamate-GABA-Glutamine cycle as a special mechanism of protection against excitotoxicity in normal and pathological conditions such as in neurodegenerative diseases.

In this lecture, we will review the current knowledge on glutamatergic signaling in the central nervous system with a special emphasis in the coupling excitatory and inhibitory neurotransmission and the key role of the astrocytes in this process.

GLUTAMATE IN THE CONTROL OF ENERGY BALANCE

Baldeón, Manuel E.

Centro de Investigaciones Biomédicas, Universidad Tecnológica Equinoccial. Ecuador.

With metabolic syndrome, overweight, and obesity on the rise worldwide, there is a need to better understand the biology that controls energy balance and regulates body weight. Several external and internal factors have been implicated in the modulation of hypothalamic neurons responsible of satiety and hunger sensations including glucose and fat metabolites; hormonal, immunological and nervous mediators. Studies considering the recognition of dietary glutamate by specific receptors in the intestinal tract have contributed to the understanding the role this amino acid has in the regulation of energy balance. Glutamate functions as a nutrient and as a dietary signal from the gastrointestinal towards the brain. At the moment, glutamate's role in umami taste upon stimulation of specific receptors on epithelial cells present in taste buds is well established. Animal studies have also shown that stimulation of glutamate receptor, mGluR1, within gastric epithelium releases serotonin, nitric oxide that subsequently stimulates the vagus nerve. The vagus nerve then carries information to the hypothalamic centers that control hunger and satiety. In addition, animal and human clinical studies have shown that consumption of glutamate modify body weight and food consumption. In a rat model of obesity, glutamate consumption decreased fat accumulation and leptin production. Data also show that children that drink infant formula rich in glutamate consume less milk than children who do not. Additionally, studies with adults have shown that monosodium glutamate consumption reduces energy intake from fat and sweet snacks. These studies provide evidence for dietary glutamate's role in the regulation of energy balance as a "proteostat" that limits food intake and increases energy consumption.

Track 6: Functional Foods and Bioactive Compounds

ESSENCE OF WASHOKU, UMAMI IS THE BASIC TASTE FOR BETTER NUTRITION?

UMAMI: THINKING OF AN IDEAL HEALTHY DIET FROM THE UNESCO HERITAGE FOOD CULTURE, WASHOKU

Yamamoto, Shigeru.

Jumonji University. Japan.

Life-expectancy at birth for Japanese is long; the mean for women is 86 and 80 for men. Cancer and heart disease have been increasing; however, the age-adjusted death rates have been quite constant, indicating the increase has been due to the increase in the elderly population. The prevalence of obesity is the lowest in the 50 developed countries, with obesity defined as BMI over 30. The prevalence of obesity in the last 40 years has increased in the USA from 15% to more than 30%, and in England from 7% to 25%. In Japan it has also increased from 2% to 3.5%, but the increase has been small. The Japanese have maintained their lipid intake at about 55g/day for more than 40 years. World-wide the higher the income, the higher the lipid intake; however, Japan has been exceptional in this. Sugar intake is more than 100g in the USA and Holland and more than 50 g in Taiwan but only about 30 g in Japan.

The above results may be attributed to the Japanese cuisine. A special aspect of this cuisine is UMAMI seasonings. These include glutamate from sea kelp, inosinate from fish, and guanosinate from mushrooms. People may always seek tasty ingredients in meals, for example, salt, sugar, lipids and UMAMI seasonings. Japanese had been using high salt for a long time and had high blood pressure. A major cause of death until 1980 was stroke (brain hemorrhage) from high blood pressure. After the 1980's, UMAMI seasonings became more common because of low-cost commercial production and salt intake decreased. Perhaps the factors of low lipid intake over a long period and low sugar intake were also due to UMAMI seasonings.

Visual appeal may be an important factor of the Japanese cuisine providing psychological satisfaction. Gourmet Japanese cuisine is trying to express a view of nature in cooking. To that end, not only expensive ceramics and lacquer ware but also fish in a container in a boat-shaped wooden container, tree branches, grasses, flowers and even seaweed are used. Even in home situations, the presentation of food is an important consideration. The tendency to provide a number of smaller separate dishes may also contribute to the health of Japanese. Japanese cuisine tends to vary the preparation of standard ingredients (such as the diverse dishes based on soybeans); this perhaps contributes to a feeling of novelty that reduces habituated consumption.

Does such an attempt have the potential to contribute to health? For example, if the same dish is served in a paper container or on beautiful tableware, is the effect on health the same? If food is beautifully presented in small amounts on a variety of dishes rather than in a large amount in a single dish, our eating speed will be moderate and our intake will decrease. I think that such factors may have influenced obesity prevention, health promotion, and longevity for Japanese.

UMAMI: ESSENCE OF WASHOKU FOR HEALTHY AGING

Uneyama, Hisayuki.

Ph.D. Exececutive Professotional. Global Communications Department. Ajinomoto Co. Inc.

More than 109 years ago, umami taste, the perceived taste essence of Washoku was originally discovered as a new taste quality by Japanese scientist, Professor Kinunae Ikeda with a motivation to improve the poor nutritional status of Japanese people. Finally, he contribute to develop the first umami taste seasoning, monosodium glutamate (MSG) as an affordable seasoning to make everybody able to cook delicious and tasty foods easily, cooperated with Ajinomoto Company. Today after his great work, Japan has been entered into the highest aged society with an active long–life expectancy. However, even now, many Japanese elderly faces to under-nutritional status, especially protein-energy malnutrition suffering from decrease in oral and gut functions with aging (hypo-salivation/ taste and swallowing dysfunction/dyspepsia/constipation). Using the purest umami taste substance (MSG), we has shown that umami taste could be sensed at oral tongue as well as gastrointestinal tracts and might act as an intake nutrient sensor (especially., protein) to modulate appetite and food digestion. Especially, many animal and human studies indicate that umami taste can stimulate exocrine secretions related to food digestion such as saliva and gastric juice. Now, we can know some clinical trials to examine whether umami taste has a power to improve the functional decrease of those aging-related health issues, or not. In this my presentation, I'll review the recent reports on umami taste research for improving elderly health, and discuss umami taste is how important to has been contributed to active-long life expectancy of Japanese people.

SUBLIMINAL IMPACT OF BASIC TASTES FOR DECISION MAKING ON FOOD SELECTIONS

Alonso-Alonso, Miguel.

MD PhD. Assistant Professor. Harvard Medical School. Director. Laboratory of Bariatric and Nutritional Neuroscience. Beth Israel Deaconess Medical Center. Boston. Massachusetts. USA.

Taste is known to play an important role in shaping food choice, and overall in the consumption of food. However, there is limited understanding of the mechanisms underlying these effects, particularly for non-sweet tastes and in the case of complex, cognitive aspects that go beyond appetite, reward or affective associations, e.g. health or dietary goals. Notably, little is known about whether taste could prime and potentially bias food choice via upstream effects, at the level of brain regions involved in cognitive executive processes that support goal-oriented, adaptive behaviors necessary for healthy eating in the current environment.

We conducted a study to explore possible associations of umami taste with brain and cognitive determinants of healthy eating. Previous experimental studies have shown that pre-meal intake of a broth or soup supplemented with monosodium glutamate, a key substance underlying the umami taste of foods, can decrease appetite and food intake, particularly in women with propensity to overeat and gain weight. Based on these data, we examined acute changes in brain and cognitive domains related to healthy eating following intake of a chicken broth alone or supplemented with monosodium glutamate in a sample of healthy young women. Subjects were evaluated with a food-modified computerized inhibitory control task, a buffet meal test with two calorically conflicting menu sets during which subjects wore eye-tracking glasses, and brain responses during a food choice paradigm evaluated with functional neuroimaging. We found evidence for improvement in key parameters related to inhibitory control following intake of the broth with monosodium glutamate, particularly in subjects with high levels of disinhibition, who also showed lower intake of saturated fat during the meal. Additionally, consumption of this broth led to a reduction in the rate of fixation switches between plates at the meal, and increased engagement of a brain region in the left lateral prefrontal cortex previously associated with successful self-control during food choice. Altogether, these results suggest potential facilitating effects of umami taste, specifically monosodium glutamate, in cognitive-executive processes that are relevant for the support of healthy eating behaviors and food choice.

CONTROL OF APPETITE WITH PROTEINS, PEPTIDES AND AMINO ACIDS

Anderson, Harvey.

PhD. Director. Program in Food Safety. Nutrition Regulation Affairs. Professor Nutritional Sciences and Physiology.

Protein consumption impacts many essential physiological functions in addition to providing amino acids for protein synthesis. Appetite control is one of these functions. Consumption of proteins increase satiety and reduce food intake when consumed alone or with carbohydrate. The role of proteins in appetite control are of interest because they are more satiating than either carbohydrate or fat. They regulate food intake and metabolic functions by the combined actions of the intact protein, encrypted peptides and amino acids in the gastrointestinal tract and brain centers. The impact of consuming proteins on appetite control depends on many factors, including source, quantity, time of day, before or with a meal and age. These factors interact with the physiologic sensing of protein intake arising from the actions of peptides and amino acids released by digestion. The sensing systems include amino acid and peptide receptors in the gastrointestinal tract, and free amino acids in plasma and brain. As well the products of digestion stimulate many gastrointestinal hormones the signal the brain's food intake regulatory centers. Proteins may also increase food intake by adding palatability to foods and meals. In contrast, isolated proteins, their peptides or free amino acids are often unpleasant when consumed alone. The exception to the generally unpleasant taste of protein hydrolysates or free amino acids is monosodium glutamate, which provides the umami taste and may also provide signaling of protein ingestion via gut receptors. With the exception of glutamate, the potential of individual free amino acids to be uses as tastants or additives for regulation of appetite and food intake in humans has received little exploration. However it is clear they provide nutrient signaling via the gut. In summary, food proteins and the peptides and amino acids have many physiologic functions that contribute to regulation of appetite and healthy body weight.

NEW TECHNOLOGIES THAT MATCH NEW CONCEPTS IN NUTRITION

FOOD LOSSES AND WASTE (FLW) AS SOURCE OF BIOACTIVE COMPOUNDS OF NUTRITIONAL INTEREST

Polenta, Gustavo.

PhD. Biochemist. Food Technology Institute. Agro-Industry Center. Instituto Nacional de Tecnología Agropecuaria (INTA). Argentina.

In recent years, two relevant facts have emerged, which will probably have an impact on the food industry agenda in the near future. On the one hand, the estimation made by the Food and Agriculture Organization (FAO), that around one third of all food produced in the world is lost or wasted. In addition to reducing farmers' incomes and increasing consumers' expenses, FLW have also an important negative environmental impact because of the associated greenhouse gas emissions and inefficient use of water and land. On the other hand, the increasing awareness raised by consumers on the significant role that diet has in the modulation of body functions, which can contribute to improve the state of well-being, to reduce the risks associated to certain chronic diseases, and ultimately to improve the overall quality of life. Market drivers for this awareness include the ageing population, the increasing health care costs, the technological advances in the food technology field, and the progresses made in different food legislations. Within this framework, agricultural by-products, which for many years have been considered as undervalued substrates due to the problems arising from their removal from food production, and the necessity to treat them before their disposal in the environment, are now being regarded as a cheap source of highly appreciated bioactive compounds. As a consequence, an exciting new field of research has arisen, which include the development of emerging processing technologies (such as High Pressure Processing Pulsed Electric Fields, and Ultrasound), able to maximize the efficiency of extraction and the remaining bioactivity of the compounds of interest during the processing and storage of the formulated product; and to successfully deliver the desired bioactive component to the target sites in the body. Other aspects to consider are related to the challenges associated to the regulatory positioning of bioactive compounds and functional foods, to the strategies that should be deployed when launching novel foods containing the recovered compounds into the marketplace (such as Kano Method), and to the need to meet consumer expectations and acceptance, in terms of documented efficacy, food safety, organoleptic properties and price of health promoting food. Therefore, the presentation will discuss general aspects related to the state-of-the-art in the recovery technologies of the target compounds, and their successful recycling inside the food chain as functional additives, in products devoted to different population niches. Specifically, topics to be addressed will be: the recovery strategies and stages to be consider, the impact that emerging technologies have in aspects such as nutritional value, functional properties, bioavailability and shelf-life of biocompounds, and the use of marketing methodologies leading to the success of the final food products. In addition to the positive impact that this new field will have on the reduction of FLW by recovering part of the nutritional potential of by-products, improving the competitiveness of food chains, and reducing the environmental impact, it can be also considered as a promising opportunity for the agro-industrial development of Countries like Argentina.

APPLIED NANOTECHNOLOGY: IMPROVEMENT OF NUTRITIONAL FOOD PROFILES

Gallardo, Gabriela.

PhD. Chemistry. National Institute of Industrial Technology (INTI). Argentina.

Nanotechnologies are considered to hold a great promise for the development of new products in almost all industrial sectors and many applications are currently marketed worldwide. The development of new products and applications involving nanotechnologies holds great promise in different industrial sectors, food not excluded.

The great advantage of materials at this dimensional state is that they show unique functional properties from bulk materials, properties that can be exploited for a wide range of applications. These properties are mainly due to a high surface to mass ratio that results in a higher reactivity for interactions.

Nanotechnology offers new opportunities also for the food and agricultural industries and several applications can be found at different stages of the food production chain.

Food additives and flavor enhancers, food supplements (e.g. to increase iron or other trace element bio-availability), novel food structure (e.g. nanoemulsion to reduce fat content), nanoparticles for selective binding and removal of contaminants and pathogens from food. Furthermore, nanotechnology has the potential to transform our future food packaging materials, as part of an active and intelligent packaging system

Despite these promises, however, nanotechnologies should be carefully applied because toxicological data on several nanomaterials already in use are lacking and because the development of analytical methods able to guarantee consumer protection is still ongoing and need to face several challenges before any routine application in food control could be imagined. To be successful in the long run, proper education of the public is also paramount in the introduction and development of nanotechnology in food system. In spite of these the development of functional foods through the addition of bioactive compounds holds many technological

challenges, so the technique that industry can use is microencapsulation. It is an useful tool to improve the delivery of bioactive compounds into foods, particularly probiotics,

minerals, vitamins, phytosterols, lutein, fatty acids, lycopene and antioxidants. Several microencapsulation technologies

have been developed for use in the food industry and show promise for the production of functional foods because the addition of bioactive ingredients should not affect the sensory properties, colour or flavour of food products. Moreover, these technologies could promote the successful delivery of bioactive ingredients to the gastrointestinal tract. The microcapsules can release their contents sealed at controlled rates under specific conditions, and can protect the encapsulated product of light and oxygen. Microencapsulation is formed by a micro-porous polymeric membrane of an active substance container. A microcapsule consists of a semi-permeable membrane, spherical, thin and strong center around a solid / liquid. The substances that can be microencapsulated are vitamins, minerals, dyes, prebiotics, probiotics, flavors, nutraceuticals, antioxidants, odors, oils, enzymes, bacteria, perfumes, drugs and even fertilizers.

Keywords: Functional food, nanotechnology, microencapsulation

THE HUMAN MICROBIOME: SHARING OUR BODIES

SHARING OUR BODIES. THE SYMBIOSIS OF HUMANS AND OUR MICROBIOTA. A HIGHLEVEL OVERVIEW OF RESEARCH IN THE FIELD

Hoffmann, Christian.

Food Research Center. University of Sao Paulo. Brazil.

Our knowledge about human gut microbiota, its resident species and their functional interaction capacity with its host has grown exponentially in recent years, especially due to next generation DNA sequencing technologies. These recent techniques have helped demonstrate the incredible diversity present in this ecosystem. Indeed, the adult human intestinal microbiome is considered one of the places with the highest microbial densities known. Estimations indicate that the gut microbiome has over 1800 bacterial genera and between 1500 and 3600 bacterial species, the vast majority of which has so far not been cultivated. Such estimations do not take under consideration other microbial groups which are present within the intestinal system, such as Archaea and Fungi. Several recent studies have provided important information with respect to what constitutes a 'healthy gut microbiota' while furthering our understanding of the role of gut microbes in intestinal and metabolic diseases. They have shown that the gut microbiota plays an important role in maintaining the host's overall health. For instance, nutrients such as non-digestible, fermentable carbohydrates can affect gut microbiota composition and modulate microbial-host interactions, which in turn maintain and/or pro-

mote health. Dysbiosis ensues when this relationship is disrupted. Manipulation of gut microbiome can provide new avenues for the treatment and prevention of human diseases.
Keywords: Human Microbiome

EXPLORING THE ROLE OF THE MAJOR GUT MICROBIOTA CLUSTERS ON NUTRITIONAL AND FUNCTIONAL BENEFITS OF NUTRIENTS AND NON-NUTRIENTS

Rowland, Ian.

PhD. Department of Food and Nutritional Sciences. University of Reading. UK.

The biotransformation capabilities encoded in the gut microbiome greatly exceed that of the host genome, these include functions involved in the breakdown, metabolism and absorption of dietary components. As such, the gut microbiota is a key factor in shaping the biochemical profile of the diet and, therefore, its impact on host health and disease.

The ILSI Europe Functional Food Task Force set up a working group to gain a perspective on the state of the art in this area with a focus on the role played by the gut microbiota in metabolism and absorption of key nutrients and non-nutrients. This has taken the form of a systematic review focussing on energy and the following candidate dietary substrates: protein, carbohydrate, fat, resistant starch, dietary fibre and polyphenols. In reviewing the literature, particular attention was paid to the characterisation of the microbiotas which are predominantly implicated in each case, and indications of the potential health impacts.

In addition to this systematic review, we have conducted a detailed evaluation of the main gut microorganisms and microbial pathways involved metabolism of these dietary components and furthermore we have critically examined existing and novel methodologies used to study diet-gut microbial interactions including 'omics' techniques, mathematical modeling, isolated microbes and enzyme assays.

It is anticipated that a more thorough understanding of the role the gut microbiota plays in the metabolism of dietary substrates and of the relevant members of the microbiota and community profiles holds considerable promise to facilitate the development of novel health-orientated dietary strategies.

HIGH QUALITY OLIVE OIL: NUTRITION AND HEALTH

MANUFACTURING OF OLIVE OIL FROM A NATIONAL PERSPECTIVE

Emilia, Raimondo.

Universidad Juan Agustin Maza. Universidad Nacional de Cuyo.

The history of the Argentine oliviculture has had periods of apogee and great depressions. A few years after the foundation of Mendoza (1561), the first olive trees were introduced to the country in order to produce oil in an artisanal way. Then a royal decree would force to be cut them, but a plant was saved in La Rioja; this olive tree still survives and is known by the name of "Fourth-Centennial Olive Tree" and is located in the Arauco District, region of which takes the name the unique Argentine variety that appears in the World Catalog of Olive Varieties (1995), published by the I.O.C. (International Olive Council). With the arrival of immigrants, the consumption of olive oil (more than 3 L/person in 1930) was impelled. The first law of promotion of oliviculture arises in 1932: "make homeland, plant an olive tree", through which one more than 7,000,000 olive trees were planted, being Mendoza the main producer. Then with the production of lower cost seed oil, the apogee of winemaking and the discrediting campaign by the health sector, there was a new cut of olive trees (60's). This situation changed radically at the beginning of the 1990s with the laws of Tax Deferrals for industrial, agricultural, livestock and tourist enterprises (Law No. 22.021 in La Rioja, Law No. 22702 in Catamarca and Law No. 22973 in San Juan). These laws stimulated the development of new plantations in the northwest provinces, so Catamarca went from 952 ha in 1998 to 16,354 ha in 2016, and is currently the first olive oil producer of Argentina. In Catamarca, 80% of varieties are oilers, mainly Arbequina, Coratina, Barnea, and Frantoio. The remaining 20% are dual purposes, such as Manzanilla and Empeltre. In Mendoza 59% of the olives is for preserves, mainly Arauco and Manzanilla. The remaining 41% goes to oils: Arbequina, Farga, Empeltre and Frantoio. The predominant olive oil extraction system is the horizontal centrifugal continuum (80%), predominantly the two-phase. In a study made at Facultad de Ciencias Agrarias UNCuyo (2016), no statistically significant differences were found in the lipid profile, using ANOVA (analysis of variance) for $\alpha < 0.05$, for the different methods of extraction (decanter or press), but there was differences for varieties and cultivation latitudes. At the moment Argentina is the eleventh world producer of olive oils, occupying the first place in America; This represents 5% of world production. However, the consumption per capita is 200 g, compared to 15 kg/person of sunflower oil. In Italy and Spain the consumption exceeds 10 kg/person and in Greece reaches almost 20 kg. In some countries, with the frontal labeling, olive oil has a red traffic light, and this goes against all nutritional recommendations, so these measures should be review

Keywords: Olive oil, production, consumption, extraction method

THE QUALITY OF OIL AS A DISTINCTIVE TOOL

Luna, María.

Máster. Chemistry. Faculty of Health Sciences. National University of Catamarca. Argentina.

The United Nations Food and Agricultural Organization (FAO) states that there is food security (FS) when all people at all times have physical and economic access to harmless and nutritious food to satisfy their needs. As a result, it is vital to reduce the negative effects of development over the environment and natural resources as well as climate change. FS thus implies offer and availability of harmless and high quality items of food. Olive oil (OO) has been declared Argentine National Food by Congress (Act N°26.839/13) and is a food matrix with synergy compounds which are responsible of its particular features of quality and for the favorable effects in the prevention of some prevalent diseases such as heart disease and cancer according to scientific evidence. In the chemical composition of virgin olive oil (VOO) two parts are distinguished: a) a principal saponifiable fraction (98-99% of the total weight of oil) made up of triacylglycerols (TAG) with a participation of major fatty acids (FA): palmitic, oleic (genetic reference) linoleic; and in minor quantities: myristic, palmitoleic, heptadecanoic, heptacenoic, stearic, linolenic, arachidic, gadoleic, behenic and lignoceric acids. Triolein and andpalmitic-oleic-oleic are the major TAG in AOV, together with low concentrations of monoglycerides and diglycerides and free fatty accids; b) the unsaponifiable minority fraction (up to 2% of the total weight of oil) made up of compounds chemically related to FA (waxes and phospholipids) and not related to FA (terpene hydrocarbons, polyphenols, sterols). The production of VOO as a result of genetic, environmental and technological interactions include: the supply and processing of olives, storage and conservation of oil, control of quality and marketing of final product. Among the principal factors which condition quality are variety, degree of fruit ripening and extraction system. The quality control of VOO monitors two chemical degenerative processes: hydrolysis and oxidation by means of physical-chemical indexes (acidity, peroxides, ultraviolet absorption), sensory analysis and authenticity control particularly profiles of FA and sterols. This is regulated in Argentina by the Argentine Food Code (CódigoAlimentarioArgentino), Chapter VII, sections 535,536, where oil is classified according to the degree of free acidity as: Extra, Virgin and Ordinary in consonance with the marketing norm of the International Olive Council. Results from the Faculty of Health Sciences are shown which were obtained of VOO varietals from Catamarca (2014 and 2016 harvests). Quality and FS are in an evolution process so as to recover consumers' confidence and the future has been placed in the commitment towards quality on the part of producers and manufacturers making sure that commercialized products are rigorously controlled. The Value Added Secretary (Argentine Ministry of Agriculture and Industry) reported in 2016 on requests on the adding of value (Geographic information / Denomination of origin) so as to protect the quality of VOO from Argentina: OO from the southwestern part of Buenos Aires and OO and olives from Araujo.

SENSORY ANALYSIS OF OLIVE OIL FROM CATAMARCA. REGIONAL EXPERIENCE FOR THE TASTING PANEL

Molina, María Sol.

Magister. Chemical engineer. National Institute of Agricultural Technology. National University of Catamarca-Faculty of Health Sciences.

The province of Catamarca, located in the olive-farming region of the Argentinian northwest, produces principally high quality olives from which to extract extra virgin olive oil (EVOO) using a two-phase technology. It possesses varied agricultural and ecological areas which give origin to olive oils with characteristic sensory profiles obtained from different varities grown according to the degree of the ripening process of the olives. Although the characteristics of the product are defined by the combination of agronomic and industrial factors, qualified and timely interventionin the fundamental stages of the olive chain of value is a key to define the sensory attributes of the product and to assure the degrees of fruit taste with their different shades of flavor as well as the balance between bitterness and spiciness. The Test Panel method is an effective tool to establish distinguishable features among olive oils from the assessment of their attributes by resorting to the senses of selected and trained tasters. In the commercial classification of olive oils, according to the International Olive Council (IOC), fruit tastes together with the absence of defects determines whether a sample of olive oil is extra virgin or not. The determination of the characteristic and representative attributes of the types of extra virgin olive oil from Catamarca and the region as well as their consistency are necessary elements to differentiate them and give them added value. The Tasting Panel known as "Catadores del Valle" in coordination with the National Institute of Agricultural Technology (INTA) is the official panel recognized by IOC and constitutes a key instrument for the control, monitoring and quality improvements of types of olive oil extracted in the region. This panel was started in the year 2000 as an initiative of the private sector and in coordination with the School for sight-impaired people from Catamarca. The panel has worked without interruption and with the aim of achieving the technical level required internationally in a context of integration and support towards people with different capacities. The results obtained from the analyzed samples show the high quality and the sensory touches of the varities of olive oil produced in the region. They are elaborated mainly with Arbequina base which provides them with delicate fruit flavors with touches of apple, banana and dried fruits. Other typical varities grown in the area are Coratina, Barnea, Frantoio, Camomile and Arauco. They produce olive oils with great personality, from medium to intense fruit flavors which are ideal to intensify or complement other types of oil. All these provide consumers with a great diversity of high quality olive oils with distinctive sensory profiles. The EVOO possesses excellent characteristics of flavor and scent all of which in a context of harmony, complexity and persistence contribute to an appetizing gastronomy.

OLIVE OIL AS FUNCTIONAL FOOD. SCIENTIFIC EVIDENCE IN HEALTH

Barrionuevo, Omar T.

National University of Catamarca. Faculty of Health Sciences (UNCA-FCS). Argentina.

Functional food is defined as all food consumed habitually as part of a normal diet, which independent from the provision of nutrients, contain biologically active components with the capacity to affect positively a particular biological activity, reducing the risk of diseases. The component which makes some food functional can be either a macro nutrient with a determined physiological effect, or an essential micro nutrient eaten in a dose above the recommended intake. It can also be a non-essential element of the food or a component without any nutritional value. The strategies of functional food production can be varied but these components will always come in the form of some food. In the case of olive oil (OO) both principal components as well as others which are present in small concentrations have been included in this category. It is important to remark that not all OO, considered to be the Mediterranean Diet fat, are equally beneficial to health. The scientific community has unanimously highlighted the beneficial nutritional effects and the healthy attributes of extra virgin olive oil (EVOO) both for its lipid part and its antioxidants. Among the principal components the most important is oleic acid (C18:1, ω-9) whose healthy properties have been recognized by the Food and Drug Administration (FDA) and the European Food Safety Authority (EFSA). Among the secondary components with bioactive character the phenolic compounds are highlighted by abundant scientific evidence. Nowadays it is also known that the special healthy attributes of OO can be found in the combined and synergic effect between principal and secondary components all of which are present in the fruit, the olives. Consequently, the most recommended olive oil for health will be the one with the highest quality. In this sense, EVOO is the one with the higher potential as a result of the scientific evidence provided by nutritional epidemiology which highlights its importance in relation to the health of its consumers. The beneficiary effects of olive oil as a functional food in dealing with different pathologies would not be merely due to its content of oleic acid but also due to the participation of polyphenols which act as a defense antioxidant mechanism against the constant production of Free Radicals (FR). These are highly unstable and reactive components which attack other cell components causing harm to proteins, lipids and DNA implied in the origin and evolution of chronic degenerative diseases. There is no data about the secondary components with a bioactive nature of the varities of olive oil obtained in Catamarca, which is considered to be the main producer province of OO in Argentina. All this makes it necessary to carry out more research about the phenolic portion present in olive oils from Catamarca so as to be able to design a functional oil enriched with these bioactive components, in the appropriate doses for the prevention of diseases associated to old age and oxidative stress.

Keywords: Functional food - Olive oil - Oleic acid - Polyphenols

CONSUMPTION OF OLIVE OIL IN A HEALTHY DIET

Cornatosky, María Alejandra.

Magister. Universidad Nacional de Catamarca.Argentina.

In a diet fats are the principal source of energy and their biological properties are defined by the quality of the fatty acids that constitute them which has a deep influence in health. In the last decade improvements and recommendations in the field of fats and fatty acids in human nutrition have been produced. They are based on a significant body of scientific evidence derived from epidemiological and clinical studies as a result of the growing global incidence of chronic-degenerative diseases related to changes in diet and life style which currently constitute the main cause of mortality and incapacityat world level. The 2008 FAO/WHO Expert Consultation defined nutritional objectives with minimum and maximum intakes of total fats and fatty acids in adults. In relation to mono-unsaturated fatty acids (MUFA) found in lots of items of food, oleic acid (C18:1,ω-9), a major component of olive oil, is the most recommended to be consumed in any diet due to its beneficial effects especially in the extra virgin quality. This is the result of its high oleic content and its contribution in minor bioactive components such as polyphenols. The studies which more strongly support the healthy cardio effects of MUFA have been conducted in the context of a Mediterranean Diet based on the habitual consumption of vegetables, fruit, legumes, fish, dried fruit, skimmed dairy products, moderate consumption of red wine and olive oil as the main source of fat in diet (20% or more in the total energetic intake). In Argentina, although the availability and consumption per capita of olive oil has been growing in the last 20 years, it is still marginal in relation to other seed oils and compared with the main consuming countries. It can be found in only 10.5% of homes and it is used mainly as a flavoring (90%) in middle income segments. From a nutritional point of view virgin olive oil is the natural juice of olives and is extracted by physical processes which make it different from the rest of eatable vegetable oils which are obtained by chemical processes of refining. Although it is mostly recommended to be used "raw" to preserve all the organoleptic and nutritional properties derived from the crushed fruit, it is also adequate to cook at high temperature without decomposing, which means it keeps its chemical structure in normal conditions. All this makes olive oil suitable for gastronomic preparations such as stir-frys, barbecues, stews or fried dishes. Our relation with food is complex as it is part of culture, consumers behaviors vary significantly among countries and among segments of consumers. The popularization of the properties of olive oil together with a change in habits which lead to a more balanced and healthy diet is a way to encourage local consumption.

FUNCTIONAL FOODS 2017 – NEW PERSPECTIVES

ANTIOXIDANTS AS BIOACTIVE INGREDIENTS IN FUNCTIONAL FOODS. A REAPPRAISAL

Nunez Selles, Alberto J.

PhD. Dr Sc. Reserach Director. National Evangelical University, Dominican Republic.

Nutritional antioxidant supplementation has been considered largely of secondary importance for human health in medical practice. However, oxidative stress caused by the body imbalance of oxygen and nitrogen reactive species (ROS/RNS) may induce gene-regulatory effects and influence signal transduction pathways1. Therefore the use of antioxidants as active ingredients in functional foods, nutraceuticals and food supplement formulations is demanding increasingly a reappraisal of its effectiveness not only in order to avoid diseases as part of a healthy life style together with a balanced diet and physical exercise but as part of adjuvant therapies in chronic degenerative diseases. Oxidative stress caused by the body imbalance of oxygen and nitrogen reactive species (ROS/RNS) may induce gene-regulatory effects and influence signal transduction pathways. Our previous findings on the effect of a mango bark extract (Mangifera indica L.) showed a dose-dependent inhibition of tumor necrosis factor (TNFα) and nuclear factor κB (NfκB) both in vitro and in vivo indicating that its antioxidant effect was down-regulated by these factors2. Other transcriptional factors (JAK 1/2, STAT 3, AKT, MAPK, IKK) and the VEGF have been also inhibited by mangiferin, the major component of the mango extract3. It has been described recently that the Antioxidant Responsive Element (ARE) acts as specific enhancer of antioxidant enzymes regulation through the transcriptional factor Nfr24. This factor may exert an autoregulatory effect on mafG and BSV1 transcriptional regulation5. These effects are underlying the human antioxidant defense pathways and may explain the potential benefits of antioxidants as bioactive principles in functional foods and food supplements as well.

FUNCTIONAL FOODS FOR THE ELDERLY - SPECIAL CONSIDERATIONS

[1]Chiarello, Marileusa D.; [2]Oliveira, Danielle; [2]Érika, Oliveira; [3]Jennifer, Lacerda; [4]Pineli, Livia; [5]Karnikowski, Margo.

[1]PhD. Food Science. College of Health Sciences. University of Brasilia. Brazil.; [2]MSc. Nutritionist. Gerontology Research Program. Catholic University of Brasilia, Brazil; [3]Chef de cuisine. Gerontology Research Program. Catholic University of Brasilia, Brazil; [4]PhD. Food engineer. Department of Nutrition. College of Health Sciences. University of Brasilia. Brazil.; [5]PhD Pharmacist. Department of Pharmacy. College of Health Sciences. University of Brasilia. Brazil.

New strategies are needed to face the current panorama in world population fast ageing. Old age generally involves specific situations that interfere in the aspects of food intake and nutrition such as a) decrease of availability of financial resources, making the access to healthy and functional foods more difficult; b) decrease or loss of autonomic decision, influencing choices of what eat and how to prepare it; c) sensory losses (vision, flavor and taste) that interfere with the level of food intake and the amount of added condiments (salt and sugar, mainly); d) physiological losses (masticatory, enzymatic, gastro-intestinal) that lead to nutrient decreased intake, digestion and absorption. The inclusion of functional foods in diet is currently discussed as a strategy to prevent damage to health and prevent or delay the establishment of chronic diseases related to age. However, regarding older people diet, there is still a gap between scientific and technological knowledge that was developed in laboratories and what in fact is applied. One hindrance about the inclusion of healthy and functional ingredients (FI) in the diet of the elderly is the difficulty to change food habits, since the food pattern results of lifelong choices. Within this context, our research group works on two main strategies: improving the acceptability of FI-containing preparations and conducting clinical trials, mainly aiming older people. In studies of acceptability improvement, yellow passion fruit (Passiflora edulis) peel flour – PePF, a very rich fiber ingredient (total fiber content is higher than 65%, db), was used. Men and women (n = 36) with daily fiber intake below the recommended healthy levels (21g for women and 30g for men with more than 50 years old) were selected to perform acceptability tests. The participants middle age was about 69.1±5.6 years old. They were submitted to anamnesis and food survey to identify preparations that were compatible with their eating habits. The two more popular dishes were supplemented with PePF (16g/100g). The final products had acceptability and consumption intention evaluated by an elderly panel. PePF-enriched preparations had a high acceptability index (93.44%) and a high consumption intention (79.9% of the elderly reported that they intend to consume PePF-enriched preparations always or very frequently). According

to Brazilian laws, each portion of developed preparations can be labeled as fiber source food. In the clinical trial, yacon root pulp (Smallanthus sonchifolius) - YRP, containing 65-70% of fructooligosaccharides – FOS (db) was used. The effect of daily supplementation with 100g of YRP for 60 days on the lipid profile, glycemic index and insulinemic index of postmenopausal women (n = 46) aged about 65.7 + 8.5 years old was investigated. Supplementation with YRP pulp did not cause alterations in the lipid profile or glycemic parameters during the investigated period compared with the control group. However, it led to a decrease in body weight and waist circumference. This model of clinical trial with elderly people will be used to evaluate functional effects of PePF added foods.

Keywords: Elderly, fibers, functional foods

COMMUNICATIONS OF FOOD FUNCTIONALITIES

Kimiywe, Judith.

PhD. Associate professor. Department of Food Nutrition and Dietetics. Kenyatta University. Kenya.

Functional foods have potential positive effect on health beyond basic nutrition. The concept of functional foods was first developed in Japan in 1980s after escalating health care costs, the ministry of health initiated a regulatory body, which documented, regulated and approved various foods that had health benefits. Nutraceuticals are dietary supplements that deliver a concentrated form of a presumed bio-active agent from a food, presented in a nonfood matrix, and used to enhance health in dosages that exceed those that could be obtained from normal food. Various clinical trials in Kenya have demonstrated the potential benefits of functional foods in solving common morbidity. Solar dried amaranth leaves blended with maize flour porridge was fed to children aged 24-48 months for 6 months among pastoralist communities. Findings realized significant improvement of nutrients and higher retention of β – carotene, iron and zinc. Another study determined the nutrient composition and contribution of hypochondriac amaranth grain based porridge on nutrition status of 52 HIV children at a comprehensive care clinic. There were positive significant contribution to the nutrition status, CD4 counts and reduced morbidity incidences. An experiment with Spirulina powder in elevation of protein-energy malnutrition and iron deficiency anemia, targeted 240 children aged 6-23 months through a randomized controlled trial. The Spirulina fortified corn soy blend showed faster recovery from PEM and IDA compared to those on CBS alone and the controls. A study on effect of 80 g of peanut supplementation on bio-markers of CVD in 85 HIV free-living adults with dyslipidemia in a randomized crossover clinical trial for 22 weeks period, lowered cardiovascular risk significantly through reduction in total cholesterol, triglyceride and Low Density Lipoprotein Cholesterol. These case studies demonstrate the high potential of functional foods from locally available foods to lower the burden of diseases in Kenya.

THE IMPACT OF FAST-FOOD DIET ON BONE DEVELOPMENT, METABOLISM AND QUALITY

[1]Monsonego-Ornan, Efrat; [2]Zaretsky, Janna; [2]Griess-Fishheimer, Shelley; [2]Travinsky, Tamara; [2]Shahar, Ron.

[1]Institute of Biochemistry and Nutrition Faculty of Agricultural, Food and Environmental Sciences, The Hebrew University, P.O.B 12, Rehovot 76100, Israel.; [2]Institute of Biochemistry and Nutrition, The Hebrew University, P.O.B 12, Rehovot 76100, Israel.

Endochondral ossification in the growth-plates provides a narrow window of opportunity to achieve optimal bone size and quality. Modern western diet has negative health implications; however, its effects on skeleton development have not been explored. We show that young rats, fed exclusively with McDonald's meals suffer from growth retardation due to growth-plates lesions within the tibiae. Bone mineral density decreased significantly, structural parameters of trabecular and cortical bone deteriorated dramatically, as did the mechanical performances of the bones. Supplementations with either multi-vitamins and minerals, or calcium alone resulted in partial rescue of growth-plate and bone phenotypes, but were accompanied by kidneys' calcium deposits. Our findings highlight for the first time, the severe pathology that consuming a fast-food diet does to the skeleton of growing young mammals. Pathologies that extends much beyond the known metabolic effects. These results are relevant to human's health as human bone pathologies corresponds with the rats' phenotypes, and fast-food eating pattern is highly common among children around the world.

LEVERAGING TRADITIONAL CROPS FOR BETTER NUTRITION AND HEALTH – THE CASE OF CHICKPEA

[1]Bar-El Dadon, Shimrit; [2]Abbo, Shahal; [3]Reifen, Ram.

[1]PhD. The Institute of Biochemistry and Nutrition. The Robert H Smith Faculty of Agriculture, Food and Environment. The Hebrew University of Jerusalem. Israel; [2]Prof. The Institute of Plant Science & Genetics in Agriculture. The Robert H Smith Faculty of Agriculture, Food and Environment. The Hebrew University of; [3]MD MSc. The Institute of Biochemistry and Nutrition. The Robert H Smith Faculty of Agriculture, Food and Environment. The Hebrew University of Jerusalem. Israel.

Adequate nutrition in early life is a prerequisite for human capital formation and economic development. Although poor feeding practices is a problem predominantly thought to exist in low income and middle income countries, malnutrition is rapidly rising among developed nations as well. In this context, and in light of scarcity of protein sources, utilization of crops- such as chickpea-as a source of micro and macro nutrients is mandatory in the long route to nutritional improvement.

In this presentation, we outline interesting features of the chickpea crop, in terms of its nutritional value and agronomic potential that may help combat several health issues in both Western countries as well as in many low income sectors in developing countries.

On the global scale, chickpea consumption is steadily increasing in recent years. In developing countries, chickpea brings a variety of taste and texture to the cereal-based diet, as well as high-quality protein, fiber, carbohydrates and minerals, thereby ensuring a balanced diet and improving the nutritional status of the population. In developed countries, chickpea may be an ultimate source of protein for the increasing vegetarian/vegan populations. On top of that, allergenicity issues, content of phytoestrogens, and more are negligible in chickpea.

The chickpea crop should be considered as an outstanding source of protein, the ultimate alternative to soybeans, as well as the next health-food for human consumption.

UPDATE ON ACTIVE PRINCIPLES. ACTIVE FOOD PRINCIPLES AND THEIR RELATIONSHIP WITH HEALTH

OLIVE OIL: SOMETHING MORE THAN A MONOUNSATURATED FAT

Barrionuevo, Omar T.

PhD. Biochemist. Argentina.

It is widely accepted that any variety of olives may be used to obtain olive oil; however, the field yields and the quality of the product vary. Each variety of olive produces a different type of oil with its own sensory characteristics that give them their distinctive features. Virgin olive oils are oils obtained from the fruit of the olive tree (Olea europaea L.), by mechanical procedures and by some other physical means in especially thermal conditions so as to avoid the alteration of the oil. It means no other treatments apart from washing, decanting, spinning and filtrate. In this process, solvents, chemical refining and additives are excluded. These olive oils are classified with different denominations according to physicochemical and organoleptic parameters. From a chemical point of view, oil contains a principal or saponifiable fraction, which represents 98-99% of the total weight of the oil, and a minority fraction which represents 2%. The latest innovations in the process and the spreading of extra virgin olive oil (EVOO) culture are based on its quality. There are many studies derived from nutritional epidemiology which support the scientific evidence concerning the importance of EVOO in connection with the health of its consumers. These oils play a central role in the Mediterranean Diet, and its habitual consumption is associated to a lower risk of chronic-degenerative diseases. Among the constituents of the

major fraction, oleic acid (C18:1, ω-9) is the principal nutrient, which besides its energetic function, is attributed the major part of the bioactivity of olive oil. It represents 68-82% of the total amount of fatty acids found in oil. It can be found it its free form, though it maily form part of the oil triacylglycerols. EVOO contains, in it sunsaponifiable fraction, hundreds of minor constituents which are difficult to determine because of their structural complexity and their low concentration; however, they have demonstrated a beneficial effect on people´s health. In this group some compound classes are included which are not chemical related to fatty acids, among which polyphenols with a great structural complexity are worth mentioning. The antioxidant potential of these compounds allows them to act as defense mechanisms against oxygen reagent species associated to the steady deterioration of the biological systems, even in good living conditions. Even today the molecular mechanism by which these compounds produce beneficial effects on health is still unknown or difficult to explain.

Keywords: Olive oil – Oleic acid – Bioactive compounds - Polyphenols

UPDATE ON PREBIOTICS

Zuleta, Ángela.

University of Buenos Aires. Argentina.

The human colonic microflora has a central role in health and disease, being unique in its complexity and range of functions. As such, dietary modulation is important for improved gut health.. Diet can affect the composition of the gut microflora through the availability of different substrates for bacterial fermentation.

As such, functional food ingredients such as prebiotics could effect a beneficial modification in the composition and activities of gut microflora by increasing positive flora components. The prebiotic approach aims to increase resident bacteria that are considered to be beneficial for human health, e.g. bifidobacteria and lactobacilli.

A prebiotic was originally defined, Dr Robertfroid, in 1995 as a "non-digestible food ingredient that beneficially affects the host by selectively stimulating the growth and/or activity of one or a limited number of bacteria in the colon, and thus improves host health"[.A more recent definition from FAO , stated that "A prebiotic is a selectively fermented ingredient that allows specific changes, both in the composition and/or activity in the gastrointestinal microbiota that confers benefits upon host wellbeing and health".

The principal concept associated with both of these definitions is that the prebiotic has a selective effect on the microbiota that results in an improvement in health of the host. The definitions arose from observations that particular dietary fibres bring about a specific modulation of the gut microbiota, particularly increased numbers of bifidobacteria and/or lactobacilli, and that ingestion of these compounds was associated with improved host health. Overall, saccharolytic fermentation leads to the formation of end products (SCFA) that are recognised as being beneficial to the host. It is recognised that there are numerous potential new ap-

plications being considered for prebiotic use e.g. prevention and or management of type 2 diabetes mellitus; drug bioavailability; effects on autoimmune diseases and allergy; modulation of pathogenic biofilms.

Common prebiotics in use include inulin, fructo-oligosaccharides (FOS), galactooligosaccharides soya-oligosaccharides, xylo-oligosaccharides, isomalto-oligosaccharides and lactulose.

The majority of studies have so far focused on inulin, FOS and GOS. These saccharides have now a long history of safe use and are generally regarded as safe, There is also a range of new prebiotic compounds emerging, and these include:

gluco- oligosaccharides, levans, resistant starch, xylosaccharides and soy-oligosaccharides. These compounds have been studied to varying degrees in vitro, in animal feeding studies, but rarely in human feeding studies.

Novel compounds new to the human diet fall under the regulatory category of "novel foods" and will require legislated levels of safety and toxicological assessment before they can be included in food products. However, little legislation exists governing the use of the word "prebiotic" itself on functional food products and there is a growing collection of commercially available products which bear the prebiotic label but for which supportive scientific literature is sparse or lacking all-together.

Keywords: Key words:colonic microflora, prebiotic, saccharolytic fermentation, bifidobacteria

VARIATION ON THE CONTENT OF POLYPHENOLS ACCORDING TO THE PRESERVATIVE PROCESS USED

Raimondo, Emilia.

Universidad Juan Agustin Maza. Universidad Nacional de Cuyo. Argentina.

There is studies that show that polyphenols from plants, reduce the oxidative stress at the cellular level, decreasing the incidence of chronic noncommunicable diseases (CNDs), hence the importance of antioxidant intake through vegetables. "A dietary antioxidant is a substance present in food, which significantly decreases the adverse effects of reactive species of oxygen and nitrogen, over normal physiological functions in humans." From here comes the recommendation of daily consumption of, at least, five rations of fruits and vegetables or other products derived directly such as green tea, wine and olive oil. In order to know the content of polyphenols that present the foods in the region, they were obtained directly from the market, both fresh and preserved, or elaborated at the pilot scale: olives, tomatoes, different varieties of beans (Phaseolus vulgaris L.) among others.

It was used the Folin-Ciocalteu technique for its quantification, measuring the absorbance in a UV light spectrophotometer at 760 nm of wavelength. The data obtained were statistically compared. Below are some values found. For example, for olives the highest content of polyphenols was found in green olives, cv. Nevadillo, untreated (2.72 g/kg over dry pulp); this content was decreasing according to the advance of the olive maturation degree, obtain-

ing the lowest value for advanced veraison which was 1.94 g/kg of total polyphenols over dry pulp. For cv. Arauco varied from 2.53 g/kg (fresh) to 1.94 g (preserves). The content of polyphenols of the elaboration of black olives type Californian, from different degree of maturation, was decreasing with the oxidation. For "green" olives it was 2.47 g/kg on the first day, reducing to 1.81 g/kg and finally stabilizing at a value of 1.61 g/kg of total polyphenols, when obtaining bright black color. The content of polyphenols was 420 mg/L for olive oil cv. Arbosana elaborated in Mendoza, Argentina, decreasing to 370 mg/L for the one elaborated in Pelotas, Brazil. The content of polyphenols in fresh vegetables was: tomato (7.32 g/kg), cucumber (3.13 g/kg), pepper (1.46 g/kg), eggplant (1.41 g/kg) and asparagus (1.18 g/kg). When the tomato was dried, its value increased to 27.93 g/kg. For legumes as dry red beans, its content was 13.38 g/kg, but there was no differences with the salad dressing-type paste obtained from it. For black beans the polyphenol content was 1.5 g/kg, obtaining a similar value for its paste, being significantly lower than for the type red. The french beans did not contain polyphenols. Applying the Student's t-test for a small number of samples and with unknown variances, it was found that there is statistically significant differences between the beans with different colorations.

It was verified that the content of polyphenols changes with the studied variety, the maturation degree of the vegetable, geographical area of cultivation, also varying according to the technological processing used for conservation

Keywords: Polyphenols, elaboration process, vegetables, conservation

LOW-GRADE INFLAMMATION AND FEEDING, IS THERE A CONNECTION?

Asus, Nazarena.

MSc. Nutritionist. Faculty of Nutritional Sciences. Juan Agustín Maza University. Mendoza. University Hospital. National University of Cuyo. Mendoza. Argentina.

Low-grade systemic inflammation has important differences with respect to a classical inflammatory response. It is characterized by an increase in circulating levels of acute phase proteins and cytokines with inflammatory activity, such as C-reactive protein (CRP), the factor of alpha tumoral necrosis (TNF-a) and interleukins (IL) 1², 6 and 17, as well as an increase in the infiltration of immune cells, macrophages and T lymphocytes in insulin dependent tissue. A distinctive characteristic of this inflammatory process is that it exhibits high levels of inflammatory factors and immune cells infiltrated in tissue, but does not show structural alterations or loss in its primary functions.

Low-grade inflammatory status is a pathological characteristic of a wide range of chronic conditions, such as obesity, diabetes type 2, metabolic syndrome, cardiovascular disease, nonalcoholic fatty liver disease, and cancer.

Currently the diagnostic criteria have not been precisely defined, there is no consensus on the markers that represent better the low-grade inflammation or that differentiate between acute and chronic inflammation or between the various phases of the inflammatory response.

Feeding plays a central role in the regulation of chronic inflammation. The inclusion of 5 portions of fruits and vegetables per day is associated with lower values of CRP, being an importance factor the variety in them. The consumption of nuts and seeds is inversely associated with CRP and IL-6, just as whole grains where there is an inverse association with CRP. Diets of high glycemic index or high glycemic load are associated with low-grade inflammation, but the results are not completely conclusive.

Respect to feeding patterns, the Western diet, rich in red meats, whole dairy products, refined cereals and simple carbohydrates, has been associated with higher levels of CRP and IL-6, meanwhile the Mediterranean diet, rich in whole grains, fish, fruits and vegetables, nuts, olive oil, moderate alcohol consumption and low red meat consumption is associated with lower levels of inflammatory markers as seen with the vegetarian diet and DASH diet.

The modulation of the inflammatory response through diet can be useful in preventing or treating non transmissible chronic diseases, but it is still necessary to know the quantities of nutrients needed, their complex relationships and whether they act equally for all individuals, ages and physiological and pathological states, or well if it could be made recommendations at population level.

PS_144/127

FUNCTIONAL FOODS AND BIOACTIVE COMPOUNDS ON THE MANAGEMENT OF METABOLIC SYNDROME

POLYPHENOLS, MICROBIOTA COMPOSITION, INFLAMMATION AND OBESITY

[1]Milagro, Fermin I.; [2]Etxeberria, Usune; [3]Portillo, Maria Puy; [4]Martínez, J. Alfredo.

[1]Department of Nutrition. Food Science and Physiology. Centre for Nutrition Research. University of Navarra. Pamplona. Spain. CIBER Fisiopatología Obesidad y Nutrición (CIBERObn). Spain.; [3]Nutrition and Obesity group, Department of Nutrition and Food Sciences, Faculty of Pharmacy. University of the Basque Country (UPV/EHU) and Lucio Lascaray Research Centre. Vitoria. Spain. CIBER Fisiopatología Obesidad y Nutrición (CIBERObn). Madrid.Spain; [4]Department of Nutrition, Food Science and Physiology. Centre for Nutrition Research. University of Navarra and Instituto de Investigación Sanitaria de Navarra (IdiSNA). Pamplona. Spain. CIBER Fisiopatología Obesidad y Nutrición (CIBERObn). Madrid. Spain.

Polyphenol intake can elicit beneficial effects on human health. For this reason, research on this field has become an increasingly

important area of human nutrition research. The consumption of diets rich in fruits and vegetables is associated with a reduction in the risk of suffering chronic diseases such as cardiovascular events, specific tumors, or neurodegenerative illnesses. The action of gut microbes on polyphenols leading to the production of metabolites with diverse physiological relevance is been analyzed in recent years. In this context, the concept of polyphenols as potential prebiotic candidates is a newly emerging concept.

Gut microbiota plays a key role in host physiology and metabolism. Diet has a major influence on gut microbiota and is able to modify its impact on health, with either beneficial or deleterious consequences. In this context, the supplementation of diets with different polyphenols has evidenced changes in gut microbiota composition that are associated with beneficial effects, including anti-inflammatory actions and an amelioration of insulin resistance.

Within the existing plant secondary metabolites, quercetin (flavonoid), trans-resveratrol and pterostilbene (stilbenes) have been described to exert anti-inflammatory, insulin-sensitizing and antiobesity effects. In rats fed a high-fat-sucrose diet, quercetin prevented body weight gain and reduced serum insulin levels, which was accompanbied by a reduction of the abundance of Eubacterium cylindroides and an increase of Bacteroides vulgatus, Clostridium clariflavum and Akkermansia muciniphila. Trans-resveratrol supplementation ameliorated insulin resistance, which was associated with an inhibition of Gracilibacter thermotolerans, Parabacteroides distasonis and butyrate-producing species from Clostridia class (Clostridium aldenense, Clostridium hathewayi, Clostridium sp. MLG661). Pterostilbene supplementation prevented body weight gain and decreased serum cholesterol levels in Zucker rats, which correlated with an upregulation of Odoribacter splanchnicus and Alistipes shahii, but particularly Akkermansia muciniphila.

In summary, the intake of phenolic compounds, either as pure compounds or as part of foods, could be an effective approach to modulate gut microbiota, contributing thus to the amelioration of obesity-related traits such as inflammation, dyslipidemia and insulin resistance.

Spain.; [3]Department of Nutrition, Food Science and Physiology. Centre for Nutrition Research. University of Navarra. Pamplona. Spain. CIBER Fisiopatología Obesidad y Nutrición (CIBERObn). Instituto de Salud Carlos III. Madrid. Spain.; [4]Department of Nutrition, Food Science and Physiology. Centre for Nutrition Research. University of Navarra, and IdiSNA. Pamplona. Spain. CIBER Fisiopatología Obesidad y Nutrición (CIBERObn). Instituto de Salud Carlos III. Madrid. Spain.

An excessive body weight contributes to increase the risk of suffering clinical manifestations, such as insulin resistance, dyslipidemia, hypertension, diverse metabolic syndrome features, and depression, among others. The prescription of nutritional strategies as well as lifestyle changes, such as the reduction of energy intake and adherence to healthy dietary patterns, could contribute to combat these metabolic disorders. Nowadays, the intake of plant extracts rich in polyphenols is receiving especial attention in the protection against obesity-associated comorbidities. Thus, cocoa is one of the richest sources of polyphenols with potential benefits on blood pressure, insulin resistance, lipid profile, endothelial dysfunction, oxidative stress, and inflammation. These therapeutic effects have been attributed to bioactive compounds occurring in cocoa, mainly flavanols, which are the most abundant polyphenols in this seed. Furthermore, cocoa also contains other bioactive compounds such as methylxanthines and minerals with additional healthy properties. Phytochemicals from cocoa are usually consumed within chocolate bars or cocoa beverages. However, taking into account the potential benefits of cocoa consumption, it could be used as a functional ingredient to be included in other foods for human consumption. In this way, the consumption for 4 weeks of 1.4 g of cocoa extract (645 mg polyphenols with 415 mg of flavanols) within ready-to-eat meals and under an hypocaloric diet (-15% energy restriction) was able to produce a higher reduction of oxidised low-density lipoprotein-cholesterol (ox-LDL) levels compared to obese subjects following the dietary strategy without cocoa supplementation. Regarding blood pressure, the regular consumption during 4 weeks resulted in a higher reduction of acute systolic blood pressure (SBP) response independently

of body weight loss and also showed an adaptive effect of the acute SBP. Moreover, the intake of cocoa significantly increased the levels of plasma homovanillic acid, which is a marker reflecting the dopaminergic activity in the brain. Interestingly, homovanillic acid was negatively associated with the reduction of depressive symptoms in cocoa consumers, suggesting the possible implication of cocoa on psychological behavior. Finally, it is important to highlight that metabolomics analyses in plasma and urine have suggested an adequate adherence to the nutritional intervention supported by the presence of metabolites derived from cocoa. To sum up, the inclusion of cocoa within a well-designed dietary hypocaloric strategy might contribute to obtain additional benefits to weight loss and body composition, such as improvements in hypertension, oxidative markers, and psychological status.

Conjugated linoleic acid (CLA) is a group of positional and geometrical isomers of linoleic acid recognized by their functional properties. The major contribution of natural CLA is supplied by dairy products and meats where c9,t11-18:2, known as rumenic acid (RA), represents 80-90% of total CLA. On the other hand, industrially synthesized commercial CLA mainly contains a mixture of equimolecular amounts of c9,t11-18:2 and t10,c12-18:2 (mix-CLA).

Nutritional studies in human and experimental animals have demonstrated a variety of beneficial health consequences from CLA consumption. However, controversial and detrimental health effects have also been reported. The precise actions and the biochemical mechanisms by which CLA-rich foods mediate the metabolic effects remain unclear. Since the specific effects of c9,t11-18:2 and t10,c12-18:2 are different, we have analyzed the effects of CLA from industrial and natural source on different animal models or experimental conditions that share some metabolic disorders observed in the metabolic syndrome. Specifically, parameters associated with the lipid depots and glucose regulations are described.

In normal mice, mix-CLA and RA-rich oil (natural-like CLA) modified the triacylglycerol (TAG) metabolism having different effects depending on the type of CLA and the dietary unsaturated fatty acids (FA) proportions. The reduction of fat in carcass and adipose tissue was higher in the mix-CLA than in RA supplemented diets, independently of the dietary n-9, n-6 and n-3 FA ratio. However, RA showed beneficial effects without hepatomegaly, steatosis, or hypertriacylglyceridaemia. In mice fed high fat (HF) diets, mix-CLA reduced plasma and muscular TAG concentrations. These beneficial effects were associated with a protection against hepatic oxidative stress mediated by an increase in glutathione levels. Nevertheless, the biochemical mechanisms involved in the regulation of lipid levels were related to a reduced hepatic VLDL-TAG secretion and decreased muscle and adipose tissue lipoprotein lipase enzymes, leading to a liver steatosis and dystrophy of epididimal fat pads. Contrary, in a steatosis rat model induced by protein depletion, protein repletion with mix-CLA showed preventive effects on liver steatosis through higher VLDL-TAG secretion and reduced adipose tissue lipid accumulation. In the glucose regulation, dietary mix-CLA supplementation at HF levels partially prevented glycolytic pathway alterations in liver of mice increasing the glycogen synthesis. Glucose utilization was also investigated in isolated skeletal muscle; where in basal conditions dietary mix-CLA improved glucose uptake and incorporation as well as glycogen synthesis via an increase in glucose oxidation. Finally, we have investigated the effect of a functional milk fat (FMF) enriched in RA on glucose and lipid metabolism of rats fed HF diets. Noteworthy, FMF prevented the hepatic TAG accretion induced by HF diets by increasing the hepatic VLDL-TAG secretion and the b-oxidation. In addition, FMF improved the muscle glucose utilization associated with a higher flux through the phosphofructokinase enzyme.

Even though the experimental results in animal models cannot be directly extrapolated to humans, knowledge of the mechanism involved in the beneficial effects of natural or commercial CLA, under different conditions, might be useful for the development of functional foods effective to prevent some metabolic alterations observed in human metabolic syndrome.

MATERNAL SUPPLEMENTATION WITH FLAVO-NOIDS AND ANTIOBESITY EFFECT IN THE OFF-SPRING OF OBESE FEMALE RATS

(1)De La Garza Hernández, Ana Laura; (2)Peña Vázquez, Gloria Itzel; (2)Treviño de Alba, Carolina; (3)Castro García, Heriberto; (4)Camacho Morales, Alberto.

Maternal obesity is a risk factor in the development of metabolic diseases of offspring including, obesity, diabetes and metabolic syndrome. This may be due to an influence by different environmental effects such as maternal feeding during early stages of life, commonly known as perinatal programming. The use of animal models in this studies helps to analyse the mechanisms by which physiological and metabolic changes can promote the development of diseases in the adult stage. Dietary supplementation with flavonoids has been studied regarding the biological properties and its effect in the prevention of diseases such as obesity. Therefore, the aim of this study was to determine the effect of the narirutin and kaempferol-3-O-glucoside on the prevention of metabolic disorders in the offspring of female Wistar rats fed and obesogenic diet during perinatal period.

Material and methods: Obesogenic group of female rats were fed with a cafeteria diet (372 kcal/100g) and supplemented group (n=2) with cafeteria diet supplemented with kaempferol-3-O-glucoside (15 mg/kg bw) and narirutin (30 mg/kg bw) during perinatal period (7 weeks); a parallel a control group (n=2) were fed a standard diet (335 kcal/100g). After the lactation period (3 weeks), male offspring (control G1 group (n=12), obesogenic G1 group (n=9) and supplemented G1 group (n=9)) were fed standard diet for 91 days. Body weight and food intake were recorded weekly. After the experimental period, animals were sacrificed and serum and tissue samples were obtained.

The obesogenic model was successfully achieved, showing statistical differences between control group and obesogenic group. According to the offspring male rats, changes in body weight were observed in the supplemented group compared to the obesogenic group (p<0.05). Likewise supplemented group showed statistically significant lower liver weight and lower fat percentage than the cafeteria group (p<0.05). Food intake (g) and food efficiency (g/100 kcal) were significantly lowered in male offspring of supplemented female rats. On the other hand, regarding biochemical measurements, there were no differences in glucose levels, however significant differences were found in leptin and insulin levels. Concerning the molecular mechanisms implicated, differences in the expression of genes involved in inflammation, glucose and lipid metabolism were observed in liver and adipose tissue between obesogenic group and supplemented group.

In this context, the obesogenic diet during perinatal period in female wistar rats induces metabolic alterations and an increase dietary intake in their male offspring in adulthood. In addition, dietary supplementation with flavonoids could prevent the development of obesity in the adult offspring.

POLYPHENOLS FROM BERRIES INHIBIT INFLAMMATION-RELATED ADIPOSITY

Garcia-Diaz, Diego.

Nutrition Department. University of Chile.

Obesity-associated insulin-resistance is set by a chronic inflammatory state established in the adipose tissue. Chilean native fruits calafate (CA) and maqui (MA) berries present remarkable anti-inflammatory features. We have been evaluated antioxidant, anti-inflammatory and insulin-sensitizer effects of these fruits in an in vitro and in vivo inflammatory setting. We exposed differentiated 3T3-L1 cells to conditioned media (CM) from activated macrophages that were treated with CA and MA extracts. Extracts modulated beneficially: metalloproteinase (both MMP-2 and MMP-9) activity, GSH levels, caspase-3 activity, and inflammatory markers gene expressions. Furthermore, MA reverted CM specific IRS-1 phosphorylation, and CA improved insulin-stimulated glucose uptake. Similar experiences were observed in a in vivo model (mouse), that were induced to present inflammatory-related insulin-resistance by a chronic exposure to high fat diet. Thus, treatments with extracts of Chilean native fruits were able to block the development of oxidative stress, inflammation and insulin-resistance in vitro and in vivo.

Keywords: Obesity, inflammation, insulin-resistance, polyphenols, chilean native fruits

PHYTONUTRIENTS IN NUTRITION AND HEALTH: FROM THEORY TO PRACTICE

QUERCETIN PROTECTS AGAINST ATHEROSCLE-ROSIS BY INHIBITING DENDRITIC CELL ACTIVATION

(1)Ling, Wenhua; (2)Lin, Weiqun; (3)Wang, Wenting; (4)Wang, Dongliang.

(1)PhD. Professor. School of Public Health. Sun Yat-sen University. China; (2)PhD. Student. School of Public Health. Sun Yat-sen University; (3)Master of Medicine. Student. School of Public Health. Sun Yat-sen University; (4)PhD. Professor. School of Public Health. Sun Yat-sen University.

Objective: Quercetin is a typical flavonol with atheroprotective effects, but the effect of quercetin on dendritic cell (DC)

maturation in relation to atherosclerosis has not yet been clearly defined. Thus, we investigated whether quercetin can inhibit DC maturation and evaluated its potential value in atherosclerosis progression in ApoE-/- mice.

Methods and results: Quercetin consumption inhibited DC activation, inflammatory response and suppressed the progression of atherosclerosis in ApoE-/- mice. Subsequently, quercetin treatment inhibited the phenotypic and functional maturation of DCs, as evidenced not only by downregulation of CD80, CD86, MHC-II, IL-6 and IL-12 but also by a reduction in the ability to stimulate T cell allogeneic proliferation. Finally, an in vitro study demonstrated that quercetin inhibited DC maturation via upregulation of Dabs, which then downregulated the Src/PI3K/Akt-NF-κB-inflammatory pathways.

Conclusions: Our data indicate that quercetin attenuates atherosclerosis progression by regulating DC activation via Dab2 protein expression.

Keywords: Atherosclerosis. Dab2. Dendritic cells. Inflammation. Quercetin

A GLOBAL SNAPSHOT OF FRUIT AND VEGETABLE INTAKE AND AVAILABILITY, AND IMPLICATIONS FOR PHYTONUTRIENT INTAKES

[1]Klosner, Alli; [2]Murphy, Mary M.; [3]Barraj, Leila M.; [4]Spungen, Judith H.; [5]Herman, Dena R; [6]Randolph, Keith.

[1]Nutrilite Health Institute. Amway Corporation.; [2]R.D. Exponent, Inc. Washington DC. USA; [3]D.Sc. Exponent, Inc. Washington DC. USA; [4]MS. RD. Exponent, Inc. Washington DC. USA; [5]Department of Family and Consumer Sciences, California State University. USA; [6]Nutrilite Health Institute. Amway Corporation. USA.

In 2004 the World Health Organization (WHO) and Food and Agricultural Organization (FAO)

established minimum fruit and vegetable intake recommendations for adults at 400 g or 5 servings per day. The basis for this recommendation was epidemiological data that showed a strong inverse relative risk for chronic disease morbidity with fruit and vegetable intakes up to this level. Despite this recommendation, there has not subsequently been a global assessment of fruit and vegetable intake. Utilizing WHO World Health Survey data (2002) and FAO food supply utilization data (2012), we evaluated fruit and vegetable intake, fruit and vegetable variety, and intakes of selected phytonutrients in different regions globally. The results show a striking shortfall globally in fruit and vegetable intake relative to the WHO minimum recommendation, and relatively narrow range of variety. According to this assessment, approximately 75% of individuals worldwide fail to meet WHO minimum intake levels. These data strongly support the need to better educate consumers regarding the health promoting and risk reducing effects of fruit and vegetable dietary patterns.

NEW LIPIDS FOR A NEW NUTRITION

ESSENTIALITY, PHYSIOLOGICAL AND NUTRITIONAL ASPECTS OF POLYUNSATURATED FATTY ACIDS AND THEIR DERIVATIVES: CURRENT TRENDS

[1]Valenzuela, Rodrigo; [2]Valenzuela, Alfonso.

[1]Nutritionist. PhD. Nutrition Department, Faculty of Medicine, University of Chile; [2]Biochemical. PhD. Lipid Center. Institute of Nutrition and Food Technology (INTA), University of Chile (Chile), University of Chile.

Linoleic acid (LA, C18: 2n-6) and alpha-linolenic acid (ALA, C18: 3n-3) are essential polyunsaturated fatty acids (PUFAs) for mammals, including humans, because they lack the enzymatic machinery to synthesize these fatty acids. These PUFAs have important biochemical and physiological functions in the body and are the metabolic precursors of n-6 and n-3 long chain polyunsaturated fatty acids (LCPUFAs). LA is the precursor of n-6 LCPUFAs, including its main metabolic product, arachidonic acid (AA, C20: 4 n-6), which has a relevant role in the development of the nervous and visual system and in the control of vascular homeostasis and inflammatory response. ALA is the precursor of eicosapentaenoic acid (EPA, C20: 5n-3) and docosahexaenoic acid (DHA, C22: 6n-3).EPA participates in the control of vascular homeostasis and the resolution of inflammatory responses. DHA plays a key role in the formation and function of the nervous and visual system, particularly the brain and retina, and in the protection of the central and peripheral nervous system. The synthesis of n-6 and n-3 LCPUFAs derived from LA and ALA occurs mainly in the liver, and to a lesser extent in other tissues, such as the brain. Formation of AA, EPA and DHA occurs through elongation and desaturation reactions of the respective precursors LA and ALA. The synthesis of n-6 and n-3 LCPUFAs requires the participation of enzymes Δ-5 and Δ-6 desaturases, with Δ-6 desaturase being the limiting enzyme of the process. The activity and expression of both enzymes is regulated by hormones such as insulin and estrogens, and by the intracellular redox state. In addition, polymorphisms in the sequences encoding these enzymes negatively regulate the synthesis and tissue levels of n-6 and n-3 LCPUFAs, particularly DHA, affecting physiological processes such as cognitive abilities or cardiovascular health. Another relevant aspect is nonalcoholic hepatic steatosis, a pathology in which there is a reduction in the activity of the Δ-5 and Δ-6 desaturase enzymes, which generates a reduction of the tissue levels of n-6 and n-3 LCPUFAs. These effects would be produced by oxidative stress of nutritional origin and by the development of insulin resistance. Most recently, several investigations have demonstrated the role of eicosanoids, 20-carbon derivatives from EPA and docosanoids, 22-carbon derivatives. Eicosanoids and docosanoids are determinant in the survival of cells against inflammatory processes that compromise its viability, in controlling the inflammatory process and, particularly, in the resolution of inflammation. In this con-

text, the DHA-derived docosanoid neuroprotectin D-1 (NPD-1) shows neuroprotective properties against cerebral aging, neurodegenerative diseases and injuries caused by cerebral ischemia-reperfusion episodes. This work discusses the physiological and nutritional importance of PUFAs, the synthesis of LCPUFAs and the metabolic implications of n-6 and n-3 LCPUFA and its derivatives.

SUSTAINABLE ALTERNATIVES TO OBTAIN NEW EDIBLE OILS AND FORMULATES RICH IN POLYUNSATURATED FATTY ACIDS WITH NUTRITIONAL INTEREST

Rincón-Cervera, Miguel Ángel.

PhD. Chemist. Institute of Nutrition and Food Technology (INTA). University of Chile. Chile.

Omega-3 polyunsaturated fatty acids (ω3 PUFAs) are key nutrients because of their multiple roles in the human metabolism. Eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA) are the most known ω-3 PUFAs due to their beneficial effects for human health. These two ω-3 PUFAs are mainly contained in marine food sources, such as fatty fish. However, fish consumption may be linked to some drawbacks such as low sustainability and high price of the resource (because of overfishing worldwide) and some health concerns (fish may be contaminated with organic and inorganic pollutants such as PCBs, dioxins and heavy metals).

EPA and DHA can be metabolized by the human body using alpha-linolenic acid (ALA) as precursor, which is contained in seed oils from chia (S. hispanica), rosehip (R. rubiginosa) and flaxseed (L. usitatissimum), among other plant-based oils. This fact is becoming ALA-rich oils into an interesting and more sustainable commercial option to provide ω-3 PUFAs. However, ALA is not efficiently converted into longer-chain ω-3 PUFAs such as EPA and DHA because of the low efficiency of the enzyme Δ6-desaturase, which is the responsible to convert ALA into stearidonic acid (SDA), an intermediate ω-3 PUFA between ALA and EPA in the metabolic pathway.

The direct supply of SDA could become a suitable option from a nutritional point of view, because it has been proved that metabolic conversion of SDA into longer-chain ω-3 PUFAs such as EPA is much more effective than when ALA is used as precursor. SDA is mainly available in the seed oils of a reduced number of plants such as Echium plantagineum, which is native from the Mediterranean basin and is being cultivated in several countries in the world because of its seed oil. This species grows wild in Central and South Chile, although it has not been cultivated with commercial purposes yet.

In the symposium, it will be explained the research that we are carrying out with seed oil from E. plantagineum at the Laboratory of Lipids in the Institute of Nutrition and Food Technology, University of Chile, as a part of a currently in force FONDECYT research project (code 11160636). Seeds from E. plantagineum grown in Chile (from an experimental and controlled production in the south of the country) are being collected to extract and characterize its oil, which in turn will be used as source to produce novel structured lipids able to deliver SDA to the human body with a high bio-efficiency.

Keywords: Novel lipids, biotechnology, omega-3 fatty acids, stearidonic acid

ROLE OF N-3 POLYUNSATURATED FATTY ACIDS FROM VEGETABLE SOURCES IN THE METABOLIC SYNDROME

Lombardo, Yolanda B.

PhD,Professor of Biochemistry. Dept.of Biochemistry. School of Biochemistry.University of Litoral.Santa Fe. Argentina.

Excessive food ingestion and the increase in the consumption of high-fat, fructose or sucrose diets characteristic of modern society have been related to the development of visceral adiposity, systemic oxidative stress, impaired glucose homeostasis, insulin resistance, type 2 diabetes, dyslipidemia and hypertension ,the major component of the Metabolic Syndrome (MS). Diets can play a major role in the prevention or improvement in this syndrome and its associated pathologies. In addition to other lifestyle interventions, it has been recognized that the adjustments to the quality of dietary lipids such as n-3 polyunsaturated fatty acids (n-3 PUFAs) from marine (fish oil, EPA and DHA) or plant sources [α-linolenic acid (ALA) 18:3 n-3]are also important in the prevention and treatment of the MS by modulating the expression of several genes involved in these chronic manifestations. This presentation highlights recent advances in the understanding of metabolic and molecular mechanisms concerning the effect of dietary whole seeds and /or oils rich in ALA , and focuses on the prevention and/or improvement of dyslipidemia, insulin resistance, impaired glucose homeostasis, diabetes and obesity in experimental animal models, with some extension to humans.

Keywords: Alpha linolenic acid. Metabolic syndrome.Dyslipidemia.Diabetes. Obesity.

ADDRESSING BARRIERS TO EXCLUSIVE BREAST-FEEDING: EVIDENCE AND LESSONS LEARNT FROM BABY FRIENDLY COUNTRY PROGRAMS

SYSTEMATIC REVIEW OF BARRIERS TO EXCLUSIVE BREASTFEEDING (EBF) IN LOW AND MIDDLE INCOME COUNTRIES: EVIDENCE AND PROGRAM IMPLICATIONS

[1]*Kavle, Justine;* [2]*LaCroix, Elizabeth;* [3]*Stevens, Hallie;* [4]*Engmann, Cyril.*

[1]PhD. Senior Nutrition Advisor. Maternal Newborn Child Health and Nutrition Division. Maternal and Child Survival Program (MCSP)/ PATH. USA.; [2]Consultant. Maternal Newborn Child Health and Nutrition Program. PATH. Washington DC. USA.; [3]Consultant. Maternal Newborn Child Health and Nutrition Program. Maternal and Child Survival Program (MCSP)/ PATH. Washington DC. USA.; [4]MD. Program Leader. Maternal Newborn Child Health and Nutrition Program. Maternal and Child Survival Program (MCSP)PATH. Washington DC. USA.

Despite numerous global initiatives on breastfeeding, trend data show exclusive breastfeeding (EBF) rates have stagnated over the last two decades. In low- and middle-income countries (LMICs), only 37% of children younger than 6 months of age are exclusively breastfed, defined as the proportion of infants aged 0–5 months who are fed only with breastmilk and no additional liquids or solids until 6 months of life. Although some countries have made gains in EBF, early initiation and EBF rates in many countries are drastically below global targets. Key challenges to EBF remain unaddressed through infant and young child feeding programming. A recent UNICEF report notes that 43% of newborn babies are fed prelacteal foods or liquids, which can lead to difficulties in establishing breastfeeding. Also, most infants are introduced to other foods or liquids too early, prior to 6 months of age. The objectives of this systematic review were to ascertain barriers to EBF in LMICs according to three domains: 1) Maternal areas: prenatal barriers; 2) Barriers encountered on the first day, including initiating and establishing EBF; and 3) Barriers encountered in maintaining EBF over the first six months of life and to summarize the program implications of these findings. A search of SCOPUS, MEDLINE, CINAHL, and PsychINFO was conducted to retrieve studies from January 2000 to October 2015. Using inclusion criteria, we selected both qualitative and quantitative studies that described barriers to EBF in low- and middle-income countries. Following application of systematic review criteria, 48 articles from 14 countries were included in the review. Sixteen barriers to EBF were identified in this review. There is moderate evidence of a negative association between maternal employment and EBF practices. Studies that examined EBF barriers at childbirth and the initial 24 hours post-delivery found strong evidence that caesarean section can impede EBF. There is moderate evidence for early initiation of breastfeeding and likelihood of practicing EBF. Breastfeeding problems were commonly reported from cross-sectional or observational studies. Counseling on EBF and the presence of family and/or community support has demonstrated improvements in EBF. Improving the counseling skills of health workers to address breastfeeding problems and increasing community support for breastfeeding are critical components of infant and young child feeding programming, which will aid in attaining the 2025 World Health Assembly EBF targets. Legislation and regulations on marketing of breastmilk substitutes, paid maternity leave, and breastfeeding breaks for working mothers require attention in LMICs.

Keywords: Barriers, exclusive breastfeeding, systematic review, low and middle income countries, program implications

DEVELOPMENT AND ROLL-OUT OF NATIONAL BABY FRIENDLY COMMUNITY INITIATIVE (BFCI) GUIDELINES: EXPERIENCE ON ADDRESSING BARRIERS TO EBF IN KENYAN COMMUNITIES

Background and Objectives: Baby Friendly Community Initiative (BFCI) is a community-based initiative to protect, promote, and support exclusive breastfeeding (EBF) through community support groups (CSGs) and mother to mother support groups. Implemented in western Kenya through the Maternal and Child Survival Program (MCSP) and Ministry of Health (MOH), BFCI offers a platform to identify and address key barriers to exclusive breastfeeding to ensure EBF is sustained for the entire 6 month period.

Methods: After development of the National MOH BFCI Implementation Guidelines, Training and Monitoring tools, MCSP and MOH rolled out BFCI. During implementation of BFCI, routine monitoring of infant and young child feeding practices, including early initiation of breastfeeding, introduction of prelacteal

feeding, and early introduction of foods and liquids and exclusive breastfeeding was carried out in Migori and Kisumu counties, Kenya. Following identification of breastfeeding problems, health providers and community workers were supported to document and counsel on breastfeeding problems through the use of a checklist.

Results: BFCI provided a platform to identify key barriers to EBF, including: issues with positioning and attachment, beliefs that "boys need more to eat than girls", pressure from grandmothers to provide mixed feeding, perceptions of insufficient breastmilk, cultural beliefs hindering EBF (i.e. 'bad/evil eye'), lack of confidence in mothers' ability to breastfeed, and lack of sufficient community support structures. BFCI addressed these challenges through continuous medical education sessions for health workers and community health volunteers (CHVs), health education to mothers through multiple channels, inclusive of health facilities, CSGs and CHV home visits, provision of 'safe' spaces for breastfeeding at health facilities and within communities, and establishment of CSGs, which allowed for discussions amongst mothers and referral of mothers to health facilities, as needed. Conclusion: Multiple channels are required to address EBF barriers with engagement at both the community and health facility level.

Keywords: Exclusive breastfeeding, community, baby friendly, barriers

PROGRAMMATIC EXPERIENCE ON REVITALIZATION OF THE BABY-FRIENDLY HOSPITAL INITIATIVE (BFHI) IN MALAWI: LESSONS LEARNT ON BARRIERS TO EXCLUSIVE BREASTFEEDING AT FACILITY LEVEL

[1]Guta, Janet; [2]Bwanali, Florence; [3]Nyaku, Albertha; [4]Straubinger, Sarah.

[1]Malawi Ministry of Health; [2]2. BSc. Nutrition Advisor. Maternal Neonatal Child Health. Maternal and Child Survival Program/PATH. Lilongwe, Malawi; [3]3. MPH. Nutrition Team Lead. Maternal Neonatal Child Health. Maternal and Child Survival Program/PATH. Washington, DC.; [4]4. BA. Senior Program Coordinator. Maternal Neonatal Child Health. Maternal and Child Survival Program/PATH. Washington, DC.

Background and objectives: In Malawi, optimal breastfeeding practices remain challenging as only 61% of babies are exclusively breastfed, according to 2016 Demographic & Health Survey data. Since approximately three-quarters of deliveries are facility-based, it is imperative to support exclusive breastfeeding (EBF) in the immediate 24 hours postpartum in health facilities.

In partnership with the Ministry of Health, USAID's Maternal and Child Survival Project (MCSP), World Health Organization (WHO), and UNICEF worked to revitalize Baby-Friendly Hospital Initiative (BFHI) with linkages to the community-level. BFHI is a global initiative to implement practices that protect, promote, and support breastfeeding and can reduce barriers to and improve rates of early initiation of breastfeeding and sustained EBF.

Methods: MCSP spearheaded revitalization of BFHI and addressed barriers to early initiation of breastfeeding and EBF in 15 districts by 1) revising infant and young child feeding (IYCF) hospital-based policies to address barriers to early initiation of breastfeeding and continued EBF, and prevention of mother-to-child transmission (PMTCT) of HIV; 2) adapting the WHO BFHI training course to the Malawi context to address breastfeeding challenges; 3) supporting hospitals on the Ten Steps to Successful Breastfeeding through staff capacity building, and; 4) identifying existing referral linkages between the hospital- and the community-levels to continue breastfeeding support to postpartum women after discharge.

Results: MCSP supported capacity building on BFHI and breastfeeding with half of health workers trained in 15 health facilities and 3 centers of excellence. Health facilities developed policies stating commitment to BFHI and to addressing barriers to IYCF, such cessation of EBF before 6 months, poor latching/positioning, and PMTCT of HIV. BFHI has been able to support early initiation of breastfeeding despite limited space in maternity wards and staff shortages. Facilities identified staff to counsel mothers in waiting areas and postnatal wards on EBF. MCSP oriented 1,400+ community-based promoters to support breastfeeding mothers on EBF barriers. The experience resulted in 13,948 mothers initiating breastfeeding within 1 hour and receiving EBF counseling at discharge.

Conclusions: BFHI is a successful approach to addressing barriers to EBF at facility and community levels. BFHI promotes multi-level cooperation to address a range of breastfeeding barriers.

PROGRAM IMPLICATIONS FOR ADDRESSING BARRIERS TO EBF: PROGRESS TO DATE AND FUTURE CONSIDERATIONS

Lutter, Chessa.

PhD. Visiting Research Professor. School of Public Health. University of Maryland. USA.

Optimal breastfeeding practices benefit all mothers and children, regardless of where they live or level of economic well-being. Exclusive breastfeeding, in particular, is considered the cornerstone of child survival and health. It not only provides all the nutrients necessary for growth for the first six months of life, but also protection from many childhood life-threatening diseases and some noncommunicable diseases later in life. Breastfeeding is beneficial to a mother's health and contributes to child development, educational achievement, and economic wellbeing. Nonetheless, despite ample evidence that rates can be dramatically improved with a proven set of policies and programs, exclusive breastfeeding for six months is not a normative behavior in most parts of the world, as shown in the systematic review and baby friendly experiences presented in this panel. Why is this so? A key reason is that for too long, breastfeeding has been viewed as a personal issue rather than a collective societal responsibility. For ex-

ample, women give birth in maternity facilities that impede rather than facilitate immediate skin-to-skin contact and early initiation and later receive care from healthcare providers who lack basic knowledge and skills to provide supportive counseling, lactation management, and information. They face obstacles in the workplace because of limited or nonexistent maternity protection and enabling workplace breastfeeding policies and relentless marketing by the breast-milk substitute industry. Family, community and cultural traditions can undermine a woman's decision to breastfeed. In summary, the world is not as supportive environment for women who wish to breastfeed and as a result they face daily barriers. To enable women to practice optimal breastfeeding, society needs to be more supportive and accommodating not the other way around as has been the case for too long. The key message in the 2016 series on breastfeeding in The Lancet was that "success in breastfeeding is not the sole responsibility of a woman – the promotion of breastfeeding is a collective societal responsibility". To this end, it called for:

• dissemination of evidence of breastfeeding's fundamental value for all women and children regardless of where they live or level of economic well-being;

• fostering of positive societal attitudes by addressing misperceptions about breastfeeding;

• demonstrating political will by mainstreaming breastfeeding into programs to promote maternal and child health and child development and prevent noncommunicable diseases;

• regulating the breast-milk substitute industry by enacting, monitoring and enforcing the Code of Marketing of Breast-milk Substitutes and subsequent relevant World Health Assembly Resolutions (Code); and,

• scaling up and monitoring breastfeeding promotion interventions using proven interventions tailored to patterns of sub-optimal breastfeeding and delivered at scale, and implementing enabling interventions to ensure that maternity and workplace protection are implemented and that all maternity facilities comply with the Baby Friendly Hospital Initiative and the Code.

THE PREDIMED STUDIES: A LEAP FORWARD IN NUTRITION

RATIONALE AND DESIGN OF THE PREDIMED TRIALS

[1]*Martínez-González, Miguel Ángel;* [2]*Dolores, Corella;* [2]*Ramon, Estruch;* [2]*Montse, Fito;* [2]*Emilio, Ros;* [2]*Jordo, Salas.*

[1]Universidad De Navarra. CIBEROBN. Spain. Havard T.H. Chan School Of Public Health. Boston, USA.; [2]CIBEROBN.

PREDIMED: The selection of the ideal dietary model to prevent non-communicable disease needs to be based on the most robust research designs.

The PREDIMED trial (www.predimed.es) was a primary prevention trial, funded by Instituto de Salud Carlos III, designed to test the long-term effects of the Mediterranean diet (MedDiet) on incident cardiovascular disease (CVD) in men (55–75 years) and women (60–80 years). Participants had no history of previous CVD but were at high risk because of either type 2 diabetes or ≥ 3 classical risk factors. Participants were randomized into one of three diets: 1) MeDiet supplemented with extra-virgin olive oil (EVOO); 2) MeDiet supplemented with nuts; and 3) control diet (advice on a low-fat diet).

Throughout the study (2003-2011), 7,447 participants attended quarterly individual educational visits and group sessions. They received written material with information on key Mediterranean foods and seasonal shopping lists, menus and specific recipes for a typical week. Free (at no cost) allotments of extra-virgin olive oil (1 L per week, including a minimum of 50 mL/day for participants and the rest for family needs) or mixed nuts (30 g/day: 15 g walnuts, 7.5 g almonds and 7.5 g hazelnuts plus extra allocations for the family) were supplied. The primary outcome was a composite of myocardial infarction, stroke or cardiovascular death. The planned duration was 6 years, but the trial was prematurely stopped after 4.8 years of median follow-up for early evidence of benefit of both MedDiets.

PREDIMEDPLUS: Since there are no clinical trials demonstrating that sustained weight loss over >2 years with diet and lifestyle reduce the risk of CVD, we designed the PREDIMED-PLUS Study. This is a randomized, primary cardiovascular prevention trial comparing the effect of two interventions: a)intensive intervention on lifestyle with hypocaloric MedDiet, physical activity and behavioural therapy (intervention group); b)MedDiet following usual care (control group) in participants with metabolic syndrome and overweight/obesity (BMI 27-40 kg/m2, aged 55-75, men or 60-75, women)

Recruitment of participants began in September 2013 in the vanguard centre of Navarra (http://medpreventiva.es/cD5Mp1).

The recruitment was completed on December-2016, in 23 centres. We randomized 6,874 participants. PREDIMEDPLUS is therefore the largest lifestyle and diet trial ever conducted in Europe. We included a 4-week run in period with 3 screening visits before randomization to select the most suitable candidates. In total, 9,677 participants received these screening visits. Participants in the intervention group receive 3 contacts/month during the first year and 2/month during the ensuing years. The control group receives a group session every 6 months. Extravirgin olive oil and tree nuts are provided at no cost to both groups.

The main goal of PREDIMED-PLUS is to get an effective tool based on a hypocaloric traditional MedDiet, physical activity and behavioral therapy strategies to mitigate the priority public health problem of obesity. The primary outcome is the same CVD composite end-point than in PREDIMED-1 and the planned duration is 6 years of intervention plus 2 additional years to collect events.

Keywords: Olive Ol, Nuts, Mediterranean Diet, Trial

THE MEDITERRANAN DIET AND DIABESITY

Salas-Salvadó, Jordi.

Director Human Nutrition Unit. Department of Biochemistry & Biotechnology. School of Medicine. Rovira i Virgili University. Reus, Spain.

A considerable body of evidence from prospective studies supports the importance of individual nutrients, foods, and dietary patterns in the prevention and management of metabolic syndrome (MetS) and type 2 diabetes (T2D). The Mediterranean diet (MedDiet) is characterized by high intake of fruits, vegetables, legumes, fish, whole grains, nuts and olive oil; moderate consumption of dairy products and wine, and low intake of red and processed meat and foods with added sugars.

We summarizes the current scientific evidence from epidemiologic studies and clinical trials on the relation between the MedDiet and T2D and the possible mechanisms underlying the reported associations. A meta-analysis of prospective studies showed that greater adherence to the MedDiet was associated with a significant reduction in the risk of T2D and gestational diabetes. Some studies have shown that the MedDiet may be effective in reducing insulin resistance. However, few randomized controlled trials (RCTs) have evaluated the effect of the MedDiet on T2D and MetS management.

Results from the landmark PREvención con DIeta MEDiterránea (PREDIMED) intervention trial showed that participants assigned to the MedDiet had a significant 30% reduction in the risk of T2D and promoted the reversion of MetS and its components, hyperglycemia and central obesity. In addition, some RCTs showed the beneficial effects of the MedDiet compared with other dietary patterns on glycemic control in patients with T2D.

Bioactive components of the MedDiet synergize to affect various metabolic pathways, leading to a reduced cardiometabolic disease risk. The abundance of healthy, nutrient-dense foods that make up the plant-based MedDiet predicts its bioactivity and potential to beneficially influence metabolic pathways that lead to MetS and T2D, as well as other chronic conditions.

Since there are no clinical trials demonstrating that sustained weight loss over >2years with diet and changes in lifestyle reduce the risk of cardiovascular disease (CVD), we have also designed the PREDIMED-PLUS Study, a parallel group, multi-centre, randomised, primary prevention trial (PREDIMED-PLUS) on men and women aged between 55 and 75 years, with a body-mass-index ≥27 to <40 kg/m2 and meeting ≥3 criteria for the MetS. The objective of the present research is to compare the cardiovascular effect of two interventions: a) intensive weight-loss intervention on lifestyle program with hypocaloric MedDiet, physical activity and behavioural therapy, b) non intensive care with recommendations on MedDiet following the usual care of medical physicians. The principal end-points are a composite of major hard clinical cardiovascular events, and weight loss and weight maintenance at long term. In October 2017, 6,874 participants have been randomized to the trial. The final results will be available from 2020.

We hypothesize that an intensive weight-loss lifestyle intervention, including physical activity, based on the traditional MedDiet is a sustainable long-term approach for weight reduction among overweight/obese adults and that the achieved lifestyle changes will exert beneficial effects on CVD incidence. The rationale for the proposed investigation is that it can provide a new, affordable, and sustainable approach to reduce excess cardiovascular morbidity and mortality, beyond what was already observed in the PREDIMED I trial.

Keywords: PREDIMED, Mediterranean diet, diabetes, obesity, metabolic syndrome

THE PREDIMED STUDIES: A LEAP FORWARD IN NUTRITION

Ros, Emilio.

MD. CIBER Fisiopatología de la Obesidad y Nutrición. Instituto se Salud Carlos III. Spain.

Growing old frequently presents with a plethora of debilitating consequences, among which there are physical disabilities, major organ damage and cognitive decline. The fact that life expectancy has increased throughout the world has raised much interest in factors leading to the presence or absence of aging-associated diseases as major determinants of healthy or unhealthy aging, also named successful or unsuccessful aging. Decades of research on environmental risk factors of cardiovascular diseases (CVD) and other aging-related disorders have firmly established the concept of healthy lifestyles as protective factors. Thus, there is consistent evidence that no smoking, physical exercise, staying lean and adhering to a healthy diet such as the Mediterranean diet account for 80% or more of protection from CVD and diabetes in the general population worldwide. The PREDIMED randomized clinical trial tested calorie-unrestricted Mediterranean diets supplemented with extra-virgin olive oil or mixed nuts against a control diet consisting of advice to reduce dietary fat in older individuals at high risk of CVD for various clinical outcomes: incident CVD (myocardial infarction, stroke or death from these causes) as primary outcome and incident diabetes, metabolic syndrome, peripheral artery disease, atrial fibrillation, congestive heart failure, depression, dementia, major cancers and cataract surgery as prespecified secondary outcomes. Together with neurodegenerative disorders, chronic kidney disease, chronic obstructive pulmonary disease and osteoarthritis, these frequent non-communicable diseases shorten the lifespan and make up unhealthy aging. The results of PREDIMED have shown a beneficial effect of the Mediterranean diets on many of these outcomes: CVD (with a noticeable effect on stroke), diabetes, peripheral artery disease, atrial fibrillation, breast cancer, depression and age-related cognitive decline. PREDIMED has also found a neutral effect of the Mediterranean diets on heart failure and the need for cataract surgery, and other outcomes are still pending analyses of results after extended follow-up. Beneficial effects observed on clinical outcomes can be explained in part by risk factor reduction with the Mediterranean diets: cholesterol, blood pressure, insulin resistance, visceral adiposity, oxidation and inflammation. Nutritional genomic studies in PREDIMED have also shown that adherence to the Mediterranean diets blunts the development of cardiometabolic phenotypes in genetically susceptible individuals, thus providing another mechanisms for the observed reduction of clinical outcomes. From the PREDIMED results up to date, one can reasonably state that the Mediterranean diet is associated with healthy aging. The ongoing PREDIMED PLUS study will eventually extend this observation to the effects of sustained weight loss with energy-restricted Mediterranean diet plus physical exercise.

Keywords: Mediterranean diet, aging, cardiovascular risk, non communicable diseases

EFFECTS OF THE MEDITERRANEAN DIET ON THE LIPID PROFILE AND LIPOPROTEIN-RELATED MARKERS

Decreased values of the most relevant HDL function, cholesterol efflux capacity, have been shown to be related to a high incidence of sub-clinical atherosclerosis and coronary events. Similarly, a predictive value of oxidized LDL for cardiovascular events has been reported. With this regard, it is becoming increasingly more accepted that the functionality of HDL and atherogenicity of LDL can be more indicative of the cardiovascular role of these particles than the mere concentration of HDL- and LDL cholesterol.

Objective: Our aim was to study the effects of a whole Mediterranean diet (MedDiet) pattern intervention on HDL biological functions and LDL pro-atherogenic traits, in high cardiovascular individuals in the frame of PREDIMED Study.

Methods: The PREDIMED Study is a large-scale, multicenter, randomized, controlled, and parallel-group trial with MedDiet interventions (supplemented with virgin olive oil or nuts) versus a low-fat diet control group, on primary prevention of cardiovascular diseases conducted in Spain.

The sub-studies about lipoprotein state and their properties were performed in subsamples of approximately 296 and 210 participants in HDL and LDL subsets, respectively.

Biological samples were obtained for the HDL- and LDL-related biomarkers at the start of the study and 1-year after for the lipoprotein-related analysis.

Results: Both MedDiets increased cholesterol efflux capacity relative to baseline. The MedDiet-VOO intervention increased HDL ability to esterify cholesterol, paraoxonase-1 arylesterase activity, and HDL vasodilatory capacity relative to control, and decreased cholesteryl ester transfer protein activity relative to baseline. Adherence to a MedDiet induced these beneficial changes by improving HDL oxidative status and composition. The 3 diets increased the percentage of large HDL particles relative to baseline.

In addition, after the MedDiet-VOO intervention LDL resistance against oxidation increased, the degree of LDL oxidative

modifications decreased, estimated LDL particle size augmented, and LDL particles became cholesterol-rich relative to the low-fat control diet. LDL lipoproteins became less cytotoxic for macrophages only relative to baseline.

Conclusion: The MedDiet, especially when enriched with VOO, improved HDL atheroprotective funcions and decreased LDL atherogenicity, in high cardiovascular risk individuals. These traits promoted by a MedDiet could contribute to explaining some of the cardioprotective benefits of this dietary pattern.

Keywords: Mediterranean diet, HDL functionality, endothelial dysfucntion, olive oil, nuts.

NUTRIGENOMIC TEACHINGS OF THE PREDIMED STUDIES

Corella, Dolores.

University of Valencia and CIBEROBN. Spain.

Introduction: There are many studies that show that the response to the same diet is not equal in everyone. There are several factors (i.e., sex, age, diet, physical activity) that may contribute to that differing response. Great importance is placed on genetic variability in relevant genes for each phenotype studied. Diet is a complex environmental factor as hundreds of macronutrients, micronutrients and other food components are ingested together. Currently, instead of analyzing specific nutrients, more relevance is placed on the study of the whole dietary patterns. On the other hand, numerous meta-analyses of genome-wide association studies have identified new single nucleotide polymorphisms (SNPs) related to cardiovascular risk factors and diseases. However, additional information on how environmental factors modulate the effect of the SNPs on their specific outcomes is scarce. Diet is one of the main environmental factors interacting with genes in determining different genotypes. Therefore our aim was to analyze whether the whole Mediterranean diet (MedDiet) pattern (both observationally measured and intervention with MedDiet) interact with the genetic risk modifying the risk of diseases (both at intermediate and at final phenotype levels).

Methods: We have analyzed gene-MedDiet interactions in more than 7,000 high cardiovascular risk participants (aged 55-80 years, who fulfilled at least one of two criteria: T2D; 3 or more cardiovascular risk factors) in the PREDIMED (PREvención con DIeta MEDiterranea) trial both at baseline and after follow-up. We have focused on intermediate and on final cardiovascular disease phenotypes after 4.8 y of median follow-up. Among genetic factors we have selected those SNPs more relevant in determining each analyzed phenotype. We also constructed genetic risk scores (GRS).

Results and Discussion: We have found several gene-diet interactions between the MedDiet intervention on stroke incidence (involving the TCF7L2 and LPL genes) and myocardial infarction (MLXIPL). Likewise, we have detected several gene-MedDiet interactions on plasma lipids and glucose involving several genes: SORT1, TRIB, , MYLIP, CITED2, CAPN3, KLF4, TRPS1, PLEC1, PDE3A, CTF1, PGS1 and ERGIC3, among others. Also, we have detected gene-diet modulations in determining obestiy and dia-

betes, particularly including CLOCK genes and taste genes. Conclusions: MedDiet intervention as well as specific dietary pattenrs modify the effects of relevant SNPs and GRS on cardiovascular outcomes and intermediate phenotypes.

TOWARDS GLOBAL LEADERSHIP IN NUTRITION

NUTRITION LEADERSHIP IN ACADEMIC RESEARCH: THE CHALLENGE OF CROSS-DISCIPLINARY COLLABORATION

Haddad, Lawrence.

Executive Director GAIN.

Cross disciplinary collaboration in nutrition research is frequently held up as desirable. It is difficult enough outside of an academic setting, but within the academy it is even more challenging. The presentation examines (1) why this type of collaboration is so desirable to help prevent malnutrition, (2) why it is challenging within an academic setting, and (3) what, if anything, can be done to incentivise greater amounts of high quality cross disciplinary collaboration to advance nutrition status.

Keywords: Cross-disciplinary academic

GLOBAL NUTRITION LEADERSHIP: PERSPECTIVES FROM THE CORPORATE SECTOR

[1]*Martins, Fernanda;* [2]*Martins, Fernanda;* [3]*Leroy, Jef;* [4]*Verstraeten, Roos;* [5]*Lartey, Anna.*

[1]Msc. Nutritionist. Unilever.; [2]Msc Nutritionist. Unilever. The Netherlands.; [3]IFPRI; [4]IFPRI. Belgium.; [5]FAO. IUNS.

Since the foundation of the first Nutrition Leadership Program in Europe in 1994, Unilever has been involved in training, building and maintaining a global network of nutrition leaders. Currently, this network consists of more than 1300 nutritional professionals in Europe, Africa and Asia.

The need for such a network has surfaced as nutrition professionals in academia, industry, and the public sector are generally very strong in their field but also require the skills to collaborate and thus to address nutrition-related public health problems in an impactful way. The Nutrition Leadership Programs (NLP) has helped provide the leadership skills such as communication, strategic influence and interpersonal skills required to do so.

From an industry standpoint, the NLPs are critical for:
• the development of future leaders that have a broader understanding of the nutrition agenda and are able to effectively collaborate across cultures

• building understanding that each actor in the field of public health has their role to play to combat nutrition related challenges (academia, industry, governments and NGOs)

• access, via employee participation and sponsor representation, to an inspiring and strong global network of (future) nutrition leaders

Based on the data from career development of NLP alumni it is evident that this program is an effective tool in nutrition leadership development across regions. The need to train nutrition professionals in leadership skills and the ability to collaborate effectively across stakeholders to drive the public health agenda forward has not diminished in the time since the first NLP was founded. As a matter of fact, increasing business across regions has identified the need for leadership at a global level. We will discuss how connecting regional NLPs into a global NLP could benefit corporate organizations in driving an aligned public health agenda at the global level.

Keywords: Nutrition leadership. Leadership program

Conflict of Interest disclosure: Fernanda Martins is Nutrition&Health Manager at Unilever, a manufacturer of Food and Beverages products and sponsor of the ENLP and ANLP.

THE NEED FOR GLOBAL NUTRITION LEADERSHIP TO MEET THE SUSTAINABLE DEVELOPMENT GOALS

Lartey, Anna

President of the International Union of Nutritional Sciences (IUNS). Director of Nutrition at the Food and Agriculture Organization of the United Nations (FAO). Rome. Italy.

In 2015, the world received a broad set of universal, ambitious and sweeping set of goals. These are considered a transformative agenda that must leave no one behind. Although nutrition is explicitly mentioned in Goals2, at least 12 out of the 17 goals cannot be achieved without addressing nutrition. The current nutrition situation where 800 million people are undernourished, two billion are micronutrient deficient and 159 million children under five years are stunted, but at the same time 1.9 billion are overweight or obese, calls for a different way of doing business. In response to this, countries are putting in place nutrition policies and strategies to be able to achieve these targets. However, the complexity of the nutrition problem requires multi-sectoral actions involving different stakeholders. The training given to nutrition professionals provides scientific content. However, in a multi-sectoral environment, new skills sets are needed, such as the ability for leading change, team building, effective communication, networking and negotiation skills, to effectively deliver on nutrition and to keep nutrition on the global agenda. Taking advantage of the SDG, the need for a Global Nutrition Leadership Program that would function and deliver effectively within a multi-sectoral environment is needed. Region-based Nutrition Leadership training programs aim to fill this gap. However, to have a stronger voice at the global table, regional Nutrition Leadership Programs should join forces under the umbrella of a Global Nutrition Leadership Program to develop a harmonize approach of building leadership skills for early to middle career nutritionists.

Keywords: Nutrition leadership. SDG. multisectoral

FINDING SYNERGY BETWEEN INTERNATIONAL LEADERSHIP DEVELOPMENT INITIATIVES: PERSPECTIVES FROM THE NUTRITION LEADERSHIP PROGRAMMES

[1]Verstraeten, Roosmarijn; [2]Jerling, Johann; [3]Leroy, Jef.

[1]PhD. Nutritionist. Independent researcher and consultant. Belgium; [2]Prof. PhD. Centre of Excellence for Nutrition. North West University. South Africa.; [3]PhD. Senior Research Fellow. Poverty, Health, and Nutrition Division. International Food Policy and Research Institute. Washington DC.

There is growing recognition that to address today's nutritional problems there is a need for effective leaders in nutrition across sectors (academic, corporate, governmental and non-governmental), and at all career levels (junior, mid-career and senior). This requires strong leadership skills to build transdisciplinary alliances, identify evidence gaps, seize opportunities for action, and to effectively communicate to varied audiences about nutrition at the individual, organizational and system levels.

Regional Nutrition Leadership Programs (NLPs) are now well established in Europe, Africa, South-East Asia, Middle East, Latin-America, and Oceania. Interest has been expressed by the SUN movement and other agencies in developing leadership capabilities in other (sub-)regions. Leading change in nutrition is challenging, and requires a unique set of values, attitudes and orientations in addition to excellent technical, facilitation, strategic, and inter-personal skills. By creating awareness and developing these skills at an early- or mid-career stage, the different NLPs seek to increase the capacity of nutrition professionals to lead from where they are at all levels in the system.

Representatives from different NLPs have joined forces to build the functional capacity necessary to deal with the global nutrition challenges common to so many regions of the world. In keeping with the region-led approach of the NLPs, the initial emphasis is on supporting and strengthening existing NLPs whilst creating a common global purpose across NLPs and forging linkages between them. We will share details of this new initiative, which includes as a first step a detailed mapping of the global nutrition leadership landscape and a critical assessment of the potential added value that inter-regional collaboration could provide.

Keywords: Nutrition Leadership Programs, Global nutrition, leadership

Further collaborators: A large group of individuals involved in leadership development globally, including the different NLPs.

THE ENUTRITION ACADEMY: GLOBAL ONLINE LEARNING AND CAPACITY DEVELOPMENT

OVERVIEW OF CURRENT COURSE CONTENT & LESSONS TO BE LEARNED

Ellahi, Basma; (2)Jafri, Ali; (3)Mukantwali, Christine.

(1)PhD. Faculty of Health and Social Care. University of Chester. UK.; (2)PhD. University of Casablanca. Morocco; (3)PhD. Rwanda Agriculture Board. B.P 5116. Kigali. Rwanda.

The eNutrition Academy (eNA) initiative, focussing on the learning needs for Africa, has been developed by global and regional nutrition professional bodies (International Union of Nutritional Sciences, Federation of African Nutrition Societies, African Nutrition Society, American Society of Nutrition, Nutrition Society UK and Ireland). The aim is to strengthen nutrition capacity in Africa using an electronic learning platform in response to identified gaps in training resources in Higher Education Institutions (HEI).

Two units of study on the subject of dietary assessment were created (co-authors BE and RA) and developed into eLearning units with support from the web host, Cambridge University Press. These are open and free access units. The unit content is stand-alone but the development of each unit followed a similar format and incudes text material, access to free learning resources, video clips and interactive online exercises. The authors used additional learning materials, produced by colleagues African group members, to supplement the content in order to ensure a context specific approach. This also encouraged a higher level of engagement and adoption of the material. A third unit to complement the dietary assessment units was developed by our sub-group from across Africa and is currently undergoing review before being developed into online content.

An evaluation form was also created by the sub-group members which explored learner satisfaction with the material and the on-line features. The two units developed to date were evaluated by nutrition students and professionals in Africa. Training based on the experience was provided for other African colleagues to support current and on-going eLearning production. The presentation will discuss the findings of the evaluation to inform future developments.

Keywords: Dietary assessment, online learning, evaluation, development

MAPPING OF FREE AND OPEN-ACCESS ELEARNING RESOURCES IN HUMAN NUTRITION

(1)*Aryeetey, Richmond;* (2)*Grace, Marquis.*

(1)PhD. Senior Lecturer. University of Ghana School of Public Health. Legon. Ghana; (2)PhD. Nutritionist. School of Human Nutrition. McGill University. Quebec. Canada.

Capacity building and leadership have been recognized as key ingredients for delivering effective actions in nutrition and health, and particularly within the scaling up nutrition framework. The eNutrition Academy (eNA) initiative has been developed by global and regional nutrition professional societies/federations (International Union of Nutritional Sciences, Federation of African Nutrition Societies, African Nutrition Society, American Society for Nutrition, The Nutrition Society [UK]). It aims to strengthen nutrition capacity in Africa using an electronic learning (eLearning) platform. The eNA is an innovative response to the identified gaps in pre-service training resources in higher education institutions (HEI) in sub-Saharan Africa. The current study maps the typology and characteristics of existing eLearning resources which are openly and freely accessible to African HEIs. This rapid mapping exercise relies on an online search of existing eLearning resources, performed between January and May 2017 by the author as well as a cross-section of nutrition students and faculty in Africa. The search strategy was guided by the following search terms: nutrition, food systems, eLearning, course, open-access. Two independent reviewers used a template to extract characteristics of the identified eLearning platforms, including category of sponsors, content, organization or content, level of interactivity and target audience. This presentation will provide evidence on the 17 identified eLearning resources in nutrition and the gaps in their content and their delivery approach. The findings will form a basis for developing appropriate content delivery of nutrition training through the eNA.

Keywords: ELearning, Nutrition, Africa, Training, Higher education.

ETHICAL CHALLENGES AND IMPLICATIONS OF SHARING, SELLING AND DONATING HUMAN MILK

STRENGTHENING SYSTEMS FOR ESTABLISHING INTEGRATED HUMAN MILK BANK PROGRAMS AS ESSENTIAL NEWBORN CARE THROUGH GLOBAL LEARNING EXCHANGES: A BEST PRACTICE FOR ENSURING OWNERSHIP

[1]Israel-Ballard, Kiersten; [2]Mansen Amundson, Kimberly; [3]Nguyen Quynh, Nga; [4]Sachdeva, Ruchika; [5]Muiruri, Juliana.

[1]DrPH. Maternal, Newborn, Child Health and Nutrition. PATH. United States.; [2]MSPH. Dietitian. Maternal, Newborn, Child Health and Nutrition. PATH. United States.; [3]MD. Maternal, Newborn, Child Health and Nutrition. PATH. Vietnam.; [4]MSc. Nutritionist. Maternal, Newborn, Child Health and Nutrition. PATH. India.; [5]BsC. Maternal, Newborn, Child Health and Nutrition. PATH. Kenya.

Background and objectives: Human milk is essential for all infants to ensure optimal growth and development. For preterm, low-birthweight infants unable to access sufficient breastmilk from their own mothers, pasteurized donor milk from a human milk bank (HMB) is recommended by the World Health Organization. HMB, when integrated with skin-to-skin, and lactation support programs, increases access to human milk, influences the culture of care to advocate for all infants to receive human milk. HMB expansion is limited due to lack of global guidance or quality standards to ensure safety. The aim of this work was to establish a systematic approach for building local technical capacity; a best practice of this approach is conducting learning exchanges to established HMB programs with the goal of developing a mechanism for mentorship and transferring skills for new HMBs.

Methods: Three HMB learning exchanges were facilitated between June 2015 and March 2017 to foster multinational collaboration. This included delegations from India to Brazil, Vietnam to Scotland, and Kenya to South Africa. Multi-disciplinary teams attending each exchange included ministry of health representatives, newborn and nutrition technical leaders, and nursing and midwifery experts. Focus was on specific needs from each region to ensure that the experience fulfilled pressing concerns. HMB champions hosted in-country site-visits. Approvals were obtained from the host ministry of health authorities to promote sustainable relationships.

Results: Each resulted in increased local ownership and capacity to adapt and strengthen systems in their own setting, including establishing local guidelines, operating procedures and policies. Various HMB models were explored in public and private sectors, exposing each team to best practices in HMB processes, and optimal integration with newborn and nutrition practices. Critical areas of learning included the importance of robust policy and practices to ensure sustainable, ethical, quality, and safe donor human milk.

Conclusions: In the absence of global guidance on HMB, learning exchanges play a critical systems strengthening role for ensuring that evidence-based best practices are integrated into new programs. Additional opportunities to share knowledge and expand best practices are lacking. Global HMB guidance and quality standards are needed as part of ensuring that infants worldwide have access to safe human milk.

Keywords: Human milk bank, breastfeeding, preterm

INDIGENOUS PEOPLES' GENDER ROLES, BIODIVERSITY AND FOOD SECURITY

INDIGENOUS PEOPLES' FOOD SYSTEMS: GENDER ROLES, BIODIVERSITY AND FOOD SECURITY – A NEW PUBLICATION

Kuhnlein, Harriet.

PhD. Founding Director. Centre for Indigenous Peoples' Nutrition and Environment. McGill University. Canada.

It is with pleasure that in this session we release our publication titled "Indigenous Peoples' Food Systems: Gender Roles, Biodiversity and Food Security, co-edited by Harriet Kuhnlein and Thingnganing Longvah. We are grateful to the journal, Maternal and Child Nutrition (Wiley), for this free access publication venue, and to the International Union of Nutritional Sciences (IUNS) for supporting this effort.

The IUNS Task Force on Traditional, Indigenous and Cultural Food and Nutrition (2010-2017) has evolved from earlier task forces within the Union that addressed Nutrition and Anthropology (1986-1994) and Indigenous Peoples' Food Systems and Nutrition (2001-2009). Major recent free access publications from the Task Force describe the methodology and process of documenting food systems of 12 diverse cultures of Indigenous Peoples, and how their biodiverse food systems are used and promoted to benefit health status of rural indigenous communities. Our current effort, released today, describes how gender roles and the right to food for several cultures of Indigenous Peoples can be fostered to protect their unique food resources and traditions for their food security benefits, especially for women and children. In particular, aspects of societal maternal or paternal lineality and locality, division of labor, spirituality, and decision-making are described to recognize the impact gender roles have on leadership process, and dynamics of family food access, availability and use. Indigenous Peoples' food systems from cultures in Ecuador, Nigeria, Thailand, India, Canada, Japan and Morocco are included. Perspectives from these traditional and transitional rural indigenous cultures give important insights on how gender roles with indigenous world views affect use of local food biodiversity and food security at family and community levels. We avoided gender-based sterotypes and sought local interpretations, customary laws and norms impacting ownership and inheritance of resources and the related decision-making that is important for maintaining biodiversity, food security, and well-being. Articles based in these local

cultures give descriptions of local food biodiversity and patterns of use; some give detailed descriptions of nutritional status of women and children; and attention is given to historical changes in environmental circumstances and cultural norms affecting food and nutrition security.

We recognize all Task Force members for their contributions to this publication, and we thank Bioversity International and the Indigenous Partnership for Agrobiodiversity and Food Sovereignty for the inspiration to conduct this research that was first discussed in 2015 at the Indigenous Terra Madre in Shillong, India.

Keywords: Indigenous Peoples, food systems, biodiversity, gender, traditional food

NUTRITIONAL DIMENSIONS AND POTENTIAL OF INDIGENOUS FOOD SYSTEM IN NORTHEAST INDIA

[1]Longvah, Thingnganing; [2]K., Venkaiah; [2]Indrapal I, Meshram; [2]VSS., Prasad; [3]Roy, Phrang; [4]Kuhnlein, Harriet.

[1]National Institute of Nutrition, Jamai Osmania PO, Hyderabad - 500 007, TS, India; [2]National Institute of Nutrition, Jamai Osmania PO, Hyderabad – 500 007, TS, India; [3]Indigenous Partnership for Agrobiodiversity and Food Sovereignty, c/o Bioversity International, Rome, Italy; [4]Centre for Indigenous Peoples' Nutrition and Environment (CINE), McGill University, Montreal, Canada.

Northeast India, home to more than 200 diverse tribes with distinct cultural, linguistic, religious and historical background is considered one of the most diverse regions of the world. The paper presents the indigenous food system in Northeast India, the diversity of the food resources, their nutritional attributes and the impact of their use on food and nutrition security among indigenous tribes.

Wide variety of wild species and interspecies still constitutes the bedrock of the indigenous food system. Several studies on the food system of the different tribes in Northeast India revealed that the indigenous food count can be anywhere from 250 to 748. Majority of these are collected from the wild however, the current usage is much lesser than documented. The indigenous tribes of Northeast India being owners of the land have access and control with customary laws protecting the forest reserves. About 10 – 15% of the wild foods from forests find market and form source of income. Traditionally local crops, ethnic vegetables and indigenous fruits are collected by women folk either from the forest areas, conserved in shifting land or indigenous kitchen gardens. This is demonstrated by the fact that many edible wild species are in various stages of domestication as a result of human selection. The most commonly harvested wild food are green leafy vegetables, roots & tubers, fruits, flowers, seeds, spices, insects, snail, crab, small fishes and game animals. The indigenous food system in Northeast India also boast of rich agrobiodiversity with several landraces. Several landraces of rice, specific to tribes have been documented that have better nutritional attributes such as low glycemic index normally not seen in high yielding or hybrid rice thus reflecting in low incidence of diabetes in the region. Traditional plants are often used as both food and medicine and this connection must be noted. For example, Clerodendrum colebrookianum leaves popularly used in Northeast India minimize high blood pressure and perhaps the use of such vegetables is the reason for lower prevalence of hypertension and diabetes in the region. Wild foods remain important from both cultural and nutritional perspective manifesting in lower rate of child undernutrition in northeast India as compared to the rest of India.

Traditionally wild foods are consumed in various combinations along with cereals and vegetables to meet the food and nutrient needs and form a significant portion of the diet but their contribution to the household food supply vary according to the region and tribe. In view of the importance of wild foods resources in the food system of the indigenous people, systematic documentation and nutrient characterization of important food source is required. This will help in efforts to capitalize on the health benefits of indigenous food systems and integrate it into contemporary food systems to be able to fully support health and nutrition of the population in a sustainable manner.

Keywords: Indigenous food system, Northeast India

GENDER ROLES, FAMILY RELATIONSHIPS, AND HOUSEHOLD FOOD AND NUTRITION SECURITY IN THE OHAFIA MATRILINEAL SOCIETY IN NIGERIA

[1]Ene-Obong, Henrietta; [2]Onuoha, Nne Ola; [3]Eze, Eme Paul.

[1]BSc, MSc, PhD. Department of Biochemistry (Human Nutrition & Dietetics Unit). Faculty of Basic Medical Sciences. University of Calabar. Calabar. Cross River State. Nigeria.; [2]BSc, MSc, PhD. Department of Home Science Nutrition and Dietetics. University of Nigeria. Nsukka. Enugu State. Nigeria.; [3]BSc, MSc. Department of Home Science Nutrition and Dietetics. University of Nigeria. Nsukka. Enugu State. Nigeria.

Objective: Information on the nutritional status and household food security of the Ohafia matrilineal society are scarce. This study examined gender roles, family relationships, food security, and nutritional status of households in Ohafia, Nigeria.

Methods: A cross sectional descriptive study was conducted. Multistage sampling technique was used to select 287 households from three villages: Akanu, Amangwu, and Elu. Qualitative and quantitative data collection methods were adopted, namely, focus group discussions and questionnaires. Anthropometric measurements (height and weight for mothers and children, and mid upper arm circumference for young children) were taken using standard techniques. The body mass index of the mothers was calculated. All nutritional indices were compared with reference standards. Food insecurity was assessed using the Household Hunger Scale (HHS) and Dietary Diversity Score (DDS), then, analyzed using the Statistical Product for Service Solution (SPSS®) version 21. Data analysis used descriptive statistics.

Results: Most (91.2%) of the respondents were female. The matrilineal system known as "ikwu nne" or "iri ala a nne" (inheritance through mothers' lineage) is still in place, but is changing. One important benefit of the system is the access to land by women. While women participated actively in agriculture, food preparation, and care of family, the men were moving to off farm activities. High prevalence of household food insecurity (66%) and signs of malnutrition including moderate to severe stunting (48.4%) and wasting (31.7 %) in children, household hunger (34.5%), and overweight (27.5%) and obesity (19.2%) among mothers were observed. Conclusion: Despite women access to land, malnutrition remains a serious problem in these communities. These communities urgently need gender sensitive interventions.

"A member of the Task Force on Traditional, Indigenous and Cultural Food and Nutrition"

MATRILINEAL SYSTEM, HOUSEHOLD FOOD SECURITY AND NUTRITIONAL STATUS OF WOMEN AND CHILDREN AMONG THE OHAFIA IBOS OF SOUTH-EASTERN NIGERIA

[1]Ene-Obong, Henrietta; [2]Onuoha, Nne Ola; [3]Eze, Eme Paul.

[1]BSc, MSc, PhD. Department of Biochemistry (Human Nutrition & Dietetics Unit). Faculty of Basic Medical Sciences. University of Calabar. Calabar. Cross River State. Nigeria.; [2]BSc, MSc, PhD. Department of Home Science Nutrition and Dietetics. University of Nigeria. Nsukka. Enugu State. Nigeria.; [3]BSc, MSc. Department of Home Science Nutrition and Dietetics. University of Nigeria. Nsukka. Enugu State. Nigeria.

Objective: Women occupy a central role in subsistence agriculture, being responsible for about 80% of agricultural production. However, gender disparity in access to agricultural resources and services count against their productivity and consequently on the food and nutrition security of their household. It has been shown that when women have access to or own land they allocated much of their household income to food and therefore have more healthy children. In patriarchal societies, rules of inheritance favour male rather than the female in terms of land allocation. Nigeria is basically a patriarchal/patrilineal society; however, a few matrilineal societies exist in different parts of the country, one of which is the Ohafia Ibos of South-eastern Nigeria. The Ohafia Ibos operate a system where inheritance is through mothers' lineage (translated into the local dialect as "iri ala a nne."). Researchers have examined the socio-political implication of the matrilineal descent system among the Ohafia Ibos. This paper focuses on the origins, features, food and nutrition security, and nutritional status of women and children in matrilineal Ohafia communities.

Methods: A cross sectional descriptive study was conducted. Multistage sampling technique was used to select 287 households from three villages: Akanu, Amangwu, and Elu. Qualitative and quantitative data collection methods were adopted, namely, focus group discussions (FGD) and questionnaires. Anthropometric measurements (height and weight for women and children, and mid upper arm circumference [MUAC] for young children) were taken using standard techniques. The body mass index of the mothers was calculated. All nutritional indices were compared with reference standards. Food insecurity was assessed using the Household Hunger Scale (HHS) and Dietary Diversity Score (DDS), then, analyzed using the Statistical Product for Service Solution (SPSS®) version 21. Data analysis used descriptive statistics.

Results: The origin of the matrilineal system in Ohafia is based on oral tradition. The system is still in place but is changing. Although the matrilineal system allows women to inherit and have access to land, men are the household heads and preside over land matters. While women are actively engaged in agriculture, food preparation, and care of family, the men are moving to off farm activities. Indigenes perceive the matrilineal system to have some merits and demerits which have had significant impact on the lives of the people. Despite the rich biodiversity, high prevalence of household food insecurity (66%) and hunger (34.5%); malnutrition, including moderate to severe stunting (48.4%), wasting (31.7 %), and severe malnutrition (11.5%; MUAC < 11.00 cm) in children; and overweight (27.5%) and obesity (19.2%) among mothers were observed.

Conclusion: The matrilineal system and women access to land did not appear to shield these communities from household food insecurity and the double burden of malnutrition among women and children. While a detailed study of the intervening variables is recommended, these communities urgently need gender sensitive interventions.

Keywords: Matrilineal system, food and nutrition security, malnutrition, women and children, Ohafia

SUPPORTING INDIGENOUS CULTURES AND HONORING POSITIVE GENDER ROLES THROUGH WOMEN'S GROUPS IN TUNGURAHUA, ECUADOR

[1]Roche, Marion; [2]Ambato, Lorena; [3]Sarsoza, Julieta; [4]Kuhnlein, Harriet V.

[1]PhD. Senior Technical Advisor Adolescent and Women's Health & Nutrition. Nutrition International. Ottawa. Canada.; [2]BSc. Community Nutritionist. Chimborazo & Tungurahua. Area Development Programs. World Vision Ecuador. Ecuador.; [3]MD. Health Advisor. World Vision Ecuador. Quito. Ecuador; [4]PhD. Centre for Indigenous Peoples' Nutrition and Environment. School of Dietetics and Human Nutrition. McGill University. Canada.

Across Latin America, there have been improvements in undernutrition in recent decades, but these improvements have not been equal for Indigenous Peoples. They do not experience the same health and access to healthcare as non-Indigenous people, resulting in physical and cultural health consequences for the individual and the collective group. Traditional food systems of Indigenous Peoples, including wild leafy greens, can provide nutritional

value to diets and also support cultural aspects of food security. This study focuses on women in the maternal land of Tungurahua and their connection with culture and the food system through a food-based community nutrition intervention. Building upon the Quichua concept of mink'a—a system of community collaboration for the common good, mothers' cooking clubs were organized. The community nutrition intervention promoted the reintroduction of local foods through community cooking clubs and recipe competitions at local fairs. A positive deviance approach identified the local foods to be included in the intervention recipes, which were prepared in mothers group sessions under the guidance of a mother that was selected and trained as a guide mother. Two leafy greens were among the key foods identified to be widely available, but used by only a few households. Mothers met for 12 days consecutively to learn the recipes and prepare a meal together with other mothers at the house of a guide mother. An elder supported each of the mothers groups with traditional knowledge and Quichua language. We assessed the social, cultural, and nutritional potential of the mothers' club intervention to increase the consumption of local foods and the potential to improve children's diets with local foods. Key informant interviews and focus groups were conducted with 54 mothers and 16 elders to identify perceptions of the intervention and traditional foods. Social and cultural dimensions, including gender, were identified through content analysis. The nutritional contribution of the leafy greens was estimated through semi-quantitative food frequency questionnaires conducted with 160 participant mothers and 98 mothers living in nearby communities without the intervention that served as a comparison group. The use of local foods was a source of pride for mothers and elders. Non-food uses of the nettle proved an initial barrier to acceptance; however, peer support within mothers' groups enabled increased consumption. The greens were estimated to contribute an additional 8% vitamin A, 7% iron, 12% vitamin C, and 27% folate to children's recommended dietary intakes. By promoting wild leafy greens, mothers' groups improved food security and the cultural and nutritional value of their diet. Additionally, mothers' cooking clubs increased self-efficacy and cultural identity for Quichua women, offering a highly acceptable nutrition intervention model, honoring both gender roles and culture.

Keywords: Quichua. Community Intervention. Mothers' Groups. Culture. Traditional Foods.

Conflict of Interest disclosure: Julieta Sarsoza and Lorena Ambato worked for World Vision Ecuador at the time of the study, but did not influence data collection or interpretation.

NUTRITIONAL STATUS, FOOD INSECURITY AND BIODIVERSITY AMONG THE KHASI IN MEGHA-LAYA, INDIA

[1]*Kuhnlein, Harriet;* [2]*Chyne, Daniella A.L.;* [3]*Longvah, Thingnganing.*

[1]PhD. Founding Director. Centre for Indigenous Peoples' Nutrition and Environment. McGill University. Canada.; [2]Research Scientist. National Institute of Nutrition. Hyderabad. India.; [3]PhD. Director. National Institute of Nutrition. Hyderabad. India.

Tribal communities in India are 8.6 % of the national population- an estimated 104 million people. The Khasi in Meghalaya State is among the largest tribal cultures and is well-known for unique matrilineal and matrilocal patterns. Women head households and enjoy positions of importance and dignity as preservers of clan, family and lineage. The youngest daughter is the receiver and custodian of intergenerational property transfer and the maternal uncle is head of family with executive management toward children, including behavioral discipline. The West Khasi Hills (WKH) district population is mostly Khasi, and is known for rich biodiversity and extensive rainfall, with sacred forests considered storehouses of genetic ecosystem resources; however, deforestation is widespread and high rates of childhood undernutrition and anemia are known in the State. The research purpose was to establish Khasi nutritional status and food biodiversity in the region to help determine priorities for food security using local natural resources.

A random sample of 600 households was determined in 20 villages for index child and mothers; anthropometry, dietary and food security interviews, and finger prick blood samples were taken; and environmental conditions recorded. Literacy was 77% for women and 67% for men, with 21% completing grade 12. Household income was low, 45% had safe drinking water, and 77% had sanitary latrines. Due to extensive missing nutrient data, food group analysis was conducted and compared to the Indian RDI. Cereals & millets, roots & tubers were consumed by more than 50% of individuals exceeding 70% RDI. White rice from the public distribution system was consumed by more than 95% of adults 2-3 times per day; leafy vegetables (GLV), milk, and fat intakes were poor; and overall dietary diversity was low. Moderate food insecurity existed in 63% of households, with 19% food secure. Colostrum was routinely given; exclusive breast feeding usually ceased at 6 mo, with breast feeding continuing until about 2 yr. Children's food intake by gender was similar with wide variation. Children's weight and height were close to 2006 WHO standards in early months, but growth faltering began around the third month. Underweight (31%), stunting (57%) and wasting (10%) existed for children <5 yr, with undernutrition higher among boys than girls. BMI ≤18.5 for women was 19% and 8% had BMI ≥ 25. Anemia was present for 68, 70, 86 and 83% of 1-5 year children, pregnant, lactating, or non-pregnant-or-lactating women, respectively. Women's hypertension was 15% and glucose intolerance was 0.7%.

The Khasi local food system has 372 differentiated species/varieties, many uncultivated and without scientific identification or nutrient data. Of 31 wild GLVs, only 10 were consumed by ›50%

of households 1-2 times/wk; 52 wild fruits were known, but only 5 varieties regularly consumed. Environmental protection, agro-biodiversity, food composition research, and food and nutrition education can be strengthened to improve health in this unique society.

Sincere appreciation is expressed to staff at the National Institute of Nutrition, Hyderabad, and the Northeast Slow Food and Agrobiodiversity Society, Shillong.

AFRICAN GRADUATE NUTRITION STUDENTS NETWORK (AGSNET) SYMPOSIUM AT ICN, 2017

"I CANNOT SIT HERE AND EAT ALONE WHEN I KNOW A FELLOW GHANAIAN IS SUFFERING; WE WERE NOT BROUGHT UP THAT WAY": PERCEPTIONS OF FOOD INSECURITY AMONG GHANAIAN MIGRANTS

[1]Osei-kwasi, Hibbah Araba; [2]Nicolaou, Mary; [3]Powell, Katie; [3]Holdsworth, Michelle.

[1]PhD student and Research Associate. University of Sheffield. Public Health Section. Sheffield. UK; [2]Department of Public Health. Academic Medical Centre. University of Amsterdam. Amsterdam.The Netherlands.; [3]University of Sheffield. Section of Public Health. Sheffield. UK.

Background: In the UK, ethnic minority groups tend to have higher levels of poverty than the white British population and therefore may be at high risk of food insecurity. Ghanaians are thought to have a high level of social support in their communities, but the role of this resource in relation to food security is unknown. We explored the influence of social and economic factors in shaping dietary practices among Ghanaians living in Greater Manchester to get an insight into perceptions of food insecurity among participants.

Methods: A qualitative study of adults aged ≥25 years (n=31) of Ghanaian ancestry living in Greater Manchester using face-to-face interviews. Participants varied in socioeconomic status, gender and migration status. Interviews were transcribed verbatim and analysed thematically.

Results: This study shows that most people can manage on limited resources and from the social support within the community, however people opt for 'belly food', which tends to be unhealthy and do not prioritize their own health. Food insecure household were perceived to be reluctant to make use of food banks for the fear of gossip and pride, paradoxically, this reluctance does not extend to close network. The church and other social groups formed a trusted base in which people operate; support given through these channels is more acceptable than through the "official context".

Conclusions: This study suggests that food security within the Ghanaian community could be enhanced through supportive networks within the community. The churches and other social organisations such as the Ghana Union might be a means through which formal support may be mediated. If the churches and social groups can target the most deprived, there is the need for research to find out whether the resources of the church are sufficient to meet their needs, as effective interventions depend on being able to effectively target the vulnerable. Future survey-based research is needed to better assess the accessibility and utilization pillars of food insecurity given that perceptions data may not suffice to capture the physical and utilization component of food insecurity. There is also the need to explore the implications of food management and coping strategies for dietary quality and health among this population.

Researcher in Nutrition. Joint Unit of Nutrition and Food Research. Ibn Tofail University-Centre National de l'Energie des Sciences et des Techniques Nucléaires. Morocco.; [6]PhD. Professor. Joint Unit of Nutrition and Food Research. Ibn Tofail University-Centre National de l'Energie des Sciences et des Techniques Nucléaires. Morocco.

Background/Objectives: Body composition is important as a marker of both current and future health. Bioelectric impedance analysis (BIA) is a simple and accurate method for estimating body composition, but requires valid equations obtained from calibration studies to derive total body water (TBW) and fat free-mass(FFM) from electrical impedance. Equations for estimating FFM and TBW using this tool, with appropriate cross-validation, have been developed in Moroccan adolescents and adults. However none of the previous studies included Moroccan children.

The aim of our study was to examine the validity of published BIA-FFM and BIA-TBW equations available in the literature in the population of study and if needed to develop a new FFM-BIA and TBW-BIA equations using deuterium dilution as the reference method.

Subjects/Methods: Data were collected from 247 healthy children aged 8-11-year-old. Children were sorted by gender and age group and assigned into development and validation subgroups. The deuterium dilution was used as reference for estimating TBW and FFM. The accuracy of previous published equations was tested using Bland and Altman approach, proportional bias, pure error and effect size. BIA new equations were developed using linear regression and cross-validated using Bland and Altman approach.

Results: The previous published equations tested, showed a significant absolute and proportional bias indicating that these equations would provide biased values in estimating TBW and FFM. The above the mentioned biases detected, emphasizes the need for the development of specific equations to predict TBW and FFM with a low standard error in pre-pubertal Moroccan children.

The new equations derived provided non-significant proportional bias values, and better agreement than other tested equations. Bias and pure error values were 0.05 and 0.76l for boys and -0.12 and 0.92l for girls, for TBW equation. For FFM equation, bias values were 0.09 and -0.14, and pure errors were 1.00 kg and 1.17 kg for boys and girls, respectively.

Conclusions: The new prediction equations for TBW and FFM developed in our study are the most accurate to estimate TBW and FFM in Moroccan pre pubertal children aged 8-11 years. Further studies are needed to examine the validity of those new equations in a large sample on children.

DEVELOPING TRANSFORMATIONAL NUTRITION LEADERS IN AFRICA

(1)Jerling, Johann; (2)Den Ouden, Simone; (3)Conradie, Cornelia; (1)Dolman, Robin.

(1)PhD. Centre of Excellence for Nutrition. North-West University. Potchefstroom. South Africa.; (2)BComm. Centre of Excellence for Nutrition. North-West University. Potchefstroom. South Africa.; (3)MSc. Centre of Excellence for Nutrition. North-West University. Potchefstroom. South Africa.

Most African countries are burdened by undernutrition and all indications are that we are set to be particularly hard-hit by the growing burden of overnutrition. Despite significant investments, progress to optimize nutritional status is variable.

Nutrition in Africa is about change – it is a multisectoral process that has to lead. Leaders are change agents and are required throughout the whole system at all levels. Effective leaders develop a special combination of values, attitudes, orientations and behaviours in addition to their excellent technical skills.

The African Nutrition Leadership Programme (ANLP) has hosted a series of leader development events since 2002 and has built a Pan-African network of more than 380 leaders in 35 African countries working in multiple nutrition-related sectors. The ANLP's focus is on the development of the individual's leadership capabilities. Since 2010 the ANLP has also developed a number of needs-based leadership development programmes for multisectoral teams and organisations at national and subnational level who contribute towards scaling up nutrition interventions. Programmes have been hosted in Kenya, Rwanda, Uganda and Zambia with more being developed for implementation in the near future. Recognising the urgent demand, the ANLP has started developing a larger group of master trainers to facilitate the scaling up of leadership capacity building across the continent.

Leader development is also of importance to enhance the employability of science graduates. The NWU has developed a personal development programme which includes aspects of self awareness, contextualizing your behavior in the workplace and conflict resolution among others. The programme has been piloted in a cohort of graduate interns and the second cohort are now engaged with the programme. The self-awareness created set participants up for a process of life-long learning and growing. In addition the need has been identified and programme initiated to embed leadership development in the dietetics curriculum to ensure that we develop a workforce that have the ability and the necessary orientations and values to stand up and lead from where they are.

These programmes are examples of ongoing capacity development initiatives that are African-led and that impact the functional capacity of our nutrition workforce.

SEEMINGLY EFFECTIVE PATHWAYS TO NUTRITION BEHAVIOUR CHANGE

THE IMPORTANCE OF COACHING AND MENTORING, POST NUTRITION EDUCATION FOR SUSTAINED BEHAVIOUR CHANGES - THE USAID SOLID APPROACH

Tillekeratne, Visakha.

President. Nutrition Society of Sri Lanka.

The approach of "coaching and mentoring following nutrition education" was the nutrition component of the USAID Supporting Opportunities in Livelihood (SOLID) project implemented

in three provinces in the dry zone of Sri Lanka. Over 2000 farm families who were part of a livelihood improvement program supported by USAID were trained on the basics of nutrition with the targeted objective of " farmers improve the quality of their diet by including more fruits and vegetables and high quality proteins in their diet". The training component was designed in consultation with the families themselves and government service providers. A 3 stage approach was used culminating with a 5 hour practical training program done using interactive methodologies and cooking. A written pre-evaluation of 24 hour recall was done coupled with a post evaluation immediately after the training, in the written form of "what am I planning as my diets in the next 24 hours. The pre and post evaluation forms were compared for increases in dietary diversity in the number of food groups as well as the percentage of participants increasing their knowledge on diversity. Follow up, mentoring and coaching was done in three intervals post training through household visits and recording observations of households randomly selected. The visits were not announced. The food diary provided as part of a nutrition manual for the family was perused as well. 67% of those targeted for training had improved their knowledge immediately post training. 61% of those visited through random selection had improved their nutrition related behaviours with respect to dietary diversity, reduction of fat, salt and sugar in the diet, increase of fresh food and improved home gardens. The conclusion is that there seems to be fairly quick improvement in nutrition related behaviour if targeted participants are closely tracked and corrected. It is important to deliver nutrition improvement programs within livelihood initiatives.

Keywords: Pre post evaluation, dietary diversity

NUTRITION BEHAVIOR CHANGES AMONG CHILDREN, MOTHERS AND COMMUNITIES!

Aghi, Mira.

PhD Behavioral Science, Healis Sekhsaria Institute of Public Health. India.

How do we change the eating behaviors of children, the feeding behaviors of their mothers and the understanding of communities to optimize wellbeing through nutrition? Wellbeing does not imply more food but the right food eaten at the right time, in a quantity commensurate with the person's activity. In the case of deprived communities it implies eating enough of whatever they have to avoid hunger.

As interventionists we have to understand that behavior change requires four elements coming together in synergy. 1. Knowledge which is likely to come from education. The education for its proper and desirable impact should be driven by the users based on their perceived needs, 2. Motivation for change of behavior in this case eating and feeding practices, 3. Skills required for the change and 4. Enabling environments which make change possible and sustainable.

The mantra is conducting relevant formative research to design the education which is easily understood and is interesting to

the user. The education content should be relevant and applicable and at the same time credible and scientifically sound. It should be respectful to the sensibilities of all members of the community so that there are no barriers on that account. The education should adopt formats which motivate the users so that they want to acquire skills to modify their behaviors and change their environments. The skills should be imparted by participatory methodology which makes learning easy.

The enabling environments are at several levels like the family, friends, community and the country. They all contribute to change of behavior.

A short video from Meena Communication Initiative Meena of UNICEF would demonstrate this dynamics.

Keywords: Knowledge, motivation, skills, enabling environments, interventionist

IMPROVEMENT OF NUTRITION OF CHILDREN WITH MOTHERS EMPOWERMENT THROUGH MOTHER SUPPORT GROUPS

[1]*Jayatissa, Renuka;* [2]*Jayakody, Gamini;* [3]*Fernando, Dulith.*

[1]Department of Nutrition, Medical Research Institute, Sri Lanka; [2]UNICEF, Colombo; [3]Emeritus professor.

Even though most health indicators for Sri Lanka are satisfactory when compared to other countries of the region, indicators related to nutritional status of under five children are not in keeping with the other health indicators. To improve the nutritional status indicators further, UNICEF in collaboration with the Ministry of Health planned to implement alternate measures. The program aimed at focusing on applying several innovative activities by groups of mothers formed as a Mothers Support Groups (MSGs)) aimed at improving the nutritional status of under five children.

Programme was implemented in 5 districts out of 25 through the public health midwife (PHMs) of the respective areas. Well motivated mothers having children under five years and who had leadership qualities were invited to a 'cluster meeting' to be held at a place convenient for the mothers. About 10 -15 mothers formed a 'cluster'. The facilitators undertook the training of mothers. During the training, the concepts of health and nutrition, wellbeing and concept of nutrition promotion were focused on. Mothers were motivated to initiate the program at community level. These trained mothers shared the information with other mother's having a child/children below five years of age. These groups had regular meetings, some of them meeting once a month and some, more frequently. At these meetings they discussed the nutritional status of their children and the possible contributory factors. As a group, they discussed possible solutions to the problems identified. PHM provided relevant advice when necessary and mothers were guided to enumerate the probable solutions. Mothers developed innovative activities and relevant indicators to assess the progress. Several innovative activities conducted by mothers were; happy calendar, brain calendar, five sensation stimulation book,

hapana calendar, baby room, play house, nutrition calendar, collective feeding, weight chart, sapa and moda malla, daily expenses reduction chart, unnecessary food and beverages reduction chart, buddhi kataya, vibhaga pohora etc. After 6 months, impact was assessed.

There were 2000 MSGs were formed. It was observed evidence of weight improvements, gains in development, current wellbeing of child and family, better money and time management in families. In many of the families, the reduction of money spent on tobacco smoking and alcohol, as well as on food items that are not nutritious, was seen as a positive impact of the program. "Active" mothers from one MSG to visit another village and assist the mothers in that village to establish a mothers group and provide guidance to carry out the activities were used. The 'mini-symposia' were conducted to share success stories and plans made to further spread of the approach. Successful groups also worked out further targets, to broaden the scope of their own activities.

In conclusion linking in MSGs with the formal health system, in promoting nutrition is likely to improve the nutritional status of children thereby benefitting the community in a multitude of ways.

DEVELOPMENT OF TRAINING AND RESEARCH IN NUTRITION AND DIETETICS IN FRANCOPHONE AFRICAN COUNTRIES

NUTRITION AND DIETETIC TRAINING AND RESEARCH IN AFRICAN FRENCH-SPEAKING COUNTRIES: WHERE ARE WE TODAY?

Kana Sop, Marie Modestine.

University of Douala, Faculty of Douala, Department of Biochemistry PO BOX 24 157 Douala.

Background and objective: More than half French-speaking people live in Africa. Sixteen of Francophone Sub-Saharan African countries (more than 21), are least-developed countries. As indicator of chronic undernutrition double by increasing prevalences of obesity, 40% of children are wasted. The main strategies of support are research and training. French speaking African countries are limited by language to access to quality training, research and scientific exchange. The objective of this work is to investigate on gap, strength and opportunities of training and research on nutrition and dietetics in Francophone African countries.

Methods: We use an inventory of available online resources in French and in English (websites, platforms), In-depth interviews with stakeholders.

Results: There are very few scientific and research support available in French. French speaking are very poorly trained in

nutrition and dietetics and related discipline. Few International Courses (PLAN in Morocco, FINSA in Benin) and related masters are available, but not really accessible for every one willing to learn. FAO is also developing online ENAF course for French speaking countries. Very limited programs are available in French. French speaking apply as well in English programs either for training or research, but are not really competitive in front of their English mate. Their application are usually rejected. There is a great lack of human capacity in the field and at the point of decision, they are absent. Refreshing courses are not sufficient to build sustainable skill in and nutrition and dietetic.

Conclusion: French resources on malnutrition are insufficient constituting a barrier to effective implementation of nutrition and dietetic programs in French-speaking countries of Africa. In order to develop a comprehensive framework to strengthen human capacity for nutrition and dietetic training and research, we appeal for a ''Inter-country Institute of Applied Nutrition and Food Science in Francophone Sub-Sahara Africa (IANFA)'' , where training and research programs will be fully implemented in French for effective nutrition interventions and relevant human capacity building.

Keywords: Training and Research, Nutrition and Dietetics, Francophone African Countries

OVERVIEW OF NEEDS AND OPPORTUNITIES IN NUTRITION TRAINING: A RAPID SITUATION ANALYSIS IN BURKINA FASO

[1]*Kangambega, Marcelline Tebkieta;* [2]*Belahsen, Rekia.*

[1]MCs. Nutritionist. Food Control and Applied Nutrition Department. National laboratory of public health. Burkina Faso.; [2]PhD. Professor. IUNS Past Secretary General. Training and Research Unit. Nutrition and Food Sciences. Chouaib Doukkali University.School of Sciences El Jadida. 24000 Morocco. Professor.

Background and objectives: In Burkina Faso, the nutritional disorders remain a major health problem. The prevalence of chronic and acute malnutrition was respectively 30.2% and 10.4% among children under five . A survey conducted in 2013 showed that the prevalence of high blood pressure and diabetes was respectively 17.6% and 4.9%. More than 75% of the survey participants have a low rate of HDL cholesterol2.

The nutritional disorders is a concern for the country and the national nutrition policy was developed to address the key issues that require technical and operational skills. This raise the following question: Does the training opportunities in the field of nutrition are in line with the needs for strengthening the control of nutritional disorders in Burkina Faso?

The purpose of this work is to highlight the needs in nutrition training, the existing opportunities and the measure developed to meet these needs in Burkina Faso.

Methods: A documents analysis and interview with key informants were used to conduct this situation analysis.

Results: The analysis of nutritional key problems identified by the national nutrition policy3 suggests the following needs:

- Nutrition education of parents, children, teachers and others key stakeholders involved in the valuation of local food products;

- Training in nutrition and promotion of nutrition at universities, public health schools;

- Capacity building of all the key stakeholders involved in the diagnosis, the treatment and prevention of nutritional disorders.

Regarding the opportunities of training in nutrition in Burkina Faso, progress has been achieved:

- Nutrition was included in the curricula of primary and secondary schools;

- Training and refresher training in nutrition at universities and health schools;

- Refresher training for health professional;

- Training of community health workers in nutrition (integrated management of childhood illness);

However, most of these trainings address the nutrition issues in general terms.

Conclusions: Progress was done in responding to nutrition training needs in Burkina Faso. However, some efforts are required for focusing more specifically on nutrition issues in the training programs and for strengthening the capacities of all the stakeholders giving the multi-sectoral nature of nutrition.

PS_144/148

THE PAST AND FUTURE OF ASIAN FOOD CULTURE AND NUTRITION SECURITY: STRENGTHS AND WEAKNESSES

GENETICALLY ENGINEERED (GE) FOODS TO MEET NUTRITIONAL & FOOD SECURITY CHALLENGES IN INDIA

[1]Bharatraj, Dinesh Kumar; [2]Siruguri, Vasanthi.

[1]Sr.Deputy Director, Coordinator – PCT, HOD Drug Toxicology Division, ICMR-National Institute of Nutrition, Hyderabad, Telangana State, India; [2]Deputy Director, Food Toxicology Division, ICMR-National Institute of Nutrition, Hyderabad, Telangana State, India.

The advances in Biotechnology is gaining wide acceptance specially in relation to early diagnosis of disease profile, development of therapeutic agents, vaccines, foods, improved agricultural productions etc. The rapid development of Genetically Engineered (GE) foods using recombinant DNA technology from different species of organism like Microbes, plant and also animal is considered to be most advanced technology. The potential benefits of GE Foods are (i) Reduced use of pesticides, Herbicides, (iii) Enhanced nutrition, (iv) Enhanced shelf life, (v) Enhanced resistance to drought and other abiotic stresses etc., The role of GE foods in alleviating global macro and micro nutritional deficiencies is being recognized.

However, ensuring the safety and quality of the GE food for intended nutritional compliance is a pre-market challenge. In the world there are many GM crops like Maize, Cotton, Soybean that are in use for the last decade in several Countries. In India the success story of Bt Cotton which occupies 80% of the crop, has not only boosted the economy of farmer and country but given a scope to introduce new crops like GM. Mustard, Bt Brinjal, Bt Okra, Bt. Rice etc., The data generated in our laboratories mentioned crops have demonstrated nutritional equivalence and their safety with the native crops. This has led to harmonize the protocols (to evaluate allergencity, acute and chronic toxicity, compositional and nutritional equivalence) for pre-market safety assessment

In the current scenario in India, sub-clinical vitamin A deficiency is increasing rapidly. Therefore, the potential strategy of developing GE crop with enhanced beta carotene content has been recognized to combat the vitamin A deficiency. This approach needs to be strengthened to counter micro nutrient deficiency so as to fight the hidden hunger. Identifying the delivery of such micro nutrients through GE foods. This requires the evidence based support involving Scientists, Academia, Regulators and Civil Societies.

Keywords: Genetically Engineered (GE) foods, Recombinant DNA technology, Benefits of GE foods, Sub-clinical vitamin A deficiency .

FOOD AND NUTRITION SECURITY OF INDONESIA

Hardinsyah, Ridwan.

Professor in Nutrition at Department of Community Nutrition. Faculty of Human Ecology. Bogor Agricultural University. Indonesia. President Food and Nutrition Society of Indonesia.

This paper is intended to reveal the food culture and nutrition security of Indonesians, the largest tropical archipelago country in Asia.. This was done through analyzing secondary data on poverty, food intake and review of the literature on food habits and nutrition status of Indonesian from the last two decades. During the last two decades, Indonesia enjoyed annual economic growth between 5 to 6.5% following by reduction of the percentage of poor people from 23.4% to 11.0% and underweight children from 31,6% to 19.6%, and anemia among pregnant women from 50.9% to 37.1%. Mayor food groups on the current Indonesian diets are similar to the traditional diet. The differences are the current diet is more from food away from home, contains more variety of foods and beverages contain more fat, sugar and sodium content. Meanwhile the intake of fruit and vegetables relatively not much change. Current Indonesian diet consists of rice as the first staple food and wheat flour products like noodle and bread as the second. Fish, egg, chicken, tempe and tofu are the side dishes commonly consumed that are usually fried. Vegetables and fruit commonly consumed are spinach, swamp cabbage, cabbage, banana, papaya, orange and water melon. Coconut milk and palm oil now are commonly used for cooking; and onions, chilies, herbs,

salt and sugar are commonly used as spices in cooking. The five most Indonesia's favorite foods are rendang, satay, nasi goreng, soto and bakso are seasoned with that spices. It is common that Indonesians consume chili sauce (sambal), soybean sauce (kecap) and crackers (kerupuk) as an appetizer. Food habits vary in different regions and ethnics. Percentage of household food expenditure for prepared food increased significantly from 12.5% to 28.08% in which mostly fatty, sugary and salty foods. In addition, currently there are about 1500 western fast food outlets in urban Indonesia, which showed changing in food culture partly. Inline with changing in food culture, accompanied by improvement in economic and access to food, obesity prevalence is increasing in Indonesia especially among women, which is increased from 23.8% in 2007 to 32.9% in 2013, while the problems of underweight, stunting and anemia among children are still prevalent. In the last two decade the main cause of death was upper respiratory infections, but now is cardiovascular diseases. This implies that Indonesia is now facing a of double burden of nutrition and health transition, which requires more innovative and comprehensive policy programs for preventing double burden of nutrition in Indonesia.

FOOD CULTURES AND NUTRITION SECURITY IN MALAYSIA: ISSUES AND CHALLENGES

Noor, Mohd Ismail.

PhD. Nutrionist. Faculty of Hospitality. Food and Leisure Management. Tayloy's University, Subang Jaya 47500. Selangor. Malaysia.

Malaysia is a multi-racial country and each ethnic groups has its own unique food culture. For centuries, it has been a melting pot of different cultures and the interaction and integration among the various ethnic groups making Malaysia unique as compared to other countries. It's often said, culture enriches life however local food cultures may have its own strengths and weaknesses in its ability to meet nutritional and health needs of the population. In addition, religion can influence food purchasing decision and eating habits. Over the last few decades Malaysia's national per capita income increased more than 25-folds from US$402 in 1970 to US$10,796 in 2014, a sizeable new middle income class has emerged, an impressive achievement but not without a cost! The increasing globalization of food systems, have resulted in a population shift from minimally processed diets rich in staple foods of vegetable origin to diets high in meat, vegetable oils, refined sugars, sodium, processed and ultra-processed foods, a significant contributor to the current and future disease burden associated with obesity and diet-related NCDs in Malaysia. From a public health perspective, the role of processed foods in nutrition transition is receiving greater scrutiny in some while others will continue to increase without policy intervention. The "mushrooming" of fast food outlets and supermarkets, aggressive advertising and marketing of cheaper industrialized products, have led to a dra-

matic rise in consumption of low nutritional quality, energy-dense, ultra-processed food and drinks, and fried snacks and sweets. The presence of "24-hour" food outlets combined with increasingly sedentary lifestyles, is a "recipe for disaster" for Malaysians, rated the highest in obesity prevalence in SEA region. A recent study (EIU, 2017) revealed total cost of obesity estimated to be between 10% and 19% of national healthcare spending. There is however renewed interest in health promoting "healing" foods and nutritional re-profiling of traditional diets to provide healthier food options for the future generation. Enhancing food security and reducing under-nutrition have been pledged since 1948 through the Universal Declaration of Human Rights. Malaysia is not likely to face food shortages but food security, especially for our staple food, rice. The food import bill in 2015 was RM45.4(US10.5) bn, with exports of RM27(US6.2)bn, with a trade deficit of over RM18(US4.2)bn. Malaysia was ranked at the 35th spot in the Global Food Security Index 2016 rankings with Singapore at third spot and highest ranked country in Asia, followed by Japan (22), South Korea (28) and China (42). Climate change is a globally important environmental issue that impacting our economic future and livelihoods and various policies are adopted to mitigate this phenomenon. The National Plan of Action for Nutrition Malaysia III (2016-2025) goes beyond improving household food security whereby element of nutrition security is given greater emphasis in line with ICN2 declaration and SDGs in the next decade.

EXPERIENCE IN REDUCING STUNTING IN VIETNAM: NUTRITION POLICY, PROGRAMS AND COMMUNITY NUTRITION INTERVENTION

Hop, Le Thi.

Vietnam Nutrition Association, Vietnam.

Nutrition policy and nutrition programs: During the 1980th, after a long devastated war and the pressure of high demographic rate, the nutritional status of Vietnamese, especially of children and mothers was very poor. Since 1980, when the National Institute of Nutrition of Vietnam was established and started to conduct several nutrition epidemiological studies, providing the scientific evidences of malnutrition rate and its main causes. In 1985, the rate of underweight was 51.5% and the rate of stunting was very high (59.7%). The network of nutrition has been set up in the whole country; Control of PEM and vitamin A deficiency has become national programs.

In 1995, the Prime Minister ratified the NPAN 1995-2000, where the Government asked authorities at all levels to integrate nutrition goals, reduction of malnutrition, into their local socio-economic development plans. The National Nutrition Strategy (NNS) 2001-2010 was officially ratified by the Government in February 2001; the overall goal was to improve nutritional status of children focusing mainly on underweight reduction. Then the second NNS for the period 2011-2020 was approved in February 2012 with the general objective to improve the diet of Vietnamese

population and focus on reduction of stunting and control of overweight and obesity.

The main nutrition interventions/projects up to 2010 were the national PEM control program, PAM project, High dose Vitamin A supplementation for children, Fe-folic supplementation for pregnant women and weekly Fe supplementation for adolescent girls… With purpose to reduce stunting among <5 children, besides malnutrition control program, the Food fortification projects (ILSI, GAIN projects), multi-micronutrient supplementation to the poor and disadvantaged areas, school nutrition project... were also developed and carried out during period 2011-2020.

The main intervention strategies in Vietnam were the preventive orientation- nutrition throughout the lifecycle; Prioritzing high risk groups and disadvantaged areas; and community-based and multi-sectoral approach in implementation of nutrition activities.

The Vietnam food-based Dietary Guidelines were developed for each 5 – 10 years (FBDG for period 1995-2000, 2001-2005, 2006-2010 and 2011-2020, as nutrition education tools.

Building up capacity for nutrtion has received high attention. Nutrition and food safety departments have been set up in several medical, agricultural universities. Since 1994, the MSc. training of community nutrition and in 2005 the Ph.D training in Nutrtion were implemented.

Success and challenges: Child malnutrition (underweight, stunting) prevalence as well as micronutrient deficiency has been remarkably reduced. However, Vietnam started facing with double burden of malnutrition (stunting is still high and overweight and obesity is increasing very fast).

Keywords: Nutrition policy, programs, intervention, stunting, Vietnam

UNDERSTANDING DIETARY PATTERNS: A STEP TOWARD DEVISING A GLOBAL NUTRITION STRATEGY

PHYSIOLOGY AND PSYCHOLOGY UNDERLYING FOOD CHOICES

Drewnowski, Adam.

Center for Public Health Nutrition, University of Washington, USA.

The simple question of why people eat the foods they do requires answers that are both complex and interdisciplinary. Taste, cost, convenience, health, and variety are commonly cited as the main drivers of individual food choice. Collective food choices are also an expression of social identity, deeply embedded in religion and culture. Finally, food systems operate within a social, economic, and political space. Food availability – and hence food choices - can be influenced by myriad factors, from political upheavals to catastrophic weather vents, global warming, and climate change.

First, the sensory response to foods involves complex metabolic and neurochemical responses that may involve opioid peptides and dopamine. Beginning in infancy and childhood, food choices are driven by biological factors that favor foods that are both palatable and rich in calories. Whereas bitter-tasting foods are generally avoided by infants, children, and by pregnant women, sweet and umami ("delicious") tastes are sensory markers for dietary energy and nutrients. Early food choices are shaped by the desire for sweetness, calories, and variety. Food cravings in later life tend to center around foods and are energy-dense, salty, or sweet.

Second, economic factors, including the cost of foods can determine food choices as the individual or population level. The economic development of low-and-middle income countries (LMIC) has been accompanied by the nutrition transition. Cereal- and tuber-based diets (rice, corn, wheat, potato and cassava) are being replaced by more diversified diets containing more animal products, more processed foods and more added sugars and added fats. Whereas the percentage of calories from added sugars and animal and vegetable fats can vary widely, depending on country incomes, protein content of the diets remains relatively constant at 12-14%

However, plant proteins are often replaced by animal proteins from milk and dairy products or from meat, poultry, or fish. This component of the nutrition transition, called "protein transition", is very much dependent on perceptions, attitudes and on social and cultural norms. For example, populations in SE Asia derive up to 70% of energy from rice, with additional energy from leafy greens, other vegetables and some fruit. The consumption of meat and fish is low, as is the consumption of milk, whereas the consumption of yogurt and cheese is virtually non-existent. The diet is deficient in calcium, iron, and zinc and protein quality and amino acid balance are questionable. By contrast, countries in South Asia have increased milk consumption but for a variety of reasons consume little pork or beef.

Ongoing studies on the drivers of protein selection in SE Asia LMICs are directly in line with the WHO and FAO policies. One goal of the global nutrition strategy is to supply LMIC populations with high-quality protein foods that are nutrient rich, affordable, sustainable, and appealing.

Keywords: Sweet taste, energy density, food patterns, cost, affordability, protein transition, protein quality.

Conflict of Interest disclosure: AD has received grants, contracts, and honoraria from public agencies, private industry, private foundations, and commodity groups for projects involving nutrient profiling, diet quality assessments, and health outcomes

METHODS TO COLLECT AND COMPARE DATA ACROSS GEOGRAPHY

Fisberg, Regina.

PhD. Nutritionist. Department of Nutrition. School of Public Health. University of São Paulo.

The wide use of dietary data for researches relating diet to health and disease or in public policies planning requires that the collection of dietary information be increasingly accurate. New technologies have been developed to facilitate the food intake assessment, such as the use of internet, computers, tablets and smartphones. Although several techniques are still under development, especially in Latin America, many progresses have already been made, providing a range of possibilities for assessing food intake in both individuals and population groups.

Online platforms can help researchers determine the best way to assess diet for any study in which estimates of group intakes are required, since there is no perfect measure of diet. Understanding the key features of self-report instruments and the benefits and drawbacks of potential approaches to collecting and analyzing dietary intake data can help the researcher to make the best choices given the research question and resources.

Another possibility for the researchers is to be part of a network of cooperation with other researchers. Dietary data from several places can be compiled to provide food and nutrient intake data from countries around the world. Continuous collaborative networks are formed for gathering, validating and disseminating data on food intake of the main foods and nutrients for individuals by age, sex, household region, educational level and geocoding. These data enable to describe the global nutritional transition, ranging from nutritional deficiencies to overfeeding.

Several initiatives have been developed for customization and standardization at the food and nutrient assessments, intending to minimize systematic and random errors in nutrient intake estimations and to allow comparisons between different countries.

New methodologies applied to dietary assessment provide us with a step-change in our ability to reliably characterize food and nutrient intake in different researches. These new approaches may help to reduce measurement error and advance our understanding of diet in health and disease process.

NUTRITION GUIDANCE IN THE AGE OF GLOBALIZED MARKETS

Fisberg, Mauro.

MD, PhD, pediatrician and nutrologist. Coordinator of Nutrition and Feeding Difficulties Center Pensi Institute Fundação Jose Luiz Setubal. Associate Professor of Pediatrics Escola Paulista de Medicina UNIFESP. Brazil.

Modernization, globalization and industrialization are active words used very often associated to modified nutritional habits, and to the epidemiological and nutrition stages of transition in different parts of the world. The double burden of malnutrition and obesity raises costs of health management specially in developing countries. These areas still are counting the number of malnourished inhabitants and the increasing figures of diseases related to excessive weight. At the same time, we do need to understand role of modified nutritional habits, changes in life style, with the decrease of physical activity, despite rising numbers in institutionalized system for physical activity (gyms and sport activities).

Urbanization is a well-known phenomenon seen in many countries, and food production shifts from small producers to huge corporations and large scale soil modification. Industrialized food guarantees the access to food for increasing number of dwellings in urban areas, in a practical, possibly affordable and easy way. Nonetheless this is considered an issue for some researchers, based on the fact that shifting from home made and more natural systems of food producing for the more processed items, the amount of fat, sugar and salt intake could be increased. Many surveys do associate these changes with health outcomes as obesity, hypertension and cardio vascular diseases.

But it is not easily discussed that home and away from home recipes, using the so called natural food, could have higher levels of the same constituents as fat, sugar and sodium. Nutritional education is not so easily accessed as it is possible to control food processing methods in order to reduce this combination of nutrients.

In a globalized market, food is accessible and many items anteriorly only available to higher classes, are now been bought by new population of consumers. Low cost items are usually rich in fat and energy, changing importance in the menus with ancient local and traditional food combinations.

Global brands substitute regional recipes or preparations, modifying the way that families are preparing and consuming different meals. Many families are skipping meals, specially breakfast and dinners and family meals are scarce, rising possible health hazardous outcomes.

How to cope with modern times, with the new possibility of having access to more food items, in a practical and convenient way to combine industrialized and local and traditional food is a puzzle for all health planners. But it is very important to understand that the final consumer has the final word. And he decides what is best for him and his family. Convenience, price, culture and habits do determine his choices.

Keywords: Globalization, industrialization, obesity, processed food, family meals

FOOD COMPOSITION IS CENTRAL TO A FOOD SYSTEM APPROACH FOR NUTRITION

HOW TO DESIGN, PROMOTE AND IMPLEMENT NUTRITION-SENSITIVE FOOD SYSTEMS USING FOOD COMPOSITION DATA, BIODIVERSITY AND THE NUTRIENT PRODUCTIVITY CONCEPT

Charrondiere, U. Ruth; Wijesinha Bettoni, Ramani; Rittenschober, Doris; Vincent, Anna; Stadlmayr, Barbara; Scherf, Beate; Leclercq, Catherine; Hachem, Fatima.

Food and Agriculture Organization of the United Nations (FAO).

A food system covers all the elements (environment, people, inputs, processes, infrastructures, institutions, etc.) and activities that relate to the production, processing, distribution, preparation and consumption of food, and the outputs of these activities, including socioeconomic and environmental outcomes.

Making a food system nutrition-sensitive entails applying a nutrition lens to all its activities, considering all forms of malnutrition. First, an analysis of the food system and nutrition situation shall be done, based on which interventions shall be planned and implemented, explicitly designed to improve nutrition by taking the constraints of the food system into account. This shall be followed by monitoring of impacts. Possible questions can be 'Will activities improve (or harm) the nutrition situation?' or 'Which of the possible activities would best enhance better nutrition – while considering other aspects such as productivity or income?' or 'Are the currently produced and processed foods meeting the nutritional requirements of populations? If not, what needs changing, and is this feasible?'

To answer most of these questions, data are needed to design, implement and monitor nutrition-sensitive activities within the entire food system. Two important datasets are food consumption, e.g. FAO/WHO GIFT platform, or food composition data (FCD).

For example, in food production, FCD can be used to inform decision makers which agricultural products have the optimal nutrient composition to reduce malnutrition using foods. Those foods should then be included in large or small scale production, seed or research programmes and policies; or in incentives considerations to enhance production while lowering prices. A useful tool is FAO's newly developed Nutrient Productivity Scale which combines yield/production of different agricultural goods per hectare with their content of nine nutrients (energy, protein, dietary fibre, iron, zinc, calcium, vitamin A, vitamin C and folate) which is then compared to human nutritional requirements. Biodiversity needs to be considered as nutrient content differ significantly among the varieties or breeds of the same food, making the difference between nutrient adequacy and inadequacy. If foods or varieties with high micronutrient contents were produced or consumed in higher quantities they would eliminate micronutrient deficiencies worldwide. For that, FDC are needed, including data on different varieties or breeds delivered by different production systems.

During food storage and processing, some foods and nutrients are lost or wasted. FCD are key to develop new approaches to reduce food and nutrient losses or waste; enhance value chains of e.g. nutrient–dense fruits and vegetables; or develop food products being naturally enriched by adding highly nutritious foods. Food labelling is part of trade and marketing and useful in guiding food choices. Food Based Dietary Guidelines (FBDG) can inform policies, guide nutrition education, and inform consumers about healthy food choices at all ages and conditions. For all these purposes, FCD are needed on raw, cooked, processed and biodiverse foods.

Although FCD are needed to formulate and implement appropriate food system policies, they are absent for over 99% of the global foods produced and consumed. This should urgently be addressed to effectively and sustainably reduce malnutrition rates worldwide.

Italy.; [3]Nutritionist. Nutrition and Food Systems Division. Food and Agricultural Organization. Italy.; [4]PhD. Nutritionist. Children's Hospital Oakland Research Institute. Oakland. California. USA.; [5]PhD. Chemist. Department of Human Nutrition. University of Otago. New Zealand.; [6]PhD. USDA Agricultural Research Service. Pacific West Area. Aberdeen. Idaho. USA.; [7]PhD. Nutritionist. Nutrition and Food Systems Division. Food and Agricultural Organization. Italy.

In many low-income countries (LICs) staple diets are often plant-based with unrefined cereals, legumes, and oleaginous seeds providing major energy sources. These plant-based foods contain high levels of phytic acid (myo-inositol hexaphosphate, IP6) and its associated Mg, Ca, and K salts -termed phytates, which serve as a storage form of phosphorus and minerals. Phytate is the major inhibitor of iron and zinc absorption, and to a lesser extent calcium, in plant-based diets, forming insoluble complexes in the gastro-intestinal tract that cannot be digested or absorbed because of the absence of intestinal phytase enzyme in humans. The negative effect of phytate on zinc absorption in adults is much greater

than previously estimated, with a minimal ability to adaptively increase zinc absorption from high-phytate diets. FAO/INFOODS in collaboration with the International Zinc Nutrition Consultative Group (IZiNCG) have compiled a new comprehensive global repository of analytical data on the moisture, phytate, and Fe, Zn, Ca content (per 100 g edible portion on a fresh weight basis) of raw and processed plant-based foods. Values for partially dephosphorylated isomers of phytic acid (IP5-IP1) are also included, when available, together with details of analytical methods, biodiversity, origin, and food preparation and processing practices. These data will enable intakes and major food sources of phytate to be calculated from food consumption data in LIC and developed countries. Inclusion of data on dephosphorylated isomers of phytic acid (IP5-IP1) as well as phytic acid (IP6) is important because many plant-based staples in LICs undergo fermentation, germination, or soaking, all practices that can result in enzymatic degradation of phytate to lower inositol phosphates (i.e., IP4-IP1) which have a negligible adverse effect on mineral absorption. For each food, molar ratios of phytate: Fe, Zn, or Ca are also specified, which can provide estimates of the proportion of absorbable zinc or iron from foods and diet types. Diets with phytate-to-zinc molar ratios > 15, between 5 and 15, and < 5 are likely to have poor (~15%), moderate (~30%), or good (~50%) zinc bioavailability, respectively, whereas for iron, much lower molar ratios must be achieved to enhance iron absorption (i.e., phytate-to-iron <1.1). Recently dietary zinc reference values for adults have been set by the European Safety Authority for four dietary phytate levels. Unlike zinc and iron, bioavailability estimates for calcium and magnesium do not take into account dietary phytate:mineral molar ratios and any deficiency is more likely due to a low intake and not low absorption. In contrast, low absorption of iron and zinc from high phytate plant-based complementary diets is a major factor in the etiology of iron and zinc deficiency among infants and young children in LICs. Enhanced absorption of iron and zinc from such complementary diets can be achieved by enzymatic degradation of phytic acid. Implementation of such strategies has the potential to reduce the need for high levels of iron fortificants or supplements and their associated safety concerns in LICs where risk of infection is high.

Keywords: Phytic acid. bioavailability. phytate database. inositol phosphates. phytate-to-mineral molar ratios.

CONVINCING DECISION MAKERS TO INVEST IN HIGH QUALITY FOOD COMPOSITION TABLES NEEDED ALONG THE FOOD SYSTEM

(1)Longvah, Thingnganing; (2)R., Ananthan; (2)VSS., Prasad; (2)Sharma, Paras; (2)A., Laxmaiah; (2)K., Venkaiah.

(1)National Institute of Nutrition, Jamai Osmania PO, Hyderabad - 500 007, TS, India; (2)National Institute of Nutrition, Jamai Osmania PO, Hyderabad – 500 007, TS, India.

Adequate nutrition and good health of the population is a major concern of every government. The food system includes the many stages of converting natural resource and human efforts into food involving the production, processing, transport and consumption of food. Food system has also evolved over centuries into immense magnitude and complexities whereby composition of foods produced and consumed by the population vary widely affecting human health profoundly. Capturing precise nutrient intake data is critical for effective implementation of national nutrition policies and programmes. Robustness of dietary assessment by investigators depends on accuracy of database used which, if found lacking would not have the desired impact. The many potential uses of nutrient intake data impose concerns regarding the accuracy of many Food Composition Tables (FCTs) that have been constructed using data that are mostly imputed from other sources. Government expenditure to enhance food, nutrition and health depends on many factors including reliable food composition data that meets strict criteria of accuracy and appropriateness. Thus, food system investment has to be customized specific for high quality FCTs in order to utilize resources judiciously.

Food composition tables derived from exclusive analytical data are expensive to produce and maintain due to the high cost involved in food sampling and analysis of samples. Unless FCTs address important scientific questions of national relevance investment will be hard to come by. Government has the responsibility to improve the nutrition and social well-being and in order to attract investment in FCTs, the outcome should address at improving such issues. The key to attract funding for FCTs lies in challenging existing paradigms by addressing critical barriers in human development where the role of nutrition is paramount. Most food system policies and interventions are not designed with nutrition as the primary objective so the link between food systems and nutrition outcomes is difficult to trace. Nonetheless, government policies play a critical role in influencing agriculture and food system to improve nutrition as in the case of food fortification where food composition form the fundamental basis. However, to attract investment for high quality FCTs, research must align with national nutrition policies and programmes which is an important step to convince the decision makers as in the case of the new Indian FCT 2017, the details of which will be discussed.

BENCHMARKING GOVERNMENT POLICIES TO IMPROVE FOOD ENVIRONMENTS GLOBALLY

THE HEALTHY FOOD ENVIRONMENT POLICY INDEX (FOOD-EPI)

(1)Swinburn, Boyd; (2)Vandevijvere, Stefanie.

(1)Professor. School of Population Health. University of Auckland. New Zealand; (2)PhD. Senior Research Fellow. School of Population Health. University of Auckland. New Zealand.

INFORMAS (International Network for Obesity/NCD Research, Monitoring and Action Support) was established in 2012

and is currently measuring and benchmarking food environments and policies in more than 20 countries on all continents. One of the modules is the Food Environments Policy Index (Food-EPI) which seeks to measure progress on the implementation by governments of recommended food policies and infrastructure support systems. The Food-EPI is a participatory, evidence-based approach to measuring the 'implementation gap' compared to international best practice and prioritising actions to better implement food policies. It is being implemented in about a dozen countries which allows for comparative cross-national studies and will be repeated over time within countries. This symposium will present some of the experiences and results of Food-EPI studies in different countries.

THE FOOD-EPI IN AUSTRALIA: COMPARING PROGRESS ON IMPROVING THE HEALTHINESS OF FOOD ENVIRONMENTS ACROSS STATES

[1]*Sacks, Gary;* [2]*Sacks, Gary.*

[1]Global Obesity Centre. Deakin University; [2]Senior Research Fellow. Global Obesity Centre. Deakin University. Geelong. Australia.

Objective: To benchmark current government actions to improve the healthiness of food environments in Australia, and to identify priority policy actions for Federal/State/Territory governments

Methods: The Healthy Food Environment Policy Index (Food-EPI) tool, developed by INFORMAS (International Network for Food and Obesity / non-communicable diseases Research, Monitoring and Action Support) to assess government progress towards good practice in improving the healthiness of food environments, was modified for the Australian context. For each of the 46 indicators in the Food-EPI tool, details of each Australian government's current policies were collected and validated by government officials. Panels of non-government public health experts were convened in each State/Territory (total number of participants = 101) to assess the extent to which current government policies meet international benchmarks. Panel members then prioritised actions for each government, taken into account their relative importance and achievability.

Results: At a national level, level of implementation was assessed as high for some indicators, such as nutrition labelling, regulating health claims on packaged foods, and monitoring of population BMI. However, most indicators received relatively low ratings. State/Territory comparisons revealed several important differences in policy across the country (such as in the area of school food and restrictions of unhealthy food marketing), and helped to identify highly achievable policy actions.

Conclusion: The Food-EPI tool provides a useful set of indicators that can focus attention on where government action is needed. The results of this study can be used to increase accountability

of governments, stimulate government action and support advocacy efforts.

Keywords: Food and nutrition, non-communicable diseases, advocacy

CONSENSUS PRIORITIES BETWEEN EXPERTS AND POLICYMAKERS FOR IMPROVING THE HEALTHINESS OF FOOD ENVIRONMENTS IN THAILAND

Phulkerd, Sirinya.

BSc, MSc, MPhil. Researcher. Institute of Population and Social Research. Mahidol University. Thailand.

Bringing together diverse groups of stakeholders, including government officials and non-government experts, to make consensus recommendations for government is important to increase awareness, accountability and commitment on policy outcomes and impacts as well as to gain support for implementation of the proposed recommendations. The objective of the study was to conduct a joint meeting between government officials (simply called state actors) and non-government experts (simply called non-state actors), and seek consensus on priority actions to create healthy food environments for obesity and non-communicable disease prevention for Thai Government.

The joint meeting was conducted after completion of assessment of level of implementation of food environment policies and of prioritization of concrete actions for the government by each of the two actor groups using the adapted Healthy Food Environment Policy Index (Food-EPI). The assessment and prioritization results from both groups were key inputs for a discussion on the priority actions in the meeting.

The meeting was facilitated by the research team with the following key steps: (i) the participants were invited to ask questions and request clarification about the study before the discussion started; (ii) the research team presented the prioritization results for both groups; (iii) the participants reviewed the proposed actions, and then had a discussion with the view of reaching consensus on the priority actions; (iv) the participants discussed if any other actions (not previously discussed) should be included as a priority; and (v) the participants approved a set of consensus priority actions for the Thai Government.

Forty-eight state and non-state actors attended the meeting. Eleven consensus actions were selected as top priorities. Four actions focused on food labeling; two were on food provision; and one each was on food composition, food promotion, leadership, monitoring and intelligence, and food trade and investment. The actions included setting standards for food and beverage products provided and sold in schools and child-care centers; promoting provision and sale of healthy foods and drinks in hospitals and other public settings; developing a Thai nutrient profiling system; establishing a marketing framework for foods and beverages, particularly promotional strategies; setting the government's clearly defined goal in limiting intake of salt, sugar and saturated

fat among the Thai population; and developing self-monitoring systems in all educational institutions and other public settings to produce primary health information, such as weight, waist circumference and blood pressure, of their related people and make follow-up actions on update of such information.

The study provided priority recommendations stemming from consensus between state and non-state actors. The process and set of agreed priorities will serve as a platform for helping to drive Thailand's future policy actions, facilitate greater collaboration between different stakeholders operating within and across sectors, and establish a baseline and targets to measure progress in the future. This forms a core part of a broader strategy for accelerating the government and stakeholders to be more responsive and accountable to their citizens.

Keywords: Healthy food environments, priority actions, obesity, non-communicable diseases, state and non-state actors

MAPPING THE EXTENT OF IMPLEMENTATION OF FOOD ENVIRONMENT POLICIES FROM THE PERSPECTIVE OF A LOW-MIDDLE-INCOME COUNTRY-MALAYSIA

[(1)]Ng, See Hoe; [(2)]Kelly, Bridget; [(2)]Yeatman, Heather; [(3)]Swinburn, Boyd; [(4)]Vandevijvere, Stefanie; [(5)]Noor, Mohd Ismail; [(6)]Karupaiah, Tilakavati.

[(1)]MSc. University of Wollongong, Australia; [(2)]PhD. University of Wollongong, Australia; [(3)]MD. University of Auckland. New Zealan.; [(4)]PhD. University of Auckland, New Zealand; [(5)]PhD. Taylor's University, Malaysia; [(6)]PhD. The National University of Malaysia, Malaysia

Background and objective: Unhealthy diets are associated with non-communicable diseases (NCDs) and obesity. Efforts to reduce exposure to NCD risk factors through appropriate policy development towards modulating the food environment is now been mooted. This study sets out to benchmark food environment policy (FEP) implementation for the first time in Malaysia.

Methods: The Food-Environment Policy Index tool was adapted to assess data on FEP implementation in Malaysia relating to policies and infrastructure support covering 13 domains with 47 indicators. Evidence evaluation was performed by a panel of 26 independent Experts with ratings performed for policies as per indicator according to international best practice. Policies were shortlisted by Experts for possible improvement of implementation. This process was cross-validated with government stakeholders. A prioritization process was then completed by the Experts to rank policy actions as per 'importance' and 'achievability' criteria.

Results: Experts rated 61.7% indicators as "low" implementation and 38.3% as "medium" implementation (interrater reliability = 0.65, 95%CI 0.56-0.74). Establishment of food-based dietary guidelines (70.4%), population intake targets (64.6%), monitoring nutrition status and intakes (65.8%), monitoring NCDs risk factors and prevalence (65.0%) and ingredient lists and nutrient declaration (61.2%) were the highest scored indicators. In total, 32

proposed FEP actions were prioritized with 5 identified domains. The prioritized policies were to restrict unhealthy food promotion to children, establish food composition targets in selected foods, support mandatory nutrition labelling for sodium and total sugar for package foods and display calorie labelling in fast food outlets with >20 outlets, optimize existing anthropometric monitoring system for providing feedback, and provide population nutrition budget commensurate with population health burden, and fund research related to reduction in obesity and diet-related NCDs.

Conclusions: This is the first benchmarking process performed on FEP implemented in Malaysia. Findings will stimulate strategies to fill gaps in implementation of FEP, thus strengthening advocacy to effectively address the burden of NCDs and obesity.

THE FOOD ENVIRONMENT POLICY INDEX (FOOD-EPI), IN SOME LATIN AMERICAN COUNTRIES: RESULTS AND PROCESS EVALUATION

[(1)]Barquera, Simon; [(2)]Sánchez-Bazán, Karina; [(3)]Nieto, Claudia; [(3)]Tolentino Mayo, María Lizbeth; [(4)]Kroker, Maria Fernanda; [(5)]Corvalan, Camila; [(6)]Vandevijvere, Stefanie.

[(1)]MD, MS, PhD. Director. Nutrition and Health Research Center. National Institute of Public Health. Mexico.; [(2)]MA. Researcher. Nutrition and Health Research Center. National Institute of Public Health. Mexico.; [(3)]MS. Researcher. Nutrition and Health Research Center. National Institute of Public Health. Mexico.; [(4)]PhD. Senior Researcher. Instituto de Nutrición de Centroamérica y Panamá. Guatemala.; [(5)]PhD. Senior researcher. Instituto de Nutrición y Tecnología de los Alimentos. Universidad de Chile.; [(6)]PhD. Senior Research Fellow. School of Population Health. University of Auckland. New Zeland.

Unhealthy food environments are a major driver of obesity and Non-Communicable Diseases (NCDs). Government actions are essential to prevent these conditions. The international network INFORMAS has developed a monitoring framework, called the Healthy Food Environment Policy Index (Food-EPI), to assess the extent of implementation of government policies and actions for creating healthy food environments, compared to international best practices. This is composed by a set of 42 indicators, divided in two components: 1) policy and 2) infrastructure support. Teams in Mexico (INSP), Guatemala (INCAP) and Chile (INTA) worked together to implement the Food-EPI in Latin America (LATAM) throughout 2016, with support of IDRC (International Development Research Centre). First, we translated and adapted the Food-EPI to the LATAM context. The tool in Spanish was tested in each country. The 42 international indicators, with additional LATAM-specific ones, were included; and evidence of implementation was gathered and validated with government officials for all of them in each country. Some of the LATAM-specific indicators explore: a) access to free drinking water both in public spaces and inside elementary schools; b) policy harmonization, c) regula-

tions on sale and promotion of unhealthy foods inside and around schools; d) governance bodies that look after for policy design, implementation and evaluation; and e) measures to prevent conflict of interest in policymaking.

To assess the indicators, we developed an on-line tool to apply an electronic questionnaire to public health experts using Red-Cap and internal web platforms. Public health experts from academia and civil society were mapped and invited to participate in the electronic assessment. Each country held workshops with the evaluators to discuss the questionnaire results and to prioritize specific actions that could address the identified policy gaps. In the case of Mexico –given the sensitive political context surrounding NCDs prevention and control policies– government officials, legislators and food industry representatives were also assessed; and an additional consensus meeting was held between academia, civil society and government relevant actors.

The most important result of this exercise is that none of the indicators received a global general aggregated score of 'highly implemented'. For the case of Mexico and Guatemala, none of the indicators was rated with a high level of implementation. Some of the challenges of the Food-EPI in LATAM were: 1) to maintain a common set of indicators to allow international comparisons in relevant policy areas, while including new relevant indicators; 2) to find a large group of experts that that could participate, for example, Guatemala still faces under-nutrition and most of the experts alleged having expertise only in this area; 3) to have all the country territories represented in the assessment. The Food-EPI process is useful to identify policy agreements and oppositions. The entire exercise could become a platform for continued policy dialogue towards effective actions to address the burden of NCDs and obesity in LATAM and other developing countries.

OPPORTUNITIES AND CHALLENGES OF BENCHMARKING GOVERNMENT FOOD ENVIRONMENT POLICIES GLOBALLY

[1]Vandevijvere, Stefanie; [2]Swinburn, Boyd.

[1]Phd. Senior Research Fellow. School of Population Health. The University of Auckland. New Zealand.; [2]Professor. School of Population Health. The University of Auckland. New Zealand.

The International Network for Food and Obesity/Non-Communicable Diseases (NCDs), Research, Monitoring and Action Support (INFORMAS) developed the Healthy Food Environment Policy Index (Food-EPI) to measure progress by governments on implementing priority policies to improve the healthiness of food environments compared to international best practice. The Food-EPI is being applied in more than 10 countries globally. National Expert Panels of public health experts, and representatives from medical associations and NGOs rate the extent of implementation of policies on food environments by their governments against international best practice. Their ratings are informed by documented evidence, validated by government officials and international best practice exemplars (benchmarks). In addition, experts propose concrete actions for implementation by their government and prioritize those according to importance and achievability. The aim of this study is to compare the extent of policy implementation on food environments by governments in different regions globally, to evaluate the Food-EPI tool and process and make recommendations for its future use and implementation.

The good practice indicators (19 for the "policy" Food-EPI component and 23 for the "infrastructure support" Food-EPI component) were grouped into "very little, if any", "low", "medium" and "high" implementation and proportions of indicators across those 4 categories were compared among countries. In addition, the Food-EPI score was calculated using weightings for impact of each of the good practice indicators on improving population nutrition as derived from a Delphi process with international food policy experts. Semi-structured interviews were organized with the different country teams applying the Food-EPI to gather insights into the major strengths and limitations of the tool and process.

The Food-EPI dashboard of indicators shows major implementation gaps in different countries globally. Key strengths of the Food-EPI include the comprehensiveness and structure of the tool, the use of evidence in the rating process, the priority setting process, the degree of engagement from experts and policymakers, and the two-way learning process. Some countries involved policymakers very extensively, e.g. policymakers compiled the evidence rather than only verifying it (Australia), or they participated in rather than observing the rating process (Thailand and Mexico). The limitations of the Food-EPI mainly relate to the benchmarks: for some indicators it is hard to find what the benchmarks are (e.g. funding, governance), some benchmarks are low since no countries are doing really well, and for some countries the benchmarks are truly aspirational while in other countries experts argue they are too far away from the ideal. Rating against the benchmarks however is more acceptable for policymakers, and it is anticipated the benchmarks will improve over time, if more countries implement the Food-EPI. The efficiency of the process could be improved as well as the time burden is considerable for people involved.

The Food-EPI allows comparing progress on policy implementation to create healthy food environments among countries and has the potential to increase accountability of governments for implementation of recommended policies. It is anticipated the Food-EPI can be used by many more countries if some of its limitations are addressed.

International Development Research Centre. Canada.

Background and Objectives: There is scant evidence of the impact of small-scale aquaculture and homestead food production programs in Cambodia. This study evaluated the effect of aquaculture and enhanced homestead food production (EHFP) on maternal and child anemia, child anthropometry, household food security, production, and income in four districts of Prey Veng Province.

Methods: In this 22-month cluster-randomized controlled trial, 900 households were randomized to 1) plant-based EHFP; 2) plant-based EHFP and fishponds (EHFP+F); or 3) control. Household food security (HFIAS), dietary diversity, weight, length/height, hemoglobin, and self-reported estimates of production and income were measured at baseline and at 22 mo. A venous blood sample was collected in a subset (n=450) of women at baseline and endline. Differences in study outcomes between study groups were measured at endline, controlling for baseline values.

Results: We found that EHFP+F households were more likely (OR: 1.73; 95% CI: 1.09, 2.75) to be food-secure compared with control households (p=0.02). We saw significant endline differences in production among EHFP and EHFP+F groups, compared with the control group: EHFP group (mean ratio: 3.04; p<0.001); EHFP-F group (mean ratio: 4.01; p<0.001). There were significant endline differences in income from sales of HFP produce: EHFP

RESEARCH AND SCALING UP NUTRITIONALLY SENSITIVE AGRICULTURAL INNOVATIONS

EMPOWERING WOMEN & WOMEN-HEADED HOUSEHOLDS THROUGH PRODUCTION, NUTRITION EDUCATION AND CONSUMPTION STRATEGIES: LESSONS LEARNED FROM PULSE-BASED NUTRITION SENSITIVE AGRICULTURAL STRATEGIES IN ETHIOPIA

[1]Henry, Carol; [2]Fereja, Mengistu; [3]Mesfin, Addisalem; [4]Whiting, Susan J.; [5]Regassu, Nigatu.

[1]PhD. Associate Professor. College of Pharmacy and Nutrition. University of Saskatchewan. Canada.; [2]MSc. Research Associate. College of Agriculture. Hawassa University. Ethiopia.; [3]MSc. Lecturer. College of Agriculture. Hawassa University. Ethiopia.; [4]PhD. Professor. College of Pharmacy and Nutrition. University of Saskatchewan. Canada.; [5]PhD. Visiting Scholar. College of Pharmacy and Nutrition. University of Saskatchewan. Canada.

Undernutrition remains one of the greatest human and economic development challenges, especially in developing countries. One in four children under five years of age suffers from stunting, or chronic undernutrition, which is caused by poor quality and quantity diets, inappropriate care and feeding practices in early life, and high rates of infectious disease. Poor nutrition can result in an inter-generational cycle of undernutrition, since undernourished women are more likely to give birth to children that begin life nutritionally disadvantaged by the age of five years and therefore are more likely to grow into disadvantaged adults. Recent national statistics in Ethiopia indicate a high prevalence of maternal malnutrition (30%) and food insecurity (>50%) especially among women-headed households, and very low women's autonomy and empowerment index scores. Improving nutrition requires a multi-sectoral, multi-disciplinary approach that brings together stakeholders in health, agriculture, nutrition, women's affairs, and education, among others. This talk will examine the impact of an innovative pulse-based nutrition-sensitive agricultural strategy implemented in Southern Ethiopia on empowering thousands of women and women- headed households in decision making through participation in production, nutrition education, and skills training for improved household food consumption and livelihood. It draws on data from several field research projects conducted in six districts of Southern Ethiopia over the last five years (2011-2016). Our studies on pulse-based nutrition education resulted in significant improvements in knowledge and practice scores regarding complementary feeding (p < 0.001), pulse based recipe preparation, and in improvement of the dietary diversity (p = 0.02) and nutritional status of children (p < 0.05). Women's participation in pulse production created an enabling environment for improved decision making and autonomy (p < 0.001). There was opportunity for food preparation skills training, such as household processing of pulses and trying new recipes. Taken together, pulse-based nutrition sensitive agriculture strategies have

group (mean ratio: 1.77; p<0.05); EHFP+F group (mean ratio: 1.58;p<0.001). Across all groups, income was used to buy micronutrient-rich foods such as beef, pork, chicken and fish.

Women in both intervention groups were more likely to have consumed >6 foods groups in the previous 24h, compared to women in the control group (OR: 1.63; 1.01, 2.12; p<0.01; 1.46; 1.01, 212; p=0.01, among EHFP and EHFP-F, respectively). After adjusting for hemoglobinopathies, we found no improvements in anemia prevalence among non-pregnant women and children, or maternal and child anthropometry measures.

Conclusions: EHFP both with and without fishponds improved household production, income, food security and women's dietary diversity, but there was no additional benefit to food security or dietary diversity from the addition of aquaculture to the EHFP intervention. There were no significant improvements observed in hemoglobin, nutrition biomarker concentrations, or anthropometric indices for mothers or children after 22 months.

DIETARY DIVERSITY AND SCALING UP THE PRODUCTION OF IRON AND ZINC-RICH YELLOW POTATOES IN COLOMBIA

[1]del Castillo, Sara Eloisa; [2]Melgar-Quiñonez, Hugo.

[1]PhD. Associate Professor. School of Nutrition. Universidad Nacional de Colombia. Colombia; [2]MD. PhD. Associate Professor. School of Dietetics and Human Nutrition. McGill University. Canada.

Food insecurity among rural Colombian households is high, reaching 90% in some regions. Almost all farmers from the Colombian-Andean region rely on potatoes as their staple food as well as their main income source. In this presentation, we will discuss an ongoing project in Nariño, a region dependent on potato farming that has high rates of food insecurity, malnutrition, and nutritional deficiencies, particularly iron and zinc. Our aim is to increase the availability of more nutritious potatoes for Colombian consumers through a strategy that integrates agriculture and nutrition. We will introduce three varieties of yellow potatoes with better agronomic properties and higher zinc and iron content compared to potatoes currently being grown.

Potatoes are a staple food for Colombians, therefore the introduction of novel high-mineral potatoes may be part of a sustainable option to combat micronutrient deficiencies when it is part of a diverse and varied diet, such as alongside increased consumption of locally produced fruits and vegetables from home gardens. Although the iron and zinc in the novel potato varieties are not as bioavailable as animal-source foods, Colombian consumers do not always have the economic resources to purchase these foods. If we are successful this may help to meet the nutritional needs of vulnerable communities in the region.

To date, we have conducted a baseline survey and one follow-up survey measuring: the production and consumption of the varieties of yellow potatoes among the families of the project; dietary diversity (dietary diversity score through 24 hour recalls. In

children under 5, we will conduct anthropometric measurements height and biochemical assessment including iron status (hemoglobin, ferritin, transferrin), zinc and vitamin A.

COST-EFFECTIVENESS OF USING SUNFLOWER OIL FORTIFIED WITH VITAMIN A: RESULTS FROM TANZANIA

[1]Horton, Susan; [2]Mosha, Theobald; [3]Saleh, Nadira; [4]Belt, John; [5]Ndau, Edna; [6]Walters, Dylan.

[1]Ph.D. Professor. School of Public Health and Health Systems. University of Waterloo. Canada.; [2]PhD. Professor. Faculty of Agriculture. Sokoine University of Agriculture. Tanzania.; [3]MSc. Project Manager. Mennonite Economic Development Associates Canada. Waterloo. Canada; [4]MSc. Senior Advisor. Sustainable Economic Development. Royal Tropical Institute (KIT). Netherlands.; [5]MSc. Doctoral Student. Faculty of Agriculture. Sokoine University of Agriculture. Tanzania.; [6]MSc. Doctoral Student. Institute for Health Policy, Management and Evaluation. University of Toronto. Canada.

This study aims to estimate the cost-effectiveness of fortified unrefined sunflower oil produced by small and medium enterprises (SMEs). Tanzania has high levels of vitamin A deficiency which has negative consequences for morbidity and mortality especially in children under five. Although there is mandatory fortification of edible oils, until recently this has applied only to large-scale producers. However some regions prefer locally-grown and locally milled sunflower oil, and fortified oil currently does not reach many poor and remote households.

We utilize data from a three-year project piloting production of fortified oil by three SMEs in two regions of Tanzania. The data include information from the producers on costs and technology, and information from retailer surveys and from eVouchers regarding sales. Baseline and endline household surveys were conducted for intervention and control areas, which collected socio-demographic and health information from lactating women and their children under five, household oil samples which were tested for retinol content, and finger-prick blood samples from mothers and children for retinol binding protein.

Findings are as follows:

• "Gold standard" technology was used for the pilot, but a lower cost technology would need to be used for scale-up, provided regulatory approval could be obtained.

• SMEs are able to produce oil which maintains vitamin A content up to the point of consumption by households, and SMEs are key to reaching vulnerable households.

We use this information to model the cost-effectiveness of fortification by enterprises of varying scale among the SME sector.

Conclusions:

• Fortification is a key way to improve vitamin A levels for pregnant and lactating women, who are key to the vitamin A status of infants. Safety concerns mean that mega-dose supplements cannot be used for this group.

• Fortification by SMEs can – if implemented appropriately – be a cost-effective intervention.

FORTIFIED COMPLEMENTARY FOODS IN VIETNAM: VALUE CHAINS TO SUPPORT LOCAL WOMEN FARMERS AND ENTREPRENEURS

[1]Yeudall, Fiona; [2]Huy, Nguyen Do; [3]Rocha, Cecilia; [4]Phuong, Huynh Nam; [5]Tuyen, Le Danh; [6]Phu, Phan Van; [7]Trung, Le The; [8]Medonca, Melody; [9]Brown, Matthew.

[1]PhD. RD. Associate Professor. Centre for Studies in Food Security. Ryerson University. Canada.; [2]PhD. Associate Professor and Head of Food and Nutrition Training Center. National Institute of Nutrition. Vietnam.; [3]PhD. Professor and Director School of Nutrition. Centre for Studies in Food Security. Ryerson University. Canada.; [4]MD. PhD. Deputy Head of Food and Nutrition Training Center. National Institute of Nutrition. Vietnam.; [5]MD. PhD. Associate Professor. Director National Institute of Nutrition. Vietnam.; [6]MD. PhD. Associate Professor and Deputy Head of Nutrition and Food Safety Department. Hanoi Medical University. Vietnam.; [7]MPH. Deputy Head of Nutrition Department. Nam Dinh Nursing School. Vietnam.; [8]MHSc. Centre for Studies in Food Security. Ryerson University. Canada.; [9]MSc. Centre for Studies in Food Security. Ryerson University. Canada.

The ECOSUN project aims to contribute to reduction of levels of food and nutrition insecurity in three northern Provinces in Vietnam by scaling up local production of fortified complementary food using locally grown crops, and local manufacturing facilities and distribution channels. Our food systems approach aims to enhance agricultural livelihoods of small scale women farmers through their integration into an agricultural value chain and increase availability of fortified complementary foods in Lao Cai, Lai Chau and Ha Giang by establishing Small Scale Food Processing (SSFP) plants. Vietnam's National Institute of Nutrition and their business subsidiary NINFoods developed and field tested fortified complementary foods made from local ingredients, developed partnerships to establish two SSFP plants and recruited and trained small scale women farmers to supply ingredients to the plants. Named after the project's ecosystem approach (ECO) and Vietnam's Little Sun maternal child counselling centres (SUN), the ECOSUN project sites were selected due to the estimated 31% (iron) and 81% (zinc) prevalence of deficiencies among children in the region. An instant rice based complementary porridge fortified with iron (0.9mg/30g) and zinc (0.45mg/30g) was developed for ease of preparation, given time constraints and limited cooking facilities accessible to the target population when their children accompany them to the field for example. Legislation requiring mandatory fortification of wheat flour was recently introduced, signaling acceptance of fortification as a cost effective and sustainable intervention. This presentation focuses on the baseline survey results of over 800 child/caregiver pairs as the first stage of the project impact evaluation. Interviews assessed KAP related to infant feeding practices, gender (Abbreviated Women's Empowerment in Agriculture Index) and standard sociodemographic indicators. Household level food security was assessed using validated HFIAS and Mean Adequate Household Food Provision scales. Nutrition Security was assessed via core IYCF indicators minimum diet diversity, meal frequency and acceptable diet), child anthropometric and hemoglobin (via Hemocue) measures. Data analysis is ongoing at the time of writing of the abstract.

TECHNOLOGY DEVELOPMENT AND SCALING UP FOR DOUBLE FORTIFICATION OF SALT WITH IODINE AND IRON

[1]Diosady, Levente; [2]Mannar, M.G. Venkatesh.

[1]Ph.D. P.Eng. Professor Emeritus. Department of Chemical Engineering and Applied Chemistry. University of Toronto. Canada.; [2]D.Sc. hon. causa. P.Eng. Adjunct Professor. Department of Chemical Engineering and Applied Chemistry. University of Toronto. Canada.

Iodine deficiency is the largest cause of preventable developmental problems, while iron deficiency is a major cause of reduced work capacity, reduced immunity, maternal and infant mortality and impaired development in children. Iron deficiency affects some 2 billion people, mostly in the developing world.

Iron and iodine deficiency may be addressed by fortification of a food staple that is universally consumed in quantities essentially independently of economic or social status. Salt is an ideal vehicle for micronutrients, as it is centrally processed, and purchased or bartered by even the poorest rural consumers. Salt is now iodized in most countries, and iodized salt reaches nearly 85% of the world's population, resulting in significant decreases in iodine deficiency disorders.

Since iodine and iron interact, resulting in the loss of iodine and reducing the bioavailability of iron, double fortification requires technology that keeps these micronutrients separated in salt. We developed microencapsulation-based technology for producing an iron premix that can be added to iodized salt, which does not interact with iodine and remains bioavailable for at least one year. The product was tested for efficacy in two large trials in Bangalore and Darjeeling, India confirming its positive impact in improving iron status and reducing anemia and iodine deficiency. The technology was scaled up and applied in a school lunch program in Tamil State benefiting nearly 5 million school children over the past 8 years. A new program to provide double fortified salt to 24 million people in the lowest income quintiles through a subsidized food commodity distribution program in Uttar Pradesh State has been initiated this year. A baseline health and nutrition survey was completed in late 2016, and the impact of the intervention will be measured after 12 months of sustained utilization of the double fortified salt.

This talk will describe the many stages of the scale-up from 100g batches to 600ton lots of double fortified salt, resulting in a proven and feasible means of combating both iodine and iron deficiency with potential for replication across large regions of the world where these deficiencies continue to be significant problems.

FROM SUSTAINABLE FARMS TO BETTER NUTRITION: LINKING COMMITMENTS TO RESEARCH, POLICY AND PRACTICE

WHAT TO DO: FRAMEWORKS AND WAYS FORWARD FOR IMPROVING NUTRITION THROUGH AGRICULTURE AND FOOD SYSTEMS

Garrett, James.

Sr Research Fellow. Bioversity International. Italy

A more holistic focus has led to increased attention to the determinant roles played by agriculture and food systems in achieving healthy diets and improved nutrition. An integrated framework for understanding how agriculture and food systems affect diets and nutrition will be presented, particularly from the perspective of low- and middle-income countries. Impact pathways and key actions to make agriculture and food systems more nutrition sensitive will be highlighted, including specific points of entry along the stages of a value chain (from inputs to consumption) and for the food system overall. This includes special attention to production, transport and transformation, and consumption, as well as the enabling policy and program environment, gender, equity, and environmental sustainability. The issues of capacity, governance, and scaling up will also be noted. The presentation will also build a bridge between research and action, highlighting key emerging questions about choice, design, and implementation of actions to promote agriculture- and food-based approaches to creating more sustainable food systems for healthy diets and improved nutrition.

HOW TO DO IT BETTER: EVIDENCE AND COMMUNICATIONS FOR HEALTHY DIETS AND SUSTAINABLE AGRICULTURE AND FOOD SYSTEMS

Kennedy, Gina.

PhD. Senior Scientist. Bioversity International.

This presentation will highlight what we already know and what we need to know in order for agriculture to contribute more effectively toward healthy diets and sustainable food production systems. The latest evidence on what works – the theory of change, the impact pathways – for how agriculture and sustainable food systems can contribute to improving nutrition will be reviewed. What we currently know about the best actions to take in agriculture and food systems to create diverse, healthy diets in a sustainable way, including areas that may not now be receiving attention,

such as the importance of agrobiodiversity, biofortification, sustainability, systems thinking, and "multi" actions (multi-sectoral, -disciplinary, -actor, -value chains, -SDGs) will be described.

The presentation will also emphasize the importance of evidence-based decision making, including the importance of strengthening monitoring and evaluation (M&E) systems and of closing the gaps between research, policymaking, and operations. It will also describe new and innovative tools and methods that are available to design more effective policies and programs.

The presentation will note where there are remaining information needs and knowledge gaps, such as data on individual and household food consumption patterns and food composition, particularly of local varieties, and appropriate and reliable project-friendly tools and indicators for nutrition-sensitive agriculture. It will also look at how national and international research and data initiatives are addressing these issues, such as the CGIAR's Research Program on Agriculture for Nutrition and Health (A4NH), GIFT, an FAO initiative for open access data on individual dietary assessment, and the RBA Working Group on Sustainable Value Chains for Nutrition. Areas for further research, such those around multisectoral governance, capacity strengthening, food safety, consumer behaviors, food environments, effects of urbanization and food system assessment will also be highlighted.

PROJECT DESIGN, IMPLEMENTATION, AND POLICY ENGAGEMENT FOR NUTRITION-SENSITIVE AGRICULTURE

Friedrich, Juliane.

Nutritionist, International Fund For Agricultural Development (IFAD).

An integrated framework for understanding nutrition-sensitive agriculture, and the current evidence base, has been presented in this symposium, but practically how do we make agricultural projects and policies nutrition sensitive?

The presentation will take real-world experiences to highlight what needs to happen on the ground for effective design and implementation of nutrition-sensitive agricultural projects and policies, as well as note key challenges and gaps. It will describe specific potential interventions and enabling frameworks and look at issues of identifying appropriate point of entry, integration of nutrition into agricultural projects (rather than setting up separate stand-alone interventions), appropriate project indicators, working multisectorally, and the need for design and implementation capacities across levels.

The presentation will note the importance of working at both sectoral project and broader policy and institutional levels. Ac-

tions can be taken both to mainstream food security and nutrition in sectoral strategies and investments; and support the contribution of food and agriculture to multi-sectoral nutrition strategies. Attention to the broader policy environment is crucial since most governments allocate funds by sector, so for nutrition to receive adequate financial and operational support, a case for nutrition and agriculture must be made at a supra-sectoral level.

In addition to identification of appropriate actions, attention has to paid to capacities and funding. Without sufficient individual, organizational, and systemic capacities or without sufficient funding even well-designed projects and policies will not work. The role of organizations like the RBAs are critical here: from technical advice and policy support, to logistics, to development of evidence, and finance, these organizations can assist to develop the needed capacities and provide needed knowledge and investment funds. The rise of nutrition as a corporate priority for these organizations, and others such as the World Bank, means that there is an excellent opportunity to increase operational synergies among them on nutrition and action and provide strong, integrated support for country actions to mainstream nutrition in agricultural investments.

GETTING IT DONE: FRAMEWORKS, APPROACHES, AND TOOLS FOR NATIONAL CAPACITIES IN AGRICULTURE AND NUTRITION

Aburto, Nancy.

Nutrition Division. United Nations World Food Programme. Italy.

Beyond conceptual frameworks, evidence, and field-based guidance for action on making agriculture and food systems more nutrition-sensitive, the RBAs also offer a range of knowledge and operational support to help countries achieve their commitments under ICN2, SUN, and the SDGs. This presentation will highlight the particular contributions of each RBA in the area of nutrition-sensitive agriculture and food systems, how they work together, and what they can offer to countries to support actions at global, regional, and country level.

FAO, for example, provides technical assistance to governments on mainstreaming nutrition in agricultural-related policies and investments (including agriculture, social protection, livestock, forests, and fisheries). IFAD is an international financial institution providing loans and grants primarily for development of smallholder agriculture in low- and middle-income countries, with special attention to climate change, women, youth, and indigenous peoples. WFP is the leading global humanitarian organization fighting hunger, with a focus on emergency assistance, relief and rehabilitation, development assistance and special operations

to build resilience and improve nutrition. Bioversity International is a member of the CGIAR and, along with 6 other institutions, a partner in the CGIAR's Agriculture for Nutrition and Health (A4NH) research program. It is an international research institution delivering scientific evidence, management practices and policy options to use and safeguard agricultural and tree biodiversity to attain sustainable global food and nutrition security. Just as important as the individual organizational mandates are the coordinating mechanisms such as the UNSCN, CFS and SUN, which provide a common platform and discussion space for inter-agency and international exchange of best practices.

These organizations can provide knowledge publications to build awareness of frameworks and design processes (e.g., Guidance for Nutrition-Sensitive Programming, Designing Nutrition-Sensitive Agricultural Investments, Guidance on Design of Nutrition-Sensitive Value Chain Projects, Resource Framework for Home-grown School Feeding, Meals Programme, Cost-Benefit Analysis, Fill the Nutrient Gap, Food-based Dietary Guidelines), project indicators (e.g., Compendium of Indicators for Nutrition-Sensitive Agriculture), and capacity strengthening (e.g., design and use of national food-based dietary guidelines, courses on nutrition education). They disseminate research publications and deliver capacity strengthening activities around critical areas of overlap between agriculture, food systems and nutrition, such as: food systems for healthier diets; biofortification; food safety; policies, programmes and enabling actions; and improving human health (which are also the five flagship research areas of A4NH). They also provide policy support (e.g., through country offices) and finance for agricultural investments (IFAD), knowledge generation (FAO), and operations (WFP) as well as support for country action on SUN.

THE ROLE OF AGRICULTURE IN IMPROVING NUTRITION IN THE GLOBAL CONTEXT: COMMITMENTS GUIDELINES AND THE ROME-BASED AGENCIES

[1]Dufour, Charlotte; [2]Garrett, James; [3]Friedrich, Juliane; [4]Kennedy, Gina; [5]Aburto, Nancy; [5]Marshall, Quinn.

[1]UN Food and Agriculture Organization; [2]CGIAR A4NH; [3]International Fund for Agricultural Development; [4]Bioversity International; [5]UN World Food Programme.

This presentation will introduce the Symposium organized by the Rome-based Agencies (RBA's) - the UN Food and Agriculture Organization (FAO), the World Food Programme (WFP), the International Fund for Agricultural Development (IFAD) and the CGIAR center Bioversity International – on the topic "From

Sustainable Farms to Better Nutrition: Linking Commitments to Research, Policy and Practice".

This presentation will describe how, over the past decade, governments and the global development community have increasingly recognized the importance of good nutrition to economic growth and social development, and introduce progress in the global governance for nutrition. The binding commitments that governments have made to eradicate malnutrition through the Second International Conference on Nutrition (ICN2), the Sustainable Development Goals, and the Scaling Up Nutrition Movement, will be presented, along with the UN Decade of Action on Nutrition, which presents a unique opportunity to promote nutrition worldwide as it pushes even more attention to global monitoring of government actions and progress on nutrition. The presentation will also describe the role of the UN Standing Committee for Nutrition (UNSCN) and the World Committee for Food Security (CFS) in supporting member states in making, implementing and reporting on commitments for nutrition will be introduced.

Linkages to other global movements of relevance to food systems and nutrition – such as the ongoing Decade on Biodiversity and the Convention on Biological Diversity, and the Save FOOD initiative – will also be made. The presentation will highlight the implications of such global commitments for country level action.

These commitments require action on agriculture and food systems, an area that governments are often not familiar with and one for which international guidance and national experiences are limited. Countries are rightfully now asking: "We've made commitments on nutrition, what do we actually need to do to fulfill them?" and "Agriculture and food systems may play roles in improving nutrition. But what are they, and what do we need to do?"

The presentation will highlight why attention to agriculture and food systems is essential to improving nutrition in today's world (and commonalities between issues in low-, middle- and high-income countries), and introduce the other presentations in the Symposium, which will describe the support that the Rome-based agencies (RBAs) can provide to help countries close the gap between commitment and action, and successfully achieve their pledged goals. The presenters will share concrete frameworks, evidence, approaches and tools that have been developed by the RBAs and others to catalyse and promote evidence-based action by governments and other stakeholders in this area, in order to fulfil those international commitments and end hunger, achieve food security and improved nutrition, and promote sustainable agriculture.

Department of International Health, University of Tampere Medical School, Tampere, Finland.

There is a current discussion if dairy protein is needed in food products for preventing and treating moderate and severe acute malnutrition (MAM, SAM), because it is an expensive ingredient. A WHO technical note (2012) on supplementary foods for the management of MAM in children 6-59mo recommends that the protein source has a PDCAAS >70%, corresponding to optimized cereal/legume mixtures, milk and animal proteins. A footnote mentions that milk powder improves the amino acid profile and bioavailability of calcium and potassium, has stimulating effect on IGF-1 and linear growth and contains no anti-nutrients. WFP (2016) specifies that at least 1/3 of the protein should come from milk powder in ready-to-use-supplemental-foods (RUSF) and lipid-based nutrient supplements, medium quantity (LNS-MQ). For ready-to-use-therapeutic-foods (RUTF) USAID (2015) specifies that at least 50% of protein must come from dairy, from either milk powder or whey protein concentrate (WPC). Specifications for fortified blended foods (FBF) also include milk protein. FBF specifications from WFP (2015) for Super Cereal plus is that 8%w/w should be dried skimmed milk (DSM). USAID (2011) specifies that 3% w/w of WPC80 is added to CSB14. DSM and WPC34 have a high content of lactose (~50%w/w) which potentially has prebiotic effects and positive effects on growth (Grenov et al, FNB 2016). Other dairy products (WPC80 and WPI) have considerably lower lactose content (10 and 1 % w/w, respectively).

Recent intervention studies have examined the effect of dairy in treatment of MAM and SAM. In a study in Malawi and Mozambique, 6-59 mo old children with MAM were randomized to a RUSF with soy or a combination of whey protein and permeate. The RUSF with dairy resulted in higher recovery and improved growth (Stobaugh et al. AJCN 2016). In a noninferiority study in Congo children with SAM aged 6-23 and 24-59mo were randomized to a RUTF with soy-maize-sorghum (SMS-RUTF) or with peanut and DSM. In children ≤23mo the recovery rate of SMS-RUTF was inferior, but it was concluded that in children ≥24mo SMS-RUTF can be used to treat SAM (Bahwere et al. 2016).

We examined the effect of different amounts of DSM in a randomized intervention study among 1609 children 6-23mo old with MAM in Burkina Faso. It was a 2x2x3 factorial design where we assessed the effectiveness of a) matrix, ie LNS vscorn-soy blend,

b) soy quality, ie dehulled soy vs soy isolate, and c) level of dry skimmed milk, ie 50 and 20% vs 0% of protein. The primary outcome was fat-free tissue accretion over a 12 week intervention, measured by deuterium dilution. Secondary outcomes included recovery rates and other anthropometric measures. The results will be presented at the meeting.

The effects of dairy on recovery and weight gain are important outcomes, but examining the effects on body composition and long-term effects on growth, development and health of using dairy in prevention and treatment of MAM and SAM should also be examined.

Keywords: Dairy, protein, acute malnutrition, food aid

RATIONALE AND EVIDENCE REGARDING SMALL-QUANTITY LIPID-BASED NUTRIENT SUPPLEMENTS FOR FOOD ASSISTANCE

Dewey, Kathryn G.

PhD. Professor. Department of Nutrition. University of California, Davis. USA.

Lipid-based nutrient supplements (LNS) are a family of fortified, lipid-based products that deliver vitamins and minerals, essential fatty acids, protein and energy in a lipid matrix. The low moisture content of LNS ensures resistance to spoilage. Large- and medium-quantity LNS are being used to treat and prevent acute malnutrition. Small-quantity products (SQ-LNS, < 20 g/d, ~110-120 kcal/d) have been developed to complement the diet with key nutrients for infants and young children, and for pregnant and lactating women, with the goal of preventing undernutrition. They typically include 22 micronutrients, in addition to essential fatty acids and a small amount of high quality protein. In food assistance programs, SQ-LNS have several potential advantages. Because the quantity is small and the product is ready-to-eat by itself or mixed with other foods, the entire intended daily ration is easily consumed even by infants, ensuring that the micronutrient needs of these vulnerable target groups will be met each day. The small quantity also minimizes transport and storage costs and reduces the likelihood of sharing of the supplement with others, by comparison to larger-quantity food assistance products such as cereal-legume blends. When necessary (e.g. widespread food insecurity), provision of SQ-LNS for these target groups can be coupled with provision of staple foods or cash transfers for the entire household. Several efficacy and effectiveness trials have been conducted with SQ-LNS. Taken as a whole, the evidence suggests that prenatal SQ-LNS supplementation promotes fetal growth, and SQ-LNS for the mother and/or young child can promote child growth and development and reduce anemia, though there is heterogeneity in these effects both within and across study populations. In some settings, a growth response appears to be constrained by certain contextual factors such as frequent infections. Further research would be valuable to evaluate the effectiveness of

SQ-LNS within food assistance programs in different contexts (including acceptance, utilization and cost-effectiveness), and when integrated with other strategies to reduce infections and promote child development.

Keywords: Lipid-based nutrient supplements; infants; pregnant women; malnutrition; child growth

SCALING-UP ACCESS TO NUTRITIOUS COMPLEMENTS TO YOUNG CHILDREN'S DIETS FOR FOOD ASSISTANCE AND BEYOND

de Pee, Saskia.

PhD. Nutritionist. UN World Food Programme, Rome, Italy.

Intake of essential nutrients, including vitamins, minerals, essential amino acids and essential fatty acids is often below required levels among populations that receive food assistance as well as among other populations whose diet has limited diversity due to availability and affordability constraints. For young children (6-23 months of age), special nutrient-rich commodities that can complement their diet of breastmilk and complementary foods are a good way to introduce them to the family diet and local foods, and at the same time ensure that their needs for essential nutrients are met. Different options for enriching the young child's diet are being developed and tested for acceptability, stability, cost as well as nutrient bioavailability and impact of its consumption on nutritional status and functional outcomes. Such options include small-quantity LNS, special fortified blended foods (also known as infant cereals), micronutrient powder and other fortified complements in powder form that contain micronutrients, high-quality protein and some essential fatty acids. Food assistance can provide access to these types of products in different ways, including in-kind distribution where the product is handed out at a specific distribution point or by a designated person (health care center, food aid distribution site, community health worker); by providing a commodity-specific voucher that can be redeemed at a distribution point, i.e. the voucher can be provided through the health center while a site that handles foods, including stores, can provide the commodity; or indirectly by providing cash or e-card together with promotion activities to stimulate purchasing of specific commodities, which hence need to be available in the area and liked by the consumer. For a sustainable supply chain to develop, there needs to be sustainable demand, which can be from both self-purchasing consumers and the public sector, whether the government, UN agencies or NGOs. This requires that the products meet a need from the consumers, i.e. they like the product and are prepared to pay for it, using their resources, including cash but also opportunity costs, i.e. the effort they have to put into obtaining, also a free, product. The use of vouchers can be considered in developing markets where manufacturers are putting different potentially suitable products on the market to meet a (growing) demand from different groups of consumers. Monitoring these initiatives for product take-up (acceptance), utilization, and impact on young children's diets and nutrient intake will be very important.

COST-EFFECTIVENESS: WHAT HAVE WE LEARNED?

University of California Davis. Davis CA.; [8]PhD. Alexander McFarlane Professor of Nutrition. Friedman Nutrition School Tufts University Boston MA USA.

Prevention and treatment of childhood undernutrition in LMICs typically relies on supplementary foods given in quantities calibrated to the needs of the target child. Foods used in supplementary feeding programs (SFPs) include fortified blended flours (FBF), prepared as porridge often with vegetable oil, multiple micronutrient powders (MNP) added to children's food, or lipid-based ready-to-use supplementary food (RUSF), consumed directly from individual single-dose packets. Controlled trials have assessed the efficacy of such foods, but their effectiveness depends on their programmatic context. Proper preparation and feeding to the target child per protocol determine effectiveness, beyond the composition of the food.

In the context of SFPs, cost-effectiveness (CE) is the cost of achieving the desired nutritional or health outcome. CE can vary widely depending on the outcome. CE depends on the cost of the daily ration, but also on the number of doses required to achieve the outcome and the amount needed for a sufficient quantity to reach the target child. Other program costs that affect CE include transportation, storage, distribution, and the losses incurred at each stage. Packaging affects shelf life and resistance to infestation and contamination; appropriate packaging can also affect the time required, and therefore staff cost, of distribution. As behavior change communication affects correct preparation and feeding, the planning, labor, and other costs of delivering it, are part of the CE calculation; indeed, program costs can be larger than product costs. Costs include the value of resources provided without charge: volunteer labor and (importantly) caregiver time.

Current FAQR studies in Burkina Faso and Sierra Leone assess the CE of four supplementary foods to treat wasting (Sierra Leone) or prevent wasting and stunting (Burkina Faso). The foods are three FBFs and one RUSF. Two of the FBFs require preparation with added oil; two (including one that does not require added oil) contain a dairy component; the RUSF contains dairy, and has high lipid density, comparable to the FBF if prepared with added oil in the recommended ratio of 30 g oil: 100 g FBF. In Burkina Faso, children received a food supplement from ages 6 – 23 months; CE was measured in terms of the percentage of children treated with each food who were not stunted by 24 months of age, and who experienced no episodes of wasting during the treatment period. In Sierra Leone, the primary outcome is recovery from MAM, but lean mass accretion and neurological performance are additional outcomes. Costs include the cost of the food and all programmatic costs.

CE requires investment in data collection and analysis, but is essential to decision-making about the most appropriate foods to include in SFPs and the most efficient way to deliver them. One food may be more effective, but less cost-effective; in the face of limited program resources, the more cost-effective product will allow successful treatment of more children. More broadly, CE gives a concrete basis for choosing cost-effective investments in health and nutrition.

COST-EFFECTIVENESS: HOW CAN WE USE WHAT WE KNOW?

El-Kour, Tatyana.

Nutrition Expert Consultant. Independent Practice. Middle East and North Africa. Egypt. Africa

Background: At a time when the world's nutrition care is moving toward accountable care, cost-effectiveness in food aid research offers an innovative approach to reducing cost and increasing quality of nutrition intervention. It empowers practitioners to prevent and treat undernutrition by informing both the cost and outcomes of nutrition interventions. It also provides evidence by comparative evaluation of the costs and consequences of using different food aid products to prevent and treat undernutrition.

Objective: The aim of this presentation is to review implications of findings from cost-effectiveness studies in food aid research for impactful nutrition practice.

Methods: The presentation provides: (1) application of the main concepts and key steps in integrating cost-effectiveness re-

search with practice, and (2) a summary of the lessons learned about interventions inspired by findings from cost-effectiveness in food aid research to evaluate nutrition interventions compared to current practice.

Discussion: Empirical research from cost-effectiveness on food aid suggests that linking programmatic costs with effectiveness outcomes are critical to influencing the impact of nutrition interventions. Different factors influence this link, including: determining cost of items, characteristics of beneficiaries, food system environment; food aid mechanism and amount; and approaches to handling cost and addressing administrative, operational, and contextual complexity. Experiences show that results of cost-effectiveness food aid evaluations influence resource allocation decisions, support advocacy efforts, improve policy design, highlight partner and community contributions, inform programmatic evaluation and learning, improve the quality and efficiency of delivering nutrition care, and estimate future nutrition care expenses.

Conclusion: Cost-effectiveness research impose both a systemic challenge and a growing opportunity to encourage global action on reducing malnutrition and realizing a world of zero hunger by 2030. Efforts to draw on lessons learned from cost-effectiveness food aid research suggest a set of practice options that are paramount to guiding practitioners and informing the global practice and policy debate with considerations to the underlying determinants of food and nutrition, strategic and operational context, cross-cultural adaptation, and gender-responsiveness. Advances in cost-effectiveness methodology, expanding use of technology for data collection and utilization, partnership coordination, and addressing socioeconomic, cultural, and institutional factors are needed, in addition to greater systematic integration of cost-effectiveness approaches into mainstream programming to affect nutrition and population health response.

Keywords: Cost-effectiveness, food aid, practice implication, nutrition care, response

POTENTIAL OF MONITORING FOOD ENVIRONMENTS FOR IMPROVING ACCOUNTABILITY AND POLICY

USES OF FOOD ENVIRONMENT DATA FOR POLICYMAKING: OVERVIEW OF CASE STUDIES FROM CANADA

L'Abbé, Mary.

PhD. Earle W McHenry Professor and Chair. Dept of Nutritional Sciences. University of Toronto. Canada.

Monitoring the food environment over time is essential for informed policy-making. Data that examines a number of aspects related to the quality of the food environment serve several purposes throughout the policymaking process: it provides policymakers with evidence regarding the need for development of new policies to address gaps; needed updates to existing policies; and can be used to help shape and evaluate a number of different policy options to address the above. Finally, information on the food environment is essential in policy implementation, whether it be through education, guidelines or regulations, as it can help inform the potential effectiveness of proposed policies that are under consideration by governments, and then can help to evaluate the effectiveness of large-scale policies on influencing the quality of the food environment after they have been rolled out. Examples will be provided from the Canadian context on how food environment data has been used by government officials to inform policy decisions in Canada, and by researchers and NGOs to help shape the policy agenda. Examples include information on the nutritional quality of the packaged foods before and after voluntary sodium and trans fat reduction targets, modelling the proposed benefits of including information on added sugars to the Nutrition Facts table, the impact of provincial menu labelling legislation on the quality of restaurant foods before and after implementation, and the potential efficacy of proposed nutrient profiling systems for front-of-package labelling regulations and and for restricting marketing to children, among others. These case studies provide examples of the important role of collaboration between food environment researchers, NGOs and policy makers to understand the food environment and interpret the implications of policy on it, and highlight the importance of collecting historical data to track changes over time.

Keywords: Food environment, monitoring, food policy,

GLOBAL BENCHMARKING OF THE COMPOSITION OF FOOD PRODUCTS

Dunford, Elizabeth; Neal, Bruce.

PhD. The George Institute for Global Health. Australia.

Background: Non-communicable diseases now account for more than 60% of total deaths globally. Governments from a number of countries are now calling for population-wide preventive measures based upon an improved food supply. Improvements will only be achieved if there are definitive data describing the food supply and how it can be improved. A number of nutrient profiling schemes exist which aim to determine the healthiness of packaged food products. The Health Star Rating is one such system which assigns a product a value between 0.5 and 5.0 stars, in half star increments, with a higher number of stars indicating a healthier product.

Objective: Our primary objective will be to compare the overall healthiness of packaged foods in supermarkets across a range of countries using the Health Star Rating system. Secondary objective will be to examine the levels of energy, saturated fat, total sugars and sodium per 100g of product.

Methods: Nutrient content data will be obtained for a sample of 10 countries currently involved in the INFORMAS network for

which existing data are available. A range of high, middle and low income countries will be included. Products will be categorised into 18 major food categories developed by the Food Monitoring Group. For our primary objective, the Health Star Rating will be calculated for all eligible food and beverage products. For our secondary objective, means (SD) levels of energy, saturated fat, total sugars and sodium per 100g will be calculated. If the data are found to be skewed, the median and range will be reported. Differences between countries will be examined.

Results: The data used for each country analysis will be summarized. The mean Health Star Rating for foods in each country overall and in each major food category will be reported and compared. Countries will be ranked by mean Health Star Rating and by mean levels of each nutrient. Examples of how the data have been used by government to inform policy development, as well as by industry to inform internal product reformulation will also be presented.

Conclusions: With processed foods playing a central causative role in diet-related disease burden, understanding differences in the global food supply is central to the prevention effort. Standardised data that can be collected in the same way over time and across jurisdictions can support this goal. Outputs can be tailored to support food manufacturers, retailers, government and consumers in a diverse range of strategies targeting improvements in the world's food supply. Data can also be used to prepare media releases that highlight the issue to the population at large.

Keywords: Food labels; processed foods; public health nutrition; nutrient profiling, diet related disease, food supply

INFORMAS

BENCHMARKING FOOD ADVERTISING ON TELEVISION AMONG COUNTRIES GLOBALLY

[1]Kelly, Bridget; [2]Vandevijvere, Stefanie.

[1]PhD. Dietitian. Early Start Research Institute. University of Wollongong. Australia; [2]PhD. Global Health, Food Policy, Obesity and NCD prevention. Department of Epidemiology and Biostatistics. School of Population Health. University of Auckland. New Zealand.

Children's exposure to unhealthy food promotions contributes to poor diets and has been identified as a global priority issue for obesity and non-communicable disease prevention. Monitoring of unhealthy food promotions is necessary to: identify the extent of children's exposure and the need for policy interventions; inform the basis of policy specifications, such as marketing media and techniques that are restricted; and, over time and across places, to evaluate the impact of policy interventions on reducing children's exposure to this marketing and its persuasive power. This study aims to compare the extent and nature of unhealthy food and non-alcoholic beverage advertising to children on television

across countries and/or regions with different types and strengths of regulations in place.

A literature review was undertaken to identify studies that had captured data on children's exposure to television food advertising. Corresponding authors were contacted and asked if they would be willing to contribute their data for a global comparison of food advertising to children. Researchers were required to reclassify information on advertised foods according to the World Health Organization European Nutrient Profile Model. All included datasets needed to include information on the hours during which the adverts occurred, to enable estimates of the frequency of advertising per hour. Sample days (weekdays/weekends) were weighted to give mean advertising frequencies. Researchers who were also known to have collected data on television food advertising using the INFORMAS protocol (but had not yet published their data) were also approached. A review of included countries' food marketing policies was undertaken to compare food advertising rates by policy types.

Around 15 research groups, spanning countries from Australasia, Europe, North America, and South America agreed to contribute television advertising data. Mean frequencies of food and unhealthy food advertising (per hour/per channel) will be described across countries and regions. Rates will be analysed according to peak viewing times of children, during regulated hours and during popular children's programs. For a subset of countries were data are available, the 'persuasive power' of food promotion will be determined, including the use of promotional characters and premium offers. Finally, the 'impact' (no. ads per timeslot x no. children watching) of unhealthy food advertising to children will be determined, including how this impact could be reduced through different policy scenarios.

This global comparison of children's exposures to television food promotions highlights the potential of INFORMAS for benchmarking food environments across countries and regions, and for evaluating the potential for policy actions in reducing children's exposure to unhealthy television food advertising.

Keywords: Marketing, Advertising, Child, Food, Beverage

IMPLEMENTATION OF THE ADVERTISING AND LABELLING LAW IN CHILE: EARLY RESULTS OF IMPACT ON FOOD REFORMULATION

[1]Kanter, Rebecca; [2]Reyes, Marcela; [2]Corvalan, Camila.

[1]PhD. Unit of Public Health. Institute of Nutrition and Food Technology-University of Chile. Chile.; [2]MD, PhD. Unit of Public Health. Institute of Nutrition and Food Technology-University of Chile. Chile.

Background and objectives: In 2012 Chile passed the Law of Food Labeling and Advertising (Law 20.606). The law specifies limits for solids (per 100g) and liquids (per 100ml) for critical nutrients (sodium, sugars, and saturated fats) and energy; applying only to products with added sodium, sugars and/or saturated fat. A product can have up to four "High in" front-of-pack warning la-

bels, one for each critical nutrient and calories. The study objective was to evaluate potential anticipatory changes ahead of the implementation of this law in June 2016 by examining food composition changes. Specifically, if food product reformulation occurred regarding selected nutrients between early 2015 and early 2016.

Methods: The INFORMAS framework for monitoring the composition of the food supply was used. In February 2015 and 2016, fieldworkers photographed a representative sample of packaged food products (n=5421 and n=5479) from 6 different supermarkets in Santiago, Chile. Foods were excluded if they required reconstitution, had missing information or if total labeled energy was estimated as incorrect. To study reformulation, only the food products collected in both data collection rounds were included in the analysis (n=2,428). Foods were grouped into 17 categories, consisting of 141 subcategories. The average change in energy and each critical nutrient was estimated for each food category averaging the change of each product; the food subcategories with the largest decreases between 2015 and 2016 were identified. Finally, foods were classified based on whether they would receive a "High in" Calories, Sodium, Sugars and/or Saturated Fats warning (solids/liquids: >350/100 kcal; >800/100 mg sodium; >22.5/6 g total sugars; >6/3 g saturated fats) and prevalence compared between 2015 and 2016.

Results: Between 2015 and 2016, 12 of the 17 (70%) food categories had overall reductions in calories (kcal) and sodium, 11 food categories experienced declines in average total sugar levels, while only two food categories (cereal-based products and salty snacks) experienced a decline in average saturated fat levels. The greatest declines in critical nutrient levels observed were with respect to sodium levels; especially, in the subcategories of instant rice (-192.4 mg/100 g) and frozen marinated fish (-164 mg/100 g). The largest reductions regarding energy and the other critical nutrients were: instant rice (-35.7 kcal / 100 g), pastry icing (-3 g sugars / 100 g) and hamburger buns (-.5 g saturated fats / 100 g). These overall reductions illustrate a low impact in terms of the new labeling as the prevalence of "High in" food products declined >1% in less than half of the food categories ("High in saturated fats" in 6 food categories, "High in sugars" (n=4), "High in sodium" (n=3) and "High in calories" (n=1)).

Conclusions: From 2015 to 2016, modest changes in food product reformulation were observed prior the implementation of the regulation. It is uncertain whether the notable reductions in sodium levels can be attributed to law 20.606 or overall global trends in sodium reduction. Data collected after the implementation of the law will serve to assess the actual impact of the new regulatory norms.

Keywords: Reformulation, INFORMAS, critical nutrients, food environment, Chile

UNHEALTHY FOOD ENVIRONMENTS IN GUATEMALA AND COSTA RICA. ARE REGULATIONS NEEDED?

[1]Krober-Lobos, Maria F; [1]Alarcon, Amarilys; [1]Cosenza, Emma L; [2]Gamboa, Tatiana; [1]Pineda, Andres; [1]Sanchez, Carmen Maria; [2]Zamora, Irina; [3]Blanco, Adriana; [4]Vandevijvere, Stefanie; [1]Ramirez Zea, Manuel.

[1]INCAP Research Center for the Prevention of Chronic Diseases (CIIPEC). Institute Nutrition of Central America and Panama (INCAP). Guatemala.; [2]School of Public Health. University of Costa Rica. Costa Rica.; [3]National Plan to reduce public consumption of Salt/sodium in Costa Rica, Costa Rican Institute of Research and Teaching in Nutrition and Health (INCIENSA).; [4]Department of Epidemiology and Biostatistics, School of Population Health, University of Auckland, New Zealand.

Background and objectives: The Central American region is facing the nutrition transition and excess body weight and diet-related non-communicable diseases –NCD´s are highly prevalent. An unhealthy food environment –FE- is considered the prevailing driver of population unhealthy weight gain. Our objective was to measure the healthiness of the FE in Guatemala and Costa Rica, using standardized methodology from the International Network for Food and Obesity/non-communicable diseases Research, Monitoring and Action Support (INFORMAS) on Food Composition (FC), Food Labelling (FL), Food promotion on TV (FP), and the extent of implementation of FE policies through the Healthy Food Environment Policy Index (Food-Epi).

Methods: For FC and FL, we extracted levels of critical nutrients, persuasive marketing techniques (PMT) and health and nutritional claims (HNC), from pictures of foods products sold in the major supermarkets in Guatemala City (n=3459) and San Jose (n=2469). FP was analyzed recording TV advertising in cable and national channels with the highest child audience during 864 hours in Guatemala and 576 hours in Costa Rica (weekends and weekdays). Food products were classified using the WHO nutrient profile (European system) to indicate whether they were marketing permitted or not-permitted. The Food-Epi was calculated with the perception of non-government experts, on the level of implementation of food policies, and priority actions were identified.

Results: In Guatemala and Costa Rica, FC and FL measures revealed that products with an excess of critical nutrients use PMT, HNC and poor labelling practices. FP measures revealed that TV advertising of food products with marketing restrictions, according with WHO nutrient profile, is higher compared with those with a healthier nutrient profile (p<0.05). In Guatemala, the Food-Epi index revealed low implementation of food policies by the government to prevent obesity and NCD´s.

Conclusions: Guatemala and Costa Rica have an unhealthy FE characterized by persuasive marketing and availability of energy-dense low-nutrient food products targeted to children. In Guatemala, current actions from the public sector are not tackling unhealthy FE. National regulatory actions such as a front-of-pack food labelling system and the limitation of child-oriented promotion are needed in order to prevent childhood obesity and NCD´s.

PS_144/1009

HEALTHY CONSUMPTION PATTERNS AND SUSTAINABLE PRODUCTION: EXPLORING THE LINKS BETWEEN AGRICULTURE, DIET AND LIFESTYLE USING ORGANIC AS AN EXAMPLE

THE ORGANIC FOOD SYSTEM AS A MODEL LINKS AGRICULTURE, DIET AND LIFESTYLE – PRESENTING THE CASE

[1]Kahl, Johannes; [2]Strassner, Carola; [1]Bügel, Susanne.

[1]University of Copenhagen. Denmark..; [2]University of Applied Sciences Münster. Germany.

Today's understanding of food systems includes product-specific values (e.g. palatability, taste, nutritional and safety values, health promotion) and process-oriented values (e.g. environmental impact, animal welfare and social fairness). These values are currently challenged and changing. Food habits, cultural, social, ethical, economic and political criteria play an increasingly important role as values. Dietary patterns are becoming more Westernized worldwide. This has tremendous impact on food consumption, the environment, society and individual human as well as public health. The socio-cultural context of food consumption and production has been recognized as an essential part of a sustainable food system. A sustainable food system comprises agriculture, environment, nutrition and human health. Indeed, it has been suggested that food systems as well as diets or dietary patterns should be assessed in all different dimensions of sustainability including impacts on health (nutrition). The central questions can be described as: how can we transform the whole food system to be more sustainable by a combination of sustainable consumption and sustainable production. For understanding, measuring and improving a system approach in food and nutrition research is required. This includes the description of the system boundaries, the actors and activities on different levels and scales. One crucial question is how to link measurable parameters to system scales

or dimensions. Furthermore models are needed for conceptualization and simulation. The organic food system offers such an example of successfully combining sustainable food production and sustainable consumption patterns within one system. Based on central findings through surveys and other studies around the world, consumers and producers of organic products share specific attitudes to food that are mainly oriented towards health and environment. Drivers of system transformation process towards enhanced sustainability including better nutrition needs to be identified and evaluated as well as translated into tools that enhance and reinforce the necessary changes in lifestyle. Another requirement for a system approach is interdisciplinary working, taking natural and social science perspectives together. The presentation will contribute with conceptualize the food system approach, taking organic food system as a model as well as present examples from different entry point of food systems. Furthermore future research challenges in taking a system approach in food and nutrition science will be discussed.

Keywords: Food system approach, sustainability, organic food systems

Carola Strassner, Susanne Bügel

PUBLIC PROCUREMENT AS A MEANS TO LINK SUSTAINABLE PRODUCTION WITH DIET AND LIFESTYLE – THE NEW NORDIC DIET WAY

Bügel, Susanne.

Professor, PhD, Department of Nutrition, Exercise and Sports, University of Copenhagen, Denmark.

The Danish Government has made a goal about doubling the agricultural area used for organic production in 2020 compared to 2007. Therefore the government supports a number of initiatives which increases the production, export and consumption of more organic products. One of these initiatives is the transition from conventional products to organic products in public procurement in Denmark.

The municipality of Copenhagen decided in 2001 that by 2011 75% of food served by public kitchens should be from organic production. In 2007 the goal was raised to 90%. The aim of this presentation is to show how transformation to organic produce without increasing costs can change diets to more healthy and sustainable diets.

Governmental support of organic agriculture, mandatory change from conventional food products to organic food products in public food service in the Municipality of Copenhagen without increasing the costs. Designation of Københavns Madhus to be the driving force behind the transition supporting the public kitchens with knowledge, motivation, education, ideas etc to make the changes.

Today that goal that 90% of public meals should be made from organic produce has been reached. Not only because it was a political decision, but also because the staff in the public kitchens have

replaced whole and semi-finished products with seasonal produce and have limited waste. The transition has been done without increasing costs. This has resulted in kitchens using more seasonal produce and more vegetables, legumes and fruits and less meat.

Mandatory change to organic food, without increasing cost, results in changes towards more healthy diets. The Copenhagen model is exported to other municipalities in Denmark, but it still remains to be shown that the transition to organic produce also transfers to people not dependent on public food service and if the transition has health promoting effects in the Danish population.

SUSTAINABILITY IN DIETARY PATTERNS ACCOUNTING FOR FARMING PRACTICES: FINDINGS FROM THE BIONUTRINET PROJECT

Kesse-Guyot, Emmanuelle.

Nutritional Epidemiologist. Nutritional Epidemiology Research Team- Inserm (U1153) Inra (U1125) Cnam, Université Paris13 - Centre de Recherche en Epidémiologie et Statistiques Sorbonne Paris Cité. France

Sustainable food market is developing and consumers' growing concerns for food quality is more and more prominent. However, little is known about the potential sustainability of the organic diet at the individual level. The aim of the study was to address the sustainability, using numerous indicators, of individual diets according to contribution of organic food to the diet.

Conventional and organic food intakes of 29,210 French adults included in the NutriNet-Santé cohort were assessed using an organic food frequency questionnaire. Weighted (on French census data) quintiles of the contribution of organic food to the diet were calculated.

Quality of the diet was estimated using two indexes (mPNNS-GS andPANDiet) evaluating the adherence to food-based and nutritional guidelines.

Daily dietary GHGEs (expressed in kgCO2eq/year) and energy uses (at production level) of the diet were computed, taking into account farming practices (organic or conventional production) using mostly data from the Dialecte database.

Diet costs were also calculated accounting for food consumption, mode of production and place of purchase.

Adjusted means were compared between weighted quintiles (Q) of contribution of organic food, using ANCOVA models. For environmental impact, scenarios (100% organic and 100% conventional) were computed to disentangle the effect of organic diet from those of composition of the diet.

In our sample, 20% of participants were never or little consumers of organic food while 20% consumed at least 50% of their diet in the organic form.

High organic consumers were more often women (Q5 versus Q1: 55.3 versus 45.1%), highly educated (Q5 versus Q1: 30.9 versus 15.6% postgraduate), and living more often in rural area (Q5 versus Q1: 29.62 versus 22.86%).

They exhibited healthier lifestyle (no smoking, low alcohol consumption, elevated physical activity) and high consumption of plant food. Plant to animal protein ratio was 13.42 in the Q5 and 0.46 in the Q1. Energy intake was 2,125 and 2,040 Kcal/d in the Q5 and Q1 respectively. Heme iron intake was 1.02 and 1.91 mg/d in the Q5 and Q1 respectively.

After adjustment for age, energy intake and sex mean mPNNS-GS (/13.5) and mean PANDiet (/100) were 8.83 and 69.18 in the Q5 and 7.80 and 62.52 in the Q1.

Diet cost (euro/d) was 8.79 in the Q5 and 7 in the Q1.

A decrease in GHGe was observed across quintiles with 1,158 in Q5 versus 1,850 kg CO2eq/year in Q1. Similar findings were observed for Primary energy consumption (Q5 versus Q1: 5,359 vs 7,202 MJ/year).

Model scenarios revealed that for GHGe, the structure of the diet was mostly responsible for the observed association; whereas for primary energy consumption, mode of production was also an important lever.

Using observational data, our study provides new arguments concerning the potential of organic diet to contribute to sustainable diets, in particular through the modification of the diet composition.

Our results highlight the importance of promoting holistic changes in dietary patterns to meet future environmental challenges, including the mitigation of global warming.

LINKING A FOOD SYSTEM WITH PUBLIC HEALTH NUTRITION: WHAT DO WE LEARN FROM ORGANIC?

Strassner, Carola.

Professor Sustainable Food Systems and Nutrition Ecology. Department of Food - Nutrition - Facilities. FH Muenster University of Applied Sciences. Germany.

Background and objectives: Organic food and farming can be described as a food system and it can be studied as such due to its legally defined production and processing methods, as well as the ability to follow organic products from farm to fork via independently audited labelling schemes in more than 80 countries worldwide. The aim of this study is to examine for any evidence of effects of the organic food system on public health nutrition. Methods: Linkages between organic agriculture, food, nutrition, and public health overall and in particular settings were explored

in literature. Results: Organic increasingly plays a role in public policy: Many countries or regions have subsidy schemes for organic agriculture for differing reasons and some of these integrate organic food products into (sustainable) public procurement goals. In particular, organic foods have been included in school meal systems. Studies in Europe show that schools with a healthy-food policy also support organic food; alternatively, an organic school policy can promote healthy eating. Consumer studies show that organic is believed to be healthier for humans and better for the environment, also providing the reasons for its selection. Recently it has been shown in national nutrition surveys that regular consumers of organic products make healthier and more sustainable food choices, including choosing a more plant-based diet. Field observations from foodservice consultancy suggest a similar pattern for so-called large-scale consumers. Here, too, buying and using organic foodstuffs seems to be associated with better diet and better knowledge of foods. On the production side, promoting health at various levels, from the individual to communities, is considered one of four central principles of organic agriculture (health, ecology, fairness, care). It aims to produce high quality, nutritious food that contributes to preventive health care and well-being. The organic process has significant impacts on the quality of organic foods compared to non-organic foods. At the same time some developed organic markets may be showing a product range increase in processed foods above other categories. In this connection the limitations on product formulation and applied processing technologies given by organic frameworks need further study. Conclusions: The nexus between public procurement, public diet and public health nutrition can be studied within the frame of organic food systems in varying geo-socio-cultural regions worldwide. Further studies are needed to validate or counter initial findings.

SWEETENERS: ADVANTAGES AND APPLICATIONS IN THE 21ST CENTURY

SWEETENERS AND NEW FLAVORS

[1]Laviada-Molina, Hugo; [2]Molina-Segui, Fernanda.

[1]MD, MSc. Endocrinologist. Universidad Marista de Merida. Mexico.; [2]MSc. Nutritionist. Universidad Marista de Merida. Mexico.

World Health Organization (WHO) recomends no more than 10% of daily calories from added sugars or "free sugars" like syrup, honey or juices. Excesive consumption is linked to cardiometabolic diseases and certain cancers. However, desirable taste for sweet flavors is innate. Health recommendations limit the use of caloric sweeteners as sucrose, high fructose corn syrup (HFCS), molasses, honey, agave nectar, maple syrup or brown rice syrup.

However perception of consummers of them as "healthy or unhealthy" is not uniform and can be deceiving when one of them is viewed as more "natural" in its source. This idea can produce overconsumption.

HFCS obtained through enzymatic processing of corn syrup to increase the fructose content increase its sweetness, being the main caloric sweetener in the soft drink industry. There is debate concerning whether HFCS presents greater risks than the other sugars concerning metabolic disorders.

WHO and other health organizations recommendations increased the debate of sugars substitution by non caloric sweeteners. Intense sweeteners are food additives containing significantly less or none calories compared to sugar. These additives may be derived from natural or synthetic sources.

Other option used by food industry are sugar alcohols like sorbitol, mannitol, xylitol and more recently erythritol, with some advantages over their predecesors because of its neutral metabolic profile, and very low energy density. Erythritol, xylitol and sorbitol have been studied as alternatives to sugars against dental caries.

Artificial sweeteners are into two categories. The first one is the chemically synthesized: sucralose, alitame, cyclamate, aspartame, neotame, potassium acesulfame, and sacharin (discovered in 1878). The second is intense sweeteners extracted from plants: Stevia rebaudiana, Luo Han Guo and glycyrrhizin. Sweet tasting proteins from fruits includes thaumantin, monellin and brazzein. Lisozyme is a protein from egg whites. High intensity sweeteners have differienciated characteristics related to their structure: show delay the onset of sweetness, lingering, bitter or metalic aftertaste, non-linear sweetener consentration to sweetness equivalency ratio, adaptation or desensitizing, and a lack of mouthfeel or body, compared with sucrose.

Flavor enhancers are used to make the high intensity sweeteners taste more like sucrose: maltol, ethyl-maltol, strawberry furanone and vanillyls. Sugar alcohols and other polyols are used to provide mouthfeel, viscosity or cooling effect.

Sacharine is a coal tar derivative sold as powder and used in a variety of foods, beverages and baked products. It has a bitter aftertaste. Aspartame is composed of two amino acids: aspartate and fenylalanine. It is 200 times sweeter than sucrose. Its caloric value is insignificant. Acesulfame-K has similar sweetening power, but resist the heat. Sucralose is 600 times sweetener than sucrose, formulated by clorination of glucose, with great stability. Cyclamates are 30 times sweeterthan sugar, with little afterstaste and are heat resistant. Stevia is 250 times sweeter than the reference, and it is shelf stable when dry. Has a bitter taste when consumed in high quantities.

Formulation of food and beverages with sugars substitutes is a complex task which requieres combination of some of the intense sweeteners with other modifiers of taste and texture.

COHORT STUDIES IN IBERO-AMERICA

A LOOK INTO PREGNANCIES IN VENEZUELA: THE IMPACT OF ADVERSE CONDITIONS IN PREGNANCY DEVELOPMENT AND NEWBORNS

[1]*Herrera-Cuenca, Marianella;* [2]*Hernandez, Pablo;* [3]*Mangia, Karina;* [4]*Mercadante, Yazareni;* [5]*Crespo, Jessica;* [6]*Rodríguez, Rodmar;* [6]*Khawam, Rania.*

[1]PhD. MSc. MD Centro de Estudios del Desarrollo. CENDES/ Fundación Bengoa. Venezuelan Health Observatory. Caracas. Venezuela.; [2]MSc. Nutritionist School of Nutrition Central University of Venezuela. Venezuelan Health Observatory. Venezuela.; [3]Nutritionist. Alcaldía de Municipio Sucre. Health Department. Venezuela.; [4]Nutritionist. Venezuelan Health Observatory. Venezuela; [5]Venezuelan Health Observatory. Venezuela.; [6]MD. Alcaldía de Municipio Sucre. Health Department. Venezuela.

Nutrition and wellbeing conditions during pregnancy and early infancy are relevant in defining short and long term health. The Developmental Origins of health and Disease (DOHaD) paradigm provides a framework to assess the effect of early exposures (adequate or not) on long term health. Based on the evidence that adequate nutrition and good environmental conditions including those social determinants of health that ensure the wellbeing of population; it is expected that advantageous consequences in the predictive adaptive responses will show, thus preparing the fetus for the later environment that is anticipated based on its developmental experience (Uauy, 2011).

Low and middle income countries are showing an increase in chronic diseases prevalence all of which are associated with poor environmental conditions at the beginning of life.

In consequence, impairment of pre-conceptional and during pregnancy nutrition status, living within a food insecure household and having an income below the line of poverty level are adverse conditions that might promote the development of diseases in the long term.

The last decade Venezuela has been facing a severe economic crisis that has promoted important alterations for the quality of life of Venezuelans (ENCOVI, 2014,2015, 2016)

A pilot for a cohort study was conducted in a low income urban area within the Venezuelan Capital city, Caracas. During 2013 a sample of 171 pregnant women was recruited from the ambulatory clinics of Sucre Municipality in Caracas, and the follow up of neonates was completed for 70. Of those women, 44% had it first pregnancy before age 17, and the majority of pregnant women (66%) were categorized as IV Graffar Méndez Castellano SEL (low). Impairment of pre-conceptional nutrition status was reported in 40% of women, 30% started pregnancy with a BMI > 25, and 10% with a BMI that showed undernutrition. 20.8% has a history of abortion (Mercadante, 2016). 49.8% of pregnant women with excess weight had 4 or more pregnancies and pre-conceptional nutrition status of the late pregnancy was associated with number of pregnancies. 15% of neonates were small for gestational age. It should be highlighted that 69% of the households had at least one characteristic of food insecurity and 30% of the sample reported no income at all. 15% of women referred going to bed at night with hunger because there was no money to buy foods and, an inverse significant association was found between the experience of hunger and family income. Logistic regression analysis showed that the probability of living in a food secure household diminished if there was a pregnant woman living in there and if the household family income was below the poverty line. In conclusion: The conditions in which Venezuelan women are facing pregnancies do not guarantee their wellbeing and their neonate's. These conditions: food insecurity, living in a household with an income below the poverty line and multiple pregnancies are factors that require effective policies for implementing strategies to guarantee a good lifestyle standard for Venezuelans and for preventing diseases in the future.

EARLY LIFE FACTORS AND CHILDHOOD HABITS INFLUENCING EXCESS BODY WEIGHT IN A SPANISH MULTICULTURAL COHORT (CALINA COHORT)

Rodríguez, Gerardo.

PhD. Professor of Pediatrics. Instituto de Investigación Sanitaria Aragón. University of Zaragoza. Spain.

Childhood obesity is a major public health problem. Despite the reported stabilization of its prevalence in developed countries, overall trends in childhood obesity mask significant and increasing differences between children from upper and lower socioeconomic status (SES) backgrounds and in those who accumulate more early life risk factors and family predisposition (a mixture of cultural, genetic or behaviour habits). Differences in obesity prevalence among vulnerable groups exist but it remains unclear

whether these differences may be partly determined by SES, parental adiposity or pregnancy and infancy risk factors. Several early-life risk factors have been identified in the literature, including maternal pre-pregnancy overweight/obesity, smoking during pregnancy, excess gestational weight gain, prematurity, high and low birth weight, caesarean section, not being breastfed and rapid early infant weight gain.

To explore early-life risk factors of overweight/obesity at age 6y and their cumulative effect on overweight/obesity at ages 2-,4- and 6y. To investigate longitudinal associations between belonging to a minority group and being overweight/obese at 6 years old, as well as between accumulation of social vulnerabilities.

Study design: 1,031 children were evaluated at birth and re-examined during a 6-year follow-up in a representative cohort of Aragon (Spain). Maternal smoking during pregnancy, gestational weight gain, gestational age, birth weight, caesarean section, breastfeeding practices and rapid infant weight gain from birth to 6 months of age were the factors studied. Parental body mass index (BMI), maternal education, parental/ethnicity origin were defined as main confounders. Children from minority groups (vulnerable groups) included Spanish Roma/gypsies, Eastern Europeans, Latin Americans and Africans. Two more vulnerable groups were defined at baseline as children whose parents reported low occupational status and low education. We used logistic mixed-effects models to assess the associations investigated.

Parental BMI and parental ethnicity/origin were the strongest predictors of overweight/obesity and they confounded several associations. Among early life factors, rapid infant weight gain (OR=2.29;[1.54-3.42]99%CI) and smoking during pregnancy (OR=1.61;[1.01-2.59]99%CI) remained statistically significant as predictors of overweight/obesity at the age of 6y after adjusting for confounders. A higher number of early-life risk factors was associated with higher odds of being overweight/obese at the age of 6; two early-life risk factors (OR=2.72;[1.54-3.42]99%CI); three early-life risk factors (OR=5.02;[2.28-11.04]99%CI) and four to six early-life risk factors (OR=7.33;[3.01-17.84]99%CI). Roma/gypsy children (OR=4.30;[1.13-16.23]99%CI) and with Latin American background (OR=2.93;[1.26-6.79]99%CI) were more likely to be overweight/obese at age 6 compared with non-gypsy Spanish group. Children with three social vulnerabilities (OR=2.08;[1.08-4.04]99%CI) were more likely to be overweight/obese at age 6 compared with children with no vulnerabilities. No associations were found at earlier ages.

Rapid infant weight gain, parental BMI and origin/ethnicity are important determinants of childhood obesity. Those with a higher number of early risk factors had elevated odds for obesity at age 6 suggesting cumulative effects. Monitoring children with rapid infant weight gain is especially important for childhood obesity prevention. Early interventions should be developed targeting Roma/gypsy children, Latin American children and those who accumulate more social vulnerabilities as they are at higher risk of being overweight/obese later in life.

ASSESSING THE IMPACT OF GROWTH TRAJECTORY OF VERY LOW BIRTH WEIGHT INFANTS ON EXECUTIVE FUNCTIONS AT 11 YEARS OF AGE

[1]Vivas, Silvana; [2]Dinerstein, Alejandro; [2]Solana, Claudio; [3]Granovsky, Gustavo; [2]Casale, Marita; [2]Conti, Roxana; [4]Cúneo Libarona, María Lucrecia; [2]Schapira, Iris; [2]Apres, Norma.

[1]Educational Psichology. Pediatrics Outpatient department. Hospital Materno Infantil Ramón Sardá, Buenos Aires, Argentina.; [2]Medical doctor Ramón Sarda Maternity. Argentina; [3]Phonoaudiologist. Ramón Sarda Maternity. Argentina.; [4]Physical Therapy Doctor. Ramón Sarda Maternity. Argentina.

Background and objectives: Several studies on preterm-born children have identified birth weight (BW) as a potent predictor of later cognitive functioning and academic success, with poorer outcomes in those born SGA (small for gestational age) compared with those appropriate for GA (AGA). The objective of the study was to compare SGA and AGA born preterm (<=1500g) children between 10-12 years old (y/o) on growth at 1 and 2 years of life and on the outcomes of the rings subtest (RSubt) of the ENFEN (Evaluación Neuropsicológica de las Funciones Ejecutivas en Niños).

Methods: 92 born preterm (<1500g) children between 10-12 y/o (53 girls, 39 boys) were studied. Children with congenital malformations, genetic syndromes, studied intrauterine infections or cerebral palsy were excluded. Instruments: Growth chart and outcomes on the rings subtest (RSubt) of the ENFEN. This test depends more on the cognitive resources that children have and less on culture, education or socioeconomic influence. It requires high attention span, efficient working memory and inhibition of interference. It is one of the tests that requires more executive functions subtasks including: ability to program behavior to facilitate sequencing (only and in sequence it leads to a specific goal), behavior planning and previewing, ability to break down a problem into stages by trying to discover the rules of the processes, cognitive flexibility; abstraction ability (estimation), prospective memory, motor skills and working memory. The child must follow certain rules in order to copy 14 colored-rings and axis figures of increasing difficulty by moving the rings from one axis to another. Statistical analysis: Outcomes range from 1-10 (lower to higher performance). RSubt performance scores were divided in 2 categories: 1-4 and 5-10. Low RSubt score was defined as a score less than 4. Normal RSubt score was defined as a score >=5. Categorical data was analyzed using Chi2 or Fisher test. Significance level was set at $p < 0.05$.

Results: 92 born preterm children (10-12 y/o) were studied. 31.52 % were SGA (n=29) and 68.47 % AGA (n=63). There were 68.96% of girls in SGA group and 52.38% in the AGA group. Mean+/-SD of BW and GA by group are shown in table 1. Table 2 shows the Chi2 results of the RSubt scores (<4 and >=5) for each group (SGA and AGA) and for each growth z score group at 1 and 2 years of life (YOL). There were no statistically significant differences between AGA children z score´s groups at 1 or 2 YOL. However, the Chi2 test resulted significant between SGA z score´s groups at 1 and 2 YOL (p<0.05).

Conclusions: Preterm SGA children are at special risk for cognitive impairment. We found that SGA preterm (<1500g) children with growth restriction at 1 and 2 years of life was associated to lower scores in the RSubt of the ENFEN (p<0.05).

Keywords: Prematurity, small for gestational age (SGA), executive functions, growth trajectory, nutrition.

THE LIMACHE BIRTH COHORT STUDY IN CHILE

[1]*Amigo, Hugo;* [2]*Bustos, Patricia;* [3]*Rona, Roberto.*

[1]PHD. Nutrition Department Faculty of Medicine. University of Chile. Chile.; [2]MD. Nutrition Department. Faculty of Medicine. University of Chile. Chile.; [3]MD. Phd department of Psychological Medicine. King's College. London. United Kingdom.

Background: By the seventies, the health and nutritional profile in Chile was of high infant mortality (>50/1000 live births) and high prevalence of nutritional and infectious diseases, but over a couple of decades birth weight increased markedly, malnutrition dropped to less than 1% and infant mortality fell to 14.6 by 1991. The current rate is 7/1000 live births.

Objective: The Limache cohort aims at assessing life course events –cardiovascular risk factors and chronic respiratory conditions– under the Developmental Origins of Health and Disease (DOHaD) paradigm in two stages of development in Chile: before and after an unprecedented economic growth and remarkable epidemiological and nutritional change.

Method: Ambidirectional follow-up study (non concurrent up to participants 22 years old, concurrent thereafter), with two birth cohorts born 12 years apart: Cohort A, a representative sample of 1232 subjects born between 1974 and 1978 –impoverished prone period– in the main public hospital of Limache and measured at 22 to 28 years (2000-2002) and at 32 to 38 years (2010-2012); Cohort B (n=1000), a representative sample of new-borns between 1988-1992 –wealthier prone period– of mothers residing in the same counties, evaluated during at 22-28 (2014-2017). Equal methods were applied to register anthropometry at birth, over the first year and in adulthood, socioeconomic position (SEP), demographic and life style traits along with respiratory, cardiovascular and mental health parameters measured in each contact in adulthood.

Results: Cohort A: Metabolic syndrome increased from 9.3% (95% CI:7.5-11.1) to 27.3 (95% CI: 25.0 to 31.0) from 1st to 2nd measurement, twofold for triglycerides, threefold for waist circumference and fivefold for blood glucose. People without risk factors fell from 32.5%; (95% CI:27.4-37.6) to 14.6% (95% CI:9.3-19.9). Median BMI was 27.8 (IQR:25.0-31.1) at 2nd measurement, an increase of three units over 10 years. Increases were also ascertained in cardiovascular risk factors: glycaemia ≥110 mg/dL from 5 (95% CI:4-7) to 24% (95%CI:22 to 27); triglycerides ≥150 mg/dL from 18 (95% CI:15-20) to 35.3% (95% CI:32.0-38.0); elevated waist circumference from 17 (95% CI:15-19) to 42% (95% CI:39-45). We found inverse associations between birth weight and gly-

caemia, blood pressure, and cholesterol in adult life but not between birth weight and insulin resistance or metabolic syndrome. Also, there were no association between weight at 12 months and blood pressure or lipids in adulthood.

Cohort B: Median BMI at 22-28 years (ongoing follow-up, completing data) is being estimated in 26.3 (IQR:23.4-30.1), almost the level reached by Cohort A when had 10 years older.

Discussion: Results show the unfavorable evolution of cardiovascular risk factors in young adults over time, still maintained in a younger generation. This evidence supports prevention policies directed to early ages without neglecting young adults, which currently, is not a target for health nutrition programs. This will allow to delay the onset of chronic diseases and improve the quality of life of adults.

RETROSPECTIVE COHORTS STUDIES IN CHILE

Mardones, Francisco

MD. MSc. Department of Public Health. Pontificia Universidad Catolica de Chile. Chile

I have been involved in three retrospective cohort studies performed in Chile. All retrospective cohorts studies presented here were designed by linking present data of children with perinatal records which were complete for about 98% of the cases. The individual identification number is recorded in the birth certificate and also in the identification card of the children; its presence enabled us to link the live birth and childhood files. This unique identification number has been recorded at birth in Chile since the 1990s.

Two publications reported results of one of our studies with a sample of about 3,300 children, with mean age of 11 years, attending public schools in a county from Santiago, Chile; a much smaller sub-sample of 156 children from that study was informed in the third publication. These three reports were the following: A) Mardones F et al. J Devel Orig Health Dis 2012;3(4):237-244. B) Mardones F et al. Biomed Research International 2014:472017. doi: 10.1155/2014/472017. C) Krause BJ et al. PLoS ONE 2015;10(6): e0128140. doi:10.1371/journal.pone.0128140. 1-18). In the first two papers we showed that some indicators of the metabolic syndrome and insulin resistance were U-shaped or J-shaped associated to birth weight, in a similar manner to findings of previous studies that have established that infants at the normal extremes of birth weight are more likely to develop chronic disease (Hales & Barker DJ. Int J Epidemiol. 2013; 42(5): 1215-22; Cnattingius S , et al. Int J Obes (Lond). 2012; 36(10):1320-4. In the third publication, it was concluded that micro-RNAs Let7e and 126 can be considered as early markers of metabolic disease; linear associations were found between those variables and U-Shaped or J-shaped

associations could not be tested due to the small sample size under consideration. The remaining two studies were respectively related to child obesity and school performance (1. Mardones F, et al.Int J Epidemiol 2008;37:902-910. 2. Villarroel L et al. J Dev Orig Health Dis 2013; 4(3):232-238). The first one covered the whole school-age population of Chile and the second one covered around 90% of it. Our findings on child obesity showed that just high birth weight values were related to that outcome during childhood; this was also the case for the association with obesity in our previously commented study of 3,300 children. Given that those studies have been done in school age populations, it is important to consider information from previous studies, notably the 1958 birth cohort in the United Kingdom which was able to assess birth weight in relation to body mass index at five different time points in the lifecourse from 7 to 33 years old (Parsons TJ et al. BMJ. 2001; 323(7325):1331-5). That analysis showed a direct association between infant birth weight and BMI, becoming more j-shaped by the age of 33. The study of the association of school performance with perinatal variables showed a positive association of birth weight and birth length with higher scores of school achievement.

CRITICAL WINDOWS FOR PREVENTION OF OBESITY AND ASSOCIATED CONDITIONS: THE GOCS AND CHIMINO CHILEAN COHORTS

[1]Corvalan, Camila; [2]Garmendia, María Luisa; [3]Pereira, Ana; [3]Uauy, Ricardo.

[1]PhD. MD.MPH. Institute of Nutrition and Food Technology. University of Chile. Chile.; [2]PhD. Institute of Nutrition and Food Technology. University of Chile. Chile.; [3]PhD. Institute of Nutrition and Food Technology.University of Chile. Chile.

Although obesity and related chronic diseases are observed in adulthood, there is now consistent evidence that originate in early life. In 2006 initiated the longitudinal follow-up of 1195 Chilean children -The Growth and Obesity Cohort Study (GOCS)- with the support of the Chilean National Preschool Program. All children 2.6 to 4.0 y of age attending public nursery schools of six counties in Santiago and who met the inclusion criteria were invited to participate. The main aim was to assess the association between early weight and linear growth and BMI trajectories in preschool children. Retrospective weight and height measurements were abstracted from health records. From age of 3 years, children had annual appointment at INTA to collect standardized anthropometric measurements. A second follow-up was initiated in 2009 aimed to assess the relation between early growth and adiposity, metabolic/inflammatory, and hormonal markers during adrenarche. We added skeletal maturation, bio-impedance and body composition measurements, blood samples (insulin, glucose, lipid profile, adiponectin, leptin, and IGF1) and physical activity. Since 2011, GOCS aimed to assess the role of early growth and adrenarche on mammary development and putative markers of breast development. We also added measurements of diet, EDC, inflammatory markers, and DNA methylation. GOCs results showed that pregestational obesity and excessive gestational weight gain related to obesity and associated metabolic conditions for both mother and offspring. Based on GOCS findings, in 2012, INTA initiated collaboration with the South East Health Area of Santiago to establish -the Chilean Maternal and Child Health Observatory (CHIMINO). This observatory aims to provide evidence (at the population, clinical and basic science level) for achieving healthy nutrition for mothers and infants during the 1000-day early life window. The study optimizes data collection in the real world, through data linkage of electronic primary care and hospital records. The first initiative of this collaboration was the CHIMINCs study. CHiMINCs is a cluster randomized controlled trial in 12 primary health care centers that aimed to assess the effectiveness of a low intensity by high coverage intervention that enhances the implementation of updated nutritional health care standards (diet, physical activity, and breastfeeding promotion) during pregnancy on maternal weight gain and infant growth. The nutritional intervention was delivered through the national health care system under standard operating conditions. 4781 pregnant women were recruited. The second initiative of CHIMINO is the MIGHT study who aimed to assess the effectiveness of two prenatal nutritional interventions (home-based diet and physical activity counseling and/or n3LC-PUFAs supplementation) delivered to obese/overweight pregnant women in achieving better metabolic control in both the mother (lower incidence of gestational diabetes mellitus) and the offspring (lower incidence of macrosomia and lower prevalence of insulin resistance at birth). A substudy of the MIGHT study will evaluate if neonates born from obese mothers supplemented with n3LC-PUFA during pregnancy show a lower percent of body fat at birth and at 4 months of age, as well as the reversion of functional and epigenetic changes in neonatal monocytes at birth, compared to neonates from obese mothers with low n3LC-PUFA intake.

PROMOTION AND CONSUMPTION OF COMMERCIALLY-PRODUCED SNACKS DURING THE COMPLEMENTARY FEEDING PERIOD: COUNTRY EXPERIENCES, POLICY IMPLICATIONS

SNACKS AND NUTRITION DURING THE COMPLEMENTARY FEEDING PERIOD: A CROSS-SECTIONAL STUDY AMONG CHILDREN 12-23 MONTHS OF AGE IN KATHMANDU VALLEY, NEPAL

[1]Pries, Alissa; [2]Sharma, Nisha; [3]Upadhyay, Atul; [1]Zehner, Elizabeth; [4]Filteau, Suzanne; [4]Ferguson, Elaine.

[1]MPH. Helen Keller International. USA.; [2]MPH. Helen Keller International. Nepal.; [3]PhD. Helen Keller International. Nepal.; [4]PhD. London School of Hygiene and Tropcial Medicine. UK.

The availability of snack foods and sugar-sweetened beverages (SSBs) has grown rapidly in recent decades, with consumption of these foods increasing globally, noted across both high-income and low and middle income countries (LMIC). Consumption of snack foods and SSBs has also increased among children, including infants and young children below two years of age. While snacks can provide energy and potentially micronutrients during the nutritionally vital complementary feeding period, consumption of unhealthy snacks and SSBs, which are typically high in sugar and salt, is cause for concern, because they could displace nutrient-rich foods in diets of young children. Complementary feeding diets high in sugar and salt could also result in excess energy intakes and contribute to over-nutrition among young children. More research is needed in this area, given the limited information on the role of unhealthy snack foods and SSBs in the diets and nutrition of infants and young children in LMIC contexts. Therefore, this study in Kathmandu, Nepal aimed to assess the association between high consumption of unhealthy snack foods and SSBs and the nutritional status of children during the complementary feeding period, and to investigate factors associated with consumption of these products. A cross-sectional survey was conducted from February to April, 2017 on a representative sample of 12-23 month old children (n=702) living in Kathmandu Valley. Dietary intake (24-hour recalls), anthropometric (length and weight) and micronutrient status (vitamin A and iron) data were collected; and are currently being analysed. Preliminary findings related to the children's nutritional status and snack consumption patterns will be presented. This study intends to increase awareness of snack consumption patterns in a LMIC context and to inform policies and programs aimed at improving infant and young child nutrition in Nepal.

Keywords: Snacks, IYCF, Nepal, nutrition, double burden

POINT-OF-SALE PROMOTION OF FOODS FOR CHILDREN UNDER THREE YEARS OF AGE ACROSS RETAIL OUTLETS IN BANDUNG CITY, INDONESIA

[1]Hadihardjono, Dian; [2]Green, Mackenzie; [3]Ong, Agustino; [4]Zakiyah, Rima; [5]Champeny, Mary; [6]Zehner, Elizabeth.

[1]MD. MSc. IBCLC. ARCH Project. Helen Keller International. Indonesia; [2]MHS. ARCH Project. Helen Keller International. Cambodia.; [3]MSc. ARCH Project. Helen Keller International. Indonesia.; [4]SP. ARCH Project. Helen Keller International. Indonesia.; [5]BSc. ARCH Project. Helen Keller International. USA.; [6]MPH. ARCH Project. Helen Keller International. USA.

Background and objectives: Caregivers of young children should be able to make decisions about breastfeeding and complementary feeding free from commercial pressure. Preventing promotion of breastmilk substitutes (BMS), curbing inappropriate promotion of complementary foods, and discouraging use of unhealthy commercial snacks are important to protect child nutrition.

Methods: A cross-sectional survey of retail outlets was conducted to document the prevalence of point-of-sale (POS) promotions of commercial foods fed to children under three years of age in Bandung City, Indonesia. Researchers compiled a comprehensive list of all BMS and commercial complementary foods for sale in Bandung, and then visited 33 purposively selected small stores in closest walking distance to public sector health facilities and ten large retail outlets purposively selected for their high volume of products. Promotional activity for any BMS and commercial complementary foods in these stores was recorded and photographed using an electronic mobile data collection system. The proportion of sampled stores which had POS promotions for each product category and the total number of POS promotions for BMS and commercial complementary foods were calculated. Any POS promotions for select categories of commercial snacks (sweet biscuits, savory snacks, jellies, candies/chocolates and sweetened milks) were also documented and assessed for child-targeted marketing elements including images of children, free gifts, or statements directed to caregivers about young children.

Results: In the 43 stores, a total of 147 BMS products and 218 commercial complementary foods were for sale. A preliminary total of 3000 promotions for BMS, commercial complementary foods and select snack categories were documented. A single promotion often featured multiple products; overall, the 3000 promotions featured approximately 900 BMS, 700 complementary foods, 2400 sweet biscuits, 1400 savory snacks, 2900 candies/chocolates, 80 jellies, and 1700 sweetened milks.

Conclusions: These findings will contribute to the Indonesian government's efforts to strengthen policies regulating promotion of products fed to young children.

Keywords: Breastmilk substitute, infant formula, snacks, promotion, complementary feeding

SNACK CONSUMPTION DURING THE COMPLEMENTARY FEEDING PERIOD: A CROSS-SECTIONAL STUDY AMONG CHILDREN 6-23 MONTHS OF AGE IN URBAN SENEGAL, TANZANIA, NEPAL AND CAMBODIA

[1]Pries, Alissa; [2]Huffman, Sandra; [3]Vitta, Bineti; [4]Sy Gueye, Ndeye Yaga; [5]Diop, El Hadji Issakha; [6]Mengkheang, Khin; [7]Adhikary, Indu; [8]Champeny, Mary; [9]Zehner, Elizabeth.

[1]Helen Keller International. ARCH Project. [2]ScD. Consultant. USA.; [3]PhD. Consultant. USA.; [4]MSc. Helen Keller International. Senegal.; [5]PhD. Helen Keller International. Africa Regional Office. Senegal.; [6]MSc. Consultant for Food Security and Nutrition. Cambodia.; [7]MPH. Consultant. Nepal.; [8]BSc. Helen Keller International. USA.; [9]MPH. Helen Keller International. USA.

Background and objectives: Dietary patterns associated with the nutrition transition have resulted in increases in consumption of commercially produced snack foods in many low and middle-income countries. Many snack foods are nutrient-poor and high in salt, sugar, and/or transfats making them inappropriate for young child feeding. This survey assessed consumption of foods and liquids including commercially produced snack foods among children 6-23 months of age and mothers' exposure to promotions for these products.

Methods: Health facility-based interviews were conducted among 218 randomly sampled mothers utilizing child health services in Dakar, Senegal; 229 in Dar es Salaam, Tanzania; 228 in Kathmandu Valley, Nepal; and 222 in Phnom Penh, Cambodia.

Results: In the day prior to the interview, 58.7% of 6-23 month olds in Dakar, 23.1% in Dar es Salaam, 74.1% in Kathmandu Valley, and 55.0% in Phnom Penh had consumed a commercially produced snack food. In the previous week, the majority of children in Dakar (79.8%), Kathmandu Valley (91.2%) and Phnom Penh (80.6%) had consumed such products. Among 12-23 month olds, snack foods were the second most commonly consumed food group in Dakar, and third most common in Kathmandu Valley and Phnom Penh. Sweet snack foods, such as cookies and candy, were the most commonly consumed snack products in Kathmandu Valley and Dar es Salaam, while savoury snack foods, such as chips or crisps, were the most commonly consumed in Phnom Penh and Dakar. In all four sites, the primary reason reported among mothers was because the child liked the snack food. Over one-third of mothers in Kathmandu Valley reported feeding commercially produced cookies (40.4%), candy (33.8%) or cakes (34.4%) because they were convenient food options and one-fifth (21.5%) of Phnom Penh mothers reported feeding cookies because they believed they were healthy for their child. Observations of promotions for snack foods were reported by almost all mothers in Dakar and Phnom Penh, over 3/4ths in Kathmandu and half in Dar es Salaam.

Conclusions: Snack consumption during the critical complementary feeding period demands attention. Overconsumption of commercial snack foods may contribute to undernutrition and may also lead to excess energy intake and increased risk for childhood overweight.

Data and Analytics Section. Division of Data, Research and Policy. UNICEF Headquarters. New York. USA.

Adequate quantities and quality of complementary foods, together with age-appropriate feeding practices are essential for children's health and nutrition. We use the UNICEF global database to report on complementary feeding at the global and regional levels as sufficient data to generate estimates only became available recently. We also examined the association between two indictors of dietary quality - dietary diversity and animal source food (ASF) consumption - and stunting (length-for-age z-score) employing existing data from 39 Demographic and Health Surveys. Data for children aged 6-23 months were pooled and multiple logistic regression models, adjusting for child, maternal, and household characteristics, employed to assess the association between dietary quality and stunting. We found that children 6-11 months old had the lowest rates of minimum dietary diversity (MDD) than any other age group (~17 per cent compared to 31.5 and 37.6 per cent for the 12-15 and 16-23 months old, respectively). The rate for MDD among children in the richest households was two times higher than children in the poorest households at the global level. Across regions, consumption of fruits and vegetables and animal source foods was particularly low. Children who had consumed zero food groups in the previous day had a 1.345 higher odds of being stunted when compared to the reference group ($\geq$ 5 food

---

groups); those who did not consume any ASF in the previous day had a 1.436 higher odds of being stunted compared to children consuming all 3 types of ASF (egg, meat and dairy). In summary, far too few children are benefitting from minimum complementary feeding practices and meeting the minimum dietary diversity is particularly of concern. Dietary diversity and ASF consumption were associated with stunting. Efforts are needed to improve children's diets for their survival, growth and development.

CONSUMPTION OF COMMERCIAL SNACK FOOD PRODUCTS AMONG YOUNG CHILDREN

[1]Pries, Alissa; [2]Huffman, Sandra; [3]Champeny, Mary; [1]Zehner, Elizabeth; [4]Filteau, Suzanne; [4]Ferguson, Elaine.

[1]MPH. Helen Keller International. USA.; [2]ScD. Consultant. USA.; [3]BSc. Helen Keller International. USA.; [4]PhD. London School of Hygiene and Tropcial Medicine. UK.

The global food system has been marked by increased production and availability of processed foods. Commercially produced snack foods and sugar-sweetened beverages (SSBs) have become common in children's diets across high-income countries and are increasingly noted in the diets of infants and young children in low- and middle-income countries (LMIC). A recent cross-sectional survey among mothers found high consumption of sweet and savory snack food products among children 6-23 months of age in urban Cambodia (55.0%), Nepal (74.1%), Senegal (58.7%), and Tanzania (23.1%), and other studies have noted similar consumption rates in Central and South America. Snacks can be an important source of energy and potentially nutrients for young children; however, this prevalent consumption of commercial snack food and beverage products, often energy-dense and nutrient-poor, among young children in LMIC is concerning. There is a need to understand the role of such foods in young children's diets and their influence on dietary adequacy and nutritional status. In 2016, a literature review was conducted to identify studies assessing snack food and SSB consumption among children in Asian LMIC, and associations between this consumption and nutritional status; 68 articles resulted from this search. While studies detailing snack food and SSB consumption among preschool- and school-age children were common, only 9 studies assessed the contribution of such foods to diets during the complementary feeding period. Across these studies among children below two years of age, snack food and beverage consumption rates increased with age, and consumption of snack foods was more common than consumption of SSB. Only 4 of the studies including infants and young children gathered quantitative dietary intake data. Of these, the contribution of energy intake from snack food and beverages among young children ranged from 25-42%, comparable to snack food and beverage consumption among children in high-income settings. Twenty-one of the 68 studies included in this review assessed associations between snack food and beverage consumption and nutritional status among pre-school/school-age children. Those investigating over-nutrition among children noted positive associations with overweight/obesity or waist circumference, while those considering undernutrition found negative associations with wasting, underweight and HAZ. However, only one study assessing these associations included children below two years of age. This review indicates a large gap in the literature regarding the contribution of commercial snack food and beverages products to diets of young children in LMIC, as well as the associations between consumption of these products and diet adequacy, micronutrient status, and linear and ponderal growth among children below two years of age. Further research is needed in order to understand how consumption of nutrient-poor snack foods influences both under- and over-nutrition in young children during the complementary feeding period.

USING BEHAVIOR CHANGE TO IMPROVE COMPLEMENTARY FEEDING PRACTICES

[1]Sanghvi, Tina; [2]Baker, Jean; [3]Seidel, Renata; [4]Jimerson, Ann.

[1]PhD. Nutritionist. Alive & Thrive FHI360 Washington DC. USA.; [2]MPH. Alive&Thrive. FHI360. Washington DC. USA.; [3]MPH. FHI360. Washington DC. USA.; [4]Senior Behavior Change Advisor. FHI360. Washington DC. USA.

There are few well-documented program experiences that can provide insights on operational steps needed to improve complementary feeding practices. This paper compares four examples of complementary feeding programs from Bangladesh, Malawi, Peru and Zambia to document different context-specific ways of designing and implementing programs. After searching published and unpublished reports, four programs met the criteria for inclusion: scalability and impact on complementary feeding practices, and detailed documentation including impact evaluation. This paper identifies similarities and differences in the program designs and in operational strategies that were used for implementation. All programs applied social and behavior change principles and used diverse, multiple program delivery platforms. The contexts in each country were different and also the challenges encountered. This provides a rich source of lessons learned for future programs. The results show that complementary feeding practices can be improved rapidly in a variety of settings using available program channels. To achieve success, interventions should systematically address specific constraints to food access and should apply effective behavior change strategies to encourage caregivers to prepare and feed appropriate foods. Programs can use a five-step process to develop effective programs: 1. Select a few practices to focus the strategy based on best potential to benefit the population, using criteria such as high efficacy, low baseline levels and high acceptability and feasibility to improve; 2. fill knowledge gaps and obtain an understanding of the determinants of complementary feeding, investing in activities that address underlying barriers and build on the facilitating factors for behavior change in the community;

3. thoroughly test and verify concepts, recipes, messages, processes and tools before large scale implementation; 4. work through channels of service delivery and communication that reach mothers repeatedly at the right ages and also engage key influential groups; and, 5. maintain high reach and frequency for at least two years while making rapid mid-course corrections as indicated by monitoring data.

TIME TO REVISE THE COMPLEMENTARY FEEDING GUIDELINES?

Grummer-Strawn, Laurence.

PhD. Department of Nutrition for Health and Development. World Health Organization. Switzerland.

In 2003 and 2005, WHO published the Guiding Principles for Complementary Feeding of the Breastfed Child and Guiding Principles for Feeding Non-Breastfed Children 6-24 Months of Age. These documents were largely focused on ensuring that young children received enough of the nutrients they need for optimal health and development. The primary outcomes of interest were prevention of wasting and stunting. Over the past decade, the growing problem of childhood obesity and the establishment of dietary patterns that predispose toward non-communicable diseases have increasingly been recognized as important issues for infant and young child feeding. In addition, new evidence has emerged on key issues of feeding, including the importance of quality and quantity of protein, animal source foods, fat quality, and sugar intake. New issues on the effect of the young child's diet on body composition and gastrointestinal microbiota may also be important.

With this backdrop, WHO is embarking on a process to develop new guidelines on complementary feeding. The WHO guidelines process is very rigorous and includes steps to scope the coverage of the guideline, create a diverse external Guideline Development Group, screen members for conflicts of interest, formulate key questions for systematic literature reviews, conduct evidence reviews, formulate recommendations, conduct external peer review, and finally publish the guideline. For complex guidelines that include a number of recommendations, such as complementary feeding, this process can take a couple of years.

Nutrition in the first 1000 days of life is critically important for child development and prevention of health problems related to both undernutrition and non-communicable diseases. Thus, it is important that we develop evidence-based feeding recommendations that will lead to optimal health and development.

SCALING UP RICE FORTIFICATION IN LATIN AMERICA AND THE CARIBBEAN

SCALING UP RICE FORTIFICATION IN LATIN AMERICA AND THE CARIBBEAN: TRANSLATING EVIDENCE TO PRACTICE FOR DEMAND CREATION AND EFFECTIVE PROGRAMMING

[1]*Kraemer, Klaus;* [2]*Pachón, Helena;* [3]*Martinez-Fonseca, Jose Antonio;* [4]*Irizarry, Laura;* [4]*Prost, Marc-André.*

[1]Sight and Life Magazine; [2]Food Fortification Initiative; [3]National Association of Rice Millers of Costa Rica; [4]World Food Programme.

Fortification of staple foods with essential vitamins and minerals is the most cost-efficient public health tool for the prevention and control of micronutrient deficiencies. Micronutrient deficiencies such as iron deficiency anemia, zinc deficiency and vitamin A deficiency remain a serious public health concern in most Latin American and Caribbean countries, particularly amongst women of reproductive age, children and indigenous groups. Most countries mandate wheat flour and salt fortification; fortification of other products like corn flour and sugar is voluntary in others. There are currently 125 national programs addressing micronutrient deficiencies across the region, most of them through supplementation. Known challenges, such as lack of reliable data, poor acceptability and adherence, weak monitoring and evaluation, limit their impact.

Rice is the staple food to a third of humanity, and represent a sizeable part of energy intake in South America and the Caribbean sub-regions. While milled rice is a good source of energy, it is a poor source of micronutrients. In countries with widespread micronutrient deficiencies and large per capita rice consumption, making rice more nutritious can effectively increase micronutrient intake, and improve nutritional status. Only six countries globally have passed legislation for the mandatory fortification of rice, including three in Central America. In practice, only Costa Rica has a standing, successful, mandatory rice fortification programme in the region. Over the years, one of the key challenges to the implementation rice fortification in country was technological limitations; today, affordable technology exists to produce fortified rice kernels that look and taste like non-fortified rice.

The World Food Programme's Rice Fortification Initiative started in 2016 and supports seven countries in the region to advance towards the mandatory fortification of rice, through technical assistance for stakeholder engagement and policy making, transfer of technology, behavior change communication, social

marketing, monitoring systems, and feasibility trials. As part of this initiative a Special Supplement on Rice Fortification for Latin America, available in Spanish and English, was published together with the Sight and Life Magazine.

In this symposium, we will present three country case studies and discuss effective policy and programme planning options taken to introduce rice fortification in the region.

Keywords: Rice fortification, food fortification, Latin America and the Caribbean, micronutrients, public health.

Conflict of Interest disclosure: The World Food Programme and DSM Nutritional Products have an ongoing global partnership. WFP does not endorse any product or service.

LEVERAGING FOOD SYSTEMS TO IMPROVE FOOD SYSTEMS AND NUTRITION

FOOD SYSTEMS ROLE IN ACHIEVING GOALS OF THE DECADE OF ACTION FOR NUTRITION

Lartey, Anna.

PhD. Nutritionist, Food and Agriculture Organization of the UN. Rome Italy.

Although global food production has increased, addressing malnutrition remains a huge challenge. About one in three persons suffers from some form of malnutrition. The current food system is contributing to worsening the nutrition situation by not delivering on healthy diets. Unhealthy diets have become the number one risk factor for the global burden of disease for adults. Concerns about the global nutrition situation was an impetus for the United Nations declaration of the period 2016 to 2025 as the UN Decade of Action on Nutrition. The aim of the Nutrition Decade is to accelerate action on implementation of commitments to achieve global nutrition and diet-related targets by 2025, and contribute to the realization of the 2030 Agenda of the Sustainable Development Goals (SDG); and leaving no one behind. The Nutrition Decade provides a momentum and direction in global action to address all forms of malnutrition. A Decade is rather short but what are the low-hanging fruits to harvest to achieve the goals of the Decade? Transforming the food system is an absolute necessity. We need functioning food systems that would deliver the diverse, safe and nutritious foods all year round. Transforming the food system is integral to the goals of the Decade and the SDGs. Transforming the food system will require a change in national policies to ensure that nutrition objectives are embedded in agriculture, trade and other sectors policies; consumers are empowered to make healthy food choices the easier choice and above all, governments must plan cities with a food systems perspective.

Keywords: Food systems, Decade of Action on Nutrition, Goals

LESSONS LEARNED FROM MULTI-SECTORAL IMPLEMENTATION OF NUTRITION PROGRAMS

WHY IS A MULTI-SECTORAL APPROACH NEEDED FOR NUTRITION, AND WHY IS IT SO HARD TO ACTUALLY PUT THAT IT INTO PRACTICE?

Guyon, Agnes.

John Snow Incorporated (JSI). USA.

The World Health Organization estimates that child undernutrition is associated to 45% of under-five death and that maternal short stature and iron deficiency anemia contribute to at least 20% of maternal deaths. The landmark Lancet Series on Maternal and Child Undernutrition, published in 2008 and updated in 2013 reviewed global data from randomized control trials and confirmed that if implemented at scale during the window of opportunity (from conception up to 24 months of age) packages of nutrition-specific and nutrition-sensitive interventions can significantly reduce nutrition related mortality and related morbidity and disability. In addition in 2013 the World Health Organization (WHO) released a guide entitled, Essential Nutrition Actions: improving maternal, newborn, infant and young child health and nutrition, which also draws on the findings of systematic reviews such as those of the Lancet to highlight the proven actions that need to be taken to scale within the health sector.

This Satellite Symposium attempts to be a technical forum on "Lessons from multi-sectoral implementation of nutrition programs". During this symposium, JSI and its partner agencies will share results, insights and lessons from a broad range of nutrition State of the Art Implementation practices. Three renowned experts will present the latest technical information and current trends and key lessons learned for nutrition implementation within and across sectors: programming nutrition sensitive agriculture, nutrition within the health sector, and WASH in nutrition programs. Following presentations, participants will experience two interactive knowledge coffee sessions in break-out groups, facilitated by guest experts who will share expertise, facilitate discussion and answer questions., Some of these sessions will be:

1. District approach on the control of anemia: training and programming activities and tools – Experiences from Ghana, Nepal and Uganda

2. Different approaches to Farmer Field Schools for improved nutrition – Experiences from Bangladesh and Ghana

3. Multi-sectoral approach of engaging district government in joint planning, budgeting, implementation – Experience from Ghana

4. Pathways for better nutrition: a tool to track country nutrition budgets across sectors – Experiences from Nepal and Uganda

5. Multiple behavioral themes in one strategy and one program – Experiences from multiple countries

6. A successful integrated approach – The Suaahara Project in Nepal

7. Programmatic approaches to impact dietary diversity – Experiences from multiple countries

8. Gender transformative approaches critical to achieving the goals of multi-sectoral nutrition programming – Experiences from multiple countries

9. Marketing of complementary foods: Findings from multiple countries – The ARCH Project

10. Use of applied technology to monitor nutrition outcomes

11. Platforms to reach adolescents to improve nutrition

At the end of the knowledge coffee sessions, participants will share their take-away messages and a guest expert will summarize how to move forward the successes shared on implementing nutrition programs across sectors.

WHAT HAVE WE LEARNED ON PROGRAMMING NUTRITION SENSITIVE AGRICULTURE?

Danton, Heather.

BSc. MSc. Food Security and Nutrition Director. SPRING Project. JSI Research and Training Institute Inc.USA.

A multi-sectoral approach is needed to meet the global targets for nutrition, including scaled-up, proven nutrition-specific and nutrition-sensitive interventions.(1) But the literature has been weak on how investments have bridged the often siloed agriculture and nutrition interventions and goals. In 2012, SPRING conducted a landscape analysis of activities of the U.S. Government's global hunger and food security initiative, Feed the Future, in 19 focus countries in Africa, Asia, and Latin America, and the Caribbean.(2) The findings of the landscape analysis pointed to specific gaps in implementing nutrition-sensitive agriculture, including the lack of:

• effective approaches for multi-sectoral coordination;

• appropriate context assessments to inform design of nutrition-sensitive agriculture interventions;

• indicators that track the intermediate steps along the agriculture-to-nutrition pathways; and

• effective behavior change interventions that target the actors along value chains and agriculture-nutrition pathways.

This presentation will review the work SPRING has done since the publication of the landscape analysis to help fill these gaps, especially related to how to make multisectoral collaboration operationally feasible.

In developing guidance and resources to address the gaps listed above, SPRING found key areas of convergence and tension between the agriculture and nutrition sectors related to the design and implementation of nutrition-sensitive agriculture programs including beneficiary targeting, intervention approaches, commercialization of food, and monitoring and evaluation. (3) These observations underscored the need for better design guidance to reconcile the tensions and leverage convergences to maximize agriculture's contribution to nutrition. We therefore developed a range of materials and tools, beginning with a database of resources for conducting a context assessment specifically for nutrition-sensitive agriculture. We also developed process guidance to enable agriculture market development activities to identify appropriate intermediate outcomes and develop custom indicators to monitor agriculture's contribution to nutrition. Finally, SPRING created an online training course, called Accelerating Behavior Change in Nutrition-Sensitive Agriculture, for designing behavior centered practices. The training helps implementers select, prioritize and then increase use of nutrition-sensitive agriculture practices.

At the same time, SPRING conducted research to better understand existing efforts to coordinate nutrition across USAID portfolios in Bangladesh, Guatemala, and Rwanda. Our findings resulted in a set of recommendations for multi-sectoral collaboration strategies for nutrition organized along a project life cycle.

SPRING has learned that not every agriculture investment can or should focus on nutrition. However, nearly all have some contribution they can make towards improving nutrition. We hope our resources help donors and practitioners design, deliver, and document their unique 'win' for nutrition.

WHY IS IT SO IMPORTANT TO INCLUDE WASH IN NUTRITION PROGRAMS?

Nielsen, Jennifer.

PhD. Senior Nutrition Advisor. Helen Keller International. New York. NY. USA.

The 2013 Lancet Series on Maternal and Child Undernutrition estimated that if the full package of 10 evidenced-base nutrition-specific interventions were delivered at 90 percent coverage across the countries with the highest burden of undernutrition,

stunting prevalence could be reduced by 20 percent and severe wasting by 61 percent. This leaves a considerable proportion of the burden that must be overcome using other strategies.

Poor water, sanitation and hygiene (WASH) conditions and practices also contribute significantly to undernutrition. Contaminated water, soils and hands cause diarrheal disease, parasitic infections, foodborne infections and many other illnesses that contribute to nutritional deficiencies. These infections cause blood loss, diminished appetite, reduced absorption and increased permeability of the intestinal lining, and trigger immune responses that divert nutrients from fueling growth to fighting infection. Both human and animal feces contain high levels of dangerous pathogens, and are often in the vicinity of living and cooking quarters. Infections can result from eating with unwashed hands, eating inadequately washed plants grown in contaminated soils or foods on which mycotoxins have grown, and by walking barefoot. In addition, flies carry pathogens from feces to foods, and microbes quickly multiply in foods that are stored at ambient temperature or insufficiently cooked or reheated. Toddlers crawl on the ground and explore their environment by putting hands and objects into their mouths, greatly increasing their exposure to dangerous pathogens. Infants and young children are especially vulnerable because their immune systems are still immature, and pregnant women also have decreased immune function.

There are many WASH interventions, most of which, like nutrition interventions, require changes in behavior, habits and norms that are challenging to achieve. These include promoting the appreciation and practice handwashing with soap, community-wide latrine construction and utilization strategies, household water treatment and safe storage techniques, food and utensil hygiene and storage, designating safe play areas for young children, and keeping animals at a remove from living spaces. While the pathways from contamination to undernutrition are clear, there is still a limited evidence base for the impact of these interventions on nutritional outcomes, thus innovative intervention strategies and further research are needed.

MALNUTRITION IN ALL ITS FORMS AND SOCIO-ECONOMIC STATUS IN LATIN AMERICA: WHO ARE MORE AFFECTED?

MALNUTRITION IN ALL ITS FORMS AND SOCIO-ECONOMIC STATUS IN ARGENTINA

[1]Zapata, María Elisa; [2]Soruco, Ana Ines; [3]Carmuega, Esteban.

[1]MSc. Nutritionist. Centro de Estudios sobre Nutrición Infantil (CESNI). Buenos Aires. Argentina.; [2]MSc. Nutritionist. Ministry of Health of Jujuy. Argentina; [3]Director. Centro de Estudios sobre Nutrición Infantil (CESNI). Buenos Aires. Argentina.

Background: Malnutrition during critical stages of life as infancy, childhood, reproductive age and pregnancy, are associated with significant functional impairment as well as health and socioeconomic consequences.

Objective: The aim of this analysis was to assess the prevalence of five forms of malnutrition (wasting/underweight, overweight, obesity, stunting/short stature and anemia) by socio economic status and education level among children, adolescents and women of reproductive age from Argentina.

Design: Cross-sectional analysis of the National Survey of Health and Nutrition carried out in 2005. Anthropometric indicators and anemia were estimated from 27015 children (aged <5y), 1729 girls (11-19y) and 4401 women (20-49y). Socioeconomic level was classified according to the proportion of contributors in the household, educational level, employment status and medical coverage.

Results: In Argentina 26% of households lived with unsatisfied basic needs and 23% receives at least one food assistance in 2005. The 23% of children, 36% of girls 10-19y and 56% of women were affected from any form of malnutrition.

Children were specially affected by anemia, overweight/obesity and stunting (15.2, 9.9, 7.4% respectively). Girls were affected by overweight/obesity, anemia and stunting (22.5, 15.2, 6.2% respectively). Women were strongly affected by overweight/obesity, anemia and stunting (43.8, 19.8, 10.5%). Stunting or short stature was higher in lower SES, doubling the prevalence between low and high level, reaching the quadruple among women in reproductive age (p<0.05). In children excess weight increased when improved SES, meanwhile in women the tendency was inverse. Anemia showed different tendency according SES.

Conclusions: The data showed high rates of excess weight and anemia, moderate prevalence of stunting and low frequency of wasting/underweight. Public health policies to date have been focalized in wasting/underweight, but have not responded adequately to the increase in overweight and obesity.

MALNUTRITION IN ALL ITS FORMS AND SOCIO-ECONOMIC STATUS IN BOLIVIA

[1]Miranda, Melissa; [2]Bento, Alenkar; [3]Aguilar, Ana María.

[1]Phd. Nutritionist. Institute of Nutrition and Food Technology. University of Chile. Chile.; [2]MSc. Public Health. Faculty of Medicine. University of San Francisco Xavier of Chuquisaca. Bolivia.; [3]MD. Health and Development Research Institute Higher. University of San Andrés. Bolivia.

Background: Malnutrition in all its forms is a growing public health problem in many developing countries. In Bolivia main public policies are mainly directed to control stunting and anemia, with few efforts to address the already high prevalence of overweight and obesity. In a country with substantial socioeconomic inequalities the current burden of malnutrition denotes a difficult challenge.

Objective: The aim of this study was to describe the characteristics of all forms of malnutrition and its association with socioeconomic status in Bolivia in order to recommend effective public health and nutrition policies to appropriately address this burden.

Design: By using the 2008 nationally representative Bolivian DHS, we estimated malnutrition's prevalence by socioeconomic status. The study comprised 8.432 children <5y, 3.258 women adolescents (15–19 y), and 12.297 women (20–49 y) with available information on anthropometric measurements. The socioeconomic status was calculated based on the DHS wealth index and nutritional status by using WHO 2006 and 2007 standards.

Results: Main prevalent problems found in this study were: underfive stunting 23% (95% CI: 22,14-24,29) and anemia 63.11% (95% CI: 60,82-65,40); overweight/obesity in women of 20-49 years old 56,88% (95% CI: 56,01; 57,76). Considering socioeconomic status lower terciles showed the higher prevalence of stunting (>30%) and anemia (>40%) in all ages. Prevalence of overweight/obesity had an upward trend from 10.81% (95% CI:10.02;11.60) in childhood to 29.46% (95% CI: 27,90;31,03) in adolescents women and 56.88% (95% CI: 56,01; 57,76) in women 20 to 49 years; with significant differences (p<0.05) across lower and high terciles (27.69% compared with 32,56%) in adolescent and low and medium terciles (p<0.05) in women (50,92 % compared with 63.08%, respectively).

Conclusions: The results reaffirms the existing double burden of malnutrition in Bolivia with high prevalence of overweight and obesity increasing throughout the course of life. Lower socioeconomic terciles have the worst situation of malnutrition. This study calls for public specific policies which need to keep in mind the differential characteristics of malnutrition across the levels of socioeconomic status.

Keywords: Bolivia, malnutrition, socioeconomic status

MALNUTRITION IN ALL ITS FORMS AND SOCIO-ECONOMIC STATUS IN BRAZIL

[1]Canella, Daniela; [2]Duran, Ana Clara; [3]Monteiro, Carlos.

[1]Professor. PhD. Department of Applied Nutrition. Rio de Janeiro State University. Rio de Janeiro. Brazil.; [2]Research Fellow. PhD. Center for Epidemiological Research in Nutrition and Health. University of São Paulo. São Paulo. Brazil.; [3]Professor, PhD. Department of Nutrition. School of Public Health. University of São Paulo. São Paulo. Brazil.

Background and objectives: Despite worldwide progress in undernutrition, the condition is still present in a few countries and among some socioeconomic and age groups. At the same time, obesity levels are growing across the globe, including in low- and middle-income countries. The objective of this study was to describe malnutrition (over and undernutrition) by socioeconomic status (SES), level of education, and race/ethnicity in Brazil.

Methods: We used nationally representative data from the Brazilian Household Budget Survey conducted in 2008-2009 in the analysis. Measures of weight (kg) and height (cm) were collected by trained interviewers. Anthropometric indicators (overweight; obesity; overweight or obesity – excess weight; wasting or underweight; stunting or short stature) were estimated for children aged <5 years old, adolescent girls aged 11-19 years old, and women aged 20-49 years old using the World Health Organization recommendations. Prevalence of each indicator was presented by tertiles of socioeconomic status (per capita household income), level of education (years of schooling of the head of the household for children and adolescents and of the women themselves for adults, grouped in low [0-6y], medium [7-12y] and high [>12y]), and race/ethnicity (white, black, mixed-race, Asian, and indigenous). Results: The sample was composed by 73,620 individuals (n=14,580 children <5y; n=15,606 girls 11-19y; n=43,434 women 20-49y). Among children, the prevalence of excess weight, wasting and stunting was 16.91%, 2.75% and 5.97%, respectively. Differences related to SES, education, and race/ethnicity were verified, except for the prevalence of child wasting by the education level. Adolescent girls presented 18.40% of excess weight, 2.80% of underweight, and 5.52% of stunting. Prevalence of excess weight varied by SES and race/ethnicity, while stunting varied by SES and education level. Stunting prevalence was lower among white girls, as compared with mixed-race adolescent girls. Over three quarters of women aged 20-49 y presented excess weight (42.17%), 13.75% were found to be obese obesity, 3.86% of underweight, and 5.71% of short stature. Prevalence of excess weight was higher among lower educated and black women aged 20-49 y, as compared with highly educated and white women. Short stature was also more prevalent among black and mixed-race, low educated, and low-income women. Underweight prevalence was higher among lower educated and black and mixed-race women, as compared with highly educated and white women. Conclusions: In Brazil, the prevalence of excess weight was at least 3-fold higher than that of undernutrition for children and for adolescent girls. In adult women, the prevalence of excess weight was at least 7-fold higher than that of undernutrition. Lower income, less educated, as well as black and mixed-race women presented both more obesity and

stunting as compared with more privileged women. Public policies were successful at reducing undernutrition, however, controlling or reducing obesity is still a challenge.

IS INEQUALITY AFFECTING THE NUTRITIONAL STATUS OF ADULT CHILEAN POPULATION? NUTRITIONAL STATUS IN ADULT CHILEAN POPULATION: INEQUALITIES IN A POST-TRANSITIONAL COUNTRY

[1]*Navarro-Rosenblatt, Deborah;* [2]*Mujica, Maria Fernanda;* [3]*Lopez-Arana, Sandra;* [4]*Corvalan, Camila.*

[1]PhD. School of Public Health. University of Chile. Santiago. Chile.; [2]PhD. Food, Nutrition and Health. Faculty of Land and Food Systems. The University of British Columbia. Vancouver. BC. Canada.; [3]RD, PhD. Institute of Nutrition and Food Technology (INTA). University of Chile. Santiago. Chile.; [4]MD. PhD. Institute of Nutrition and Food Technology (INTA). University of Chile. Santiago. Chile.

Background and objectives: Previous research in Latin America shows that socioeconomic status (SES) influences dietary patterns and obesity distribution. However, it is unclear how SES impacts overall nutrition status, in a post-transitional country such as Chile. The objective of this study was to assess the relationship between nutritional status (overweight, short stature and anemia), and two key aspects of SES-income and educational level in adult Chilean population.

Methods: Nationally representative data of 1,413 women (20-49y) and 819 men (>49y) from the 2003 and the 2009-2010 Chilean National Health Surveys were included in these secondary analyses. Body mass index (BMI) was categorized as underweight, overweight and obesity according to WHO criteria. Overnutrition was defined as BMI ≥25 kg/m2. Short stature (height <1.49m) and anemia (hemoglobin concentration <12 mg/L) data were assessed only for women. Descriptive statistical analysis and Chi square tests were used to compare prevalence (%; 95% CI) by educational level (low=0-7 y, middle=8-12y, and high>12y) and income tertiles.

Results: Overweight [(34.0% (30.1%-38.2%) in women] and [47.8% (41.5-54.1) in men] and, as well as, obesity [(27.1% (23.5%-30.9) in women] and [28.9 (23.7-34.8) in men], were high while underweight was negligible. Less educated women had higher prevalence of overnutrition (80.2%; 68.8%-88.1%) and short stature (14.9%; 8.5%-13.7%) than higher educated women (49.2%; 40.9%-57.5% and 3.7%; 2.0%-6.9%, respectively) (P<0.05 for both). Poorer women had higher prevalence of short stature (10.1%, 7.4%-13.8%) than richer women (2.2%, 1.0%-5.0%) (P<0.05). Anemia did not differ by SES. In men, nutritional status did not vary by income or educational level (all p>0.05).

Conclusions: In a post-transitional country such as Chile we observed SES and gender inequalities in adult nutritional status; this poses important challenges for future nutrition policies.

MALNUTRITION IN ALL ITS FORMS BY SOCIOECONOMIC STATUS IN COLOMBIA

[1]*Cediel, Gustavo;* [2]*Gaitan-Charry, Diego;* [3]*González-Zapata, Laura Inés;* [2]*Pérez-Tamayo, Eliana;* [4]*Sarmiento, Olga.*

[1]Post-doctoral fellow. Department of Nutrition. University of São Paulo. Brazil.; [2]PhD. Nutrition and Dietetics School. University of Antioquia. Medellín-Colombia.; [3]PhD. Nutritionist. School of Nutrition and Dietetics, University of Antioquia, Medellín. Colombia.; [4]PhD. Faculty of Medicine. Los Andes University. Colombia.

Background and objectives: Understanding the socio-economic inequalities of malnutrition in Colombian population is important in order to effectively address the double burden of malnutrition and associated health consequences. This study examined the association of all forms of malnutrition by socio-economic status (SES) in preschools and non-pregnant women, in Colombia.

Methods: A Secondary analysis of data from the 2010 Colombian National Nutrition Survey was conducted. Sample for this analysis comprised children less than 5 y (preschools), and non-pregnant women (11-49 y). Criteria for malnutrition were: overweight/obesity (preschools: BMI-for-age-z-score >2; non-pregnants 11-19: BMI-for-age-z-score >2; non-pregnants 20-49: BMI ≥25kg/m2), wasting/underweight (preschools: weight-for-age-z-score <-2; non-pregnants 11-19: BMI-for-age-z-score <-2: non-pregnants 20-49; BMI <18.5kg/m2), stunting/short-statute (preschools: height-for-age-z-score <-2; non-pregnants 11-19: height-for-age-z-score <-2; non-pregnants 20-49: height<1.49m) and anemia (preschools: hemoglobin <110g/L; non-pregnants: hemoglobin <120g/L). SES was stratified in terciles. Individual sample weights were applied to all regression analysis of malnutrition variables and their association with SES.

Results: Prevalence of overweight/obesity was 45.2% in non-pregnants 20-49 y, 16.2% in non-pregnants 11-19 y and 5.2% in preschools. Prevalence of wasting/underweight was: 2.9% in non-pregnants 20-49 y, 1.8% in non-pregnants 11-19 y and 1.2% in preschools. Prevalence of stunting/short-statute was: 13.8% in preschools, 11.3% women 20-49y and 11% in women 11-19y. While, prevalence of anemia was 27.4% in preschools, 12.4% in non-pregnants 20-49y, and 7.8% in non-pregnants 11-19 y. Preschools from the lowest tercile of SES presented the lowest prevalence of overweight/obesity (4.4%), but the highest prevalence of wasting (1.5%), stunting (17.3%), and anemia (30.8%) (p<0.05). On the other hand, non-pregnants 11-19 y in the lowest tercile of SES presented the highest prevalence of overweight/obesity (17.0%), underweight (2.1%), short-statute (13.7%), and anemia (10.3%) (p<0.05). Similarly, non-pregnants 20-49y in the lowest tercile of SES presented the highest prevalence of overweight/obesity (47.6%), underweight (3.5%), short-statute (15.1%), and anemia (15.4%) (p<0.05).

Conclusions: Socioeconomic inequalities are present in the epidemiological context of the double burden of malnutrition. Public health nutrition policies should address these inequalities.

MALNUTRITION IN ALL ITS FORMS DIFFERS BY SOCIOECONOMIC STATUS, EDUCATION LEVEL AND RACE/ETHNICITY IN ECUADOR

[1]*Ramirez-Luzuriaga, Maria J;* [2]*Belmont, Philippe;* [3]*Waters, William F;* [3]*Freire, Wilma.*

[1]MSc. Nutrition and Health Science Program. Laney Graduate School. Emory University. Atlanta. Georgia. USA.; [2]MSc. Health and Nutrition Research Institute. University of San Francisco de Quito. Ecuador. ; [3]PhD. Health and Nutrition Research Institute. University of San Francisco de Quito. Ecuador.

Background: In Ecuador, undernutrition in the form of stunting has modestly declined but remains high in some regions and subpopulations, whereas overweight and obesity have increased at alarming rates in all age, racial, and socioeconomic groups. Objective: Describe the prevalence and distribution of malnutrition in all its forms (stunting, wasting, anemia, overweight, and obesity) by ethnicity/race, level of education, and socioeconomic status.
Methods: We analyzed data of the last National Health and Nutrition Survey to estimate national prevalences for stunting, wasting, anemia, overweight, and obesity in children <5 y, adolescent women 11-19 y, and women 20-49 y. Level of education was defined by the mother's or the woman years of schooling: low (0 to 6 y; primary school or less); medium (7 to 12 y; secondary to high school); and high (more than 12 y; more than high school). Socioeconomic status was divided into tertiles and measured by using a multidimensional poverty index, which identifies deprivations across three dimensions (health, education, and standard of living). Results: In children<5 y and adolescent women the prevalence of stunting and anemia is significantly higher in indigenous groups and among children and adolescent women of low level of education and of low socioeconomic status. Indigenous women have the highest prevalence of overweight (41.3%) compared to Afro-Ecuadorian (31.8%) and Mestizo (38.9%), whereas obesity is higher in Afro-Ecuadorian women (34.9%) compared to Indigenous and Mestizas (13.3% and 25.4%, respectively). Conclusions: Stunting, anemia, overweight and obesity significantly differ by race and by socio-economic status. Racial minorities are proportionally more affected by malnutrition than mestizo children and women in Ecuador.

MALNUTRITION IN ALL ITS FORMS AND SOCIO-ECONOMIC INDICATORS IN GUATEMALA

[1]*Mazariegos, Monica;* [1]*Kroker-Lobos, Maria F.;* [2]*Ramirez-Zea, Manuel.*

[1]Researcher. INCAP Research Center for the Prevention of Chronic Diseases (CIIPEC). Institute of Nutrition of Central America and Panama (INCAP). Guatemala.; [2]Director. INCAP Research Center for the Prevention of Chronic Diseases (CIIPEC). Institute of Nutrition of Central America and Panama (INCAP). Guatemala.

Background and objectives: Malnutrition results from the interaction of poor-quality diets and healthcare environments, and unhealthy behaviors, all of which are shaped by political instability, poor economic development, social inequalities, and globalization. Socioeconomic disparities in malnutrition denote the degree to which the prevalence of malnutrition in all its forms (MAF) differ between more or less social and economically advantaged groups. In Guatemala, data is lacking about how MAF distributes across socioeconomic indicators for the subsequent identification of health disparities. Therefore, our objective was to reveal disparities of MAF by socioeconomic indicators in children <5y, adolescents, and women of reproductive age (WRA).
Methods: We used the 2008 National Maternal and Child Health Survey conducted in Guatemala. We estimated the prevalence (95%CI) of MAF: stunting/short stature, anemia and overweight/obesity in children <5 y (n=10,645), adolescent girls (15-19 y) (n=2,894), and WRA (20-49 y) (n=13,925). Then we evaluated whether the prevalence of MAF differed according to SES tertiles, educational level (classified as low for 0-6 y, middle for 6-12 y, and high for ≥12y), and ethnicity. Disparities are shown as the ratio of low to high-SES, and low to high educational level and the ratio of indigenous to non-indigenous. Results: Stunting/short stature national prevalence was 48.0% (45.8,50.2) among children, 51.1% (48.4,53.8) among adolescents, and 29.0% (27.5,30.1) among WRA. The prevalence of stunting in these age groups was 3.1, 1.9, and 3.0 times significantly higher in the poorest SES compared to the richest tertile; 3.4, 1.9 and 3.5 times significantly higher in the lower educational level than in the highest level; and 1.8, 1.9 and 2.6 times significantly higher in indigenous than in non-indigenous population. Anemia national prevalence was 49.2% (47.1,51.3) among children, 25.1% (22.7,27.7) among adolescents, and 26.9% (25.3,28.5) among WRA. The prevalence of anemia in these age groups was 1.3, 1.8 and 1.7 times significantly higher in the poorest SES compared to the richest tertile; 1.2, 1.7 and 1.7 times significantly higher in the lower educational level than in the highest level. The prevalence of anemia was 1.2 times higher in indigenous vs. non-indigenous only in WRA. Overweight/obesity national prevalence was 6.0% (5.3,6.6) among children, 21.3% (19.3,23.4) among adolescents and 57.8% (56.5,59.2) among WRA. Overweight/obesity prevalence between SES and educational level was only significantly different in WRA (richest SES tertile was 1.4 higher compared to the poorest tertile; the medium educational level was 1.1 higher than the lower level). Among adolescents, overweight/obesity was 1.3 significantly higher in indigenous than in non-indigenous; whereas for WRA run in the opposite direction as the higher prevalence was 1.1 times among the non-in-

digenous. Conclusions: In Guatemala, stunting/short stature and anemia were more prevalent among low-income, low education level, and indigenous population. Overweight/obesity was more prevalent in high-income, medium educational level, and non-indigenous WRA. These outcomes demonstrate socio-economic and ethnic disparities for MAF. Therefore, a national priority should be given to a set of the most cost-effective interventions which can be scaled up immediately. Not addressing malnutrition disparities has social, economic and moral implications.

Keywords: Malnutrition, socioeconomic status, ethnicity, educational level, nutrition policy

MALNUTRITION IN ALL ITS FORMS BY SOCIOECONOMIC STATUS IN MEXICO

(1)Batis, Carolina; (2)Denova-Gutiérrez, Edgar; (3)Estrada-Velasco, Bárbara .I; (4)Rivera-Dommarco, Juan Ángel.

(1)CONACYT Nutrition and Health Research Center. National Institute of Public Health of Mexico. Mexico; (2)Hospital Infantil de México. Mexico City. Mexico.; (3)Componente de Nutrición, Departamento de Atención a la Salud de la Infancia y Adolescencia. Servicio de Salud de Morelos. Mexico; (4)National Institute of Public Health. Mexico.

Background: In Mexico, undernutrition has declined and overnutrition has become a public health concern. However, the distribution of both conditions is not equal throughout the population, therefore it is important to document disparities by socioeconomic indicators, particularly among the most vulnerable populations such as children and women of reproductive age.

Objective: Compare the prevalence of malnutrition (over and undernutrition) by socioeconomic indicators in Mexican children and women of reproductive age.

Methods: We included children <5 y old (n=10 658) and non-pregnant women of reproductive age (n=8,044 for women 11—19 y; n=14,542 for women 20—49 y) from the Mexican National Health and Nutrition Survey 2012. We defined overweight, obesity, wasting/underweight, stunting/short stature following the World Health Organization criteria, and anemia as altitude-adjusted hemoglobin <110 g/L for children <5 y; and <120 g/L for women 11—49 y. We compared the prevalence of malnutrition by tertiles of SES, education level (of the mother in the case of children and adolescents), and ethnicity (indigenous/non-indigenous).

Results: In all age groups those with low SES, low education and indigenous compared to high SES, high education and non-indigenous had 2.8—4.4 times higher prevalence of stunting or short stature, and those with low SES had 1.1—1.4 times higher prevalence of anemia. For overweight and obesity, among children <5 y old the prevalence was similar across groups; among women 11-19 y those with low SES and indigenous had 1.3—1.5 times lower prevalence; and among women 20-49 y those with low education had 1.3 times higher prevalence.

Conclusions: Disadvantaged populations (low SES, low education and indigenous) have a higher prevalence of malnutrition,

whereas the prevalence of overnutrition is either equal (children <5 y), slightly lower (women 11-19 y) or even higher (women 20-49 y with lower education). These results highlight the need for specific actions to address nutrition inequalities in the Mexican population.

Keywords: Undernutrition, overnutrition, socioeconomic indicators, Mexico

MALNUTRITION IN ALL ITS FORMS AND SOCIO-ECONOMIC STATUS IN PERU

(1)Quinto, Katherine; (2)López de Romaña, Daniel.

(1)PhD. Student. Nutritionist. National Institute of Public Health. Mexico.; (2)PhD. Technical Advisor. Micronutrient Initiative. Canada.

Background and objectives: Peru is undergoing the double burden of malnutrition. There is an unequal distribution among subgroups of the population between the increase in overweight and the persistence of undernutrition that are likely explained by social disparities. We compared the distribution of malnutrition in children under five, adolescents (15-19 y) and women of childbearing age (WCA; 20-49 y) by socioeconomic status (SES), education and ethnicity.

Method: The 2015 Peruvian National Demographic and Family Health Survey were used for the present analysis. We calculated the prevalence of overweight and obesity combined (OW), wasting/underweight, stunting/short stature and anemia in children under 5 y, adolescents and WCA as per WHO standards. A crude prevalence ratio (PR) was calculated dividing the prevalence of the highest stratum to that of the lowest stratum for SES, education or ethnicity. A t-test for complex surveys was used to identify if the differences in prevalence were statistically significant (p<0.05).

Results: In children the prevalence of OW, wasting, stunting and anemia was 9.1% (8.5-9.8), 0.9 % (0.7-1.1), 14.1% (13.4-14.9) and 32.0% (31.0-33.0), respectively. OW was higher in children from households with high SES and whose mother´s education was high [PR=3.5 and 2.6, respectively] and lower in indigenous children [PR=0.4]; wasting, stunting and anemia was higher among indigenous children [PR=2.3, 2.8 and 1.5, respectively] and lower in children from households with high SES [PR=0.3, 0.2 and 0.6, respectively] and whose mother´s education is high [PR=0.1, 0.1 and 0.6, respectively]. In adolescents the prevalence of OW, underweight, stunting and anemia was 31.7% (29.5, 33.9), 0.5% (0.2, 0.9), 22.9% (21.1, 24.6) and 20.6% (18.7, 22.5), respectively. OW was higher among high SES adolescents [PR=1.4] and lower in those with indigenous ethnicity [PR=0.7], whereas stunting was higher among indigenous adolescents [PR=1.6] and lower in high SES and educated adolescents [PR=0.4 and 0.2, respectively]. In WCA the prevalence of OW, underweight, short stature and anemia was 65.2% (64.3-66.2), 0.9% (0.8-1.1), 34.5% (33.5-35.6) and 21.7% (20.8-22.6), respectively. OW was higher among women with high SES [PR=1.1], and lower among indigenous and high educated women [PR=0.8 for both]; underweight was higher among highly educated women [PR=2.6]; stunting was higher among indigenous woman [PR=1.5] and lower in women with

high SES and high education [PR=0.5 and 0.3; respectively] and anemia was higher among indigenous woman [PR=1.2].

Conclusions: The double burden of malnutrition is still prevalent in Peru. Anemia remains the most prevalent indicator of undernutrition for children and WCA, and OW is most prevalent among WCA. There was a significant difference in the distribution of malnutrition by social indicators. In general, undernutrition is negatively associated to SES, education and being indigenous, whereas OW is positively associated to SES.

MALNUTRITION IN ALL ITS FORMS AND SOCIO-ECONOMIC STATUS IN URUGUAY

[1]Severi, Cecilia; [2]Medina, Mercedes; [3]Moratorio, Ximena; [4]Natero Felipe, María Virginia; [5]Barreto, Patricia.

[1]Interdisciplinaire group of family studies. Preventive Medicine. Faculty of Medicine. Universidad de la República. Uruguay; [2]MSc. Nutricionist. Interdisciplinaire Group of families studies. Universidad de la República. Uruguay.; [3]MSc. Nutricionist. Ministry of Health. Uruguay; [4]MSc. Nutricionists. School of Nutrition. Universidad de la República. Uruguay; [5]MSc. Nutricionist. Ministry of Social Develpoment. Uruguay

Objective: to describe the forms of malnutrition in children under 4 y.o and women 20 -49 by SES.

Method: two data bases were used, National Survey of Nutrition, Health and Development, carried on 2013 (<4 y.o) and the Second National Survey of Noncommunicable Disease Risk Factors (20 to 49 y.o) carried on 2013. To know the degree of association of the quantitative variables, Pearson Chi-square hypothesis test (chi2) was used. All tests were considered statistically significant with a status (α) of 0.05 (p <0.005). Income was studied in terciles in the first data base and in ranges of income in the second.

Results: Regarding the socioeconomic characteristics of Uruguayan households, it could be highlight that their general conditions are good, since it was observed that almost 100% of households have electric light (99.25%), drinking water (94.83%), motor vehicle (94.37%), television (97.12%), Computer (93.98%) and refrigerator (97.48%). No significant differences were found either by income tertile or by mothers´educational level.

In the only situation it was found significant differences in the first tercile of income was the health system that children were attended.

From a nutritional point of view in children under 4 years old, the public health problem what is stands out is overweight and obesity, (17.73%), finding no significant differences by income tercile or mother´s educational level.

Under weight does not seemed to be a public health problem although there are significant differences in the lowest tertiles of socioeconomic satus (SES) and educational level, although the percentages are very low (0.84% and 0.38%). As short stature is around 5%, there are significant differences in the third tertile of income and the second and third mothers´educational level.

Regarding to women from 20 to 49 y.o it was found that 53% were overweight or obese (29.8% overweight and 23.3% obese), while on the other hand, 2.7% were low weight and 2.1% had short stature.

The women educational level, was low in the 15.8%, 57.1% had the medium level, and 27% had a high level.

While in the study of the level of income, 46% were found in the lowest income range, 27.4% were within the second level of income (medium-low), 13.5% in the third (medium), 9.2% in the fourth (medium high) and 4.0% in the highest level of income.

A statistically significant association was found between obesity in the low SES (25.6%) with the medium and high level (17.0%) (p <0.005). As well as a significant association between malnutrition due to overweight and obesity in the low SES (55.4%) vs. medium (43.5%) and medium high (44.5%) (p <0.005).

Regarding the analysis of nutritional status and educational level, it was found a positive association between overweight or obesity with low educational level (61.5%) in relation to a high level (36.2%). (P <0.005). In the case of obesity, it is observed that a lower level of education, increase the probability of developing obesity in all cases (33.8% in the first level of education, 24.2% in middle and 15.6% in high level) (p < 0.005).

MALNUTRITION IN ALL ITS FORMS AND SOCIO-ECONOMIC STATUS IN CHILE

[1]Navarro-Rosenblatt, Deborah; [2]Mujica, Maria Fernanda; [3]Lopez-Arana, Sandra; [4]Corvalan, Camila.

[1]PhD Student. School of Public Health. University of Chile. Santiago. Chile; [2]PhD. Food, Nutrition and Health. Faculty of Land and Food Systems. The University of British Columbia. Vancouver. BC. Canada.; [3]RD. PhD. Institute of Nutrition and Food Technology (INTA). University of Chile. Santiago. Chile.; [4]MD. PhD. Institute of Nutrition and Food Technology (INTA). University of Chile. Santiago. Chile.

Background and objectives: Previous research in Latin America shows that socioeconomic status (SES) influences dietary patterns and obesity distribution in population. However, it is unclear how SES impacts overall nutrition status, in a post-transitional country such as Chile. The objective of this study was to assess the relationship between nutritional status (overweight, short stature and anemia), and two key aspects of the socio-economic status (SES), monthly income and educational level, in adult Chilean population.

Methods: Nationally representative data of 2574 women and 1695 men (>20 years) from the 2003 and the 2009-2010 Chilean National Health Surveys were included in this secondary analyses. Body mass index (BMI) was categorized as underweight, overweight and obesity according to WHO criteria. Over-nutrition was defined as BMI ≥25 kg/m2. Short stature was considered as a height <1.49m for women and <1.62m for men. Women with he-

moglobin <12 mg/L were classified as anemic. Descriptive statistical analysis and Chi square tests were used to compare prevalence (%; 95% CI) by educational level (low=0-7 y, middle=8-12y, and high>12y) and income tertiles.

Results: Overweight [(34.6% (31.6%-37.7%) in women] and [48.3% (44.1-52.2) in men] and, as well as, obesity [(32.7% (29.7%-35.8) in women] and [21.3% (18.4-24.6) in men], were high while underweight was negligible. Less educated women had higher prevalence of overnutrition [(82.0% (77.3%-85.8%)] and short stature [14.9% (8.5%-13.7%)] than higher educated women [(50.3% (42.8%-57.8%)] and [3.7% (2.0%-6.9%)], respectively) (P<0.05 for both). Poorer women had higher prevalence of short stature [10.1% (7.4%-13.8%)] than richer women [2.2% (1.0%-5.0%)] (P<0.05). Anemia did not differ by SES or educational level. High educated men showed a higher prevalence of overweight [(55.1% (46.2-63.7%)] compared with those with a medium educational level (all p>0.05).

Conclusions: Chile, considered as a post-transitional country, faces a significant SES and gender inequality which affects the nutritional status of the adult population. This situation is a challenge for future public nutritional policies.

ADVANCES AND CONTROVERSIES OF NUTRITION IN LATIN AMERICA

BREAKFAST, PERFORMANCE AND DIETARY BALANCE: HOW IS BREAKFAST INTAKE IN SPANISH PEOPLE?

Pérez-Rodrigo, Carmen.

MD. PhD. Spanish Society of Community Nutrition (SENC). FIDEC Foundation. University of the Basque Country (UPV/EHU). Bilbao. Spain.

Breakfast is the first intake of the day and must provide the energy needed to start daily activities. Scientific evidence supports that adequate breakfast consumption induces metabolic and neurohormonal changes in the short and medium term that favor a better performance of cognitive capacities, attention and even help to better physical performance throughout the morning. Breakfast consumption also contributes to nutritional balance and adequate intake of several nutrients. Studies conducted in schoolchildren as well as in adults have investigated associations between breakfast consumption and cognitive effects, exploring outcomes such as attention, sensorimotor responses, recent memory, problem solving or verbal capacity. Results are not conclusive, but they provide some evidence of a positive effect on sensorial-motor responses and problem solving. Different studies have shown an association between usual consumption of adequate breakfast with a lower risk of obesity, lower risk of inadequacy of calcium intake and other nutrients.

In Spain recent data show that 92% of men and 93% of women usually have breakfast. This intake on average yields 18% of the calories of the day, 18% in men and 17% in women. Some 8% of the Spanish school age population age does not take any food or beverage before beginning their school tasks. There is unequal distribution of the proportion of usual breakfast consumers across age groups, gender and socioeconomic level, with a higher rate of non-consumers in adolescents and lower socioeconomic level.

Among Spanish people, foods and beverages consumed with this first intake of the day are similar on working days and weekend days. It usually consists of milk (76% usual consumers), coffee (54%), bread (45%), with optional added oil (16%), tomato (7%), butter (11.8%), margarine (3%) and / or marmalade (9.8%). Other options include cookies (25%), bakery products and pastries (17%) or breakfast cereals (13.5%). Less frequent options can be cold meats and sausages (11%), cheese (4.4%) or yogurt (3%). Fruit is usually consumed by 9% and/or natural freshly pressed juices 10.4%, or to a lesser extent bottled juices (6.5%). The proportion of schoolchildren who complete an adequate breakfast, including a dairy food or beverage, a choice of either bread or cereal and a portion of fruit is below 10%, even lower (3%) in adolescents. Correlates of adequate breakfast consumption include having breakfast in the company of other family members, sitting at the table and dedicating enough time, at least 10 minutes, for consumption.

BREAKFAST HABITS IN VENEZUELA AND COLOMBIA: A REVEALING COMPARISON

Bernal, Ines Jennifer.

PhD. Nutritionist. Food and Nutrition Consultant. Venezuela.

Colombia and Venezuela have a similar geography, tropical climate and influence of Spain and Africa for their food pattern. Traditionally, both countries share similar foods, preparations and customs, such as arepa based on corn flour. Breakfast is similar in both regions with foods such as coffee, arepa, cheese and egg. According to ENSIN 2010, 91.8% of Colombians eat breakfast. The Nielsen study showed how Colombians keep the tradition at breakfast of consuming eggs, bread, homemade arepa, coffee and chocolate. These foods are consumed by 7 out of 10 Colombians in their households. A Colombian breakfast is made up of 37% for beverages and 61% for solid foods. Within the solids, about 3/4 of the food is processed at homes. According to the ENCOVI 2016 study in Venezuela, of the three main daily meals, breakfast is omitted by 22% of the population, but also is the most absent meal. From 2014, 11.3% of the population was reported to eat only two or fewer meals a day. 80% of the population and 88.7% of the poorest do not have resources for the weekly purchase of food,

which affects the quality and quantity of the diet. A recent report from the NGO Caritas shows how the Venezuelan diet has deteriorated at an accelerated rate, in the last 5 years. This NGO evidenced that 61% of households have changed their usual pattern of meals, more than 71% of families have deteriorated their diet and 80% have had some food deprivation. 8% of these households have resorted to eating in the street and 3% have requested food on the street. The Food and Nutrition Security Outlook for Latin America and the Caribbean reported by FAO in 2016, remarked that food inflation reached 315% in Venezuela, the highest in the region for several decades, while in Colombia it has reached 10.8% for the same period. Moreover, the price of breakfast has increased more than 2210% in the last 3 years, according to the ENCOVI 2016 study. More than five years ago there were concordances between the breakfasts of Colombians and Venezuelans. Today, the Colombians maintain their traditions, quantity and quality in the first meal of the day, while the breakfast of Venezuelans is submerged between food shortages, low quality and high prices. In Venezuela there is an unprecedented food crisis. The FAO Global Information and Early Warning System, which lists and updates the list of countries requiring external assistance for food, has placed Venezuela on its list of warning since 2017.

BREAKFAST HABIT AND NUTRITIONAL QUALITY, IN STUDENTS OF THE LICENCIATE IN NUTRITION, ATTENDING TO UNIVERSIDAD NACIONAL DE CÓRDOBA, ARGENTINA

[1]*Asaduroglu, Ana Virginia;* [2]*Herrera Cussó, Gonzalo Federico;* [2]*Celoira Peña, María Victoria.*

[1]PhD. Nutritionist. Universidad Nacional de Córdoba. Argentina; [2]Graduate in Nutrition. Argentina

Breakfast is the first daily meal used to interrupt with the overnight fast. Etymologically the term "breakfast" means "to break the fast."

It has been demonstrated that the breakfast habit contributes significantly to the nutritional balance of food as a whole.

Breakfast must pay 20-25% of the total daily energy; its quality depends largely on the variety of elements which is composed. It has been suggested that a good breakfast should contain, at least 3 food groups: dairy, cereals and derivatives and fruit.

A nutritionally adequate breakfast is associated with a better physical and intellectual performance, better health and the prevention of certain pathologies (overweight/obesity).

Objective: To inquire into the habit, nutritional quality and conditioning factors during breakfast in 2nd to 5th year students attending the Licentiate in Nutrition at Universidad Nacional de Córdoba in 2015.

Material and Methods: Cross-sectional descriptive study. Universe 1287 students. Random sampling n = 98 students (8%) who gave consent. Variables: age (years old) <24 and ≥24, origin (Córdoba-capital, Córdoba-interior, other provinces), habits (frequency, composition, time, use of electronic devices). Instruments: Alibefis-Glanc Project Questionnaire (reduced) Habits, Uses and Habits of Food, Recreation and Physical Activity in Latin America (SENC). Approved by the Ethics Committee of the Hospital Nacional de Clínicas, UNC (REPIS No. 2706/15). Nutritional quality of the usual breakfast: Adapted Breakfast Quality Index (BQI-a) whose total score = 10. Quality categories: deficient, average and adequate. Statistical analysis: Infostat.

Results: The average student's age was 22.93±3.07 years old. 6.1% of respondents never had breakfast and 39.8% did not daily. The main causes were: lack of time (50%), lack of appetite (33.3%) and feeling of discomfort at breakfast time (16.7%). 64.1% of those students who used to have breakfast, recognized doing so using an electronic device. The average breakfast time was 17.5±7.5 minutes (max. 45, min. 3). 61.4% consumed dairy drinks, and 94.7% bakery products derived from cereals. Only 15.8% consumed fruits. 14% exceeded the recommendation about the daily intake of free sugars according to WHO only during breakfast and 54.9% used artificial sweeteners. Breakfast did not cover energy recommendation in 80.7% of the cases.

Usual breakfast quality obtained from BQI-a showed that most students do not have adequate nutritional qualities breakfast (p <0.01), only 10.5% were at this level, and almost ¼ presented deficient quality breakfast. The average score was 5.28±1.63. No ideal score breakfast was recorded. The group of students ≥24 years old, from Córdoba Capital who did not attend classes regularly showed better quality.

Conclusion: 60.2% of the surveyed students had breakfast daily. None presented ideal nutritional quality and only 10.5% showed adequate quality, showing very low fruits intake. The rest did not have breakfast or did it infrequently

BREAKFAST FOOD CONSUMPTION IN PERUVIAN SCHOOLCHILDREN: A COMPARISON BETWEEN RURAL AND URBAN AREAS

[1]*Arija, Victoria;* [2]*López-Toledo, Sabina;* [3]*Ballonga, Carla;* [4]*Canals, Josefa.*

[1]Professor of Preventive Medicine and Public Health. Faculty of Medicine and Health Sciences. Rovira i Virgili University. Tarragona. Spain; [2]Predoctoral student. Faculty of Medicine and Health Sciences Doctoral Program in Nutrition and Metabolism.; [3]Predoctoral student. Faculty of Medicine and Health Sciences Doctoral Program in Biomedicine.; [4]Professor of Psychopathology. Faculty of Psychology. Rovira i Virgili University. Tarragona. Spain.

Background: An unbalanced diet, whether due to excess or deficit of ingested calories, is one of the main causes of (overweight and obesity) malnutrition. Breakfast is considered the most

important meal of the day and should contribute to 20-25% of nutritional needs. In developing countries, as Peru, the prevalence of overweight among children is increasing every year. However, few studies have assessed the associations between breakfast intake and overweight/malnutrition.

Objective: To assess breakfast intake in two Peruvian zones: rural-area in extreme poverty with a state food-aid program and urban-area in nutritional transition without program.

Methods: Cross-sectional descriptive study. 451 school children, 171 from rural and 280 urban areas. Socioeconomic characteristics, anthropometric measures (weight and height, z-score, BMI, Age) and food consumption at breakfast and at day (24-hour recall) were evaluated.

Results: The rate of literacy was 70.8% and an average income of 268 soles/month, being higher in the urban-area (95% and 349.6 soles/month) than the rural-area (46.5% and 185.5 soles/month) (p<0.001). Nevertheless the prevalence of thinness (23.3%) and overweight (19.4%) was higher in the urban-area than in the rural-area (4.7%, 8.8% respectively) (p<0.001).

In both areas, children eat breakfast at school about 10:30 in the morning, 2 hours after school starts. Children in the rural area do not bring home breakfast since they receive food from the state school feeding program "QALI WARMA", consisting of a glass of milk with a cereal (bread, cracker with kiwicha or quinoa). Breakfast is carried out within a daily pattern consumption, characterized by : milk (593.41±335.18g), blue fish (18.3±16.5g), legumes (50.3±62.2g), cereals (150.85±71.59g) and tubers (156.7± 142.0g).

Schoolchildren in the urban area mostly (95%) bought breakfast at food kiosks in schools and less frequently (5%) it was brought from home. In the kiosk there were: Breaded fried chicken, fried sausage, boiled or fried eggs; as accompaniment: potatoes, mainly fried or boiled; or sandwiches (fresh unpasteurized cheese, sweet ham or egg) and juices or soft drinks. No fruits were dispensed at school, although they were occasionally bought out. The breakfast they brought home was mainly made up of eggs, boiled potatoes and occasionally season's fruit. This breakfast is made in a food pattern characterized by meat (67.78±61.32g/day), sausages (5.03±14.38g/day) and superfluous foods (sugar/sweets/cakes/chocolate/soft drinks) (80.52±32.32g/day).

Conclusions: Schoolchildren in both areas eat very few fruits and vegetables at breakfast, especially in the rural area. However, rural schoolchildren's breakfasts represent a healthier eating choice, due to state food- aid program, while breakfasts in the urban area are less healthy due to their high content of fat and sugar.

BREAKFAST IN PARAGUAY: QUANTITATIVE AND QUALITATIVE ASPECTS

Figueredo Grijalba, Rafael.

MD, MSc. Faculty of Health Sciences. Catholic University. Asuncion. Paraguay.

According to O'Neil et al. "Breakfast is the first meal of the day that breaks the fast after the long period of sleep and is consumed within 2 to 3 hours of waking; It is comprised of food or beverage from at least one food group, and may be consumed at any location ".

Breakfast is considered one of the most important meals of the day, because it provides essential nutrients and produces pleasant sensations that are maintained throughout the day. In addition, different investigations have shown that breakfast helps to improve eating habits and the cardio-metabolic risk profile.

According to the first National Nutrition Survey, traditional Paraguayan food is comprised of three important meals per day. Breakfast was one of them and varied according to the urban or rural area. In urban areas, breakfast included milk that was generally not drunk alone, but accompanied by infusions (infusion of yerba mate called "cocido", or coffee). It was accompanied by baked goods (biscuits), made with wheat flour. In rural areas the "cocido" with milk was accompanied by manioc which is a tuber consumed very much in Paraguay. Milk could also be accompanied by ground coconut or peanuts in a "Mortar and pestle".

However, different factors have influenced this traditional feed pattern to change substantially. The accelerated urbanization experienced by the Paraguayan population; The change of working hours from a double shift schedule with a break at noon to a continuous schedule, where workers who move appreciable distances, consume one or two meals outside the home, globalization with a promotion of foods rich in Calories, sugars and saturated fats, and with devaluation of the consumption of traditional foods like seasonal fruits and vegetables, are factors that have influenced the change.

One of the main problems in relation to the food consumption habits of the Paraguayan population, especially the young population living in urban areas, is the high percentage of people who have insufficient and inadequate breakfast before going to work or to study.

In a pilot study investigating breakfast-related habits among 50 students in medical and nutrition careers in Asuncion, we have shown that 60% of the students had adequate breakfast, 35% ate insufficiently at breakfast and 5% did not eat breakfast. Insufficient breakfast is a very frequent habit in our young population. It generally consists of a portion, represented by a glass or cup, of milk or fruit juice, without any other food. These figures are similar to the findings of other studies in the school population.

We are currently developing research in different populations (schoolchildren, university students, pregnant women and the elderly) to determine the severity of the changes experienced in the habits related to breakfast of the Paraguayan population.

Keywords: Breakfast, Paraguay

MEASURING FOOD AND NUTRITION VULNERABILITY IN THE ELDERLY

[1]*Bernal, Ines Jennifer;* [2]*Candela, Yngrid;* [3]*Salgado, Tania.*

[1]PhD. Nutritionist. Food and Nutrition Consultant. Venezuela.;
[2]PhD. Nutritionist. Professor and Researcher at Universidad Central de Venezuela. Venezuela; [3]MSc. Medical doctor. Universidad Simon Bolivar. Caracas. Venezuela.

The number of people aged 65 or older is projected to grow from 524 million in 2010 to nearly 1.5 billion in 2050. According

to the UN, the proportion of those over 80 and over 100 years are also rapidly increasing. The elder adult is among the most vulnerable in the population. Regardless of their socio-economic status, the old may have difficulty buying, preparing, consuming, and assimilating food. Restrictions in their autonomy, lack of care, changes in feeding priorities, organic, emotional and economic problems are some of the factors that interfere with their access to food and maintenance of their nutritional status. Studies carried out in Venezuela, based on mixed-methods, have identified a method that captures the food and nutritional vulnerability in people over 60 years of age. The qualitative instrument allows a simple, fast and economical initial screening. The dimensions of the vulnerability capture food insufficiency, lack of autonomy to provide food, cognitive, psycho-social, socio-cultural, alteration of appetite, solidarity and physical factors. These 19-items are related with: 1. Unhealthy meals. 2. Low quantity of food 3. Skip one of the main daily meals (breakfast, lunch and / or dinner), 4. Limited meals for lack of money. 5. Still hungry after your meals. 6. Changes in your body weight. 7.Physical problems that interfere with chewing, swallowing, or feeding yourself. 8. Avoid preparing your meals because of lack of energy or motivation. 9. Forget to eat your meals. 10. Forget to buy your food. 11. Skip a meal, when you are alone, sad, or nervous. 12. Need support from a relative or other person to take your meals. 13. Need financial aid to buy food. 14. Avoid some foods because of religion, custom or health problems. 15. You feel you need to eat better to overcome pain and combat sickness. 16. Is more important to buy your medicines than your food. 17. Loose your appetite if you are not in your usual place. 18. Share your food with others. 19. Buy little food when shopping so as not to carry heavy bags home. The instrument is responded by the elderly, without any physical manipulation. The instrument was used in Venezuelan communities with a good reliability of 0.78 of alpha-Cronbach's. It needs to continue being validated in diverse communities. This instrument allows: to identify vulnerable older adults, focus on programmed actions and evaluation of social programs for the improvement of the quality of life, especially the nutritional status. The overall goal for a healthy aging is the reduction of disability due to diseases, where food and nutrition plays an important role.

NUTRITIONAL ASSESSMENT OF THE ELDERLY POPULATION OF RURAL COMMUNITIES OF CHIAPAS

[1]*Bezares Sarmiento, Vidalma del Rosario;* [2]*León Gonzaléz, Juan Marcos;* [2]*Coello Trujillo, Verónica Guadalupe;* [2]*Pascacio González, María del Rocío.*

[1]Phd. Facultad de Ciencias de la Nutrición y Alimentos. Universidad de Ciencias y Artes de Chiapas. Mexico; [2]MSc. Nutritionist. Faculty of Nutrition and Food Sciences. University of Sciences and Arts of Chiapas. Mexico.

Older adults are at increased risk for malnutrition diseases, with an incidence in women. Globally, the number of elderly people has increased; The United Nations in 2002 projected for 2025 figures of 1200 million people over 60 years and by 2050 will amount to 2 billion. In Mexico, life expectancy has increased in recent years (73 years for males and 77.9 years for females), in addition to the increase in rates of chronic degenerative diseases.

The National Health and Nutrition Survey (2012) indicates that rural and indigenous women have a higher prevalence of deficiency diseases (iron and folic acid), coupled with the presence of obesity, metabolic syndrome and other diseases of old age. The rural diet shows high energy density and low nutrient content, giving preference to volume, low cost of the product and to alleviate hunger, legumes being the source of protein, with low consumption of dairy products, meat and vegetables, a situation prevailing in the zones Of Mexico

The prevalence of abdominal obesity is significantly higher in the 40-79 years of age, with an incidence in the 70-79 years - 80% (males) /93.9% (females) - with a tendency to decrease with age; In rural Chiapas the prevalence of overweight and obesity is lower, but tending to increase.

The evaluation of the nutritional status of a sample of elderly adults from rural communities in the central zone of Chiapas, aims to present the longitudinal, descriptive study in 365 individuals older than 60 years of age (180 women / 185 men), free-living, without mental disabilities, with a collaborative attitude; Anthropometric information was recorded: weight, height, waist circumference and brachial, as well as application of the questionnaire "The Mini Nutritional Assessment (MNA)", the latter using a directed interview, being used for measurements: digital scale, ultrasonic stadiometer (ADE) and flexible tape measure (SECA); With percentage analysis and test for independent samples (t-students), 95% confidence interval.

The results show a population with mean age of 74 + 7.4 years, with body weight (kg) per centimeter (cm) of height by age and gender located in 50th percentile —weight: 57.22 + 13.50 (women), 64.50 + 14.85 men's)-, presence of low size; Waist circumference in women showed a higher risk for metabolic diseases (91.79 ± 14.22 cm) than men (91.13 ± 18.26 cm), brachial circumference according to the NHANES III women located in 75th percentile (25.64 + 8.47), men in percentile 50 (25.34 + 7.82); With respect to body mass index (BMI), both genders are within the parameters of normality: 24.04 + 8.49 (women) and 23.61 + 7.40 (men). The MNA indicates that 43.5% are at risk of malnutrition, 49.7% are well nourished and 6.8% are malnourished.

In conclusion the integral evaluation in the older adult favors to emit a better diagnosis of the nutritional situation, as in this study, where the population despite the fact that it reflects a normal BMI, there is the risk of malnutrition on the one hand and waist circumference Denotes metabolic risk, being observed thin people but with predominant waist.

Keywords: Elderly, nutritional evaluation, rural population

RISK ASSESSMENT AND NUTRITIONAL VULNERABILITY AND FUNCTIONALITY OF MUSCULO-SKELETAL TISSUE, IN ELDERLY HOSPITALIZED IN SANATORIO LA TRINIDAD DURING FEBRUARY – MARCH, 2017

[1]Garcia, Stella Maris; [2]Perri, Noemi; [3]Leal, Marcela.

[1]PhD. Nutritionist. Service of Nutrition Group Galeno. Argentina.; [2]BSc. Nutritionist. Maimonides University. Argentina.; [3]MSc. Faculty of Health Sciences. Maimonides University. Argentina.

Background: Malnutrition is a very frequent situation in the elderly. Aging conditions increase the risk of suffering from changes in body composition (fat mass increase, lean mass decrease and function loss) along with pathophysiological characteristic factors that are added to basic nutritional status. One of the central facts that comes along aging are body composition changes, and the most significant phenomenon of aging is sarcopenia, which is defined as muscle mass loss and strength that occurs from the 50´s at a rate of approximately 1-2% per year. Is very difficult to recover nutritionally an elderly deteriorated, hence the importance of valuing nutritionally this group and detecting early risks to take measures of action.

Objectives: To assess the risk and nutritional vulnerability and functionality of musculo-skeletal tissue, in elderly hospitalized in Sanatorio La Trinidad during February – March, 2017.

Methods: Quantitative, descriptive, observational, correlational and transverse. Population= Adults ≥ 75 years hospitalized in Sanatorio La Trinidad, excluding patients who had pathologies that by itself altered the base nutritional status. Sample = 141, not probabilistic. The selected sample was evaluated by different methods and tools: Mini Nutritional Assessment Questionnaire (MNA), Geriatric Nutritional Risk Index (GNRI), Nutritional Vulnerability Survey and Dynamometry Grip Force. Results were tabulated and a database was generated with the program Microsoft Excel® 2016. Description was made by proportions or percentages for quantitative and qualitative variables. Data were correlated by means of Chi-square test with yacht corrector, a significance value of 0.05 (5%) was adopted.

Results: Average age 82 years (SD±6). 61% was female. 74% lived with relatives and/or caregivers at the time of the internment, 25% lived alone and 1% in private geriatrics. The Nutritional Risk obtained by MNA: 43% normal, 45% risk and 12% malnutrition; according GNRI: 50% without risk, 18% under, 20% moderate and 11% high. Nutritional Vulnerability Degree: 3% didn´t present, 91% mild, 6% moderate. Grip Force: 41% weak, 38% normal, 21% strong. Positive correlation between MNA and GNRI (p =

1.77131E-09), GNRI and Grip Force (p = 0.001), Grip Force and Calf Circumference (p = p = 0.003) and GNRI and CP (p = 0.000).

Conclusions: The elderly are vulnerable individuals. Detecting the needs, difficulties and challenges that they live in order to obtain food along with the nutritional status evaluation and functioning of the skeletal muscle tissue is fundamental at the moment of the hospitalization for the decision making during the same and also for patient following after hospitalization.

DIETARY AND NUTRITIONAL ADEQUACY IN BREAKFAST AND IN DIETARY SUPPLY OFFERED TO OLDER ADULTS: A LOOK INTO THE FUTURE

Aranceta, Javier.

MD.PhD. Department of Food Sciences and Physiology. University of Navarra. Spanish Society of Community Nutrition (SENC). Latin American Group of Community Nutrition (GLANC). Spain.

Throughout life, an adequate breakfast should provide 20-25% of the daily energy intake. In the Spanish context, considering the most common eating habits in the population, breakfast should consist of three main food groups: a portion of dairy or equivalent food, a portion of bread or other cereal based food and a portion of fruit. Optionally, depending on the type of activities to be carried out and on usual daily intake, items from other food groups can also be added, adjusting portion sizes and amounts of foods consumed.

Social and demographic changes along increased life expectancy have led to a progressive aging of the population, so that, at present, the group of people aged over 65 y. represents approximately 18% of the Spanish population, expected to reach up to 20% by 2020. Although it is currently under debate which is the best and most efficient model to provide quality care services for the elderly, the trend so far in Spain has been towards professional residential care in institutions that accommodate more than 100 elderly people.

The group of elderly people is very heterogeneous, and so are their nutritional needs. Aging processes as well as other frequent circumstances in the elderly influence food habits, food intake and nutritional status in senior people. Estimates of the prevalence of malnutrition in the elderly are variable, but it is a frequent problem in institutionalized elderly.

Suffering multiple pathologies and use of multiple pharmaceutical prescriptions are common in this population group. Older people often show difficulty in chewing food due to dental or oral cavity problems, loss of dental pieces or use of poorly fitting prostheses, as well as problems in swallowing solids and / or fluids. Mobility problems and/or sensorial decline are even more frequent difficulties that contribute to limit the autonomy for food and beverages consumption. Anorexia and depression are com-

mon as well. Due to all the above, the elderly group is typified as a group at nutritional risk.

According to the Spanish report White Paper on Food for the Elderly, in only 9% of geriatric institutions food supply is supervised by a dietitian. The wide interpersonal variability in nutritional requirements in older people requires the prescription of individualized guidelines, taking into account the health status, underlying pathology, drug consumption, alcohol consumption, sociocultural characteristics, degree of autonomy, physical activity and eating habits. Overall, it is advised a universal basic diet for the elderly, based on a prudent and healthy diet and strategies to promote personal autonomy, active life and prevention of dependence.

TOOLS TO PROMOTE TAILORED INTERVENTION PROGRAMS IN NUTRITIONAL DEPRIVED ELDERLY LIVING COMMUNITIES

TOOLS TO PROMOTE TAILORED INTERVENTION PROGRAMS IN NUTRITION FOR ELDERLY

Vaz de Almeida, Maria Daniel.

PhD. Nutritionist. Faculty of Nutrition and Food Sciences. University of Porto. Portugal.

Introduction to the symposium:

According to the United Nations*, the ageing of the world population (that is, the increasing proportion of older people in the population) is one of the most significant social transformations of the 21st century spanning all countries, regardless of their developmental stage. It is expected that in 2050, nearly half of the world's population will live in countries or areas where at least 20 per cent of the population is aged 60 years or over. This phenomenon has implications for most sectors of the society, including the demand for goods and services,as well as family structures and intergenerational ties. Amongst those, the health and food provision sectors play an important role to the maintenance of independence and quality of life in old age. The outcomes of the PRONUTRISENIOR project constitute the basis for the symposium. The methodologies designed and applied aiming to create and disseminate among health professionals, caregivers and elderly, simple tools to assess elderly nutritional status and to promote healthy eating will be explored. Such tools originated from a detailed evaluation of elderly within their living space (environmental, social and economic features), at a local scale and with a cohesive combination of multidisciplinary theoretical and methodological frameworks. This symposium also addresses the key issues of food, eating and meals in elderly everyday life as well as interventions tailored specifically to improve the nutritional status, physical function and quality of life of elderly citizens, in order to avoid further events and complications.

HOLISTIC APPROACH TO THE STUDY OF FREE LIVING ELDERLY: LESSONS FROM THE PRONUTRISENIOR PROJECT

[1]*Torheim, Liv Elin;* [2]*Vaz de Almeida, Maria Daniel;* [3]*Birgisdottir, Bryndis Eva.*

[1]Professor. Nutritionist. Oslo and Akershus University College. Norway.; [2]Professor. Nutritionist. University of Porto. Portugal.; [3]Professor. Nutritionist. University of Iceland. Iceland.

Countries worldwide face an increasingly elderly population. An important public health goal is to support healthy ageing, where adequate nutrition and prevention of malnutrition plays a key role.

The Pronutrisenior project was conducted by the University of Porto in collaboration with Oslo and Akershus University College and the University of Iceland, within the catchment area of the Nova Via Health Unit. It was funded by an EEA grant. The aim of the project was to develop tools for assessing and monitoring the food and nutrition situation among free-living elderly in the north of Portugal, and to develop training materials for health and other professionals working in gerontology and elderly. The project was designed to have an holistic and interdisciplinary approach and used a range of quantitative and qualitative methods. For assessing health and nutritional status, questionnaires and anthropometric measurements were used. Dietary intake was assessed by 24-h recall and FFQ. Geocode mapping was used in a geographic information system (GIS) to identify the elderly and to map both their food environment, the built environment and their social environment. Their socio-economic situation, cognitive status, food-related quality of life (QoL) and other information was also collected using interview assisted questionnaires.

Out of 602 elderly (> 64 years), 27% were malnourished or at risk of malnutrition. The most important predictors of malnutrition were low social support and low food-related QoL. The study also shed light over important factors for healthy ageing, such as possibilities of maintaining a social network, distance to health center and places to buy food, as well as to what extent the environment supported physical activity and walking outside, for example by having safe sidewalks.

The approach used in ProNutriSenior gives a holistic understanding of several aspects of the elderly's health and nutritional situation including food-related QoL. This provides a good basis for developing tailored interventions. The data collected in this

project was extensive, and the experiences could be used for further developing simpler and more targeted tools in Portugal and other countries, for monitoring and for multi-country comparisons. The interdisciplinary approach involving geography, nutrition and bio-statistics proved to be most useful and could be applied also in other settings.

UI and Landspitali University Hospital. Faculty of Food Science and Nutrition. SHS. Iceland; [3]School of Health Sciences. Universtiy of Iceland. Department of Physiotherapy. School of Health Sciences. University of Iceland. Iceland; [4]School of Health Sciences (SHS). UI.The Icelandic Gerontological Research Center. SHS. UI & Landspitali University Hospital. Faculty of Medicine. Department of Geriatrics. National University Hospital of Iceland. Iceland.

Background and objectives: The aim of the present work was to identify baseline predictors of drop out with particular focus on physical function; and to compare changes in physical outcomes after a resistance exercise program between elderly men and women.

Methods: Subjects (N=236, 73.7 ± 5.7yrs, 58.2% female) participated in a supervised 12-week resistance exercise program (REP) designed to increase muscle mass and -strength. Body composition (DXA), quadriceps- and grip strength, physical function as 6-minutes-walk-for-distance (6MWD) and timed-up-and-go (TUG) were measured before and after the REP. Quality of life (QoL) was assessed.

Results: Neither drop-out (11.9%) nor the attendance rate (91%) were different between genders. Although absolute gains in lean body mass (LBM) (1.10 ± 1.30 vs 0.61 ± 1.21kg, P<0.001) and appendicular skeletal mass (ASM) (0.67 ± 0.81 vs 0.42 ± 0.62kg, P<0.001) were higher in men than in women, relative gains were similar (LBM: 1.9 ± 2.2 vs 1.6 ± 2.9%; ASM: 2.3 ± 2.8 vs 2.1 ± 3.0%). Both men and women improved similarly in quadriceps strength (55 ± 57 vs. 52 ± 49), grip strength (3.2 ± 6.2 vs. 3.0 ± 5.4lb), 6MWD (31 ± 38 vs. 35 ± 32m), and TUG (-0.55 ± 0.98 vs. -0.72 ± 1.22sec). In comparison to completers, participants who dropped out were older and had poorer physical function at baseline than the completers. They also exercised less at baseline,

however, neither body composition, QoL nor MMSE were related to drop out.

Keywords: Resistant training. Physical function. Elderly. Intervention.

NUTRITIONAL STATUS OF HEART FAILURE OUTPATIENTS IN ICELAND – FOOD, FUNCTION AND FEELINGS

[1]Vilborgardottir, Vilborg Kolbrún; [2]Geirsdottir, Ólöf Guðný; [3]Gudlaugsdottir, Gudbjorg J; [4]Thrainsdottir, Inga; [5]Tryggvadottir, Ellen A.

[1]PhD student. Iceland.; [2]PhD. Nutritionist. Faculty of Food Science and Nutrition. University of Iceland. Iceland.; [3]MSc. RD. Department 14E. Clinic for Heart Failure Outpatients. Landspitali. The National University Hospital. Reykjavik. Iceland; [4]MSc. MD. Department 14E. Clinic for Heart Failure Outpatients. Landspitali. The National University Hospital. Reykjavik. Iceland; [5]MSc. Nutritionist. Faculty of Food Science and Nutrition. University of Iceland. Iceland.

Introduction: Malnutrition is associated with increased length of stay in hospital and further complications, consequentially increasing the cost of care. Heart failure is a disease prevalent in older adults, characterized by chronic symptoms, such as fluid retention, dyspnea and fatigue. Therefore patients suffering from heart failure are a delicate group that can be susceptible to malnutrition. Evaluation of nutritional status has never been performed for this group in Iceland.

Aim: To assess the risk of malnutrition in heart failure outpatients using the Simple Screening tool for Malnutrition (SSM) as well as assessing the nutritional status of a smaller sample of the same population using estimations of: appetite and dietary intake; body mass index, reported weight loss and fluid retention; biochemical measurements; grip strength and quality of life.

Methods: This was a cross-sectional study. All patients with an appointment at the outpatient clinic of heart failure at Landspitali University Hospital were screened for malnutrition (n=84). A total of 60 patients were invited to participate, whereof 33 signed an informed consent (55%). Participation consisted of answering three questionnaires, as well as undergoing blood sampling and measurement of grip strength. Information on the results of SSM, ICD-10 diagnoses, medication, height, weight, blood pressure and edema were collected from electronic medical records.

Results: Screening for all patients (n=84) showed that around 30% were at medium or severe risk of malnutrition. Participants in the current study (n=33) were of both sexes, thereof 27% (n=9) women and medium age was 76 (25th, 75th; 70, 80) years. The participants' diet turned out to be rather rich in protein, with majority reporting to eat at least one warm meal per day. A total of 23% of participants reported loss of appetite and 27% reached reference values for grip strength. Mean T-score for quality of life was 43.8 (±10.4), with the norm being 50±10. Using diagnostic criteria from ASPEN, in tota, 19% (n=6) of participants were diagnosed

with malnutrition and are in need of nutritional intervention, whilst 16% were defined at risk and need supervision.

Conclusion: One third of all patients were at risk of malnutrition and grip strength of participants proved to be impaired. Health related quality of life was significantly lower than among healthy older adults. It is of importance to routinely monitor nutritional status of all patients for timely interventions. Such interventions are valuable to improve both nutritional status and quality of life, as well as to preclude further events and complications. The outpatient clinic of heart failure provides high level of services, which likely plays a big role in maintaining the quality of life of patients.

'FILL THE NUTRIENT GAP' WITH 'COST OF THE DIET' TO INFORM NUTRITION POLICY AND PROGRAMMING

'FILL THE NUTRIENT GAP' APPROACH TO SITUATION ANALYSIS AND DECISION-MAKING FOR IMPROVING NUTRITION

[1]de Pee, Saskia; [2]Baldi, Giulia; [3]Bose, Indira; [4]Kiess, Lynnda.

[1]Technical Advisor. Nutrition Division. World Food Programme. Rome, Italy.; [2]Nutritionist. Nutrition Division. World Food Programme. Rome. Italy.; [3]Economist. Nutrition Division. World Food Programme. Rome. Italy.; [4]Nutritionist. World Food Programme. New York. USA.

Advancing national multi-sectoral nutrition policies and programming can greatly benefit from an assessment of opportunities and challenges to meeting nutrient requirements of key target groups, because meeting nutrient intake requirements is a key prerequisite for preventing malnutrition. The Fill the Nutrient Gap (FNG) tool for situation analysis and decision making analyses context-specific secondary sources of information on factors that directly or indirectly impact on whether people can access and consume nutritious foods and whether they meet recommended nutrient intakes. The aim of the FNG is to formulate recommendations for policies and programming in agriculture, food systems, health, social protection, education and other sectors that can contribute to improving nutrition. The tool has been developed by WFP, with inputs from UNICEF, IFPRI, University of California Davis, Harvard University Boston, Epicentre Paris and Mahidol University Bangkok.

The FNG analysis focuses on different target groups, such as young children, pregnant and lactating women and adolescent girls, in different situations, by distinguishing for example whether they live in urban or rural areas, in food-secure or -insecure areas, belong to higher or lower socio-economic groups etc. The

analysis seeks information (and identifies gaps) on food system related information, such as access to markets, availability of nutritious foods, affordability of nutritious foods based on price relative to income (using Cost of the Diet analysis, CotD) and (public-) private sector initiatives to improve availability and affordability of nutritious foods; social protection system related information such as coverage, targeting and design of social safety nets programs; health system related information, such as coverage of supplements, home-fortification and nutrition education; education system related information; and also information on food choice and preparation practices, intra-household food distribution, and infant and young child feeding practices, from surveys as well as qualitative enquiries. The CotD analysis is also used for modeling the impact on affordability of a nutritious diet of approaches that increase availability and affordability of nutrients from affordable nutritious foods, fortified foods and supplements and/or improve purchasing power.

The analysis is designed and conducted together with in-country stakeholders from different constituency groups (government, UN, academia, private sector, civil society) that work in the food system, health system and/or social protection system, and concludes with recommendations for improvements to be made to policies and programs across these sectors that are most needed, relevant and feasible in the country's context. Since its development in 2015, the FNG and CotD has been used in 10 countries and several more are planned for 2017 and 2018.

IMPLEMENTING THE FILL THE NUTRIENT GAP – IN COUNTRY PROCESS AND DATA SOURCING

[1]Baldi, Giulia; [1]Bose, Indira; [1]Knight, Frances; [2]Kiess, Lynnda; [3]Badham, Jane; [1]de Pee, Saskia.

[1]World Food Programme. Nutrition Division. Rome. Italy.; [2]World Food Programme. Nutrition Division. New York. USA.; [3]JB Consultancy. Johannesburg. South Africa.

The Fill the Nutrient Gap (FNG) has been developed to gain greater insights into and develop strategies to address one of the two prerequisites to prevent the immediate causes of malnutrition - adequate nutrient intake. It includes a framework for analysis, based on secondary data and linear programming (Cost of the Diet), and a process for multi-stakeholder engagement at country level.

Secondary sources used for FNG analysis include data and other relevant information (reports, grey literature, peer reviewed papers, socio-ethnographic studies and formative research) on nutrition indicators, food access and availability, dietary intake, preferences and practices, food security, household food expenditure and socio-economic conditions, together with analysis of affordability of nutritious diets and intervention modelling using the Cost of Diet (CotD) tool. The secondary data review is extensive, for example, in Pakistan 190 and in Lao PDR 112 sources were reviewed.

Analysis and triangulation of different data sources is used to cross-check findings. National stakeholders contribute to identify and validate data and information sources, and to provide insights on the interpretation of finding inconsistencies. Where available, information from market and consumer surveys on complementary and fortified foods (e.g. Ghana, Indonesia), purchasing patterns of different food commodities by various population segments and, on local supply chains for nutritious foods provide useful insights as to opportunities to be leveraged, on both the demand and supply sides of the food system.

Through this iterative process, the 'nutrient gap' within a country can be better defined in terms of who (vulnerable population groups), where (regions, urban/rural), when (seasonality), why (compounding factors) and how (quantity and/or quality of nutrient intake). Secondary data also contributes to an analysis of the enabling environment, including national legal and regulatory framework, policy, programmes and partnerships relevant to nutrition, to inform entry points for sustainable action. The analysis then identifies and models the potential economic and nutritional impact of possible interventions to address the defined gaps, across the identified sectors and entry points, using CotD (see Deptford et al. and Bose et al.).

The multi-stakeholder engagement process at country level, starts with the identification of key target groups (e.g. children under two, pregnant and lactating women, adolescent girls) and determines the level of analysis (e.g. national, sub-national). Consultation continues throughout the data consolidation and analysis of secondary data and CotD phases, ending with the joint identification of a prioritized set of recommended interventions and policy measures across the food system to improve intake and access to a nutritious diet engaging multiple sectors. Where possible (e.g. Pakistan, Madagascar, Lao PDR, Tanzania), SUN country platforms are used to leverage the multi-sectoral, multi-stakeholder process, involving health, agriculture, social protection, education and the private sector.

WHAT CAN COTD ANALYSES TELL US?

[1]Roschnik, Natalie; [2]Schofield, Lilly.

[1]MSc. Senior Nutrition Advisor. Save the Children UK; [2]MSc. Nutrition Advisor. Save the Children UK.

The Cost of the Diet is a method and software developed by Save the Children in 2004 to estimate the cost of a nutritious diet in different contexts. The software uses linear programming to calculate the amount, combination and overall cost of local foods that are needed to provide individuals or typical families with their average needs for energy and their recommended intakes of protein, fat and micronutrients. The software was developed in response to research which showed that the poorest households could not afford the diets being promoted and to better understand the extent to which poverty affects nutrition.

The software uses three streams of information: nutrients from foods (from food composition tables); human requirements for nutrients (from WHO/FAO dietary recommendations) and the local cost of food (collected via market surveys). The software pulls these three streams of information together to find the cheapest combination of foods that meet human nutrient requirements. The software generates four standard low cost diets: 1) an Energy-only diet, which only meets the family's energy requirements; 2) a Macronutrients diet which meets the family's energy, protein and fat requirements; 3) a Minimum-cost nutritious diet, which meets the family's energy, macro and micronutrient requirements and 4) the Food habits diet, which meets the family's energy and macro- and micronutrient requirements, while also reflecting people's typical dietary habits e.g. main staple food and food taboos. The software tells us whether poor households can afford a nutritious diet, what the gap is between the cost of a nutritious diet and what they can afford (their income minus essential non food items). It also allows modelling to be done to identify interventions that would reduce the affordability gap e.g cash transfers, supplementary food, food fortification, and the most cost nutrient efficient diets to promote in different contexts.

A review of Cost of the Diet assessments in Asia found that the affordability gap was 48% and 22% for very poor and poor households respectively. This means that on average very poor households would need to increase their annual income by almost 1.5 times to be able to afford a nutritious diet in addition to other essential non-food expenditures (Save the Children, 2017). In Malawi and Nigeria, national recipes were tested and adjusted to increase their nutrient content at a lower cost using local foods.

In 2016, Save the Children released the Cost of the Diet software Version 2 (rewritten in Delphi XE4©) which is more stable, reliable, and adaptable and the method was published and endorsed in BMC Nutrition (Deptford A, 2017). The software is freely available for use on request, but can only be used by trained practitioners. http://www.heawebsite.org/countries/reports/cotd-software-version-2-2016

Keywords: Cost, Diet, poverty, software

HOW ARE COST OF THE DIET ANALYSES CONDUCTED?

[1]Deptford, Amy; [2]Hall, Andrew; [1]de Pee, Saskia; [1]Kiess, Lynnda; [1]Baldi, Giulia; [1]Bose, Indira.

[1]World Food Programme. Italy; [2]University of Greenwich. England.

A Cost of the Diet (CotD) analyses requires the following information: a list of all foods available in the assessment area; the average cost per 100g of these foods during a season(s) or given time point; the energy and nutrient composition and typical dietary habits of these foods; the typical size of households in the assessment area; and the estimated average requirements for energy and recommended nutrient intakes for the individuals included within the typical household. If the affordability of the diet is to be estimated, data on household or per capita income or expenditure is required.

For the list, cost and typical dietary habits of locally available foods, primary data collection using the CotD standardised methods should be used. Alternatively, secondary data sources such as market price monitoring surveys and household consumption and expenditure surveys could be used. In order to determine household size, income or expenditure, household consumption and expenditure surveys could be used. Secondary data can save time and resources and has been previously validated by stakeholders in-country. However, it is important that this data is reviewed for its quality, access rights and appropriateness. Although a more costly and resource intensive option, primary data is current and purposefully collected based upon the objectives of the CotD assessment and the local context.

The CotD software contains numerous databases: the energy and nutrient content for 3,500 foods, their portion sizes and the energy and nutrient specifications for 237 individuals. The CotD software applies these parameters to the data collected through primary or secondary sources and the linear programming solver calculates the least expensive combination of foods to meet the nutrient specifications for the selected household.

The software summarises the results for each diet in terms of the costs, quantity and proportion of nutrient specifications provided by all the foods selected for a given individual/target group or household by day, week, season and year. A study conducted in Ntchisi district in Malawi found that the cost of a nutritious diet that was adjusted to include staple preferences for a household of 5 people was 44,212 MWK a month, for which an adolescent girl was the most expensive individual. Only 59% of the population could afford this diet. The software selected maize, cowpea, green leafy vegetables, liver and dried fish as inexpensive sources of essential nutrients but found calcium, iron and zinc the most difficult nutrients to meet specifications for, using foods available in the market.

Depending on the scope of the assessment and the type of data used, a CotD analysis can take between 3-6 weeks. The process should begin with a consensus on the objectives and scope of the assessment. If primary data collection is to be undertaken, enumerators will need to be hired and trained. CotD analyses should be conducted by certified practitioners. These are nutrition or food security personnel who have attended the 5 day practitioners training and completed an assessment for which the data and report has been reviewed by an independent, certified practitioner.

Keywords: Data, cost, diet, linear programming

HOW IS A COST OF THE DIET ASSESSMENT CONDUCTED?

[1]Deptford, Amy; [1]de Pee, Saskia; [1]Baldi, Giulia; [1]Bose, Indira; [2]Hall, Andrew.

[1]World Food Programme. Italy; [2]Save the Children. UK.

The Cost of the Diet (CotD) is a method and software developed by Save the Children to calculate the lowest cost of meeting specifications for energy, protein, fat and micronutrients from local foods. A CotD assessment requires the following information: a list of all local foods; the average cost per 100g of the foods in a season(s); the energy and nutrient composition of the foods; the typical dietary habits of people in the area; the size and composition of a typical household; and the estimated average requirement for energy and the recommended nutrient intakes for the individuals included within the typical household. If the affordability of the diet is to be estimated, data on household or per capita income or expenditure will be required.

Standard methods are used to create the list of foods, record their cost, assess the typical dietary habits of local people, and estimate the typical household size. Alternatively, secondary data from market price monitoring surveys or household consumption and expenditure surveys could be used. This is less costly and labour intensive than collecting primary data but it is important that these data are reviewed in terms of their quality, validity, access rights and appropriateness.

The CotD software contains two main databases: the energy and nutrient content of 3,500 foods with their edible portion sizes, and the energy and nutrient specifications for 237 individuals. The CotD software applies these values with the cost of local foods to a linear programming solver which calculates the least expensive combination of foods to meet the energy and nutrient specifications of the individuals in the household selected. The software presents the results for four standard diets in terms of their costs, quantity and proportion of nutrient specifications provided by the foods selected by the software for all individuals in the household separately and collectively by day, week, season and year.

An assessment done in Ntchisi district in Malawi found that the cost of a nutritious diet that was adjusted to include a preferred staple for a household of 5 people was 44,212 MWK a month, and was most costly for an adolescent girl. The software selected maize, cowpeas, green leafy vegetables, liver and dried fish as inexpensive sources of essential nutrients but found calcium, iron and zinc the most difficult specifications to meet. Only about 60% of the population were estimated to be able to afford this diet.

Depending on the scope of the assessment and the type of data used, a CotD analysis can take between 3-6 weeks. The process should begin by defining the objectives and scope of the assessment. If primary data are to be collected, enumerators need to be hired and trained. A CotD assessment should be conducted by a certified practitioner. This is a nutritionist or food security expert who has attended a 5-day practitioners' training course and has completed an independent assessment for which the data and report has been reviewed by a certified practitioner.

Keywords: Data, cost, diet, linear programming

MODELLING WITH COST OF THE DIET AND INFORMING FILL THE NUTRIENT GAP (FNG) ANALYSIS

[1]Bose, Indira; [2]Baldi, Giulia; [3]Kiess, Lynnda; [4]Deptford, Amy; [5]de Pee, Saskia.

[1]Nutrition Division. World Food Programme.; [2]Programme and Policy Officer. Nutrition Division. World Food Programme. Rome. Italy.; [3]Programme Advisor. Nutrition Division. World Food Programme. Rome. Italy.; [4]Nutritionist. Nutrition Division. World Food Programme. Rome. Italy.; [5]PhD Nutritionist. Nutrition Division. World Food Programme. Rome. Italy.

Many households cannot afford to meet the nutrient needs of all its members, which has been shown by Fill the Nutrient Gap (FNG) analyses and Cost of the Diet (CotD) studies in numerous different countries across the world. In particular household members with high nutrient needs relative to their energy needs such as children aged 6-23 months, pregnant and lactating women (PLW) and adolescent girls, are often the most expensive household members and/or require specific foods in addition to those consumed by the rest of the family so it is especially difficult to meet their nutrient needs. In order to address this issue solutions are required that reduce the cost of nutritious foods, make nutritious foods more available (e.g. in cases where certain foods do not exist or the availability of foods meeting nutrient needs are highly seasonal), and/or increase purchasing power. Using the Cost of the Diet tool different solutions to improve affordability can be modelled to help inform the FNG analysis on possible feasible solutions within the specific context and guide the formulation of sector specific recommendations.

Throughout the FNG process stakeholders from agriculture, food systems, health, social protection, education and other sectors are engaged to provide their input and interpretation into the analysis. One key area in which stakeholders provide input is the identification of appropriate interventions to be modelled. For example, stakeholders working in agriculture might be interested to see the potential impact of home-gardening interventions such as vegetable production; bio-fortification of crops; or large scale agricultural interventions aimed at reducing the overall cost of certain foods or making certain foods more available. Those involved in social protection might be interested in modelling cash transfers or vouchers for nutritious foods (e.g. leafy greens or animal source foods) or fortified Specialised Nutritious Foods (SNFs). Stakeholders within the health sector might be interested in seeing the impact of interventions such as the provision of iron folic acid tablets for PLWs; micronutrient powders or fortified complementary foods for children under 2; or staple food fortification. These interventions can be targeted at specific individuals of interest in the household, such as a child under 2, a PLW and an adolescent girl, or to the household as whole. Interventions aimed at specific target groups can also be combined to form a potential 'optimal' package of interventions targeting different household members. Different types of transfer modalities can also be modelled such as the provision of these foods through market channels or via voucher/ in-kind.

The results of the modelling are then used to inform stakeholders of the different potential intervention options that could be effective within their context. These results are intended to stimulate discussion and sensitise sectors on the contribution they could provide to improve access to nutritious diets, rather than prescribe specific actions. The results of the modelling combined with the wider FNG analysis then provide a basis upon which sector-specific recommendations to directly or indirectly improve nutrient intake can be formulated and implemented.

APPLICATION OF WHO GUIDELINES ON OPTIMAL BLOOD FOLATE CONCENTRATIONS TO PREVENT NTDS IN COUNTRIES

OPTIMAL SERUM AND RED BLOOD CELL FOLATE CONCENTRATIONS IN WOMEN OF REPRODUCTIVE AGE FOR PREVENTION OF NEURAL TUBE DEFECTS

Rogers, Lisa Marie.

PhD. Technical Officer. Department of Nutrition for Health and Development. World Health Organization. Geneva, Switzerland.

Increasing awareness of the public health significance of insufficient folate intake due to its association with neural tube defects has emphasized the need for guidance on use of appropriate biomarkers for the assessment of folate status and cut-offs to define folate deficiency and insufficiency at the population level. In the early 1970's, the World Health Organization (WHO) endorsed serum and red blood cell folate cut-off values for defining folate deficiency based on risk of occurrence of macrocytic anaemia. In 2005, WHO updated the cut-off values to reflect folate deficiency based on metabolic indicators, primarily homocysteine concentrations. In recognizing the important role of folate in the prevention of neural tube defects, WHO has recently released guidance on the assessment of optimal folate status among women of reproduction age for the prevention of these birth defects. WHO recommends that red blood cell folate concentrations should be above 906 nmol/L (400 ng/mL) at the population level to achieve the greatest reduction in neural tube defects. This same threshold can also be used as an indicator of folate insufficiency in women of reproductive age at the population level. However, this should not be used at the individual level, as it cannot explain all cases of neural tube defects and therefore cannot predict an individual's risk of having a neural tube defect-affected pregnancy. The use of microbiological assay is recommended for the assessment of red blood cell folate concentrations with appropriate quality control measures. The current recommendations are based on results of microbiological assay with chloramphenicol-resistant strain and folic acid calibrator. The use of different folate calibrators or dif-

ferent microorganisms may lead to different results among microbiological assays and laboratories and may need to adjust the threshold value for optimal red blood cell folate. Due to insufficient evidence, a threshold for serum folate could not be made at this time for defining folate insufficiency.

USING THE WHO OPTIMAL BLOOD FOLATE CONCENTRATIONS FOR THE U.S. TO EVALUATE THE IMPACT OF FORTIFICATION AND SUPPLEMENT USE POST-MANDATORY FOLIC ACID FORTIFICATION (NHANES 2007-2012)

[1]Crider, Krista; [2]Qi, Yan Ping; [2]Tinker, Sarah.

[1]PhD National Center on Birth Defects and Developmental Disabilites, CDC Atlanta GA USA; [2]National Center on Birth Defects and Developmental Disabilities (NCBDDD). Centers for Disease Control and Prevention (CDC). Atlanta GA USA.

Intake of 400μg folic acid per day before and during early pregnancy prevents many neural tube defects (NTDs). Since 1998 there have been three sources of folic acid in the U.S.: enriched cereal grain products (ECGP) mandatorily fortified with 140μg folic acid per 100g; ready-to-eat (RTE) cereals, which are allowed but not required to contain up to 400μg per serving; and dietary supplements, generally 400-800μg. In 2015 the World Health Organization established a threshold for the population level optimal red blood cell (RBC) folate concentration [> 906nmol/L (>400ng/L)] for prevention of NTDs. We found previously that 22.8% of the U.S. population is below the threshold. To evaluate the impact of the current folic acid fortification policy and consumption patterns on NTD risk, we used 2007-2012 data from the National Health and Nutrition Examination Survey (NHANES), a cross-sectional survey representative of the non-institutionalized U.S. civilian population, to examine usual daily intake of synthetic folic acid and naturally-occurring food folate and RBC folate concentrations among U.S. women of reproductive age (12-49 years). RBC folate concentration distributions were then used in simulations to predict NTD risk based on published dose-response relationships in the population overall and among those consuming folic acid from difference sources. The predicted NTD risk among U.S. women of reproductive age was 7.1 NTDs per 10,000 live births (95% uncertainty interval [UI] 5.3-9.2). Among those with ECGP as their only source of folic acid had lower median usual daily intake of folic acid (115 μg interquartile range 79-156) and higher predicted NTD risk (8.5/10,000 live births; 95% UI 6.4-10.8) compared to those consuming folic acid from additional sources. We estimate that if reproductive-aged women with ECGP as their only source of folic acid (48% of population) increased their folic acid intake through RTE cereal and/or supplements, it could be possible to prevent up to an additional 640 NTD-affected pregnancies (95% UI 143-114) per year. Although folic acid fortification has prevented many NTDs, under current consumption patterns some U.S. women of reproductive age remain at risk for having an NTD-affected pregnancy.

RED BLOOD CELL FOLATE INSUFFICIENCY AMONG NON-PREGNANT WOMEN OF CHILDBEARING AGE IN BELIZE: PREVALENCE AND PREDICTED RISK OF NEURAL TUBE DEFECTS

Ministry of Health, Belmopan, Belize.

Background and objectives: Studies have shown that increased consumption of folic acid by women during the periconceptional period can significantly reduce the occurrence of neural tube defects (NTDs), which has led to current recommendations for women to consume 400 μg (0.4 mg) of folic acid daily. Based on these studies the World Health Organization recently released recommendations stating that red blood cell (RBC) folate concentrations should be above 400 ng/L (906 nmol/L) for optimal prevention of folate-sensitive NTDs. The objective of this study was to determine the distribution of RBC folate insufficiency (<906 nmol/L) and potential risk of NTDs based on RBC folate concentrations among non-pregnant women of childbearing age (WCBA) in Belize.

Methods: A national and regional multistage cluster probability survey was completed during 2011 among Belizean WCBA, aged 15–49 years. Demographic and health information, and blood samples for RBC folate analyses were collected from 973 women. Prevalence rate ratios of folate insufficiency and predicted NTD prevalence were estimated based on RBC folate concentrations.

Results: The national geometric mean of RBC folate was 719 nmol/L (95% confidence interval (CI) 689, 750). National prevalence of RBC folate insufficiency was 48.9% [95% CI 44.8, 53.1]. RBC folate insufficiency showed wide variation by ethnicity: Mayan 70.5% (60.1% - 79.2%); Mestizo 46.2% (40.2%-52.3%); Creole/Garifuna 54.3% (46.3%-62.1%) and Other 33.5% (21.0%-48.8%). There was also wide variation by geographic region (40.2%-60.4%). Based on the population distribution of RBC folate con-

centrations, the national predicted NTD risk was 15.4 per 10,000 live births (95% CI 11.8, 19.9). The predicted NTD risk was more than 12 times higher among women with RBC folate concentrations at the 5th percentile compared to women with RBC folate concentrations at the 95th percentile (49.5 vs. < 4 per 10,000 live births, respectively).

Conclusions: Folate insufficiency is very high and remains a public health concern in Belize. Folate insufficiency was more prevalent among Mayans, Creole/Garifunas and in regions with a large proportion of indigenous populations. These results suggest that there is a need to ensure that WCBA in all ethnic groups in Belize receive at least 400 μg of folic acid daily to reduce the risk of folate-sensitive NTDs.

FOLATE AND VITAMIN B12 STATUS AMONG NON-PREGNANT WOMEN OF REPRODUCTIVE AGE IN MALAWI, 2015-2016

Nyirenda, Eunice.

MNS coordinator. Nutrition Technical Assistant. Malawi Ministry of Health. Dept of Nutrition HIV and AIDS. Malawi.

consumption of 400 mcg of folic acid prevents the majority of NTDs. Folate insufficiency or deficiency is thought to be a public health problem in Malawi among women of reproductive age (WRA), but data on folate and vitamin B12 micronutrient status are lacking.

Objective: To determine baseline prevalence of folate deficiency and insufficiency and vitamin B12 deficiency among non-pregnant women aged 15-49 years in Malawi.

Methods: A cross-sectional two-stage cluster sampling design was used to conduct a national nutrition and biomarker survey from December 2015 to February 2016. Demographic and health information were obtained through in-person interviews. Blood samples were collected and analyzed for serum and RBC folate and vitamin B12 from 35 clusters (8 urban, 27 rural) in the country's three regions (North, Central, South). Serum folate deficiency, RBC folate deficiency, and RBC folate insufficiency were defined as <7 nmol/L, <305 nmol/L, and <748 nmol/L, respectively. Vitamin B12 deficiency was defined as <148 pmol/L.

Results: Preliminary data show the prevalence of serum folate deficiency, 8.5% (95% CI 5.8-11.2); RBC folate deficiency, 13.3% (95% CI 9.6-17.0); RBC folate insufficiency, 81.4% (95% CI 75.7-87.0) and vitamin B12 deficiency, 11.8% (95% CI 8.1-15.4). Char-

acteristics of Malawian women by micronutrient status will be presented.

Conclusions: Establishing baseline folate and vitamin B12 status among non-pregnant women of reproductive age will help to define folate and vitamin B12 micronutrient insufficiencies and deficiencies in Malawi.

PERICONCEPTIONAL SURVEILLANCE FOR PREVENTION OF ANEMIA AND BIRTH DEFECTS IN SOUTHERN INDIA

[1]*Finkelstein, Julia;* [2]*Fothergill, Amy;* [3]*Bose, Beena;* [4]*Guetterman, Heather;* [5]*Johnson, Christina;* [6]*Bonam, Wesley.*

[1]MPH SM ScD. Assistant Professor. Division of Nutritional Sciences. Cornell University.; [2]MPH. Doctoral Student. Division of Nutritional Sciences. Cornell University.; [3]Research Fellow. St. John's Research Institute. Bangalore. India.; [4]Graduate Student. Division of Nutritional Sciences. Cornell University.; [5]MS. Study Coordinator. Arogyavaram Medical Centre. Andhra Pradesh. India.; [6]MBBS. Director. Arogyavaram Medical Centre. Andhra Pradesh. India.

Neural tube closure defects (NTDs) are among the most common and debilitating adverse pregnancy outcomes globally. The association between maternal folate status and NTD risk was first observed over 40 years ago. However, there is little representative population-level data, particularly in South Asia, where the burden and consequences of micronutrient deficiencies are unacceptably high.

We are establishing a periconceptional surveillance program as part of our collaborative community-based research program in Southern India. As part of this project, we are establishing the gold standard microbiological assay for folate in our laboratory in India, with expert guidance from the Centers for Disease Control and Prevention, and conducting a biomarker survey to elucidate the burden of anemia and micronutrient deficiencies in women of reproductive age. This living laboratory will also serve as the foundation for future intervention trials and public health programs in this well-characterized population, for the prevention of anemia and birth defects.

In this presentation, we describe the establishment of this periconceptional surveillance program in Southern India, and discuss preliminary findings from the pre-intervention biomarker survey.

Keywords: Folate, neural tube defects, biomarker, surveillance, India

Track 4: Nutrition and Management of Diseases

OBESITY AND EPIGENETICS

Raman, Rita.

University of Oklahoma Health Sciences Center. Oklahoma City. Oklahoma. USA.

Epigenetics involves the study of heritable changes in gene expression that are not due to changes in the nucleotide sequence, but involve for example other mechanisms such as histone modifications or changes in DNA resulting from alterations in the methylation patterns. Such modifications can be impacted by diet, nutrients, and environmental factors such as chemical, psychological, and behavioral influences. While the role of dietary factors is more readily understood in the context of obesity, the epigenetic phenomena associated with obesity risks provides the linkage between factors such as stress, sleep deprivation, and obesity.

The specific genetic alterations that result in diseases and complex syndromes continue to be identified. Genome-wide association studies have identified concepts such as the rare variant-common disease hypothesis and the common variant-common disease hypothesis. Through association studies, unique gene-environment interactions, which may occur with or without specific periods of permissiveness or vulnerabilities, have also been identified. Major conditions where the role of exposomes and epigenetics are rapidly evolving are obesity, neurological disorders, immune disorders and cancers. These concepts are particularly intriguing in the context of obesity. Search for the origins of disease have led to investigations into the roles of dietary and environmental factors as potential triggers or modifiers of risk. In reproduction, certain genes are turned on while others are turned off in the process of imprinting. In the case of imprinting, even though there are two copies of the gene, only one copy is expressed and there is no substitute functional allele. For this reason, imprinting makes the imprinted genes more vulnerable to the negative effects of mutations.

Nutritional epigenetics is seen as a means for the prevention of developmental diseases and cancer, and to delay processes associated with aging. Studies with rodent models suggest that during both early development and in adult life, environmental signals can activate intracellular pathways that directly remodel the epigenome, leading to changes in gene expression and function. These studies define a biological basis for the interplay between environmental signals and the genome in the regulation of individual differences in behavior, cognition, and physiology. Diseases in which epigenetic factors are considered significant include type 2 diabetes mellitus, obesity, inflammation, cardiovascular diseases, neurocognitive disorders, and immune diseases, with function influenced by environmental factors including early experience. In conclusion, epigenetics can be defined as heritable traits resulting from changes in DNA or chromatin structure without alterations in the DNA sequence and is considered an important phenomenon in understanding the environmental influences that modify disease risk profiles.

OBESITY AND SLEEP DISORDERS

[1]*Giorelli, Paulo;* [2]*Giorelli, Guilherme;* [3]*Sartoretto, Silvia.*

[1]International Colleges for the Advancements of Nutrology. Brasil; [2]Md. MS. International Colleges for the Advancements of Nutrology. Brasil.; [3]MD. International Colleges for the Advancements of Nutrology. Brasil.

We will discuss about the link between obesity and sleep disorders.

The sleep deprivation leading to a continuous organic stress syndrome with disbalance in body homeostasis and the release of hunger and satiation's neurotransmitters.

We'll show the sleep patterns identified like epigenetic factors that could pull the trigger of obesity.

We show an easier way to identify the presence of sleep disorders in obesity patients.

Finally we call the attention about the role of treat those sleep disorders because if we don't treat them we are making the treatment obesity worse than already is.

Keywords: Obesity, Sleep disorders

NUTRITIONAL FOODS OR SUPLEMENTS IN OBESITY: CLINICAL APPROACH

[1]*Giorelli, Guilherme;* [2]*sartoretto, Silvia.*

[1]MSc. MD. Associação Brasileira de Nutrologia. International College for Advancement of Nutrology. Brasil; [2]MD, Associação Brasileira de Nutrologia. Brasil.

The incidence of obesity, diabetes and insulin resistance are associated with high glycemic load diets. Identifying food or food groups that can help patients to achieve their glycemic, cholesterol or weight goals could be an preventive strategie with high impact on the cost of the treatment and in public health funds.

Our aim was to analyze the insulin secretion in subjects free of diabetes in response to different food groups with high glycemic index .

We evaluate 24 volunteers free of diabetes, 11(45,8%) female, with 24±3,7years old that underwent laboratory and anthropometric during three days with a seven day distance between each day. Were exclude from the study subjects with diabetes and hypertension. After a 10 hour fasting subjects received a meal with

50 grams (g) of carbohydrate (CHO) with high glycemic index from different foods.

The 3 meals had 240 milliliters (ml) of whole milk (12g of CHO). For the first day (1D) we added 65g of wheat flour bread (38g de CHO). In de second day (2D) we added 43g of wheat flour bread (25g de CHO) and 50g of chunkey bananas (13g de CHO). In the third day (3D) we added 43g of wheat flour bread and 86g of apple (13g de CHO). Subjets were asked to consumed the meal in 10 minutes and blood samples were performed in -15, 0, 30, 60, 90 and 120 minutes. Were determined: BMI, abdominal circumference, glycemia and insulin in all of the samples, glycemia peak value (VPG), insulin peak value (VPI), glycemia time peak value (VTPG), insulin time peak value (VTPI), absolute insulin increase (deltai), absolute glycemia increase, area under de glycemia curve (AUCG) e area under de insulin curve (AUCI).

There were no statistical difference between glycemic values in all the samples and between the curves at VPG, VTPI, deltai and deltag. The VTPG at the 1D were 67,5 ±36,7, at 2D 50,6 ±34,2, at 3D 99,9 ±13,9 (p < 0,008). The AUCI was higher at 1D 2867,2 (809,2-6947,2) than in 2D 1771,5 (689,2 – 4194,0). The 3D was 2345,2 (416,2-9605,2), iqual to 1D.

There is no glycemic índex for meals, only for food. High Glycemic index foods are determined with 70 or above. In this study the 1D had 85 of IG, the 2D had 81 and the 3D had 73. The major responsible for this high IG in all meals were the wheat flour bread that induced an higher insulin secretion in order to maintain the same glycemic value. The VTPG had smaller values in 1D and 2D than in 3D because of its higher IG.

Our study suggests that healthy individuals in order to maintain the same glycemic response after a meal with food from different carbohydrate sources is necessary to have a bigger insulin secretion when the meal has high glycemic index foods

COLLAGEN SUPPLEMENTATION FOR HEALTH OF THE SKIN, CARTILAGE AND MUSCLES – CURRENT MYTHS AND TRUTHS

Garcez Duarte, Marcella.

Brazilian Association of Nutrology (ABRAN) / ICAN. Brasil.

Collagen is the most abundant protein in the animal body, it is present from the most primitive invertebrates to man, in at least 27 protein isoforms found in connective tissue throughout the body, such as bones, tendons, cartilage, veins, skin, teeth and muscles.

The commercially important types are Type I, the most common, found in skin, tendons and bones, Type II found in cartilage, and Type III, which forms the reticular fibers of the lungs, intestines, blood vessels, liver, uterus.

Permanent collagen exchange processes in body takes place during the whole human life, the old fibrils are replaced by new ones all the time. In young organism, the collagen production and degradation is balanced dynamically, but with aging the degrada-

tion becomes more intensive and UV radiation, smoking, stress and unhealthy diet can speed up the process.

After protein intake, the most important nutritional factor for proper biosynthesis of collagen is the level of circulating vitamin C. There are at least three vitamin C-depended enzymes, prolyl 3-hydroxylase, prolyl 4-hydroxylase and lysyl-hydroxylase, essential for the biosynthesis of collagen fibers.

Hydrolysate collagen has been generally regarded as having low biological value, because it does not contain all the essential amino acids, it's a reputable nutritional component often used to supplement other proteins because of its superb digestibility and high user tolerance. Hydrolysate collagen have been reported to have beneficial biological functions and designated as Generally Recognized as Safe (GRAS) by the Food and Drug Administration (FDA).

Many researches reported the beneficial effects of oral collagen hydrolysates administration, which crosses the intestinal barrier by dietary bio actives peptides, which reaches the blood circulation and becomes available for metabolic processes. Collagen hydrolysate can be used in several medical applications, such as high energy supplements, geriatric and enteric products, therapeutic or weight control diets for specific digestive disorders, amino acid absorption and metabolism. Papers also included cases of patients with malnutrition attached with trauma, burns, cancer and hepatic encephalopathies. Hydrolysate collagen can be a good source of amino acids for people suffering from anorexia, anemia and for vegetarians. The main scientific evidences show that collagen after absorption can reach and accumulate in the cartilage, stimulating a significant increase in extracellular matrix synthesis by chondrocytes that can prevent or reduce pain in patients suffering from osteoarthritis and osteoporosis. Clinical studies suggest that dietary hydrolyzed collagen supplements are protective agents of tendons, muscle structures and act on joint regeneration in athletes with pain related to joint activity. Important beneficial effects have also been observed in the maintenance of tonus and hydration of skin structures and the quality of hair and nails.

PERSPECTIVES ON NUTRIENT DENSITY: TOO HIGH AND TOO LOW

NUTRIENT-ENERGY DENSITY: ORIGINS OF THE CONCEPT

Drewnowski, Adam.

University of Washington. United States.

The question of what makes a food "healthy" continues to puzzle both regulatory agencies and expert panels. A literature review conducted in 1977 showed that the concept of a nutritious food was not fully defined. General statements that such a food should provide "significant amounts of essential nutrients" were not backed by any firm standards or criteria. The concept of nutrient density was defined three decades later (Drewnowski 2005), along with some of the first attempts to devise a composite nutrient density score. Later attempts to quantify nutrient density of foods, now collectively known under the name of nutrient profiling, have been based on a variety of calories-to-nutrient scores, nutrients-per-calorie indexes, and nutrient-to-nutrient ratios. One problem was that healthy foods were often defined by the absence of problematic ingredients—fat, sugar, and sodium— rather than by the presence of any beneficial nutrients they might actually contain. By contrast, the naturally nutrient rich (NNR) score was based on mean percentages of daily values (%DVs) for 14 nutrients contained in in 2000 kcal of food. The subsequent Nutrient Rich family of scores included nutrients to encourage, notably protein, fiber, and a range of vitamins and minerals, as well as the so-called disqualifying nutrients, saturated fat, added sugars and sodium. The US Food and Drug Administration had been disqualifying foods from carrying nutrition or health claims if they contained excessive amounts of fat, saturated fat, sodium, and cholesterol . Later scores of composite nutrient quality assessed amounts of index nutrients per reference amount: 100g, 100 kcal, or serving size. In addition to nutrients, some models also included food groups to encourage (vegetables, fruits, nuts). The goal of nutrient profiling models was to separate empty calories from more nutrient-dense or nutrient-rich food. Nutrient profiling models were also extended to create novel metrics of affordability or environmental impact. Whereas nutrient density was measured in terms of nutrients per calorie, affordability of foods was measured in terms of calories or nutrients per penny. Environmental impact has been measured in terms of energy or nutrient cost in greenhouse gas emissions associated with food production, processing, consumption, and waste. Initially intended to support of nutrition and health claims, nutrient profiles have found a role in consumer education, regulation of marketing to children, and in food taxation. Industry has used nutrient profiling to assess and reformulate product portfolios.

Adapting nutrient profile models to the needs of low and middle income countries (LMIC), many undergoing nutrition transition, raises additional questions about diet composition, animal versus plant foods, nutrient bioavailability, and amino acid composition of protein. Any nutrient standards need to be based on dietary shortfalls for a given country. Not all nutrient composition and dietary intake data may be readily available. A nutrient profiling manual to evaluate the LMIC food supply would be a valuable addition to the nutrition literature.

APPLICATION OF THE CONCEPT IN A PUBLIC HEALTH CONTEXT

Solomons, Noel W.

Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala City. Guatemala.

There are practical and applied aspects for employing "nutrient-density" (ND) as a perspective, beyond total daily intake, as an expression of public health nutrition interest. One can think of ND as a ratio, with a numerator and denominator. The numerator is a quantity of a macro- or micronutrient. The denominator is any expression that can contain (or constrain) the intake of food; it is generally a standard amount of dietary energy, e.g. per 1000 kcal, but it can also be a weight (grams), specific meal or standard portion-size, or even cost/price or environmental footprint (carbon-emission, water-consumption, etc.).

We recognize Brown, Dewey and Allen and their "Complementary feeding of young children in developing countries" (WHO,1998) for insights stimulating the use of ND both in the evaluation and planning of diets, specifically through the infant and toddler years, when human milk forms a variable component of the early-life diet. Both the "critical nutrient-density" concept and the "problem nutrient" term derive from this monograph.

Whereas the nutrient-intake recommendations from the US-Canadian (DRI) and UN (WHO/FAO) sources are based on a fixed daily quantity for each age/sex-group, a novel experience (and experiment) for Latin America was inspired by the Cavendes Foundation of Venezuela, under the leadership of the late Dr. Jose Maria Bengoa in the 1980s. The insightful principle was based on the assumption of a common, communal household-diet (rather than individualized rations); they proposed a prescribed density for each essential nutrient in the family fare, one that would satisfy the needs of each member when consuming the proportion of the foods and beverages meeting their specific daily energy needs. It failed to gain traction in the Region, however, which remained

with the more-established international guidance. With increasing consumption outside of the home in the intervening three decades, however, the assumption of a pooled fare has become obsolete.

Although the future trajectory of the human food supply cannot be predicted with certainty, there are reasonable bases for expecting constraints on caloric intake around the world. Urbanization, and its concomitant sedentary lifestyle imperative, will advance the restriction in effective energy needs, whereas food scarcity may ensue in other settings. In the face of the shrinking energy as the denominator factor, public health tolerance for "empty calories" is reduced, while an imperative to construct dietary fares from micronutrient-enhanced calories will become evident. To the extent that unprocessed foods are to contribute, their biofortification – even in the fruit and vegetable sector – must be considered. The residual processed component of the diet will also need to offer more micronutrients per calorie, but the fortification logistics represent a challenge. Dietary diversity confounds any given staple food's being the conveyor of key nutrients across the whole population. A strategy of "total fortifiable foods," in which a thin – but broad – "veneer" of balanced micronutrient fortification is distributed among all commercially-processed foods, has been proposed by Omar Dary. This, however, presents challenges for micronutrient-safety in any setting with broad extremes of individual energy requirements.

GUATEMALAN CASE-STUDY: SITUATIONAL LOW-ENERGY INTAKE

Vossenaar, Marieke.

PHD. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.

Guatemala has a unique history for contribution to the understanding of nutritional problems. It has been a pioneer for public policies in micronutrient fortification and supplementation. In the 1950s potassium iodate was found to be as nutritionally efficacious and much more resistant than potassium iodide for fortification of salt. In the 1970s, Guatemala pioneered the fortification of table sugar with vitamin A. Despite these measures, micronutrient malnutrition has not been completely controlled in Guatemala.

At any age, from fetal life to older age, Guatemalans have small body size, with the corresponding implications for daily energy requirements. The combination of the basic dietary pattern in Guatemala and its undersized population allows for a rich basis for understanding the utility of a nutrient-density in analyzing nutrient intake and devising remedial solutions.

The initial issue in the convergence is that recommended intakes for micronutrients are common for any given age, sex or physiological group independent of the weight of the individuals. A population reference value of energy is also created as a standard

reference, but it is widely understood that each individual has a unique energy requirement based on body size, lean-body tissue and exertional efforts.

In our work with Guatemalan women we used reference 'critical nutrient densities' – i.e., nutrient amount per 1000 kcal which would provide the nutrient requirements when the energy requirement is satisfied – to assess the nutrient adequacy of the diet and pregnant and lactating women from rural and urban communities of the Western Highlands. For women who are either pregnant or lactating, the required daily energy and nutrients are higher – sometimes substantially higher – than for women in the non-reproductive state. Although women reported eating more during pregnancy and lactation, estimated energy intakes were below the status-specific requirements. Without the additional foods to meet the greater energy and nutrient needs, intake gaps with respect to the 2004 FAO/WHO Recommended Nutrient Intakes (RNI) were observed for 9 of 17 index micronutrients in pregnant women and 6 of 17 micronutrients in lactating women across the studied communities. If these women were to consume more calories of the same diet, requirements of some – but not all – nutrients would be met. Nutrient which would remain inadequate across the studied communities – i.e., which have a critical nutrient density above the observed nutrient density – include vitamin C, pantothenic acid, vitamin D, E, and K, calcium and iron in pregnant women and vitamin C, pantothenic acid, vitamin D, E, and K in lactating women. Nutrients with an adequate estimated nutrient density – i.e., for which intakes would meet requirements if the women were to eat 100% of their energy assignment – include vitamin B6, B12 and iron in pregnant women and calcium in lactating women.

The realities in Guatemala are such that normative amounts of micronutrients are not consumed both because energy-intakes are below the group reference, and because nutrient-density is intrinsically low. Both situations, however, justify increasing nutrient density as a solution to achieve recommended daily intakes of micronutrients.

Keywords: Pregnant and lactating women, nutrient adequacy, nutrient density, Guatemala

BIOFORTIFICATION: INCREASING MICRONUTRIENT DENSITY OF STAPLE CROPS

Boy-Gallego, Erick.

PhD. HarvestPlus. International Food Policy Research Institute. Washington DC. USA.

Nutrition interventions to alleviate vitamin and mineral deficiencies (hidden hunger) have made significant contributions to the health and wellbeing of entire generations in low and medium income countries. Universal and targeted supplementation and food fortification schemes with multiple or single micronutrients, however, carry recurring costs that donors and/or consumers must bear because the existing food system does not provide sufficient nourishment for one or more vulnerable stages of the life cycle. The poor have very limited or no access to commercial food or pharma-

ceutical products to eliminate the micronutrient intake gap associated with monotonous plant-based diets. In societies that derive over 50% of the daily energy requirements from a single staple crop such as maize, wheat, rice or cassava, it makes sense to add varieties of the same staples with higher micronutrient densities, especially if the target populations can grow a significant proportion of the food they consume. Biofortification targets the poor, which makes it a supply-driven initiative; but these crops must also be in demand by the food sector to keep the plant breeding and bioengineering pipelines generating high yielding, pest resistant, climate resilient varieties continuously. Biofortified crop varieties are intrinsically loaded with higher concentrations of iron, zinc or provitamin A carotenoids; therefore, their adoption does not bring additional recurring costs to farming households. The plants do the work; and because the crops developed by international agricultural research network centers and national agriculture agencies are public goods, sustainability is not an issue. HarvestPlus and collaborators from multiple disciplines and sectors have developed provitamin A-rich maize, cassava and sweet potato; high iron beans and pearl millet; and high zinc wheat and rice varieties during the past 15 years. While plant-breeding programs continue to feed a responsive pipeline of crop cultivars, 140+ varieties of 10 staple crops are already publicly available and contribute to crop varietal diversity in over 30 countries across continents. The provitamin A, iron and zinc density of the targeted crops have increased up to 15-fold for provitamin A maize and cassava, doubled the iron in several common bean varieties and pearl millet varieties, and increased zinc concentration by 30% in whole wheat and 75% in milled rice. Randomized controlled efficacy trials have demonstrated that at the currently available micronutrient density levels, biofortified crops improve micronutrient status and important nutrient-dependent functions in different vulnerable population groups. Economic analysis indicates that biofortification is cost-effective due to large reductions in inadequate intake and resulting DALYs saved. The potential additive effects of the adoption of multiple biofortified crops can have an important impact on dietary nutrient density and therefore the vitamin A, iron and zinc status of entire populations. The way forward for biofortification follows a 2030 vision of global availability and consumption of micronutrient-rich crops by 1 billion people. Achieving the goals associated with this vision will require scaling up delivery systems in 30+ countries, mainstreaming breeding for higher micronutrient density, and expanding markets and adoption of biofortified crops with multiple partners.

FOOD FORTIFICATION ADDRESSING DIETARY NEEDS

Klassen, Petra.

PhD. Scientific Advisor. Corporate Nutrition, Health and Wellness Unit. Nestlé. Switzerland.

Inadequate intakes and absorption of vitamins and minerals to sustain good health and development lead to micronutrient deficiencies. With two billion people suffering from deficiencies in Iron, Iodine, Vitamin A and Zinc, this remains one of the world's biggest public health issues.

While ideally, essential micronutrients should be obtained from a balanced and varied diet, this is not always possible. Fortified foods that are both affordable and accessible have been recognized as a cost-effective way to improve nutrition and health of vulnerable populations alongside efforts to diversify diets. Infants, young children and women of childbearing age are disproportionately affected, because of their greater need for these nutrients.

The path to provide relevant and impactful fortified offers should entail:

• understanding the local nutritional needs and gaps to identify most relevant fortificants

• select vectors that are widely and regularly consumed by the target population

• educate and communicate on the benefits of fortified foods

• ensure accessibility of the fortified products

• partner with stakeholders to leverage efforts

• study the impact of our actions for continuous improvements

Quality, safety and sensorial aspects have to be taken into account and it is recommended that food manufacturers develop mandatory internal fortification policies clearly defining fortification levels and appropriate quality management and monitoring procedures.

Eliminating malnutrition is a top priority in the global development agenda and is the second of the United Nation's Sustainable Development Goals. The private sector can work together with governments and civil society to develop new models to make tasty, nutritious and affordable foods accessible to the people who need them.

NOVEL HOME-FORTIFICATION FOR LACTATING WOMEN

[1]*Bonorden, Melissa;* [2]*Hirst, Daniel.*

[1]M.S. Nutritionist. Research & Development. Hormel Foods Corporation. Austin. Minnesota. USA; [2]B.S. Packaging Scientist. Research & Development. Hormel Foods Corporation. Austin. Minnesota. USA.

Thoughtful design of a food supplement will consider both dietary needs and cultural behaviors as a way to improve nutritional impact and compliance. This talk will focus on the model we used to develop a novel food supplement for use at home among lactating women in Guatemala. It is well documented that the first 1000 days of a child's life provide a critical window of opportunity to influence cognitive and physical development. Examination of cultural practices during the early postpartum period in the Western Highlands of Guatemala identified the role of atole, or thin gruels,

as a beverage perceived to improve both quality and quantity of breastmilk and an important vehicle to deliver additional nutrients through home fortification. Gruels are consumed in Guatemala several times per day and make an important contribution to total daily water intake, which frequently falls below the Adequate Intake recommendations among lactating women. Initial work quantifying the characteristics of how atole is prepared, served and consumed in markets and at home identified a wide variety in temperature at which atole is served and standard volume consumed. Nutrient gaps were identified by comparing intakes from 24 hour dietary recall to recommended values for women in urban, semi-rural and rural locations. Gaps were found for protein and several micronutrients and were more pronounced in rural women. Based on these data, a goal was developed to deliver an additional 15 grams of high quality whey protein dispersed three times throughout the day. The supplement was initially tested at benchtop for impact on solubility in atole and changes in organoleptic quality. Acceptability and use was further tested through in-country consumer testing in rural and urban dwelling women using both commercially-available and home-prepared gruels. In these panels, women were able to identify a difference between atole with and without whey protein supplementation; however, the supplemented atole was reported as the more preferred beverage. Future work will encompass identifying novel forms of vitamins, minerals and long chain fatty acids that will have little to no impact on color and flavor. Packaging options will focus on materials that protect integrity and prolong shelf life as well as graphic designs that clearly convey serving size and clear, appropriate directions for use. Successful integration of this novel home fortificant into the diet of lactating women will provide a culturally-relevant approach to improve hydration, intake of high quality protein and micronutrient status.

POLYPHENOLS IN HUMAN NUTRITION

POLYPHENOL ADME: HOW FOOD AND PHYSIOLOGICAL FACTORS IMPACT DELIVERY OF THESE BIOACTIVE PHYTOCHEMICALS

Ferruzzi, Mario.

Professor. Plants for Human Health Institute. North Carolina State University. Kannapolis NC. USA.

With evidence suggestive of a health-protective role for dietary polyphenols, interest in factors that can influence their bioavailability from foods has increased. Both food matrix and physiological factors are important modifiers of digestive behavior, absorption and metabolism of polyphenols. Using tea, cocoa, grape and berries as models, the role of food formulation on bioaccessibility and bioavailability of key dietary flavonoids (flavan-3-ols, flavonols and anthocyanins) were investigated. Macro and micronutrient interactions in foods and through the GIT were found to alter digestive stability and intestinal transport of flavan-3-ols from these foods. Specifically, formulation with ascorbic acid, minerals and carbohydrate improved flavan-3-ol digestive stability and bioavailability in vivo. In contrast, protein has only a modest negative impact to overall absorption, despite the ability to enhance stability of flavan-3-ols to normal digestion. These factors suggest that flavonoid interactions with macro and micronutrients in foods and through normal digestion may lead to differences in acute bioavailability.

Flavonoid bioavailability and metabolism may also be impacted by dietary and physiological factors including repeated exposure typical of dietary patterns high in fruits and vegetables and the presence of underlying conditions. To study these factors, the impact of background diet (high fat versus low fat), repeated exposure and presence of risk factors (obesity and diabetes) were investigated in animals and clinical settings. 10 day repeated dosing studies with grape polyphenols were conducted with Sprague Dawley (SD) and Zucker diabetic fatty rats. Background diet did not significantly impact anthocyanin or flavonol acute absorption or metabolism in SD rats. However, flavan-3-ol and flavonol bioavailability and metabolism were reduced in diabetic Zucker diabetic fatty rats relative to lean controls suggesting that obesity and diabetes might impact flavonoid bioavailability and metabolism. Similar results were observed in a pilot clinical with lean (BMI 23.5) and obese (BMI 30.5) participants. Following 11 day repeated dosing of grape polyphenols from Concord grape juice (20 oz/d), grape seed extract (900 mg/d) and resveratrol (250 mg/d) to grape polyphenols an increase in acute pharmacokinetic response was observed for catechin, epicatechin and quercetin in lean in-

dividuals but not obese suggesting the potential for differential adaptation in the gut to flavonoid absorption in obese individuals.

Mechanisms of adaptation were explored using the Caco-2 human intestinal cell model. Findings suggest that repeated exposure to 1-10μM of flavonoids during differentiation of intestinal cells results in an enhancement of trans-epithelial transport over time despite a tightening of tight junctions. Changes in xenobiotic and metabolizing systems (COMT, ABCC2 and ABCB1) were observed from exposure to flavonoids and extracts which suggest that repeated exposure to flavonoid rich foods may alter gut function and response to flavonoids. Overall, it is apparent that both food and physiological factors can alter bioavailability and metabolism of flavonoids and that adaptation to flavonoid dietary exposure must be considered as a factor in the study of association to disease risk and outcomes.

Keywords: Flavonoids; Bioavailability; Metabolism; Food Matrix; Adaptation

POLYPHENOLS AND INTESTINAL FUNCTION: LOCAL AND SYSTEMIC EFFECTS

Oteiza, Patricia.

Ph.D. Professor. Department of Nutrition. University of California. Davis. USA.

The intestinal epithelium is not only the place of nutrient absorption, but it is also the first barrier against the systemic entrance of microbiota-derived and food toxins, The gastrointestinal tract (GIT) also exerts major immunomodulatory actions, regulates energy metabolism, and hosts the microbiota, which plays a central role in gut physiology. The GIT is exposed to large amount of flavonoids present in foods, which can exert local effects as parent compounds, or can be transformed by the microbiota to bioactive metabolites. Current evidence supports the concept that flavonoids and their metabolites may have significant health effects at the GIT by: i) preserving the functionality of the intestinal barrier, ii) regulating fat absorption, iii) regulating energy metabolism (e.g. by modulating the release of incretins and GIT hormones), iv) shaping the gut microbiota, and v) exerting anti-colorectal cancer (CRC) actions. Among the multiple types of existing flavonoids, the flavanol (-)-epicatechin (EC) and its polymers, the procyanidins (PACs), and anthocyanins (AC) are among the most abundant in human diets. These polyphenols protect the intestinal epithelium from different aggressors, including pro-inflammatory cytokines, bile acids and high fat diets. The capacity of AC and EC to prevent intestinal permeabilization and the associated increased transfer of luminal bacterial endotoxins into the circulation (endotoxemia), underlies in part their capacity to prevent steatosis and insulin resistance in high fat diet-fed mice. AC and EC also increase the circulating levels of glucagon-like peptide-1 (GLP-1) and 2 (GLP-2), which improve glucose homeostasis and have trophic effects on the GIT. AC and PAC also modulate the GIT physiology by positively modulating the microbiota ecology and exerting anti-inflammatory and anti-CRC actions. In this regard, PAC interacts with select areas of the epithelial cell membranes, inhibiting inflammatory, proliferative and anti-apoptotic cell signals. In summary, flavonoids can have significant beneficial effects at the GIT that may be relevant not only locally, but can also extend to systemic health benefits, including an improvement of Western style diets-induced insulin resistance and steatosis.

Polyphenol-rich foods and polyphenol-rich diet may affect the development of age-related diseases, and therefore lifespan. There are, however, a number of limitations related to epidemiological studies concerning the associations between diet and healthy aging. One of the causes of these limitations is the multi-factorial complexity of accurately assessing dietary exposure. Therefore, nutritional biomarkers are increasingly used in current research.

Our findings in InCHIANTI study increasing evidence on the protective effects of total polyphenols, and indirectly, diets with polyphenols rich foods like fruit and vegetables and some beverages such as red wine, against cognitive decline and overall mortality.

Our results also demonstrate the importance of assessing the intake of polyphenols, whenever possible, using nutritional biomarkers and not only by dietary questionnaires.

FLAVANOLS AND VASCULAR FUNCTION: FROM HYPERTENSION TO KIDNEY FILTRATION

[1]*Galleano, Monica;* [2]*Prince, Paula Denise;* [2]*Litterio, Maria Corina;* [2]*Fischerman, Laura;* [2]*Piotrkowski, Barbara.*

[1]Universidad de Buenos Aires. Facultad de Farmacia y Bioquímica. Fisicoquímica. IBIMOL. CONICET. Buenos Aires. Argentina.;
[2]Universidad de Buenos Aires. Facultad de Farmacia y Bioquímica. Fisicoquímica. IBIMOL. CONICET. Buenos Aires. Argentina.

Flavanols are under active research as responsible for the beneficial effects on human health associated to the consumption of certain fruits and vegetables. Particularly, the effects on vascular function constitute a relevant topic and are being thoroughly studied because on their potential impact decreasing the prevalence and incidence of hypertension and its related diseases, including kidney dysfunction.

We have extensively studied the vascular protection by (−)-epicatechin (EC) in rodents subjected to dietary overload with both fructose and fats. In both conditions the main effects of dietary EC were associated with decreasing oxidative stress, inflammation, and maintaining functional levels of nitric oxide (NO).

In rats overloaded with fructose (condition that mimics most of the features of the metabolic syndrome in humans) was observed increase in the blood pressure in association with a compromised NO bioavailability at vascular level. Concomitantly, there was a development of kidney functional alterations, evaluated as the presence of mild proteinuria, as well as renal cortex fibrosis, decreases in nephrin, synaptopodin, and WT1 (all indicators of podocyte dysfunction), increased markers of oxidative stress, and development of pro-inflammatory conditions, manifested as NF-κB activation, and higher expression of TNFα, iNOS, and IL-6. Dietary supplementation with EC prevented or ameliorated most of these adverse effects of high fructose consumption.

When analyzed in terms of biochemical mechanisms, it is possible to hypothesize that all these effects are consequence of the regulation of the tissue production of NO and superoxide anion by EC: i) NO generation through NO synthases, ii) superoxide anion, essentially produced by NADPH-oxidases, and iii) the resultant balance considering the high rate of reaction between NO and superoxide anion.

In summary, our results suggest that EC ingested through the many fruits and vegetables that contains it, would protect the vascular and kidney function of patients with metabolic diseases. This information can be valuable to design nutritional approaches with scientific bases to modify the development of silent conditions that when chronically established develop in disease and pathological conditions.

SHOULD WE EAT MORE POLYPHENOLS?

Fraga, Cesar G.

Professor. Universidad de Buenos Aires. Facultad de Farmacia y Bioquímica. Fisicoquímica. IBIMO. UBA-CONICET. Buenos Aires. Argentina.

Major research efforts are currently aimed to identify healthy foods and healthy food components. The overall purpose is to design appropriate dietary strategies that positively influence the quality of life. Plants are substantial sources of compounds that once in our body can interact with the biological machinery. One of the most robust recommendations for improving health is to increase the intake of fruits and vegetables. Based on the premise that different plants contain different bioactives, it is crucial to identify the substances that can better act against pathological conditions. Our research is focused on characterizing select polyphenols, e.g. (−)-epicatechin (EC), as bioactives. That is, to find biochemical mechanism(s) that could explain EC physiological effects considering its actual presence in human tissues (ADME). These mechanistic data together with epidemiological and clinical studies would finally define evidence based recommendation for populations. In this road to define the need for establishing recommendations for EC consumption, it is today accepted: a) the consumption of EC-containing foods has no known undesirable effects; b) the consumption of EC has been epidemiologically and clinically ascribed to lower risk of disease or decreased markers of disease; c) there are several biochemical mechanisms in which the actions of EC are well characterized; and d) there is a consistency between clinical data, in which EC is mostly treated as a drug, and the dietary consumption of EC by human populations. Overall, the consumption of EC as well as of other polyphenols could help to prevent, delay, or ameliorate diseases, especially those that progress silently during life. Establishing the amounts of these polyphenols needed to exert such health effects is conditioned by the absence of formal evaluative processes that quantitatively establishes the importance of these bioactives.

CRACKING THE EGG POTENTIAL TO REDUCE CHILD STUNTING AND IMPROVE RURAL LIVELIHOODS

EGGS IN EARLY COMPLEMENTARY FEEDING AND CHILD GROWTH: A RANDOMIZED CONTROLLED TRIAL

[1]Iannotti, Lora; [2]Lutter, Chessa; [3]Stewart, Christine; [4]Gallegos, Carlos Andres; [5]Malo, Carla; [6]Reinhart, Gregory; [6]Palacios, Ana; [5]Karp, Celia; [1]Chapnick, Melissa; [1]Cox, Katherine; [5]Waters, William.

[1]Washington University in St. Louis. United States; [2]University of Maryland. United States.; [3]University of CA. Davis. United States.; [4]Washington University in St. Louis. Universidad San Francisco de Quito. Ecuador; [5]Universidad San Francisco de Quito. Ecuador.; [6]The Mathile Institute. Ohio. United States.

Background: Eggs are a comprehensive source of nutrients for growth and development. We hypothesized that introducing eggs early during complementary feeding would improve child nutrition.

Methods: A randomized, controlled trial was conducted in Cotopaxi Province, Ecuador from March-December 2015. Children ages 6-9 months were randomly assigned to treatment, one egg per day for 6 months (n = 83), and control, no intervention (n = 80) groups. Both arms received social marketing messages to encourage participation in the Lulun Project ("egg" in Kichwa). All households were visited once per week to monitor morbidity symptoms, distribute eggs and monitor egg intakes (for egg group only). Baseline and endpoint outcome measures included anthropometry, dietary intake frequencies, and morbidity symptoms.

Results: Mothers or other caregivers reported no allergic reactions to the eggs. Generalized linear regression modeling showed the egg intervention increased length-for-age z score by 0.63 (95% confidence interval [CI], 0.38-0.88) and weight-for-age z score by 0.61 (95% CI, 0.45-0.77). Log-binomial models with robust Poisson indicated a reduced prevalence of stunting by 47% (prevalence ratio [PR], 0.53; 95% CI, 0.37-0.77) and underweight by 74% (PR, 0.26; 95% CI, 0.10-0.70). Children in the treatment group had higher dietary intakes of eggs (PR, 1.57; 95% CI, 1.28-1.92) and reduced intake of sugar-sweetened foods (PR, 0.71; 95% CI, 0.51-0.97) compared to control.

Conclusions: The findings supported our hypothesis that early introduction of eggs significantly improved growth in young children. Generally accessible to vulnerable groups, eggs have the potential to contribute to global targets to reduce stunting.

Keywords: Eggs, complementary feeding, growth, stunting

Conflict of Interest disclosure: At the time of the study, Gregory Reinhart and Ana Palacios worked for The Mathile Institute, which funded the study. The Mathile Institute has no vested interest in the outcome(s) of the study. The Mathile Institute is a not-for-profit organization that financially supports basic research in the global nutrition sector pertaining to infant and young children nutrition. The other authors have no conflicts of interests.

BIOLOGICAL PATHWAYS THROUGH WHICH EGGS MAY INFLUENCE CHILD GROWTH AND DEVELOPMENT

Stewart, Christine.

PhD. Associate Professor. Dept of Nutrition. University of California, Davis. USA.

Background: Child stunting is a problem of public health significance in many low and middle-income countries. Animal source foods may be particularly important for child nutrition, particularly early during the complementary feeding period when nutrient requirements are high. Recent evidence has suggested that eggs may improve child growth in populations at high risk of stunting.

Methods: 163 infants aged 6-9 months were recruited into a randomized controlled trial with two groups: 1) Egg intervention: one egg per day for 6 months or 2) Control: usual diet. Blood samples were collected at baseline and after 6 months of intervention to measure choline and related metabolic pathways, essential fatty acids, long-chain polyunsaturated fatty acids, vitamin B12, and retinol concentrations.

Results: Infants in the egg intervention group had higher concentrations of choline, betaine, trimethylamine N-oxide (TMAO), and dimethylamine (DMA); docosahexaenoic acid (DHA), and some amino acids, notably aspartic acid (all p<0.05). Phosphatidylcholine concentrations were lower in the egg group compared to controls. Choline, DHA, and histidine concentrations were all significantly associated with lower odds of stunting and were potential mediating factors of the egg intervention on improved growth.

Implications: Eggs are a rich source of choline, essential amino acids, essential fatty acids, and micronutrients all of which may be associated with improved growth. Effects may be mediated through insulin-like growth factor-1 (IGF-1) stimulation, the one-carbon metabolic cycle, or through anti-inflammatory pathways.

Keywords: Eggs, growth, choline, amino acids, docosahexaenoic acid

PUTTING OUR EGGS IN MORE THAN ONE BASKET – LESSONS LEARNED FROM WORKING WITH MULTIPLE SECTORS IN RURAL GHANA

[1]Marquis, Grace; [2]Colecraft, Esi; [3]Aryeetey, Richmond; [4]Aidam, Bridget; [5]Kanlisi, Roland.

[1]PhD. Associate Professor. School of Human Nutrition. McGill University. Canada.; [2]PhD. Lecturer. Department of Nutrition and Food Science. University of Ghana. Ghana.; [3]PhD. Senior Lecturer. School of Public Health. University of Ghana. Ghana.; [4]PhD. Senior Research & Evaluation Advisor. Evidence & Learning Unit. World Vision International. USA; [5]Country Representative. Heifer. Ghana.

Background:. The diet of infants and young children (IYC) is influenced by policies and programs of multiple sectors, includ-

ing health, agriculture, and finance. Collaborative and complementary initiatives are needed to develop effective approaches to improve child nutrition in rural Ghana where families face challenges linked to endemic poverty, erratic weather, and limited and uncoordinated district resources.

Methods: Nutrition Links is a 5-y project to improve the well-being of vulnerable rural populations, including IYC, in the Upper Manya Krobo district of Ghana. Three of six sub-districts were selected for a cluster randomized trial to test the effect of a 12-month integrated intervention on child nutrition. Forty-three communities were randomly assigned to the intervention or control arm. Enrollment occurred in two phases, one year apart, using the Heifer 'pass-on-the-gift' model (participants pay back inputs to fund others). The study included 316 (phase-1) and 185 (phase-2) households.

The intervention used a multi-level, multi-sector approach. District-level training to build capacity of frontline workers and harmonize knowledge on nutrition, disease control, gender, and data analysis was provided for staff from agriculture, health, education, finance, and local governance institutions. At the community level, nutrition/health, agriculture, and gender education was provided for residents of intervention communities. At the household level, the intervention included income-generating activities (IGA), promotion of gardens, and related education. The central IGA was poultry farming for egg production. Caregivers received 30-40 hens, initial inputs, weekly technical assistance, and facilitated market access. A second IGA, beekeeping, was primarily taken up by men in phase-1 intervention households. Home gardens were supported with planting materials and training to increase access to micronutrient-rich vegetables. Weekly group education sessions on nutrition, health, and child stimulation promoted optimal caregiving behaviors. Caregivers were encouraged to feed children eggs and diversify the diet. Children's diet on the previous day and anthropometric measurements were documented at baseline and endline; data from both phases will be presented.

Results: Less than one-fifth of infants in phase-1 consumed eggs the previous day at baseline (14% intervention, 20% control; p=0.16). The poultry IGA rapidly increased the percent of children consuming eggs (61% intervention, 27% control; p<0.001). For children who already consumed eggs at baseline, the prevalence at endline of phase-1 was similar for both study arms (52-54%). However, for children with no egg consumption at baseline, 60% more children were reported to consume eggs in the intervention than control group (27% vs. 17%; Mantel-Haenszel p<0.01). Intake of eggs was associated with higher BMI (difference = +0.25; p<0.05).

Conclusions. Finding the winning mix of interventions that addresses the multiplicity of contributors to childhood malnutrition is challenging. The benefit associated with egg consumption corroborates the value of increasing accessibility to eggs as one of a mix of interventions that can be supported through the presence of multiple sectors in rural communities. Nutrition Links is registered at Clinical Trials (NCT01985243); partially funded by Government of Canada.

SOCIAL MARKETING TO BUILD COMMUNITY ENGAGEMENT IN NUTRITION-SENSITIVE AND NUTRITION-SPECIFIC INTERVENTIONS

[1]*Gallegos, Carlos Andres;* [2]*Waters, William F.;* [3]*Lutter, Chessa;* [4]*Stewart, Christine.;* [5]*Iannotti, Lora.*

[1]PhD Student. Brown School of Social Work. Washington University in St. Louis. Research Associate. Institute for Research in Health and Nutrition. Universidad San Francisco de Quito. Ecuador; [2]PhD. Professor. Institute for Research in Health and Nutrition. Universidad San Francisco de Quito. Ecuador; [3]PhD. Visiting Research Professor. School of Public Health. University of Maryland. Maryland. United States. ; [4]PhD. Associate Professor. Department of Nutrition. University of California. United States; [5]PhD. Associate Professor. International Nutrition. Brown School of Social Work. Institute of Public Health. Washington University in St. Louis. United States.

Background: Social marketing (SocMkt), a sub-discipline of social psychology, applies a multidisciplinary approach that integrates commercial marketing techniques with other bodies of knowledge in order to promote voluntary prosocial behavior in targeted audiences. In the Lulun project, we developed a SocMkt strategy that accompanied a randomized controlled trial (RCT) to test an egg-based intervention in five rural indigenous parishes in the Ecuadorian highlands. This campaign drew from our previous SocMkt experience in a comparable sociodemographic context, which showed that nutrition interventions are effective when participants become project owners. Effective SocMkt should respond to social realities that recognize cultural norms and values as well as opportunities and barriers that participants face. Our strategy aimed to empower participants and generate solutions for methodological RCT challenges, fieldwork complexity, and potential difficulties.

Methods: Our targeted audiences included caregivers of eligible children and other stakeholders such as community leaders. The design and implementation of the strategy was shaped by a creative process developed from market research, which accounted for culture, worldviews, sense of aesthetics, and local expectations. Key outcomes included a communication plan and the "Lulun Project" brand. In tandem with the implementation of the RCT, the SocMkt strategy contained four campaigns: outreach; recruitment; intervention promotion; and project closing. Each campaign was based on specific messages, promotional materials, and activities, which were designed to systematically stimulate behavior change from an isolated event ("giving one full egg to a 6 to 9 months' child"), to the establishment of a habit ("a full egg a day every day"), and ultimately as practice ("a full egg a day should be given to children 6-9 mo. to improve their nutrition").

Results: SocMkt implementation was instrumental for overcoming factors beyond our control (e.g. the eruption of the nearby Cotopaxi volcano), protecting the integrity of the RCT, and responding to concerns in the community around methods applied (e.g. blood collection, perceptions of inequity among caregivers with control group children, and negative rumors). Our strategy was directly linked to four interconnected effects. First, the Lulun Project received targeted audiences' loyalty, giving us a compet-

itive advantage in the project's market, where other agents who also seek the loyalty of the target group interact. Second, participants were empowered, as reflected in their narratives, low attrition levels (7%,) and attendance in activities. Third, the strategy influenced behavioral change, as demonstrated by high treatment compliance and low contamination in the control group (n= 80). This was monitored through weekly household visits, health outcomes attained, and attitudes and practices analyzed in qualitative research. Fourth, based on the results of the Lulun project and its SocMkt strategy, Ecuador's Ministry of Health policy changed guidelines regarding the introduction of eggs in complementary diets.

Conclusions: Our SocMkt experience offers theoretical and methodological value to the SocMkt sub-discipline as a whole. The strategy was central to the success of this highly effective nutrition intervention. Furthermore, the SocMkt strategy allows for the possibility for scaling up the egg intervention in the region and beyond.

ONE ACRE FUND: SCALING UP SMALLHOLDER FARMERS' ACCESS TO POULTRY IN EAST AFRICA

[1]Youn, Andrew; [2]Lloyd, Emily.

[1]Co-Founder. One Acre Fund. Rwanda.; [2]MSPH. Global Nutrition and Health Lead. One Acre Fund. Rwanda.

Poultry and eggs are unrivaled sources of micro- and macronutrients for undernourished populations, yet how to make poultry accessible and affordable to remote communities remains unknown. Smallholder farmers face difficulties buying, feeding, housing, and vaccinating non-indigenous poultry breeds that are healthier and more productive than indigenous breeds. One Acre Fund aims to offer improved poultry species for purchase on credit to over 500,000 East African farmers. These efforts revolve around ongoing poultry trials in western Kenya.

Phase 1 Trials compare chicken breeds and feeding regimens. We are evaluating growth, egg laying, morbidity, and mortality between breeds Rainbow Rooster, Kruoiler, KALRO and local. Chickens at research stations and on farmers' properties were divided into three groups and fed three different diets: commercial feed, scavenging, and commercial feed plus scavenging. Early results reveal best weight gain in Rainbow Rooster and Kruolier. Group 1 (commercial feed) chickens were heaviest and little difference was seen between Group 2 (scavenge only) and 3 (scavenge plus feed). Data is also being collected on poultry mortality, disease resistance, egg laying, farmer taste preference, and price valuation.

Phase 2 Trials gave farmers in Kakamega District, Kenya, the opportunity to purchase four Rainbow Rooster hens and one rooster for 25 USD. 250 enrolled farmers received the chickens and 250 will serve as a control and not receive chickens. Poultry weight, mortality, health and expense of health items, and egg laying will be monitored until July 2018.

Scale-up will continue with the Phase 3 Trial in which 1500 Kenyan farmers purchase five chickens on credit. The aim of this trail is verifying Rainbow Rooster's performance in the field and our ability to operate this program on a large scale. We aim to distribute poultry at scale in Kenya by 2020, offering five chickens and a small amount of feed on credit to all farmers in all districts with an expected 10-15% adoption rate. Additionally, in 2017 we began trialing fortified chicken feed to enhance egg nutrition, laying, condition and size. We are considering establishing our own hatching and brooding center to reduce costs and ensure adequate supply and timely delivery of healthy birds. Finally, we may create a buy-back program for farmer's chickens and eggs, an idea that has received interest from businesses seeking chicken suppliers.

Several challenges were faced during these trials. Before we located a large poultry supplier 2-3 hours from farmers, long transport times from supplier to farmers made chickens stressed and tired on arrival. We also had to adapt logistic and delivery system to handle live poultry distribution, new protocols, tracking methods, and reconciliations and returns of dead birds.

Successful scale-up of the poultry trials would result in healthy, productive, and vaccinated poultry being accessible to smallholder farmers across Kenya. These farmers would also receive financing and trainings on poultry housing and cost-effective feeding. One Acre Fund is establishing a model for scaling up poultry access to vulnerable and undernourished populations across sub-Saharan Africa that we hope will be widely replicated.

Track 7: Food Culture Practices and Nutritional Education

NUTRITIONAL EDUCATION IN SPAIN & FESNAD PROJECTS

ANALYSIS OF NUTRITIONAL PATTERNS FOR A PRECISION NUTRITION

[1]*San-Cristobal, Rodrigo;* [2]*Navas-Carretero, Santiago;* [2]*Martínez, J. Alfredo.*

[1]PhD student. Nutritionist. Department of Nutrition, Food Science and Physiology. Center for Nutrition Research. University of Navarra. Pamplona. Spain.; [2]PhD. Nutrition. Department of Nutrition, Food Science and Physiology. Center for Nutrition Research. University of Navarra. Pamplona. Spain.

Chronic diseases such as obesity, diabetes, dyslipidemia, and hypertension are characterized by nutritional imbalances or by the need to adjust and manage nutrient intake to specific requirements to counteract the associated metabolic dysfunctions. Dietary intake assessments have conventionally been more orientated on macronutrient/micronutrient supply and seldom on food dietary patterns. Currently, there are some epidemiological and statistical approaches enabling to screen the dietary quality and variety on a population, in order to provide nutritional guidelines for healthy nutrition and safe nutritional intervention programs. Actually, observational and association studies considering dietary patterns and the prevalence/incidence of different metabolic diseases are allowing to identify and define metabolic derangements accompanying chronic unhealthy dietary habits. Potential suitable tools to be applied for the characterization of dietary patterns are diverse, but health professionals and policy makers must distinguish those that are appropriate for each occasion. The design of scores or nutritional indices allow finding out the role of the adherence to a specific dietary pattern on health outcomes, whereas bio-statistical strategies based on cluster, principal component, factor analysis or reduced rank reduction tests allows to determine the onset of dietary patterns within a specific population or nutritional exposures that contribute to prevent obesity and metabolic syndrome associated manifestations. A factor analysis concerning food intake to feature those patterns in a Spanish population interested in an on-line Personalised Nutrition program (Food4Me) was performed. Food items were branded according to nutritional value to carry out the nutritional profile analysis. After the food patterns were defined, results based on the differences in macronutrient distribution between these dietary patterns were re-appraised. Thereafter, association studies between such dietary patterns and reliable anthropometric determinations were implemented to find out potential relationships. The factor analysis statistical strategy produced two quite different regimes; the first one was mainly consti-

tuted by high energy yielding foods, and the second one, featured a higher consumption of vegetables or fruits and seafood products. When the patterns were independently assessed, contrasting trends between both analyses and body adiposity (BMI) were found, although they followed the expected tendency, respectively. Nevertheless, those studies considering with both patterns showed interesting interactions with specific nutrients. Quantitative and qualitative analyses concerning food consumption may assist not only to understand the relationships between nutrition and health issues, but also to prevent the onset and development of chronic diseases as well as to detect specific nutrients that may be metabolically protective for a given population. The assessment of the dietary adherence could be helpful for the design of screening tools and algorithms in Personalised Nutrition evaluation, in order to identify nutritional targets to be precisely approached in every person.

HEALTHY FOOD FOR PREGNANT AND LACTATING WOMEN. ACTIVITIES RELATED TO THE NATIONAL NUTRITION DAY

Arija, Victoria.

Professor of Preventive medicine and public health. Faculty of Medicine and Health Sciences. Rovira i Virgili University. Tarragona. Spain.

Given the importance of food and nutrition for the health of the population, the Federation of Societies of Nutrition, Food and Dietetics (FESNAD) has developed one of its objectives over nutritional education for the population, celebrating every year the National Nutrition Day (NND), since the year 2003.

Among the different campaigns, FESNAD recently focused its campaign on healthy eating for pregnant and lactating women, given the importance it has for their health and the health of their baby. The growth and development of the baby from the embryonic and fetal stage and during the first year of life is a critical period of extreme vulnerability, especially dependent on the environmental factors that surround the mother, with nutritional intake being one of the most important.

To carry out of the NND campaign, FESNAD conducted a survey on eating and healthy lifestyles in a national sample of women of childbearing age, in order to know their knowledge, habits and attitudes regarding feeding during gestation and lactation, at the same time what was done an update of the scientific evidence on the subject.

The scientific evidence and guidelines of the main international organizations were reviewed on the following sections: energy recommendations and weight control during gestation, as well as nutritional recommendations during gestation and lactation, focusing on the iron and folate status, and their patterns of supplementation during gestation. Evidence on dietary patterns and habits, as well as other lifestyles strongly related to maternal and child health, was reviewed.

Subsequently, all the information obtained in the survey of pregnant and lactating women, as well as the proximity of their knowledge, habits and attitudes to the most appropriate, according to scientific evidence, were evaluated.

From the understanding of all the information, the key points of education were formulated, while the most adequate messages were defined for the realization of the campaign of health promotion adapted to the reality of our environment.

Different materials were made with this information: posters, triptychs, slides of a presentation. The dissemination of the NND was carried out among professional groups of education, health, business, etc ...; Who are invited to perform a nutritional education activity on the subject of DNN-15 in their professional or personal environment. For this they were provided, printed and online, the material designed for the campaign.

In the NND on Healthy Foods for pregnant and lactating women, different materials were distributed throughout the Spanish territory, with more than 300 activities being carried out in different centers and institutions. The activities were directed to small and large groups of the population in general, school or university students, members of associations, workers of companies, users of primary care, etc.

NUTRITIONAL EDUCATION AT SCHOOL

Polanco, Isabel.

Full Professor of Pediatrics. School of Medicine. Autonomous University. Madrid. Spain.

Scientific evidence supports that prevailing food patterns and physical activity during infancy and childhood influence growth and development; have an impact on health not only during this period of life, but also on the potential development of risk and protective factors related to the onset of chronic diseases later in adulthood. Programs on nutritional education have been widely used for teaching or reinforcing knowledge on food habits or healthy life styles in children and are considered a useful strategy to prevent the appearance of nontransmissible chronic diseases at early ages. The implementation of nutritional education programs in schools may help to inculcate in children the ability of identifying a healthy food choice for themselves.

It has been established that the triangulation of information amongst the teacher, the children, and the family is a useful strategy for modifying negative feeding behaviors that are contributing to the recent increase in the prevalence of overweight, obesity, hypertension, diabetes, and metabolic syndrome in children, while in the opposite extreme of the spectrum, nutritional deficits persist as important nutritional problems, especially regarding micronutrient, and vitamin deficiencies such as iron, calcium, folic acid, and vitamin A, among others.

The inclusion of nutritional education into formal education programs is one of the most used and recommended strategies, mainly because the children obtain and fix the information in a easy, fun, and permanent way, but also because they act as multipliers of the information, bringing the new information to their homes to achieve, in the best case scenario, the transmission of the information to the whole family group.

Some studies indicate that to obtain a better impact on changing habits on the long term, nutritional education programs must include the whole community, to assure the permanence of changes .

HOSPITAL DIETOTHERAPY AND UNDERNUTRITION. EDUCATING PROFESSIONALS

Ashbaugh Enguídanos, Rosa Ana.

Nurse. Nutrition and dietetics service. Hospital Príncipe de Asturias University. Alcalá de Henares. Madrid.Spain.

The hospital food presents characteristics that make it unique in the context of collective catering. It is not just about offering a catering service. It has to translate the science of nutrition into medical therapy. On the other hand, hospital feeding must provide all its technique to get the patients admitted to the hospital receive that nutritional therapy with quality to achieve an adequate food

intake. This is not an easy job because of the patient's own pathological process.

It should always be taken into account that in developed countries there is a significant percentage of patients admitted to hospital with malnutrition, which is not diagnosed as such, and which, in addition to its acute pathology, causes the patient's clinical situation to worsen .

To this must be added the appearance of new cases of malnutrition among the population admitted. All these situations constitute a worrying scenario of great clinical significance.

We must know that hospital feeding is a complex process where the science of nutrition, dietetics, bromatology and hotel techniques are united. This food service should contribute to the recovery of patients and to provide a level of well-being (everyone knows that food is a factor that influences the concept of patients in the hospital).

Nutrition occupies an important place in health and throughout the history of medicine the prescription of adequate food has been part of the treatment of patients

The diary code: is the document where all diets available in each center are recorded

The philosophy that governs the preparation of a therapeutic diet responds to two general lines. The first one focuses on the patient's education regarding the principles of proper nutrition, while the other is about providing foods that the patient can eat and enjoy. There is usually a compromise between the two trends, taking into account that:

Energy and nutrient needs must be met according to the clinical situation.

It must provide a sufficiently broad and varied diet

It will represent a rewarding action.

Must have an appropriate and attractive presentation

The habits of the patient, their tastes, religious beliefs and any other factors that may influence the acceptance or rejection of the diet

CONSENSUS ON FATS AND OILS IN THE DIET OF SPANISH ADULTS. POSITION PAPER OF THE SPANISH FEDERATION OF FOOD, NUTRITION AND DIETETICS SOCIETIES

[1]Riobó, Pilar; [2]Bretón, Irene; [3]Rubio, Miguel Ángel; [4]Gil, Ángel; [5]Salas-Salvadó, Jordi.

[1]MD, PhD. Endocrinology and Nutrition Department. Jimenez Díaz Foundation. Spain.; [2]MD PhD. Endocrinology and Nutrition Department. Hospital Gregorio Marañón. Spain.; [3]MD PhD. Endocrinology and Nutrition Department. Clinical Hospital of San Carlos. Spain.; [4]PhD. Biochemistry Department. University of Granada. Spain.; [5]MD PhD. Nutrition Department. University of Reus. Spain.

In this consensus document the scientific evidence relating effects of dietary fat quantity and quality on cardiovascular risk is reviewed and recommendations for the Spanish adult population are issued. As a novelty in nutrition guidelines, emphasis is made more on parent foods than on fatty acids per se. In summary, replacing saturated fatty acids (SFA) for monounsaturated fatty acids (MUFA) and polyunsaturated fatty acids (PUFA) reduces cardiovascular risk. Recent data suggest that SFA proper may be harmful or not depending on the parent food, a reason why an intake threshold is not established, but consumption of butter, processed meats, and commercial confectionery and fried foods is discouraged. The established threshold of <1% of energy intake as trans FA, well known to be harmful for cardiovascular risk, is fulfilled in Spain due in part to its present low levels in margarines. MUFA are beneficial or neutral for cardiovascular risk depending on their dietary sources (virgen olive oil versus other fats), and no intake limitations are established. n-6 PUFA are cardioprotective and recommended intakes (5-10% of energy) are not always fulfilled in the Spanish population, thus increased consumption of their vegetable food sources (seeds, derived oils, and margarines) is encouraged. Marine n-3 PUFA are also cardioprotective and the recommendation stands to eat fatty fish ≥2 servings/weeks to reach intake levels up to 1% of energy. Increasing evidence suggests that alpha-linolenic acid (ALA), the vegetable n-3 PUFA, is also cardioprotective, but the parent foods (walnuts, soy products, greenleaf vegetables) may provide benefits beyond ALA itself. Finally, low-fat (high carbohydrate) diets appear to lack cardiovascular preventive effects, while high-fat, high-vegetable fat dietary patterns such as the Mediterranean diet, are protective, a reason why a fat intake limit of up to 40% of energy is suitable for the Spanish population. This position statement targets dietitian, nutritionists and other health professionals involved in dietary counsel so they can deliver it rightly and according to the last scientific evidence

DAIRY PRODUCT CONSUMPTION AND RISK OF CARDIOVASCULAR DISEASES

Salas-Salvadó, Jordi.

Director of Human Nutrition Unit. Department of Biochemistry & Biotechnology. School of Medicine. Rovira i Virgili University. Reus. Spain.

Cardiovascular disease (CVD) is the responsible for 17.3 million deaths each year being the leading cause of mortality in the world. Dairy products has been suggested as a marker of diet quality and has been related with cardiometabolic health outcomes (1).

During the last years, consuming dairy products has been criticized by several nutritional and non-nutritional reasons without consistent scientific evidence. However, the consumption of dairy, including milk, cheese and yogurt has been associated with a reduced risk of several cardiovascular risk factors. The purpose of this presentation is to review the recent literature examining the relationship between dairy product consumption and the risk of type two diabetes (T2D), obesity, metabolic syndrome (MetS), hypertension (HT) and CDV.

High-quality evidence supports favorable associations between the consumption of milk, regular high-fat, low-fat and fermented

dairy such as cheese and yogurt and a reduced risk of T2D. The most consistent inverse association has been reported for yogurt consumption. In case of obesity, studies reflect that dairy consumption is not positively related with changes in body weight. Yogurt was the only dairy food that showed some evidence for a beneficial effect, where higher intakes were inversely associated a reduced risk of obesity, changes in body weight or waist circumference (2).

Additionally, the last systematic review performed in seven prospective cohorts showed inverse associations between dairy products consumption and MetS incidence, especially in relation to yogurt intake (3). Moreover a favorable association between the consumption of dairy products, low-fat dairy, fermented dairy and cheese and the risk of HT. No association with of high-fat dairy, milk and yogurt and HT was found (4).

The newest systematic review indicates with moderate evidence, neutral associations between the consumption of total dairy, cheese, yogurt and CVD risk. Furthermore, with higher evidence total dairy and milk consumption were positively associated with lower risk of CVD.

In conclusion, intake of some type of dairy products seems to be related with a lower risk of CVD and other cardiovascular risk factors such as T2D, obesity, MetS and HT (10). Further research in different populations are required to replicate and confirm strongly all the published literature in reference to this issue.

STATEMENT ON OBESITY

Marcos, Ascensión.

Research Professor at the Spanish National Research Council (CSIC). President of the Spanish Federation of Nutrition, Food and Dietetics Societies (FESNAD). Spain.

The epidemics of obesity across the world is a big concern of public health associated to diverse disorders at a metabolic, social and mental levels. Over the last decades, the increase in obesity prevalence has been attributed to excessive intakes of calories within diets including low-density nutrients. Generally, obesity, as the excess of adipose tissue in the organism, is the consequence of the high consumption of macronutrients but with a suboptimal intake of micronutrients, together with distorted lifestyle habits. Weight management treatments for obese children and adolescents should aim to ensure adequate growth and development, by reducing excessive fat mass accumulation, avoiding loss of lean body mass, improving well-being and self-esteem and preventing cyclical weight regain. Nevertheless, there are also genetic and environmental factors that should be taken into account in efforts to tackle obesity. In the case there are no appropriate actions on time, this global crisis has been predicted to develop obesity in 2050 in 60% of male adults, 50% of female adults and 25% of children. The World Health Organization has defined childhood obesity as one of the most important health challenges for this century. One of each five European children is estimated to suffer from overweight and every year around half million children achieve more weight than they should for their age and height. Albeit the actual damage on the metabolism does not show up immediately at an early stage of life, the harm provoked by overweight has to be beard in mind from the beginning since "a posteriori" in the adulthood, the reactions can arrive too late. However, it is important to highlight that not everybody has the same predisposition to lose weight at the same level due to genetic agents. Therefore, with the aim to prevent obesity and maintain an adequate weight during the whole life, the main strategy to manage obesity at any age is to deliver an appropriate nutritional education among the general population, but taking into account the bases of personalized and precision nutrition.

REMARKS ON FESNAD FUTURE PROJECTS

Sanchez-Gonzalez, Ignacio.

PhD Food Science and Tech. Spanish Society of Food Science and Tech. ALCYTA. Spain.

FESNAD arose with the spirit to gather all the organisations devoted to the Nutrition, Feeding and Dietary Sciences (NFDS). The general aim is to create a voice in order to have healthy life habits to improve and expand the hope and life quality (www.fesnad.org).

The federation future projects are:

1. SCIENTIFIC ACTIVITIES

A)   The National Nutrition Day (DNN). The line developed in DNN works with the food groups properly said. The 2018 DNN will be about legumes. Source of vegetal protein with equiparable quality to the meats and fishes , have an important percentage of soluble and insoluble fibre, (15-20 g/100 g). Have a low contribution of fats (2-5%). Consumption is associated, to a satiating effect and suggests that help in the weight loss , contribute to the colorectal cancer prevention, and have a reverse relation with the high levels of total cholesterol making a LDL-cholesterol decrease and a HDL-cholesterol increase . In summary, taking into account their properties, the important proteinaceous source regarding to the low content of fats, the high content in fibre (Fibre consumptions in Spain (18g/person/current day vs. 30 g/pers/dayrecommended) and a decrease in the recommended consumptions in Spanish people (1,5 weekly rations: vs 3-4 weekly rations recommended). FESNAD will develop this campaign to inform of the nutritional properties, culinary properties and good relation between nutritional quality and price.

B)   NAOS Strategy: The obesity in the spanish chilhood is about (18-23 %) (10). Although all FESNAD projects include activities to eradicate it, we will develop collaborations with the AECOSAN* to propose and establish new models of work to decrease the obesity percentage.

C)   FESNAD Congress 2020: There are demands to organise an event that gathered to all the NFDS professionals. With this premise FESNAD develops a congress every five years, with more than 1000 participants. The next announcement will be in Zaragoza 2020. Our challenge is the creation of new research groups to improve the efficiency of resources and the scientific results.

D)   Recommended rations (RR) for spanish people document. It exists a professionals needed to establish RR for menus (patients, commensals… or to the development of epidemoiology studies). There are some guides (SENC) but is complex to establish RR in function of physical activity, age, health, or even the culinary process… The changes in the habits and the diversity of opinions regarding the RR demand of a project with all professionals involved.

2. ACTIVITIES OF SCIENTIFIC MANAGEMENT

A)   FESNAD has a system of accreditation and standardisation of external training activities. It realises an evaluation to the contents to obtain the greater scientific quality. www.fesnad.org.

B)   To the achievement of point 1.D, FESNAD realise agreements for the adhesion of affine organisations involved in the NFDS. In this process will participate Professional Colleges, consumers organisations and professional Societies…

C)   FESNAD participates like a scientific membership in the National Food Safety Day (DNSA). This proyect is a informative approach on the process involved in food chain (including consumer) in order to have a better food safety .

INNOVATIVE METHODS AND METRICS FOR AGRICULTURE AND NUTRITION ACTIONS

DIAGNOSTICS TO SUPPORT THE IDENTIFICATION, DESIGN, AND EVALUATION OF INTERVENTIONS IN VALUE CHAINS TO IMPROVE DIETS OF LOW-INCOME POPULATIONS

[1]Gelli, Aulo; [2]Aberman, Noora-Lisa; [3]Donovan, Jason; [4]Margolies, Amy; [5]Santacroce, Marco.

[1]PhD. Nutrition. Poverty Health and Nutrition Division. IFPRI. DC. USA.; [2]PhD. Malawi Country Programme Manager. IFPRI. DC. USA.; [3]PhD. Agriculture Economics. ICRAF. DC. USA.; [4]PhD candidate. Johns Hopkins University. USA; [5]MA. Economics. IFPRI. USA.

Emerging evidence on the nutrition double burden suggests income growth alone cannot solve the problem of malnutrition and may in fact create problems linked to overweight and obesity. The challenge from the nutrition perspective is how to sustainably improve diets, as well as other health-related behaviors, across different low-income populations. In recent years, the nutrition community has explored value chain approaches to address malnutrition. The value chain framework focuses on the actors involved in the production, processing, trade, and consumption of a given product, and the opportunities to achieve beneficial economic outcomes for some or all of the actors through changes in the structures, systems, and relationships. Because value chains play a key role in determining food availability, affordability, and quality, they have a role in shaping diets and can contribute to improving nutrition. Most applications, however, have focused on a single chain and its implications for nutrition, which from a diet quality perspective implies a partial solution at best. The challenge lies in better understanding the options for leveraging a set of value chains (a multi-chain focus) to address the various constraints to improving the diets of a given target group. This case study from the Zomba District of southern Malawi applies data from household surveys, in-depth individual interviews, and market surveys to examine opportunities for improved diets through leveraging demand and supply of nutritious foods, and enhancing value chain performance with a nutrition lens. Preliminary results on bottlenecks and opportunities provide insights for policy and programs.

DEVELOPING AN INNOVATIVE APPROACH TO MEASURING THE LIVELIHOODS OF SMALLHOLDER FARMERS AND TESTING CRITICAL LINKAGES FROM FARMER LIVELIHOODS TO NUTRITION

[1]Jones, Andrew; [2]Somé, Jérôme; [3]Mensah, Edouard; [4]Blesh, Jennifer; [5]Dillon, Andrew.

[1]PhD. Assistant Professor. Department of Nutritional Sciences. University of Michigan. USA.; [2]PhD. In-Country Researcher. International Dietary Data Expansion (INDDEX) Project. Burkina Faso.; [3]MSc. PhD Student. Department of Agricultural, Food, and Resource Economics. Michigan State University. USA.; [4]PhD. Assistant Professor. School of Natural Resources and Environment. University of Michigan. USA.; [5]PhD. Assistant Professor. Department of Agricultural, Food, and Resource Economics. Michigan State University. USA.

Background: Analyses of agriculture and nutrition relationships often rely on data collected using different survey design methods. Assessing the magnitude of bias of estimates of agricultural production characteristics resulting from the design of such surveys could inform the development of surveys that make efficient use of limited resources for collecting data on those agricultural characteristics most relevant for predicting nutrition outcomes. This study aims to assess the effect of agricultural survey design on estimates of agricultural production characteristics, and on the association of these characteristics with dietary quality and diversity as well as anthropometric outcomes among pre-school-aged children in Burkina Faso.

Methods: A methodological cluster-randomized controlled trial was carried out between January and February 2017 in seven provinces of Burkina Faso testing three different approaches to collecting data on agricultural production characteristics by varying respondents and agricultural units of analysis. Provinces were randomly selected within each of the country's three agro-ecological zones. Five communities per province, and 30 households per community were randomly selected, with 10 households per community randomly assigned to one of three study arms (n=1,050 households). Respondents in the control arm received a comprehensive questionnaire that collected plot-level data on land area, crops raised and harvested, earnings from agriculture and non-agricultural activities, and control of management decisions and agricultural income. These data were collected from each plot manager separately. Households assigned to treatment arm one of the trial were administered a diagnostic version of the control arm survey that collected aggregate data from the household head only. Households in treatment arm two were administered the same survey version as treatment arm one, but a randomly selected household member, excluding the household head, was chosen as the respondent. We use multi-level regression analysis adjusting for intra-village clustering to estimate the average treatment effect of the three alternative survey designs.

Results: We will examine the extent to which sociodemographic characteristics of surveyed households are well balanced across the three treatment arms of the trial. Mean child height-for-age Z-score (HAZ) (SD) for children aged 24-59 months among the entire sample was -1.2 (1.2). Mean child weight-for-age Z-score (WAZ) and weight-for-height Z-score (WHZ), respectively, were -0.98 (-0.96) and -0.41 (0.96). The area of cultivated land, overall crop yields (by weight), and the species diversity of crop production were all significantly lower among treatment arms 1 and 2 as compared to the control arm of the trial (P<0.05). We will present findings from separate adjusted regression analyses examining associations of land area, crop yield and crop species diversity with child diet and anthropometric outcomes, and including the interaction of agricultural production characteristics with dummy variables representing the randomized treatment assignment.

Conclusions: Survey design choices have a clear influence on estimates of agricultural production characteristics based on data collected from household surveys in Burkina Faso. Estimating the extent to which survey design may bias the assessment of key agriculture-nutrition relationships can allow for the estimation of confidence intervals for interpreting results across studies that apply different survey designs to examine similar relationships.

Keywords: Agriculture, dietary diversity, child anthropometry, crop diversity, Burkina Faso

SCHOOL FEEDING PROGRAM IMPLEMENTATION AND CHILD NUTRITION IN GHANA: IMPROVED METHODS AND TOOLS

Laar, Matilda Essandoh.

PhD. Lecturer/Nutritionist. Department of Family and Consumer Sciences. Sch of Agriculture. University of Ghana. Ghana.

School feeding is among the most universal form of nutrition intervention, aiming to improve nutrition, health and educational outcomes of children. In Ghana, school feeding follows a "home grown" approach to promote agricultural development through local food procurement from smallholder farmers. The program uses a decentralized procurement model which involves caterers who pre-finance procurement and serve as the potential link between small-scale farmers and program beneficiaries. The lack of simple and effective monitoring and evaluation (M&E) tools hinder process and impact assessments of the Ghana School Feeding Program (GSFP) that are needed to inform decisions to improve program effectiveness. Furthermore, existing M&E efforts have emphasized on assessment of educational (e.g., enrollment and attendance) and qualitative outputs (e.g., farmer-reported cultivated land size), while outcomes and outputs that assess nutritional quality of meals and the link between school feeding and local agriculture have been ignored. This study aimed to assess the feasibility of using the GSFP's new M&E tools in measuring nutritional quality of the meals and the link of the program to local agriculture. The new tools combined measurement of program impacts on school children with effects on local agriculture, using meal quality from school-level data on beneficiary children combined with procurement and meal planning data from GSFP caterers. The study was conducted in a total of 18 beneficiary schools from the Northern, Ashanti and Greater-Accra regions of Ghana over a school term. Data on type and portions of meals served were collected by school headteachers or their representative, and procure-

ment information collected from caterers. The findings showed that, in 16 out of the 18 schools observed, meals were provided for pupils every school day in the school term. However, the quality of meals served were low. Generally, no fruits were provided in 99.8% of the observed school meals. The school meals consistently met less than a third of the recommended nutrient intakes of protein (animal source protein offered was mostly milled smoked fish) and micronutrients (Iron, Calcium, Vitamin A & Vitamin B) for school-age children. From the procurement data, the link between caterers and small-scale farmers is either weak or non-existent. Caterers used both imported foods (e.g., rice, tinned tomatoes) and produce from other districts or regions in meal preparations. There was a heavy reliance on wholesale retailers who had more flexible payment terms and sourced food from both local and foreign producers. Caterers attributed their choice to the irregular financial reimbursement by the GSFP management, which often made it impossible to buy from local small-scale farmers who required immediate payment. In conclusion, the new M&E tools were successfully used to access meal quality and procurement from local farmers. However, there is a need to develop or adopt a user-friendly menu-planning tool and standardize handy measures used by caterers to reduce the burden involved in monitoring meal quality and training staff. In addition, efforts to improve local procurement, including timely payment of caterers and formation of farmer-based groups, should be promoted.

INDICATORS OF AFFORDABILITY OF NUTRITIOUS DIETS IN AFRICA (IANDA)

(1)Herforth, Anna; (2)Coates, Jennifer; (3)Masters, Will; (4)Sarpong, Daniel; (5)Mishili, Fulgence; (6)Bai, Yan; (7)Kinabo, Joyce; (8)Heidkamp, Rebecca; (9)Gersten, Zachary.

(1)PhD. Nutritionist. Friedman School of Nutrition Science and Policy. USA.; (2)PhD. Nutritionist. Friedman School of Nutrition Science and Policy. Tufts University. USA.; (3)PhD. Economist. Friedman School of Nutrition Science and Policy. Tufts University. USA.; (4)PhD. Economist. University of Ghana. Ghana.; (5)PhD. Economist. Sokoine University of Agriculture. Tanzania.; (6)MSc. Friedman School of Nutrition Science and Policy. Tufts University. USA.; (7)PhD. Nutritionist. Sokoine University of Agriculture. Tanzania.; (8)PhD. Nutritionist. Johns Hopkins Bloomberg School of Public Health. USA.; (9)MPH. Friedman School of Nutrition Science and Policy. Tufts University. USA.

Background and Objectives: A primary way that agriculture can influence food security and nutrition is by increasing year-round availability and affordability of diverse, nutritious foods. Food prices are tracked by national governments and international agencies but typically encompass basic commodities, or a food basket not closely related to nutritional needs. The IANDA Project (Indicators of Affordability of Nutritious Diets in Africa) develops indicators that reflect nutritious food, using existing food price monitoring systems. Additionally, IANDA partners with national data collectors and end users, toward mainstreaming the use of new indicators that reflect the affordability of nutritious diets.

Methods: In Ghana and Tanzania, IANDA worked with stakeholders to identify the most important sources of food price data and to understand their scope in geographic coverage, foods covered, frequency and methods of data collection. The food lists covered by each organization were analyzed for comprehensiveness from a nutritional perspective, in partnership with stakeholders from national agencies. Using both historical data and new pilot data, three types of indicators were constructed. To construct the Cost of Dietary Diversity (CoDD) indicator, food items were grouped into the 10 food groups of the Minimum Dietary Diversity for Women indicator (MDD-W), and the lowest cost items for each group were used to establish the cost of minimum dietary diversity. To construct the Cost of Nutrient Adequacy (CoNA) indicator, food price data were used in conjunction with the West African Food Composition table, and linear programming determined the lowest cost way to achieve adequacy of essential nutrients. To construct the Cost of Recommended Diets (CoRD) indicator, the average price of foods in each food group were summed to determine the cost of meeting food-based dietary guidelines.

Results: In each country, there were two primary sources of food price data: in Ghana, the Ministry of Food and Agriculture (MoFA) and the Ghana Statistical Service, and in Tanzania, the Ministry of Industry and Trade and the National Bureau of Statistics. In Ghana, a total of 22 food items were added to the existing food price monitoring list used by MoFA; this expanded list was piloted in four geographically distinct districts. MoFA determined that the expanded list would be useful for monitoring the price of nutritious foods and not overly burdensome, and therefore is now institutionalizing the expanded list nationwide. These data, as well as data from the national statistics organizations in both countries, were adequate to construct the three indicators (CoDD, CoNA and CoRD).

Conclusions: Resulting from partnership between the Ghana MoFA and IANDA, in our knowledge Ghana is the first country to institutionalize monitoring of the price of nutritious diets. The indicators developed can be incorporated into food price monitoring systems in other countries as well, to track costs of nutritious food across seasons and geographies. They can also be used as indicators of nutrition-sensitive agriculture within programmes or national evaluation platforms. The accuracy and feasibility of the indicators in representing a nutritious diet depends on the comprehensiveness of food lists within food price monitoring systems, and strong partnerships with stakeholders.

Keywords: Food prices, food environments, food access, affordability, monitoring systems.

FARM TO FORK – PATHWAYS TO NUTRITION OUTCOMES AND IMPLEMENTATION CHALLENGES OF INTEGRATED AGRICULTURE-PROGRAMS

WHY ARE INTEGRATED NUTRITION SENSITIVE AGRICULTURE PROGRAMS NECESSARY AND WHAT ARE THE IMPLEMENTATION CHALLENGES?

Nordhagen, Stella.

PhD. Africa Regional Monitoring and Evaluation Advisor. Helen Keller International.

There is great potential for mutual influence between agriculture and nutrition. Seventy-five percent of the world's poor work in agriculture in rural areas and are dependent on agriculture as their main source of income and at least some of their food. Agriculture thus plays a direct role in determining nutrition through food production and consumption, providing access to diets rich in diverse nutritious foods. The crops and livestock chosen and the methods used for production, harvest, processing, and storage can all influence nutrition. Agriculture also plays an indirect role in nutrition by generating income that can be spent on market-purchased food as well as healthcare, water, education, and other living essentials; all of these play a key role in influencing nutrition. Agriculture also impacts women's empowerment, including decision-making over income and time use, assets, and knowledge. When women control a larger share of income and production, this generally strengthens the pathways from income to nutrition and production to nutrition, respectively. Agriculture also plays a role in women's time use and workload, which can have impacts on their own nutrition as well as that of their families. Agriculture can also negatively influence health and nutrition through zoonosis and environmental enteropathy from livestock production, exposure to agricultural chemicals, and food-based diseases and toxins, such as aflatoxins.

Given these complex linkages, there is now widespread recognition that agriculture has a role to play in addressing malnutrition and increasing human health and wellbeing. However, a wide range of past experiences and micro- and macro-level data have borne out the fact that, without specific planning and design, agriculture will not have a large impact on nutrition or health. There is thus a need to develop interventions that aim to explicitly influence nutrition through agriculture. Interest in such nutrition-sensitive agricultural programs and policies is growing, but there remain a number of challenges to their implementation. These include adapting global best practices to resource-constrained local contexts, targeting to reach the most vulnerable while also creating conditions for successful uptake, demonstrating impact, managing diverse multi-sectoral collaborations, empowering women, avoiding adverse impacts on women's time use, mitigating potential increases in environmental enteropathy and zoonosis, balancing diverse demands on water use, avoiding adverse environmental impacts, balancing income-earning with consumption, and delivering integrated agriculture-nutrition behavior change communication. Moreover, interventions must increasingly strive to have impacts at numerous levels of agricultural systems, including across large-scale market zones. Finally, all of this must be done at sufficiently large scales and in a sustainable and cost-effective way.

This talk will give an overview of these motivations for nutrition-sensitive agriculture programs and constraints on their successful implementation, thereby laying the foundation for a rich discussion among experts who are involved with a diverse set of projects currently making advances in this sector.

SELENIUM IN COMMONLY CONSUMED FOODS OF BANGLADESH

[1]Shaheen, Nazma; [2]Akhter, Kazi Turjaun; [2]Khan, Ishrat Nourin; [2]Md. Irfan, Nafis; [3]Rahim, Abu Torab Md. Abdur.

[1]PhD. Professor and Director. Institute of Nutrition and Food Science. University of Dhaka. Dhaka. Bangladesh; [2]Lecturer. Institute of Nutrition and Food Science. University of Dhaka; [3]PhD. Professor. Institute of Nutrition and Food Science. University of Dhaka.

Background and objectives: As an essential trace mineral Selenium has a pivotal role in maintaining human health. The beneficial role of Selenium includes antioxidant activities, proper functioning of the immune system, DNA synthesis and conservation of reproductive health. In spite of such beneficial roles of Selenium, there was a lack of data on the Selenium content of foods in Bangladesh. This study is the very first approach of incorporating analytical data of Selenium of commonly consumed foods.

Methods: Sample selection and prioritization were done according to the key food approach throughout the year. A total of twenty foods of predominant varieties were collected for analysis. Fresh samples of cereals (Rice, Wheat flour), pulses (Lentils), vegetables (Brinjal, Bean, Carrot, Green chili, Onion, Potato, Tomato) fruits (Banana, Mango, Jackfruit), freshwater fish (Rohu, Tilapia, Pangas), meat (chicken leg and breast), egg (chicken), and milk (cow) were collected for analysis of Selenium. The samples were analyzed by inductively coupled plasma mass spectrometry (ICP-MS) followed by microwave digestion.

Results: The result shows that highest and lowest content of Selenium (fresh weight basis) was found in tilapia fish (1.18 μg/g) and in rice (0.13 μg/g) respectively. Among the different food groups the estimated average Se content (μg/g) was found in the decreasing order of egg (1.06) > fish (1.03) > meat (0.75) > milk (0.42) > fruits (0.27) > Cereals (0.13) > Pulse (0.07) > Vegetables (0.06). Again among the individual food categories, the food sample which showed the highest concentrations of Se are cereals- Wheat flour (0.24), pulse-lentil (0.07), Vegetables-bean (0.1), fruits-mango (0.43), meat-chicken breast (0.79), fish-Tilapia (1.18), milk (0.42) and egg (1.06) respectively.

Conclusions: Accurate food compositional database for Se is immensely important to find out the rich source of Selenium. Findings of the present study from nationally representative com-

DIETARY PATTERNS IN ADOLESCENTS AGED 18 YEARS: RESULTS FROM THE 1993 PELOTAS (BRAZIL) BIRTH COHORT

[1]Buffarini, Romina; [2]dos Santos Vaz, Juliana; [3]Baptista Menezes, Ana Maria; [4]Formoso Assunção, Maria Cecília.

[1]PhD. Nutritionist. Post-Graduate Program in Epidemiology. Federal University of Pelotas. Brazil; [2]PhD. MSc. Nutritionist. Post-Graduate Program in Epidemiology. Federal University of Pelotas. Brazil; [3]MD. PhD. Post-Graduate Program in Epidemiology. Federal University of Pelotas. Brazil; [4]Nutritionist. MSc. PhD. Post-Graduate Program in Epidemiology. Federal University of Pelotas. Brazil.

Background and objectives: The employment of dietary patterns (DP) to assess dietary has increased rapidly over recent years as an alternative to studying the intake of individual food items or a nutrient-specific approach. In this study we aimed to obtain dietary patterns in adolescents aged 18 years using principal components analysis (PCA), a multivariate method which may allow a meaningful approach to assessing dietary intake.

Methods: Cross-sectional analysis of 4052 adolescents belonged to the 1993 Pelotas (Brazil) Birth Cohort. A food frequency questionnaire (FFQ), composed by 88 items with eight frequency options (from zero to five or more times a day), was administered. The food items were combined into 44 food groups based on nutrient composition similarities and frequency of consumption. Varimax rotation was applied to obtain orthogonal factors. The food groups that showed factor loading >0.25 were considered to have a strong association with this factor. The number of factors that best represent the data were chosen primarily on the basis of the screeplot.

Results: Four DP were identified: "meat and fast foods", "fruit and vegetables", "candies, sodas, and dairies" and "common Brazilian". They explained 40% of the total variance. The first component had a high loading on all types of meat, including processed meats (canned tuna/sardine, salt-cured meat, bacon) and fast foods (hamburger, hot dog). The second component loaded highly on all types of fruits, vegetables and other legumes (except black beans). The third component was characterized by high loads of chocolate powder, regular sodas, dairies products (milk, yogurt, cheese, soft cheese), sweets and chocolates, candies and caramels. Lastly,

the fourth component loaded highly on black beans, white sugar, margarine/butter, white rice and white bread, and was labeled as "common Brazilian" in line with the usual Brazilian lunch "rice and beans" and "coffee and bread" breakfast.

Conclusions: This study identified four DP through a useful method that overcome the inherent problem of intercorrelations between food items when examining individual food associations. These patterns describe 18 years old adolescents' food habits and may be useful for future epidemiological research on health risk in the 1993 Pelotas Birth Cohort.

PROGNOSTIC VALUE OF METABOLITES FOR PREDICTING RESPONSIVENESS TO NUTRITIONAL INTERVENTION AGAINST OXIDATIVE STRESS AND INFLAMMATION

[1]Kim, You Jin; [2]Kwon, Oran.

[1]PhD. Department of Nutritional Science and Food Management, Ewha Womans University, Republic of Korea; [2]Professor, PhD. Department of Nutritional Science and Food Management, Ewha Womans University.

Background and objectives: Integrating traditional biomarkers and omics biomarkers might allow the discovery of prognostic markers for distinguishing responders from non-responders to nutritional interventions. We aimed to identify prognostic metabolites that predict responses to an intervention against oxidative stress and inflammation, using a data set from a randomized controlled trial evaluating Korean black raspberry (KBR).

Methods: We performed a case study to evaluate the prognostic use of 1H NMR metabolite profiling, using a data set from a four-week, randomized controlled study evaluating Korean black raspberry (KBR) in sedentary overweight/obese adults. To achieve this, we applied several statistical analyses to integrate biochemical and metabolite markers.

Results: Compared with the placebo group, KBR supplementation significantly changed erythrocytes oxidized glutathione (GSSG), the ratio of reduced glutathione (GSH) to GSSG, plasma malondialdehyde (MDA) and interleukin-6 levels, and seventeen urinary metabolites. Seven urinary metabolites were associated with clinical biomarkers. A two-metabolite set (glycine and N-phenylacetylglycine) had the strongest prognostic power for oxidative stress and probably inflammation (AUC-ROC=0.778, AUC for the leave-one-out cross-validation ROC= 0.683).

Conclusions: The integration of 1H NMR metabolomics data and biochemical markers may provide a novel prognostic marker that can be used to screen for responders to an intervention against oxidative stress in sedentary overweight/obese adults.

Keywords: oxidative stress, nutritional intervention, prognostic marker, metabolomics.

INTAKE OF MARINE DERIVED OMEGA 3 POLYUNSATURATED FATTY ACCIDS AND MORTALITY IN RENAL TRANSPLANT RECIPIENTS

[1]Sotomayor, Camilo G.; [2]Gomes Neto, António; [2]Pranger, Ilse G.; [3]van den Berg, Else; [4]Gans, Rijk O. B; [5]S. Soedamah-Muthu, Sabitha; [4]Navis, Gerjan; [4]Bakker, Stephan J.L.

[1]Medical Intern. University Medical Center Groningen. University of Groningen. The Netherlands; [2]MD, PhD candidate. Internal Medicine, Nephrology. University Medical Center Groningen. University of Gronigen. The Netherlands; [3]MD, PhD. Internal Medicine, Nephrology. University Medical Center Groningen. University of Gronigen. The Netherlands; [4]MD, PhD. Internal Medicine. University Medical Center Groningen. University of Gronigen. The Netherlands; [5]PhD. Human Nutrition. University of Wageningen. The Netherlands.

Background and objectives: Marine-derived omega-3 polyunsaturated fatty acids (n-3 PUFA) have been shown to exert protective effects on all-cause and cardiovascular (CV) mortality in the general population. In renal transplant recipients (RTR) all-cause and CV mortality is high but the effect of n-3 PUFA intake on long-term outcome is unclear. We investigated whether marine-derived n-3 PUFA intake is associated with risk of all-cause and CV mortality in a large cohort of RTR.

Methods: Intake of Eicosapentaenoic acid plus Docosahexaenoic acid (EPA-DHA) was assessed using a validated Food Frequency Questionnaire. Cox-Proportional Hazards Regression analyses were performed to evaluate the associations of EPA-DHA intake with all-cause and CV mortality.

Results: We included 627 RTR (age 53 ± 13 years, 56% male). EPA-DHA intake was 102 [interquartile range: 42-216] mg/day. During median follow-up of 5.4 years, 130 (21.0%) RTR died, with 52 (8.3%) due to CV causes. EPA-DHA intake was associated with lower risk of all-cause mortality (Hazard Ratio (HR) 0.85; 95%

confidence interval (95%CI) 0.75-0.97, P = 0.02), independent of potential confounders. The HR for the association of EPA-DHA intake with CV mortality was of similar magnitude, but did not reach significance (HR 0.83, 95%CI 0.68-1.02, P = 0.08). The association of EPA-DHA intake with mortality was significantly modified by age (P = 0.03) and smoking status (P = 0.01), with lower risk for all-cause and CV mortality particularly in the older (≥ 63 years old) (HR 0.75; 95%CI 0.61-0.92, P = 0.01; and 0.68; 95%CI 0.48-0.95, P = 0.02 respectively) and non-smokers (HR 0.80; 95%CI 0.68-0.93, P = 0.01; and 0.74; 95%CI 0.56-0.98, P = 0.04, respectively) subgroups of RTR.

Conclusions: Higher marine-derived n-3 PUFA intake was associated with lower risk of all-cause and CV mortality in RTR. Strongest associations were present in elderly and non-smoking RTR. Our study adds further evidence to the plea for EPA-DHA supplementation in RTR, particularly in subgroups of this population.

Keywords: Renal transplant recipients; Omega-3 polyunsaturated fatty acids; Cardiovascular mortality; All-cause mortality.

Department of Nutrition, Exercise and Sports. University of Copenhagen. Denmark.

Background and objectives: Severe acute malnutrition (SAM) is common in children in low-income countries and may be associated with low polyunsaturated fatty acids (PUFA) status.

The objective was to describe changes in PUFA-status during SAM treatment.

Methods: A prospective study among children treated for SAM in Uganda. Whole-blood fatty acid composition was assessed at admission, transition, discharge and follow-up, and among healthy children. ANCOVA was used to identify predictors of change.

Results: The study included 120 children with SAM and 29 controls. At baseline, the relative contribution of saturated fatty

acids to fatty acids in whole-blood (FA%) were lower, while most monounsaturated fatty acids were higher in children with SAM compared to controls. All n-6 PUFAs including linoleic (LA) and arachidonic acid (AA), as well as total n-3 PUFA and docosahexaenoic acid (DHA) were lower in children with SAM. Whole-blood n-6 PUFA proportions increased until follow-up, except for AA, which decreased by 0·79 (95%CI 0·46, 1·12) FA% from admission to transition and additional 0·10 (95%CI 0·23, 0·44) FA% to discharge. Compared to admission levels, total n-3 long-chain (LC) PUFA decreased by 0·21 (95%CI 0·03, 0·40) FA% at discharge and 0·22 (95%CI 0·01, 0·42) FA% at follow-up. This decrease was greater in children from families with recent fish intake before admission and those with nasogastric tube feeding.

Conclusions: Children with SAM had low whole-blood LCP-UFA. Current therapeutic feeds do not correct whole-blood levels of LCPUFA, particularly n-3 LCPUFA.

Keywords: Essential fatty acids, malnutrition, treatment, children

University of British Columbia. Canada.

Background and objectives: Genetic hemoglobin (Hb) disorders are autosomal inherited conditions caused by mutations and/or deletions in the genes encoding the α- and β-globin chains of Hb. The Glu6Val variant in HBB causes sickle cell trait in the heterozygous form and sickle cell disease in the homozygous form. Deletions in HBA1 and HBA2 cause α-thalassemia; the most com-

mon variant is the α3.7 deletion. Our aim was to determine the prevalence of these gene variants in children in the Democratic Republic of the Congo, and to assess the association with Hb concentrations and anemia.

Methods: Venous blood was collected from n=709 children 6-59 months in South Kivu (SK) and Kongo Centrale (KC) provinces. Genomic DNA was extracted from buffy coat. Pyrosequencing was used to detect the Glu6Val variant in HBB and PCR was used to detect α3.7-thalassemia deletions. Capillary Hb concentration (g/L) was determined using a Hemocue®. One-way ANOVA (Bonferroni-adjusted for multiple comparisons) was used to detect significant differences in Hb concentration across genotypes.

Results: Prevalence of sickle cell trait was 6% (n=26/426) in SK and 16% (n=47/283) in KC, and sickle cell disease was <1% (n=1/426) in SK and <1% (n=1/283) in KC. Prevalence of α3.7-thalassemia heterozygous was 10% (n=39/372) in SK and 6% (n=2/31) in KC, and α3.7-thalassemia homozygous was 2% (n=6/372) in SK and 6% (n=2/31) in KC. Overall, Hb concentrations were not significantly different among children with no sickle cell variants (111±16 g/L) compared to children with sickle cell trait (111±17 g/L) and sickle cell disease (94±30 g/L) (P>0.05); anemia prevalence (Hb <110 g/L) was 43%, 48%, and 50%, respectively. Hb concentrations were not significantly different among children with no α3.7-thalassemia deletions (111±14 g/L) as compared to both α3.7-thalassemia heterozygous (108±12 g/L) and α3.7-thalassemia homozygous (107±8 g/L) (P>0.05); anemia prevalence was 41%, 54%, and 50%, respectively.

Conclusions: These disorders were not significantly associated with Hb concentrations. Sickle cell disease and thalassemia are associated with ineffective erythropoiesis that may result in increased iron absorption and higher concentrations of ferritin and/or sTfR. Further work is warranted to investigate the associations with iron status.

Keywords: hemoglobin, anemia, sickle cell, α-thalassemia

Biochemistry and Nutrition Research Center, Department of Biochemistry and Nutrition Sciences. School of Medicine. Mashhad University of Medical Sciences. Mashhad. Iran.

Background and objectives: Several animal studies showed the expression of peroxisome proliferator activated receptor-gamma (PPAR gamma) in adipocytes among rats fed with high-fat diet was higher than those fed with normal diet. However, there are no human studies to support this. The objective of the present study was to investigate the association between the PPAR gamma expression in visceral and subcutaneous human adipose tissues and intake of hydrogenated and non-hydrogenated vegetable oils and butter.

Methods: Visceral and subcutaneous adipose tissues were obtained from 97 subjects (41 non-obese, 18 obese, and 38 morbid obese), who underwent open abdominal surgery with minimal impact on dietary intake. Intake of hydrogenated and non-hydrogenated vegetable oils and butter were collected using a valid and reliable food frequency questionnaire. The gene expressions of PPAR-gamma in visceral and subcutaneous adipose tissue were assessed by Real-Time PCR.

Results: after adjustment for total energy intake and age, visceral adipose tissue PPAR-gamma gene expression was correlated with total fat and oil intake (β=-0.531, P=0.014) in the total population. Among non-obese subjects, visceral adipose tissue PPAR-gamma gene expression was correlated with non-hydrogenated oil (β=0.621, p=0.017). PPAR-gamma gene expression in subcutaneous adipose tissue was correlated with non-hydrogenated oil (β=0.481, P=0.026) among obese subjects. Moreover, among morbidly obese subjects, we found significant correlations between visceral adipose tissue PPAR-gamma expression and total fat and oil intake (β=0.417, P=0.020).

Conclusions: Expression of adipose tissue PPAR-gamma mRNA negatively correlates with total fat and oil intake mostly in

visceral fat. In addition, non-hydrogenated oil positively correlates with PPAR-gamma expression.

Keywords: PPAR-gamma, adipose tissue gene expression, oil and fat

Background and objectives: The evidence showed that the insulin level concentrations have an important role in apelin gene regulation and circulation. Diet may affect the level of insulin. The aim of the current study was to investigate the association of the apelin gene expression and concentration with habitual carbohydrate intake.

Methods: Visceral and subcutaneous adipose tissues were obtained from 32 morbidly obese and 32 age- and sex-matched non-obese subjects, who underwent open abdominal surgery. Dietary intake was collected using a valid and reliable food frequency questionnaire, and daily intake of carbohydrates, fiber, glucose, fructose, and total sugar were calculated. The mRNA expressions of apelin gene in visceral and subcutaneous adipose tissues were analyzed by Real-Time PCR.

Results: The mean age was 39.6 years for both groups and body mass index for morbid obese and non-obese subjects were 45.3 and 25.6kg/m2, respectively. Apelin gene expression was more increased in morbid obese than non-obese subjects in both subcutaneous (3.42 vs 0.49, P<0.05) and visceral adipose (3.65 vs 0.19, P<0.05) tissues. Apelin expression in visceral adipose tissue among non-obese subjects was marginally correlated with fructose (r=0.314, P=0.061); however, among morbid obese subjects, carbohydrate (r=0.429, P=0.014), fiber (r=-0.360, P=0.034), glu-

cose (r=0.341, P=0.048), and fructose (r=0.310, P=0.057) was correlated with apelin gene expression in visceral adipose tissue. Moreover, among obese subjects we found significant correlations between apelin expression in subcutaneous adipose tissue and carbohydrate (r=0.447, P=0.010), fiber (r=-0.443, P=0.013), total sugar (r=0.369, P=0.038), and among non-obese subjects we found significant correlations with glucose (r=0.481, P=0.006), fructose (r=0.467, P=0.008), and total sugar (r=0.435, P=0.014). Apelin concentration was correlated with percentage of energy from carbohydrate (r=0.379, P=0.046), fiber (r=-0.501, P=0.001) only in non-obese subjects.

Conclusions: The results of the current study showed that apelin among morbid obese had a positive correlation between carbohydrate and simple sugar intakes and a negative correlation with fiber intake.

Keywords: Fiber; Carbohydrate; apelin gene expressions; visceral and subcutaneous adipose tissues

COMPARISON BETWEEN ENERGY INTAKE AND EXPENDITURE USING ACCELEROMETERS IN LARGE SCALE DISASTER SCENARIOS

[1]Koizumi, Nao; [2]Ogata, Hitomi; [3]Omi, Naomi.

[1]Master. Graduate School of Comprehensive Human Sciences. University of Tsukuba. Japan.; [2]PhD. Graduate school of integrated Art & Sciences. Hiroshima University. Japan; [3]PhD. Faculty of Health and Sport Sciences. University of Tsukuba. Japan.

Background and objectives: When large-scale disasters occur, firefighters are expected to engage in high-intensity and long-term disaster response activities under harsh environments. Total energy consumption at the time of disaster activity is presumed to be about 3,000 to 4,000 kcal from literature review research, etc. However, the necessary amount (energy) is wide and there is no sufficient basis yet for these values.

In a report issued by the Fire and Disaster Management Agency of the Ministry of Public Management, Home Affairs, Posts and Telecommunications in 2012, each fire department headquarters has been shown to make efforts to prepare foods, drinking water, personal equipment, etc. that can function for 72 hours or more.

"Eating" or food plays an important role in maintaining the condition of firefighters even in case of emergencies and continuing to demonstrate their strength. Therefore, food (reserve) stockpiling needs to be considered in advance. However, the energy requirements of firefighters engaged in disaster response activities are not known, and it is the current situation that is left to the judgment of each municipality.

When large-scale disasters occur in the future, there is a need to clarify energy consumption and energy requirement at the time of disaster response activity in order to prevent the condition maintenance and performance deterioration of firefighters.

Therefore, in this research, we aimed to investigate the amount of activity in training close to the actual disaster activity and clarify the current state of energy consumption.

Methods: We targeted firefighters consisting of 62persons in 11 departments of three prefectures participating in a two-day blind firefighting training dedicated to large-scale disasters (hereinafter referred to as brand training). For the activity level survey, a clinical triaxial acceleration sensor activity meter was mounted from before the start of the blind training until after the end. Food content survey was recorded by photographing and filling in the survey form.

Results: In the blind training assuming large-scale disasters, the obtained result supported the past literature in terms of energy consumption.

Conclusions: In comparison, it became clear that there is a deficiency in the amount of energy of the meals currently being ingested by firefighters or disaster rescue personnel.

Department of Epidemiology and Biostatistics. School of Public Health. Xi'an Jiaotong University Health Science Center. P.R. China.

Background and objectives: The benefits of maternal micronutrient supplementation in pregnancy on their offspring's mental development in early childhood have been evaluated from the randomized controlled trials. The aim of this study is to further examine the long-term effect of perinatal micronutrient supplementation on the adolescent intellectual development.

Methods: Eligible adolescents whose mother received one of three kinds of daily antenatal micronutrient supplementation (folic acid, iron/folic acid, and multiple micronutrients [MMNs]) in a community-based, double-blind, randomized controlled trial in rural western China, were recruited to a follow-up evaluation. Intellectual development of adolescents was assessed by the Fourth Version of Wechsler intelligence scale for children (WISC-IV). 5 composite scores were derived from WISC-IV to indicate the full-scale intelligence quotient (FSIQ), verbal comprehension index (VCI), working memory index (WMI), perceptual reasoning in-

dex (PRI), and processing speed index (PSI). Mean differences and 95% confidence intervals (CI) of 5 composite scores among three treatment group were estimated by generalized estimated equation linear models, and adjusted for the potential confounders.

Results: 2119 adolescents aged 9-15 years old were interviewed. There were non-significant differences among three treatment group in scores of FSIQ, WMI, PRI, and PSI. The score of VCI in MMNs group was significant higher than those in folic acid group (adjusted mean difference: 1.71; 95% CI: 0.11-3.32). In adolescents, whose mother initiated micronutrient supplementation before 12 gestational weeks, MMNs supplements significantly increased FSIQ by 2.05 (95% CI: 0.20-3.90) compared with folic acid group. For adolescent from poorest one-third household both in pregnancy and in current, maternal MMNs supplements was significantly associated with increased PRI scores (adjusted mean difference: 4.31; 95% CI: 0.77-7.86) compared with folic acid only. Compared with iron/folic acid group, MMNs supplementation significantly increased FSIQ (adjusted mean difference: 1.94; 95% CI: 0.18-3.70) in adolescent with their maternal total consumption number of antenatal supplementation less than 180.

Conclusions: In rural China, maternal MMNs supplementation was positively associated with the intellectual development of their offspring in adolescent compared with iron/folic acid or folic acid alone with the largest benefits in initiating supplementation in first trimester and in poor household subgroup.

Keywords: Maternal micronutrient supplementation, adolescent, intellectual development, longitudinal study, rural western China.

School of Medicine, Mashhad University of Medical Sciences. Mashhad. Iran.

Background and objectives: adipose tissue is an expanded endocrine organ affects body hemostasis by secreting protein named adipokine. Plasma level of apelin (a new adipokine) decreased after exercise; however, the evidence on gene regulation in

adipocyte is rare. The objective of the present study was to investigate the association between the apelin gene expression and habitual physical activity among morbid obese and non-obese subjects.

Methods: Visceral and subcutaneous adipose tissues were obtained from 32 morbidly obese and 32 non-obese age- and sex-matched subjects, who underwent open abdominal surgery. Physical activity was collected using a valid and reliable International Physical Activity Questionnaire (IPAQ)-long form, and the metabolic equivalent of task (MET) was calculated. The mRNA expressions of apelin gene in visceral and subcutaneous adipose tissues were analyzed by Real-Time PCR.

Results: The mean age was 39.6 years for both groups and body mass index for morbidly obese and non-obese subjects was 45.3 and 25.6 kg/m2, respectively. Apelin gene expression was more increased in morbid obese than non-obese subjects in both subcutaneous (3.42 vs 0.49, P<0.05) and visceral adipose(3.65 vs 0.19, P<0.05) tissues. Apelin expression in visceral adipose tissue among morbidly obese subjects was correlated with total MET (r=-0.345, P=0.045); however, apelin gene expression in subcutaneous adipose tissue was not significantly correlated with total MET. Among morbid obese subjects, total home MET (r=-0.412, P=0.019) was correlated with visceral adipose tissue.

Conclusions: Decreased apelin gene expression in visceral adipose tissue is linked to total MET in morbidly obese subjects, suggesting an important role of physical activity pathways in the causal relationship between consequences of higher physical activity and the development of obesity.

ANTI-STEATOTIC EFFECTS OF DOCOSAEXAENOIC ACID AND HYDROXYTYROSOL IN THE LIVER OF MICE FED A HIGH-FAT DIET: PPAR-A AND NRF2 UP-REGULATION, AND OF SRBP-1C AND NF-KB DOWN-REGULATION

[1]*Valenzuela Baez, Rodrigo Wladimir;* [2]*Echeverria, Francisca;* [2]*Soto Alarcón, Sandra Anakaren;* [2]*Orellana, Paula;* [3]*Rincón-Cervera, Miguel Ángel;* [4]*Vargas, Romina;* [5]*Valenzuela, Alfonso;* [6]*Videla, Luis A.*

[1]Nutritionist. PhD. Nutrition Department, Faculty of Medicine, University of Chile; [2]Nutritionist. MSc. Nutrition Department, Faculty of Medicine, University of Chile; [3]Chemical. PhD. Lipid Center, Institute of Nutrition and Food Technology (INTA), University of Chile; [4]Biology. MSc. Molecular and Clinical Pharmacology Program, Institute of Biomedical Science, Faculty of Medicine, University of Chile; [5]Biochemistry, PhD. Lipid Center, Institute of Nutrition and Food Technology (INTA), University of Chile; [6]Biochemistry, MSc. Molecular and Clinical Pharmacology Program, Institute of Biomedical Science, Faculty of Medicine, University of Chile.

Background and objectives: Background: Non-alcoholic fatty liver disease (NAFLD) is characterized by abnormal ac-cumulation of lipids, being insulin resistance, oxidative stress, inflammation and a drastic depletion of n-3 LCPUFA the main expressions of the disease. Docosahexaenoic acid (DHA, 22:6, n-3) controls liver lipid metabolism by stimulation of lipolysis and inhibition of lipogenesis and Hydroxytyrosol (HT) exhibits strong tissue cytoprotective effects. Objetive: To evaluate the molecular mechanisms involved in the protective effects of a mixture of DHA and HT (DHA /HT), to prevent the development of NAFLD induced by high-fat diet (HFD) in mice.

Methods: Male C57BL/6J mice received control diet (CD) (10% fat) or high fat diet (HFD - 60% fat), non-supplemented/ supplemented of DHA (50 mg per kg per day)/ HT (5 mg per kg per day) for 12 weeks. Parameters studied included liver histology (optical microscopy), activity of hepatic antioxidant enzymes (catalase, superoxide dismutase, glutathione peroxidase, and glutathione reductase (by spectrophotometry), oxidative stress indicators (glutathione, thiobarbituric acid reactants, and the antioxidant capacity of plasma), gene expression assays for PPAR-α, Nrf2, SREBP-1c and NF-κB (qPCR and ELISA), and LCPUFA profiles in liver (gas-liquid chromatography).

Results: Results: HFD induced (i) liver steatosis (increasing total fat, triacylglycerols and free fatty acid content), (ii) higher fasting serum glucose, insulin levels and HOMA index, total cholesterol, triacylglycerols, TNF-α and IL-6, (iii) liver and plasma oxidative stress enhancement, (iv) depletion of n-3 LCPUFA content of liver phospholipids, increasing lipogenic and reducing lipolytic enzyme activities (v) down-regulation of PPAR-α and Nrf2, and (vi) up-regulation of SREBP-1c and NF-kB (gene expression and DNA binding activity). These changes were either reduced (p < 0.05) or normalized (compared to CD) in animals feed HFD supplemented with DHA/HT.

Conclusions: DHA/HT intervention exerts anti-steatotic effects underling antioxidants and anti-inflammatory responses by improving insulin sensitivity and recovering the lipolytic/lipogenic status of the liver altered by HFD, being PPAR-α and Nrf2 up-regulation, together with SREBP-1c and NF-κB down-regulation important molecular mechanisms involved in the protective action of DHA/HT. These effects may support the potential therapeutic use of DHA/HT supplementation in the treatment of liver steatosis induced by nutritional factors and/or other etiologies.

Keywords: Anti-steatotic effects; docosahexaenoic acid; hydroxytyrosol; antioxidant effects ; antiinflammatory effects

THE FADS GENETIC VARIANTS, FISH INTAKE AND LONG TERM WEIGHT CHANGE: RESULTS FROM THE SINGAPORE CHINESE HEALTH STUDY

Huang, Tao; Koh, Woon Puay.

National University of Singapore.

Background and objectives: A recent study in Greenlandic Inuit identified genetic signatures for adaption to diets rich in fish and n-3 polyunsaturated fatty acids (PUFAs), such as variants in

FADS cluster, which also affect adiposity feature. We therefore hypothesized that the genetic signatures might interact with fish/PUFA intakes on body weight.

Methods: The interactions between FADS variant and the fish, long chain polyunsaturated fatty acids intakes in relation to long term changes in body-mass index (BMI) were prospectively tested in 6,592 Chinese women and men from the Singapore Chinese Health Study (SCHS).

Results: We found that total EPA+DHA intake consistently accentuated the genetic influences of signatures FADS rs174570 (C/T, with T is rich in Inuit) on long term changes in BMI in the SCHS cohort. Differences in long term changes in BMI were -0.105 (SE 0.067), 0.027 (SE 0.064), and 0.120 (SE 0.067) kg/m2 across three tertiles of total EPA+DHA intake. Similarly, fish intake significantly accentuated the genetic influences on long term changes in BMI (p for interaction=0.006). Differences in long term changes in BMI were -0.096 (SE 0.071), 0.041 (SE 0.052), and 0.251 (SE 0.151) kg/m2 across three categories (≤1 serving/week, 1~6 servings/week, and ≥ 1 serving/day) of fish intake. In addition, the T carriers had much stronger associations of fish and long chain n-3 PUFAs intakes with long term changes in BMI than did the non-T carriers.

Conclusions: Our data supports that fish and long chain n-3 PUFAs intakes might modify the genetic effects of FADS variant on weight change in Chinese.

HANDBOOK FOR CONDUCTING CLINICAL TRIALS WITH DIETARY SUPPLEMENTS OF NATURAL ORIGIN

[1]Casamayor Laime, Zuleika; [2]Castanedo Valdés, Raquel; [3]Adalberto, Adalberto.

[1]MSc. Clinical trials department. Entrepreneurial Group LABIOFAM. Cuba.; [2]MSc. Clinic department. National Institute of Hygiene Epidemiology and Microbiology. Cuba.; [3]MSc National Coordinating Center for Clinical Trials (CENCEC). Cuba.

Background and objectives: Introduction: The clinical development of natural products, especially dietary supplements, is a field of research currently under development around the world and in Cuba. The clinical trials with dietary supplements used different methodologies which are sometimes inadequate, with inconclusive results. There is no methodology for clinical trials with these products, the scientific evidences, supporting health benefits, are insufficient and limited for their generalization.

Objective: To prepare a handbook for conducting clinical trials with dietary supplements of natural origin.

Methods: A study that classified as applied research was carried out. The current situation of clinical trials with dietary supplements, the theoretical and the methodological foundations and the methodology used in clinical trials with these natural products, were identified in the scientific literature; and was designed a handbook to conducting clinical trials with natural dietary-supplements.

Results: The dietary surveys, anthropometric, biochemical and hematological determinations are methodological aspects defended by specialists of nutrition and the handbook suggest, it have to take into account in the investigative practice with this type of natural product, that`s why that proposal suggest necessary the participation of the accredited specialist in nutrition and propose their functions. The handbook contains issues to be taken into account during the planning and execution of the clinical trial. The specialists who valued the proposal agree with more than 75% of the indicators and 76.92% with all the indicators to evaluate the guide.

Conclusions: The handbook provides the necessary theoretical and methodological aspects while performing clinical trials with dietary supplements of natural origin.

Keywords: The handbook provides the necessary theoretical and methodological aspects while performing clinical trials with dietary supplements of natural origin.

Background and objectives: Calcium is the only dietary factor that affects both non-heme and heme iron absorption in humans. Mechanisms behind this effect are not elucidated. Our hypothesis is that calcium could modify the expression of gene and proteins involved in iron absorption. An interesting experimental model for evaluating this effect in small intestine is the human cell line Caco-2, which is easy to use and produces results that strongly correlate with the absorption of iron in humans.

Objective: To evaluate the effect of calcium on the expression of gene and proteins involved non-heme iron absorption by Caco-2 cells

Methods: Caco-2 cells were exposed by 1h with 2μM iron solution (ferrous sulfate) and calcium (chloride) using different calcium:iron molar ratios (MR) 0:1 to 1000:1. Intracellular iron concentration was determined by ECLIA method, mRNA expression by qRT-PCR and protein expression by Flow-Cytometry. Changes in ferritin, mRNA and protein expression were compared between non calcium-stimulated cells (calcium: iron molar ratio=0:1) and cells stimulated with calcium at different concentrations.

Results: Calcium does not affect intracellular iron concentration. However, calcium increased mRNA DcytB expression (p=0.007) but an opposite effect was found in DcytB protein expression in membrane (p=0.001). No effect was found on both, mRNA and protein expression in membrane of DMT1 (p=0.42 and p=0.55 respectively). Otherwise, mRNA levels and protein expression of FPN (Ferroportin) were decreased by calcium (p=0.002 and p=0.03, respectively).

Conclusions: Calcium decreased the protein expression of DcytB and FPN in membrane. Because FPN is the only protein involved in efflux of all dietary iron forms from diet, this effect may explain the negative effect of calcium on iron absorption previously described in humans. However, our results as well as previous data warrant further investigation into the effect of calcium on iron absortion.

Keywords: Non-heme iron, Calcium, Iron absorption, Caco-2 cells

IDENTIFICATION OF BLOOD CELL TRANSCRIPT LEVELS OF POMC AND AGRP IN THE OFFSPRING OF GESTATIONAL CALORIE RESTRICTED RATS AS POTENTIAL BIOMARKERS OF PREDISPOSITION TO IMPAIRED ENERGY HOMEOSTASIS CONTROL

Background and objectives: Undernutrition during gestation is associated to perturbations in neuropeptides regulation and impaired leptin sensitivity, setting the stage for further obesity development. In turn, leptin supplementation during lactation reverses most of these detrimental effects. We used the animal model of gestational calorie restriction to determine potential transcript-based biomarkers in peripheral blood mononuclear cells (PBMCs) in adulthood indicative of a deficient energy homeostasis control and hence predictive of increased risk to develop obesity.

Methods: Adult male Wistar rats belonging to three experimental groups were studied: the offspring of control dams fed ad libitum with standard diet during gestation (controls); the offspring of 20% calorie-restricted dams from days 1-12 of gestation (CR); and CR rats supplemented with a daily oral dose of leptin throughout lactation (CR-Leptin). All offspring were fed standard diet thereafter. Body weight was followed. Body fat content and plasma leptin levels were determined at 3 and 6 months. Results of a microarray analysis performed in PBMCs at 4 months were used to identify genes related to feeding control being differentially expressed between controls and CR animals. RT-qPCR analysis was performed to confirm gene expression results.

Results: No significant differences were found between the three groups of animals concerning body weight, although CR an-

imals, but not CR-Leptin animals, presented a higher feed efficiency from 4-6 months than controls, and a higher adiposity index at 6 months. At this age, CR animals, but not CR-Leptin animals, also displayed higher leptin levels than controls. Up-regulated Agouti-related transcript (Agrp) and down-regulated proopiomelanocortin (Pomc) were identified by microarray gene expression analysis of PBMCs between CR versus control animals and related to feeding control. RT-qPCR confirmed the results. These alterations were partially reverted in CR-Leptin animals.

Conclusions: Expression levels of Agrp and Pomc are revealed as potential blood-cell transcript-based biomarkers of predisposition to excess fat accumulation in adulthood due to alterations in energy homeostasis control. Notably, these transcript levels are sensitive to oral leptin supplementation during lactation, in accordance to its ability to revert most of the detrimental effects on energy homeostasis control caused by inadequate fetal nutrition.

Keywords: PBMCs, maternal undernutrition, metabolic programming, feeding control.

CIBERobn, Fisiopatología de la Obesidad y la Nutrición. Carlos III Health Institute. Madrid. Spain.

Background and objectives: Our group has previously shown that a Mediterranean-based nutritional intervention is able to induce changes in the expression of Let-7b and miR-155-3p in white blood cells of individuals with metabolic syndrome. In addition, a low consumption of lipids and saturated fat has been associated with higher expression of Let-7b. However, to our knowledge there are no evidences about the role of anti- and pro- inflammatory fatty acids (FAs) on the expression of these microRNAs. In this sense, the main objective of the current study was to investigate the regulatory roles of miR-155-3p and Let-7b on the expression of inflammation-related genes in monocytes, macrophages and LPS-activated macrophages (AcM). Moreover, we explored the regulatory role of pro- and anti- inflammatory fatty acids on the expression of these miRNAs in the three cell types.

Methods: Human acute monocytic leukemia cells (THP-1) were differentiated into macrophages and activated with LPS for 24 hours. Monocytes, macrophages and AcM were transfected with miR-Let-7b-5p and miR-155-3p mimics or a negative control. The expression of the miRNAs and selected genes involved in inflammatory pathways (TNF, IL6, SERPINE1 and TLR4) was measured by qRT-PCR. The three cell types were also incubated with palmitic, oleic, docosahexaenoic (DHA) and eicosapentaenoic (EPA) acids.

Results: miR-155-3p mimic increased the expression of IL6 in the three cell types. In the same way, SERPINE1 was upregulated in monocytes and macrophages. However, TLR4 was downregulated in miR-155-3p-transfected monocytes and macrophages. Let-7b mimic downregulated TNF/IL6 in monocytes and SERPINE1 in AcM. However, TNF, IL6 and SERPINE1 were upregulated in macrophages. Oleic acid was able to increase the expression of miR-155 in monocytes when compared with DHA but not when compared with non-treated cells. On the other side, oleic acid increased the expression of Let-7b in macrophages and AcM.

Conclusions: Overall, these findings suggests a pro-inflammatory role for miR-155-3p and an anti-inflammatory role for Let-7b in THP-1 cells. However, these effects depended on the cell type. Moreover, some of the beneficial properties of oleic acid in non-activated and LPS-activated macrophages might be mediated by increasing Let-7b expression.

Keywords: TNF, SERPINE1, monocyte, macrophage, oleic acid

ASSOCIATION BETWEEN FOOD INSECURITY AND NUTRITIONAL STATUS OF ADULT WOMAN

[1]Kodavalla, Venkayya; [2]I I, Meshram; [3]T, Longvah; [4]Kuhnlein, Harriet; [5]Roy, Phrang.

[1]MSc. Bio-statistics. National Institute of Nutrition. Indian Council of Medical Research. Telangana. India; [2]M.D Social and Preventive Medicine. NIN.Telangana. India; [3]MSc. Food Chemistry. NIN. Telangana. India; [4]PhD.Nutritionist.India; [5]PhD. Nutritionist.India.

Background and objectives: The Food and Agriculture Organisation (FAO) Voices of the Hungry (VOH) developed an

experience-based measure called the Food Insecurity Experience Scale (FIES). The FIES consists of a set of eight questions that focus on reported food-related behaviours associated with difficulties in accessing food due to resource constraints. The paper examines the association between food insecurity and nutritional status of Chakhesang people, an indigenous tribe of Nagaland, Northeast India.

Methods: Data on Food insecurity was assessed using pretested questionnaire from a representative sample of adult women to provide the information in order to (a) test the coherence of the selected questions and explore the degree of food insecurity, (b) classify the respondents into different classes of food insecurity (secure, moderately insecure, and severely insecure) and (c) estimate the prevalence of people experiencing food insecurity at various levels. R-program was developed to build the Rasch model for the analysis of FIES data.

Results: Different scoring methods (Raw and Weighted) were used to obtain the prevalence rates of food insecurity. A significant association between the prevalence by raw scores and Rasch model (<0.001) was observed indicating the synergy between the two methods in estimating the food insecurity prevalence rates. Rasch model suggests a higher prevalence of mild and moderate food insecurity (72%) whereas it was 59% with the raw scores. Approximately, 72% of the households experienced food insecurity at different levels and only 28% of the households are food secured. The prevalence of Food Insecurity is significantly (p<0.01) associated with Literacy rate, per capita income and family size. Food insecurity was higher among illiterate subjects (74%) as compared to literates (47%), low income groups (74%) as compared to high income groups (33%) and with family size of >=9 members (74%) as compared to family size of 1-4 members (54%). However, no significant association was observed between Chronic Energy Deficiency (CED) food insecurity levels.

Conclusions: Food Insecurity is heavily depending up on socio-demographic profile of the households.

Keywords: Food insecurity, Association, Rasch model, nutritional status, tribal population

Nutrition and Dietetic Research Group. Division of Endocrinology and Metabolism. Imperial College London. W12 0NN, U.K.

Background and objectives: A cornerstone of governments' policies to reduce the risk of non communicable diseases is to encourage population change towards healthier diet and lifestyle. However, monitoring dietary changes in response to policy recommendations is based on self-reported dietary assessment tools, which are known to have high misreporting rates. We have developed a novel analytical pipeline capable to independently of recorded food intake, classify people into consumers of a healthy or unhealthy diet based on urinary metabolic patterns (Garcia-Perez et al., Lancet Diabetes Endocrinology, 2017).

Here we aim to apply this methodology based on metabolic profiling to improve the accuracy of monitoring dietary intake and adherence to diet guidelines for free living people and evaluate its utility for establishing inter-individual variation in response to diet.

Methods: We used a randomised controlled trial in 19 volunteers to develop metabolite models of eating patterns. Volunteers were admitted to a clinical research unit for four day periods. Participants were provided with all food and drink representing 25, 50, 75 and 100% of healthy eating recommendations to increase fruits, vegetables, carbohydrates, dietary fibre and to decrease total fats, sugars, and salt. A cohort of 20 volunteers collected spot urine samples once a week for six months and a matching 24-hours food diaries for each day of the sample collection. Metabolic profiles were measured by 1H-NMR spectroscopy. MetaboNetworks has been used to investigate the metabolic coverage based on inter-individual variation.

Results: Analysis of 1H-NMR spectroscopy data indicated significant differences in the urinary metabolic profiles of the four diets. These were used to predict the healthiness of the dietary habits of free-living people and tracking adherence to healthy eating recommendations over time. Missreporting of dietary data has been investigated using dietary biomarkers against the food records.

In addition, significant differences in metabolite concentrations were investigated to assess individual's variability in response to diet.

Conclusions: This study demonstrates the utility of applying our methodology to monitor adherence to healthful diets and assess individuals' variability in response to dietary changes.

Keywords: metabolic profiling, dietary patterns, dietary assessment, dietary adherence.

Background and objectives: Obesity is a complex phenotype that arises as a result of interaction between lifestyle and genetic factors. Epigenetics has been proposed as a molecular mechanism that accommodates genes to the environment and potentially could describe further the link between obesity and its complications. We conducted an epigenome-wide association study (EWAS) on obesity-related traits.

Methods: We used data from two prospective, population-based cohort studies: the Rotterdam Study (RS) and the Atherosclerosis Risk in Communities (ARIC) Study. We used RS (n=1,454) as the discovery panel and ARIC (n=2,097) as replication panel. Linear mixed-effect models were used to assess the association between genome-wide DNA methylation in leukocytes with body mass index (BMI) and waist circumference (WC) adjusting for sex, age, smoking, leukocyte proportions, array number, and position on array.

Results: Fourteen CpG sites were associated with BMI and 26 CpG sites with WC in RS after Bonferroni correction (P <1.07 × 10-7), of which 12 and 14 CpG sites successfully replicated in ARIC Study, respectively. The most significant novel CpG sites were located at MSI2 (cg21139312) and LARS2 (cg18030453) and were associated both with BMI and WC. CpG sites at BRDT, PSMD1, IFI44L, MAP1A, and MAP3K5 were associated with BMI and CpG sites at LGALS3BP, MAP2K3, DHCR24, CPSF4L, and TMEM49 were associated with WC.

Conclusions: We report novel associations of methylation at MSI2 and LARS2 with obesity-related traits. These results provide further insight in mechanisms underlying obesity-related traits, which can enable identification of new biomarkers in obesity-related chronic diseases.

Keywords: DNA methylation, EWAS, BMI, waist circumference, cohort

ASSOCIATION OF THE FTO FAT MASS AND OBESITY – ASSOCIATED GENE RS9939609 POLYMORPHISM WITH REWARDING VALUE OF FOOD AND EATING BEHAVIOR IN CHILEAN CHILDREN

[1]Obregon Rivas, Ana Maria; [2]Santos, José Luis; [3]Valladares, Macarena; [4]Goldfield, Gary.

[1]PhD. Nutritionist. San Sebastian University, Concepción. Chile; [2]PhD. Departamento de Nutrición, Diabetes y Metabolismo, Escuela de Medicina, Pontificia Universidad Católica de Chile, Santiago, Chile.; [3]PhD. Centro Integrativo de Biología y Química Aplicada (CIBQA), Universidad Bernardo O Higgins, General Gana 1702, Santiago 8370854, Chile.; [4]PhD. Children's Hospital of Eastern Ontario Research Institute, Ottawa, Canada.

Background and objectives: FTO is the strongest known genetic susceptibility locus for obesity. Experimental studies in animals suggest a potential role of FTO in regulating food intake and eating behavior. Objective: The aim of this study is to assess the association between the genetic variant rs9939609 in the FTO gene and homeostatic and non-homeostatic eating behavior patterns in Chilean children.

Methods: Cross-sectional study in 258 Chilean children (44% female; 8-14 years-old) showing a wide variation in BMI. Anthropometric measurements (weight, height, Z-score of BMI and waist circumference) were performed by standard procedures. Eating behavior was assessed using the Eating in Absence of Hunger Questionnaire (EAHQ); Child Eating Behavior Questionnaire (CEBQ); Three Factor Eating Questionnaire (TFEQ) and the Food Reinforcement Value Questionnaire (FRVQ). Genotype of the

rs9939609 in FTO was determined by a Taqman assay. Statistical Analysis: Association of the rs9939609-A allele with eating behavior was assessed using non-parametric tests.

Results: Allelic frequencies of the rs9939609 was estimated as 77% for the A allele and 23% for the T allele in Chilean children. We found that normal weight girls carrying the A-allele have higher scores of Satiety Responsiveness and higher scores of the Slowness in Eating subscale. In normal-weight boys, carriers of the A-allele showed significantly higher scores of the Negative Affect sub-scale and lower scores of the Desire to Drink sub-scale, in relation to the non-carriers. In the overweight group we found that carriers of the A-allele showed higher scores of the Food Responsiveness, Emotional Overeating, Enjoyment of Food and Food Choice sub-scales and lower scores of the Satiety Responsiveness and Slowness in Eating sub-scales. In the obese group we found higher scores of the Cognitive Restrained subscale and significantly lower Food Choice.

Conclusions: The rs9939609-A allele is associated with eating behavior traits that may predispose obese children to increased energy intake and obesity.

Background and objectives: The postnatal overnutrition (PON) influences the generation of metabolic disorders such as obesity and dyslipidemia. Recent reports in animal models with hypercaloric diet show changes in the concentration of peptides that regulate the activation or inhibition of neurons that induced behaviors of appetite and satiety, resulting in hyperfagia after treatment.

The objective of this work was analyze the short-term effect of the PON in the hypothalamus and adipose tissue transcriptome. Particularly analyzing metabolic pathways related to the regulation of the processes of hunger, satiety and inflammation.

Methods: Overnutrition model in Wistar rats by overlactation from day 3 to day 21 of life by litter size reduction method using pup male was generated: control group (n=5) and overnutrition group (n=5). Transcritome was analyzed with microarrays of expression technology (Ratgene ST 2.2, Affymetrix®), with a coverage of 28,407 transcripts. The pathway analysis was performed with the Ingenuity Pathway Analysis software (IPA). Bioinformatic analysis was performed on the R statistical software, statistical analysis for phenotypic and biochemical parameters were analyzed in Graphpad Prism 6® software, it was applied Student´s t test with $p < 0.05$.

Results: Treatment group shows overweight, and high concentration of triglycerides, glucose and leptin serum. Transcriptome analysis in hypothalamus showed 226 deregulated transcripts of which 98 are under-expressed transcripts and 128 overexpressed with a cutoff of fold change (Log fold change) of 1.5 were found. Furthermore the adipose tissue transcriptome showed 161 deregulated transcripts of which 61 are overexpressed and 100 are underexpressed. Analysis of the pathways expressed in hypothalamus showed a deregulation of the pathways of lactation, inflammation, circadian rhythms and leptin resitance. The desregulated vias in adipose tissue was associated to inflammation, disorder of lipid metabolism and hyperleptinemia.

Conclusions: Early postnatal overnutrition generates insulin resistance and dyslipidemia. We show for the first time the effects of early postnatal overnutrition in the hypothalamus and adipose tissue transcriptomes to 21 days. Some of differentially expressed transcripts controls neuronal circuits involving the hypothalamus control circadian rhythms and endocrine regulation (leptin vias), this is an evidence of metabolic disruption in hypothalamus and adipose tissue.

Keywords: Hypothalamus, adipose-tissue, metabolic-programming, whole-transcriptome.

DO MEASURES OF SWEET TASTE INTENSITY AND HEDONIC LIKING OF GLUCOSE PLAY A ROLE IN DIETARY INTAKE OF SWEET FOOD?

[1]*Richter, Marilize;* [2]*Cao, Guojiao;* [3]*Jayasinghe, Shakeela;* [4]*Kruger, Rozanne;* [5]*Bernhard, Breier;* [6]*Walsh, Daniel.*

[1]PhD, Dietitian, Lecturer, College of Health, Massey University; [2]M.Sc Student, Massey University; [3]PhD Student, Massey University; [4]Associate Professor, Nutrition and Dietetics, Massey University; [5]Professor, Nutrition and Dietetics, Massey University; [6]Institute for Natural and Mathematical Sciences, Massey University.

Background and objectives: A range of psychophysical taste measurements are used to characterise an individual's sweet taste

perception. The links between sweet taste perception and dietary intake of sweet foods should to be explored, since it could be a link to address health outcomes. This study aims to investigate the relationship between both perceived sweet intensity and hedonic liking of sweet taste, and the relationship with dietary intake.

Methods: This cross sectional study recruited women (n=44) aged 20-40 years. Measures of sweet taste perception (sweet taste intensity and hedonic liking of suprathreshold concentrations) were assessed using glucose as the tastant. Dietary intake was assessed for energy, macronutrients and sugars (total sugar, glucose, sucrose, fructose, lactose and maltose) using a four-day weighed food record.

Results: There were significant inter-individual variations in sweet taste measurements. Mean perceived sweet taste intensity correlated inversely with mean recorded energy (r=-0.403, p=0.009), carbohydrate(r=-0.449, p=0.003), total sugar (r=-0.421, p=0.006), glucose (r=-0.411, p=0.008), fructose (r=-0.408, p=0.008) and maltose intake (r=-0.325, p=0.038). Mean hedonic liking correlated positively with mean recorded energy (r=0.324, p=0.039), carbohydrate (r=0.360, p=0.031), total sugar (r=0.437, p=0.004), glucose (r=0.418, p=0.007), fructose (r=0.391, p=0.012) and maltose intake (r=0.463, p=0.002).

Conclusions: To the best of our knowledge this is the first study reporting robust significant relationships between a combination of both sweet taste intensity measures and hedonic liking measures of suprathreshold concentrations with dietary intake measures. Although causality cannot be inferred due to the cross-sectional design, the increase in strength of correlations and strength of significance suggest a dose-dependent relationship between sweet taste intensity, as well as the hedonic liking and dietary intake of energy, carbohydrates and particularly glucose.

Keywords: sweet taste intensity; hedonic liking; dietary intake; glucose

Background and objectives: Real time data collection and management is crucial for public health research. A centralized data capturing mechanism using tablet and web based application was implemented in a large community based trial in rural Bangladesh where information was collected from 35,372 pregnant women. The goal of designing such a data capturing and storing system was to introduce an advanced tab-based technology for real time, error free and cost effective, and data collection and reporting mechanism.

Methods: A paper-less data management software was centrally developed for data collection, and transmission, to central server for monitoring and field management. All data collection variables were incorporated into the smartphone [with Symbian operating system (OS)] and tablets (with Android OS) with internet enabled SIM card. Separate software were developed for the smartphone and tablets. All types of display and validation conditions were built into the software to prevent errors and ensure logical flow, range check, uniqueness check and skip-rules. Data were stored locally in the tablet during interview. Data coollectors upload data daily to a central server to create a pooled central database. For real time monitoring and supervision, a separate web-browser based interface was developed. Password protected login identifications and audits were incorporated to ensure data safety.

Results: Such a digital data capturing system ensured high quality, reliable data. This allowed evasion of conventional way of manual data entry, data filing and stocking. A built-in GPS tracking system helped data collector and investigators to locate the respondent's households, reducing the barrier of distance. Any mismatch in data could be easily detected and traced using unique identifiers, and accordingly respondent specific corrections were made. A back-

up copy of the entre database were stored in a separate server in a different physical location to ensure data protection.

Conclusions: We have developed an application for Symbian, Android operating system and web platform to assist research activities. Quality, complete and timely data collection from a large community based trial is unprecedented in rural Bangladesh. This innovation ensured quality data capturing by reasonably educated workforce at point of contact in an integrated manner.

HIGH-FAT DIET DISRUPTS PERIPHERAL CIRCADIAN CLOCKS IN WHITE AND BROWN ADIPOSE TISSUES

[1]Li, Dongyang; [2]Yamazaki, Tomomi.

[1]MD. Graduate School of Humanities and Sciences and Program for Leading Graduate Schools. Ochanomizu University. Japan.; [2]PhD. Department of Nutritional Science. National Institute of Health and Nutrition, National Institutes of Biomedical Innovation, Health and Nutrition. Japan.

Background and objectives: Due to the periodic changes of 12h-light and 12h-dark in the environment, circadian clock rhythmic exists in almost all living creatures. The circadian oscillation system is generated by a transcriptional feedback loop that consists of clock genes. It has been reported that clock genes regulate metabolic and physiological process in peripheral tissues. However, the relationship between dysfunction of circadian mechanism and obesity has not been revealed clearly. The aim of this study is to examine the change of circadian oscillation of clock genes in white adipose tissue (WAT) and brown adipose tissue (BAT) in high-fat diet-induced obese mice.

Methods: Six-week-old male ddY mice, after one week feeding of a normal laboratory diet, were divided into a low-fat diet (LFD, 10 energy%), or a high-fat diet (HFD, 60 energy%) for 8 weeks under strict 12h-light and 12h-dark cycle. Mice were sacrificed every 4h over continuous 24h, and WAT and BAT were isolated. The circadian expression of clock genes was examined by quantitative real-time PCR.

Results: Without difference in the quantity of energy intake between feeding groups, after 8 weeks on a HFD, mice displayed obese metabolic features. In LFD group, a similar oscillatory pattern of the clock genes was revealed in WAT and BAT. Additionally, HFD feeding affected the circadian expression of clock genes by altering phase, amplitude or oscillatory pattern, but the effects varied from WAT to BAT. In WAT, the oscillations of Bmal1, Clock, Per(1-3), Cry(1-2), Rev-erb(α,β) and Rorα were affected by HFD feeding significantly. However, in BAT, the oscillations of Npas2, Bmal1, Cry(1-2), Ror(α,β,γ) were changed significantly by HFD feeding.

Conclusions: Clock genes displayed robust cyclic expression both in WAT and BAT. The oscillatory pattern of the clock genes were disrupted in HFD induced obese mice, but the effects of HFD on peripheral circadian clocks are different between WAT

and BAT. This indicates an intrinsic correlation between circadian oscillation and metabolic function in adipose tissues, and the difference in circadian regulation between WAT and BAT. Further study is needed to reveal the mechanisms.

Keywords: circadian oscillation, obesity, disruption, brown adipose tissue, white adipose tissue

COMPARISON BETWEEN EQUATIONS TO ESTIMATE ENERGY REQUIREMENT FOR WOMEN FROM ANTIOQUIA WITH EXCESS WEIGHT (COLOMBIA)

[1]Deossa Restrepo, Gloria Cecilia; [2]Gómez Maquet, Sandro; [3]Velasquez, John Edinson; [4]Restrepo, Luis Fernando; [3]Rodriguez, Daniela.

[1]Nutritionist dietitian. Specialist and master in food science and human nutrition. Professor, school of nutrition and dietetics, University of Antioquia, Medellin Colombia.; [2]Medical nutritionist. Medellin, Colombia; [3]Nutritionist dietitian school of nutrition and dietetics, University of Antioquia, Medellin Colombia; [4]Statistician, Specialist in statistic and Biomathematics, associate professor. Colombia.

Background and objectives: Energy is the ability of bodies to perform work and produce changes in themselves or in other bodies. The energy balance occurs when the daily energy needs are equal to the expenditure, in this way the weight is conserved. Objective: To compare the energy expenditure by indirect calorimetry vs diverse equations to estimate the energy expenditure at rest, in women with overweight

Methods: Materials and methods: population and sample: 1500 female patients, aged between 18 and 73 years, with overweight, who attended for 9 years (2006-2015) to private medical consultation and performed indirect calorimetry, of the total of calorimetry, was made a selection of a sample corresponding to 1178 calorimetry for this study. Statistical analysis: we performed a comparative descriptive analysis of multidimensional type of cross-section. To the statistical analysis we used multivariate analysis of variance (MANOVA) with canonical orthogonal type contrast, the analysis was complemented by the Spearman correlation technique, additionally was one-dimensional type descriptive statistics. We used SAS University 2015 statistical packet

Results: The present investigation it showed that as the age increases, it diminishes the stature, increases the average weight and increases the body mass index (BMI). When performing the analysis of variance (MANOVA), we did not detect significant differences in energy expenditure, determined by indirect calorimetry (IC) in the analyzed groups ($p > 0.05$); we detected a significant difference ($p < 0.05$) in energy expenditure according to the Harris and Benedict equation (HB).

Conclusions: An overestimation or underestimation of energy requirements in individuals can lead to a deficit or excess in caloric intake, which will be reflected in their nutritional status.

Keywords: Energy requirement, indirect calorimetry, energy expenditure

The Netherlands; [5]Prof. Center for Medical Biomics. University Medical Center Groningen. The Netherlands; [6]MSc. Research Group Functional ingredients. TNO, Netherlands Organization for Applied Scientific Research. The Netherlands.; [7]Asst. Prof. Division of Human Nutrition. Wageningen University. The Netherlands.

Background and objectives: Whole grain wheat (WGW) consumption has been associated with beneficial health effects in observational studies. However, intervention studies show mixed effects upon traditional measurements under overnight fasting conditions. The aim of the study was to show that quantification of resilience can be used to substantiate health effects of WGW in a healthy population. For this purpose we used a standardized mixed meal challenge test called PhenFlex test (PFT).

Methods: A randomized controlled double blind trial was performed with 50 male and female participants with mildly elevated plasma total cholesterol levels. After 4 weeks run-in with refined wheat (RW) participants were assigned to either 12 weeks WGW (98 g per day) or RW. Before and after 12 weeks intervention PFT was performed. Blood samples were taken at overnight fasting (t=0) and 30, 60, 120, and 240min postprandial. During the 4 hour response time course, 31 biomarkers were quantified focusing on cardio-metabolic health.

Results: At fasting only 2 out of 31 biomarkers were significantly different between RW and WGW, in contrast to the PFT response with 12 out of 31 biomarkers. Among these were ALAT and ASAT, TG and HDL, CRP, IL8, SAA, IL10, IL6, IL1b and TNFα. PFT response showed little or no significant differences in NEFA, TG, cholesterol, glucose and insulin responses between the two interventions, but when combining these into a health space model a clear WGW metabolic health effect in the direction of subjects from younger age was observed.

Conclusions: Here we show for the first time in a RCT that WGW improved metabolic health, liver health and inflammatory status as measured by a set of biomarkers to a nutritional challenge test. This confirms the associated beneficial health effects from epidemiology, while traditional overnight fasting blood measurements showed little or no health effect of WGW.

Keywords: whole grain wheat, phenotypic flexibility, biomarkers, challenge test, metabolic health

IN OBESE WOMEN, INCREASED BLOOD VOLUME AND REDUCED SERUM IRON PARTIALLY EXPLAIN THE HIGHER RISK FOR IRON DEFICIENCY

[1]Cepeda Lopez, Ana Carla; [2]Melse-Boonstra, Alida; [3]Mettler-Naef, Nicole; [4]Mueller, Sandro Manuel; [5]Toigo, Marco; [6]Zimmermann, Michael Bruce; [7]Herter-Aeberli, Isabelle.

[1]PhD. MSc. MD. Ciencias de la Salud. Universidad de Monterrey. México.; [2]Nutritionist. Division of Human Nutrition. Wageningen University. The Netherlands.; [3]Balgrist Move>Med. Universitätsklinik Balgrist; [4]PhD. Exercise physiologist. Department of Neurology. University Hospital and University Zurich. Switzerland.; [5]PhD. Muscle Physiologist. Laboratory for Muscle Plasticity. University Hospital Balgrist. University of Zurich.; [6]PhD. MD. Laboratory of Human Nutrition, ETH Zürich, Switzerland; [7]PhD. MSc. Nutritionist. Laboratory of Human Nutrition, ETH Zürich, Switzerland.

Background and objectives: Obesity has been shown to be a risk factor for low serum iron status in different settings. The hypoferremia of obesity might be explained by a combination of biological factors such as inflammation, hemodilution and increased iron requirements. Excess body mass has been suggested to lead to increased blood volume, which may explain lower serum iron concentrations observed in obese individuals.

This observational study compares blood volume in normal-weight versus overweight and obese, healthy, non-anemic women (n=62) (BMI 18.5-39.9 kg/m2). We examined if differences in blood volume might explain the reduced serum iron in overweight/obese women. Additionally we developed an equation to calculate blood volume in overweight/obese women.

Methods: We assessed body composition by dual energy X-ray absorptiometry (DXA), iron status, inflammation, and blood volume using the carbon monoxide (CO)-rebreathing method.

Results: Overweight/obese women presented higher absolute blood volume, plasma volume and red blood cells, and lower serum iron compared to in normal-weight (P<0.05). There were no significant differences in body iron stores comparing in normal-weight, overweight and obese women. Body mass (r=0.74), lean mass (r=0.82) and fat mass (r=0.56) were correlated with blood volume (p<0.05). Blood volume (r2=0.22, β=-0.29, P=0.02) was a negative predictor for serum iron when adjusted for body iron stores. Equations utilizing combined height-body mass and lean mass were the most accurate for predicting blood volume in all BMI groups.

Conclusions: Due to the dilutional effect of blood volume, 'true' hypoferremia may be overestimated in populations with a

high prevalence of obesity when using serum iron as an indicator. Nevertheless, our results indicate that the iron requirements of obese women are actually increased.

Keywords: hypoferremia; overweight; plasma volume; iron status

Track 2: Nutrition Through Life Course

Spain.; [3]Departamento Nutrición y Bromatología. Universidad de Granada. Spain.; [4]Universidad de Santo Tomás de Talca (Chile).; [5]Departamento de Enfermería. Universidad de Granada. Spain.

Background and objectives: Human milk is a fluid of extreme chemical complexity that provides the required nutrients for the suitable development of the newborn and a series of compounds with biological activity essential for adaptation to extrauterine life. Last years, the presence of polyunsaturated long chain fatty acids in breast milk and infant feeding has become very important. They are obtained by the mother's diet during pregnancy and lactation. The purpose of the study is to determine the nutritional status of pregnant women and their influence on the markers of fatty compound synthesis in breast milk.

Methods: A prospective cohort study will be conducted in women during pregnancy and lactation. The sample is 112 healthy women and 112 women with risk pregnancies (diabetic, obese and hypertensive).

The anthropometric evaluation will be performed obtaining the following parameters: weight, size, folds, perimeters, diameters.

The nutritional assessment will be done using 3 types of validated questionnaires: food register, 24-hour reminder questionnaire and food consumption frequency questionnaire. The lactogenesis is evaluated through the collection of 3 samples: colostrum, transition milk and mature milk. Each of the above samples will be determined as follows: short chain fatty acids, total fatty acid quantification. The following complementary parameters will also be determined: triglycerides, cholesterol, and glucose. As well as, bioactive peptides: study of in vitro digestibility of milk protein and identification of functional peptides, identification of peptides, study of antioxidant activity, antibacterial and probiotic, bioavailability of minerals.

Results: The fat composition of the milk will be different depending on the nutrition of the woman during gestation, her anthropometric measurements and the presence or absence of risk pathologies during the course of gestation.

Keywords: Bioactive peptides, breastfeeding, pregnancy, nutrition

EXPLORING THE POTENTIAL ROLE OF BREAST-FEEDING IN THE RECOVERY OF ACUTE MALNUTRITION AMONG INFANTS AGED BELOW 6 MONTHS

[1]Mwangome, Martha; [2]Berkley, James; [3]Jones, Caroline; [4]Moloney, Grainne.

[1]PhD. Nutritional Epidemiologist. Clinical Department. Kenya Medical Research Institute. Kilifi. Kenya; [2]FRCPCH. Clinician Paediatrician. Kenya Medical Research Institute. Kenya; [3]PhD. Social scientist. Kenya Medical Research Institute. Kenya; [4]MSc. Public Health Nutritionist. UNICEF Kenya. Nairobi. Kenya.

Background and objectives: Globally, 4.7 million infants under 6 months (U6M) suffer from severe acute malnutrition (SAM). Recent data suggests that survival of these infants during and after admission is very poor. In a clinical trial, mortality among SAM infants u6m followed up for 1 year after discharge from treatment was 31 per 100 child years and weight gain was poor. Re-establishing exclusive breastfeeding is the main thrust of the WHO updated treatment guidelines, however no studies have tested if successful re-establishing exclusive breastfeeding during inpatient treatment would result in maintained exclusive breastfeeding after discharge and result in nutritional recovery (catch-up growth) and survival.

Methods: We are conducting a prospective cohort study involving 90 infants aged 4 weeks to 4 months admitted with acute malnutrition (WFLZ<-2 or WFAZ<-2) at the Kilifi County Hospital (KCH), Kenya. Study participants are nutritionally managed as per the WHO treatment guidelines emphasizing on re-establishing exclusive breastfeeding and followed up at 2nd, 4th and 6th weeks after discharge to assess growth (anthropometry), breastfeeding status, morbidity and mortality. Views on challenges and drivers of breastfeeding retention are also be collected using interviews.

Results: We anticipate the following outcomes from the study; i) the proportion of malnourished infants under 6 months effectively re-establishing exclusive breastfeeding (attaining weight velocity of >5g/kg/day on breast milk only for 3 consecutive days before discharge); ii) proportion of infants retaining exclusively breastfeeding 4 weeks after discharge; iii) post-discharge weight gain in relation to breastfeeding status; iv) challenges and motivators to retaining exclusive breastfeeding among recovering infants.

Conclusions: The results of this study which will be presented in the conference will demonstrate if exclusive breastfeeding can be attained and retained after discharge; and if breast milk alone is sufficient for recovery of acutely malnourished infants.

Keywords: Severe Acute Malnutrition; infants under 6 months; Breastfeeding; weight gain; Kenya

AN ANALYSIS OF THE RELATIONSHIP BETWEEN 25-HYDROXY VITAMIN D LEVELS AND MUSCULOSKELETAL HEALTH: A POPULATION-BASED STUDY OF CHINA'S ELDERLY

[1]Zhao, Wenzhi; [2]Zhao, Ai; [3]Szeto, Ignatius Man Yau; [4]Zheng, Wei; [5]Zhang, Yumei.

[1]PhD candidate. Department of Nutrition and Food Hygiene, School of Public Health. Peking University. China.; [2]PhD. Department of Social Medicine and Health Education, School of Public Health. Peking University. China; [3]PhD. Yili Innovation Center. Inner Mongolia Yili Industrial Group Co., Ltd. China.; [4]PhD. Department of Social Medicine and Health Education. School of Public Health. Peking University. China; [5]Professor. Department of Nutrition and Food Hygiene. School of Public Health. Peking University. China.

Background and objectives: ackground and Objectives Vitamin D deficiency is a public health problem worldwide, in spite that vitamin D plays an important role in musculoskeletal health, immunity system, chronic non-communicable diseases and other diseases. Vitamin D is essential in the regulation of calcium and phosphate homeostasis, which affect bone development and preservation. More and more evidence has shown that vitamin D plays an important role in skeletal muscle, affecting falls or sarcopenia in the elderly. This study was to analyze the reasons behind the prevalence of vitamin D deficiency in Chinese community-dwelling elder people, and furthermore explore the relationship between vitamin D levels and indicators of bone health and muscle health.

Methods: Subjects were part of a cross-section survey, in which questionnaires contained social demographic information, lifestyle information, diseases history, dietary survey and other questions. Physical examinations included somatometry, bone density, body composition and blood test.

Results: The prevalence of vitamin D deficiency and vitamin D insufficiency among the respondents was 74.1% and 20.9%, and there was significant difference among respondents from different regions. The percentage of respondents diagnosed with osteopenia or osteoporosis was about 69.5% and there was significant difference between genders in terms of prevalence of osteoporosis. The prevalence of sarcopenia was 5.7%, and there was no significant difference between genders and residential places. In the final regression models, vitamin D conditions failed to show significant difference on the probability of leading to osteopenia and sarcopenia, though vitamin D conditions were retained in the final model of sarcopenia, while age and residential place were on the contrary.

Conclusions: Vitamin D deficiency is severe in our respondents, and so as the prevalence of osteopenia. Age and gender do affect the prevalence of osteopenia, and for that of sarcopenia the factors are age and region . We should pay more attention on vitamin D deficiency and musculoskeletal health in the elderly.

Postal code: 01246-904. Sao Paulo, Brazil.; (4)PostDoc Position. Department of Nutrition. School of Public Health. University of Sao Paulo. Av. Dr. Arnaldo, 715. Postal code: 01246-904. Sao Paulo, Brazil.; (5)Department of Physical Education. Federal University of Paraíba. University City. Postal code: 58059-900. João Pessoa, Brazil; (6)Department of Nutrition. School of Public Health. University of Sao Paulo. Av. Dr. Arnaldo, 715. Postal code: 01246-904. Sao Paulo, Brazil.

Background and objectives: Introduction. Adolescence is marked by changes in body composition due to growth and development, which may be influenced by many factors as food and beverage intake. Several studies show that high consumption of sugary drinks is associated with risk factors for noncommunicable diseases, for example, abdominal obesity. However, especially among teenagers, it is observed an increasing trend in the consumption of these drinks.

Objective. To assess the relationship between consumption of sugary drinks and abdominal obesity among adolescents from public schools of João Pessoa/Brazil.

Methods: Design. This is an analysis of the baseline study Loncaafs cohort - "Longitudinal Study Sedentary Behavior, Physical Activity, Food and Health of Adolescents", conducted with 1009 adolescents between 10-14 years. Abdominal obesity was evaluated by the waist circumference measures; and the sugary drinks consumption by 24-hour recall. Sugary drinks consumption above 10% of daily total energy intake was considered excessive.

Results: The daily average energy intake of the adolescents was 2357.5kcal, of which 11.0% (254.5kcal), on average, were arising from sugary drinks. The prevalence of excessive consumption of sugary drinks among adolescents was 46.6% (n=470), while the prevalence of abdominal obesity was 40.2% (n=404). Although the relationship between this two variables was not statistically significant (p=0.40), the high prevalence of abdominal obesity and sugary drinks intake are worrying.

Conclusions: Monitoring and health promotion actions targeting adolescents are necessary to change not only the quality of food and beverage intake, but also the anthropometric measurements of this population, improving the quality of life of a whole generation.

Keywords: Sugary drinks; Abdominal obesity; Teenage School

ASSESSMENT OF ANEMIA CONTROL AND PREVENTION SERVICE PROVISION DURING ANTENATAL CARE IN NORTHERN GHANA

(1)Guyon, Agnes; (2)Kappos, Kristen; (3)Osman, Mohammed Shaibu.

(1)John Snow Inc. (JSI). Ghana.; (2)MPH. John Snow Inc (JSI).Ghana.; (3)PHD. John Snow Inc (JSI). Ghana.

Background and objectives: Anemia is a severe public health problem in Ghana, particularly among women of reproductive age (42 percent), and children under five (66 percent), the most common causes being diets deficient in absorbable iron, malaria, and intestinal parasites. Anemia shows regional disparities as in the Northern Region (48 and 82 percent, respectively). The USAID-funded Resiliency in Northern Ghana (RING) Project seeks to reduce anemia and has trained health workers on anemia prevention and control, including on the use of HemoCue Hb 301 devices to measure hemoglobin during antenatal care (ANC) visits.

The objectives of the assessment were to:

1. Assess gaps in anemia prevention and control during ANC visits, including provision of nutrition counseling, anemia testing, iron folic acid (IFA) supplementation, treatment, and referral;

2. Identify the origin of the gaps in the supply chain of medicines provided.

Methods: We used the Expanded Programme on Immunization cluster survey methodology with the primary sampling unit being the districts, the secondary sampling being the level of health facility, and the tertiary the health facilities. The sample was based on two groups: the Interventions Districts (IDs) (where HemoCue devices have been supplied for anemia testing) and the non-IDs (where devices have not been provided). Thirty health facilities were randomly selected across each group in which seven interactions between health workers and pregnant women were observed, and information was collected with Android-based tablets. In addition, in each health facility, interviews and review of documents were conducted in order to assess the supply of IFA and others anemia related medicines at the facility, district, and regional stores.

Results: We will present the results in the two targeted groups, in particular the main bottlenecks in regarding to service delivered during ANC visits. In addition we will provide a comprehensive diagnostic of the supply chains of the essential commodities needed in the control and prevention of anemia. Results: **Conclusions:** We will discuss how bottlenecks in service delivery as well as in access to essential medicines were addressed following the survey.

Keywords: anemia - antenatal care – service delivery - supply chain

MATERNAL ALPHA-LINOLENIC ACID INTAKE IS ASSOCIATED WITH OFFSPRING BIRTHWEIGHT

Australia.; [7]BSc. PhD. Future Leader Fellow. Boden Institute. Sydney Medical School. University of Sydney. Australia.

Background and objectives: Epidemiological evidence indicates that birthweight is inversely associated with adult ischemic heart disease, with a 10–20% lower risk per 1 kg higher birthweight. Imbalanced maternal fatty acid intakes have been reported to be associated with impairments in fetal growth. Accordingly, we sought to determine the association of maternal fatty acid intake during pregnancy with offspring birthweight in healthy mother-child dyads in an Australian tertiary hospital.

Methods: Newborn infants (n=223) were recruited at birth from the Royal Prince Alfred Hospital, Australia. Maternal diet during pregnancy was assessed using a validated Food Frequency Questionnaire. Individual fatty acids were expressed as a percentage of total fatty acid intake (%TFA). Birthweight percentiles were obtained using the most recent Australian national birthweight percentiles. All analyses were adjusted for gestational age and sex and total energy intake.

Results: Neither maternal total fat nor polyunsaturated fat intake were associated with offspring birthweight. Higher maternal intake of omega-3 alpha-linolenic acid (ALA) as percentage of total fatty acid intake (%TFA) was associated with higher offspring birthweight [201g per 1% higher of total fatty acids (95% CI: 21, 380); P=.03]. Categorical analysis of dietary ALA intake by tertiles showed an increasing trend in birthweight across the lowest to highest tertiles (P ANOVA =.05) and significant differences in birthweight between the lowest and highest groups of dietary ALA intake [mean difference:-221g, (95%CI:-429,-12); P=.04]. Subgroup analyses by birthweight percentiles for gestational age and gender reported that mothers of infants born small-for-gestational age (SGA; birth weight <10th percentile for gestational age and sex; n=32) had the lowest ALA intake compared to those born normal birthweight (<25th to ≤75th percentile; n=109) or large for gestational age [(LGA; >90th percentile; n=21); P ANOVA =.05]. No statistically significant associations were observed for the longer chain omega-3 polyunsaturated fatty acids or omega-6 polyunsaturated fatty acids.

Conclusions: In otherwise healthy women giving birth at a major tertiary hospital in Australia, intake of ALA, a plant-derived omega-3 fatty acid, is associated with higher birthweight. This may have impli-cations for prevention strategies aimed at improving fetal growth via modification of maternal diet, and warrants further study.

Keywords: birthweight, maternal diet, fatty acids, alpha-linolenic acid

A HIGHER-CARBOHYDRATE, LOWER-FAT DIET DURING PREGNANCY IS ASSOCIATED WITH GREATER GESTATIONAL WEIGHT GAIN: THE GUSTO STUDY

Background and objectives: Diet during pregnancy can influence gestational weight gain (GWG), but evidence relating dietary macronutrient composition and food groups to GWG is inconclusive. Hence, we aim to examine the associations of maternal energy, macronutrient and food intakes with GWG in the Growing Up in Singapore Towards healthy Outcomes (GUSTO) mother-offspring cohort.

Methods: Dietary intake of pregnant women was assessed at 26–28 weeks' gestation mainly using the 24-hour recall, with a subgroup completing the 3-day food diaries. GWG z-scores were calculated from weights measured at first antenatal appointment and before delivery. Inadequate and excessive GWG were defined using the Institute of Medicine recommendations based on weights at 15 and 35 weeks' gestation. Associations were examined using substitution models for macronutrient composition, with linear or multinomial logistic regressions.

Results: Mean (SD) daily energy intake, and percentage energy intakes from carbohydrate, protein and fat of 960 pregnant women were 1868 (598) kcal, 51.4% (8.7), 15.7% (3.7), and 32.8% (7.6),

respectively. Higher energy intake (per 500kcal increment) was associated with a 0.18 higher GWG z-scores. In isocaloric diets, higher-carbohydrate and lower-fat intakes (at 5% energy substitution) were associated with 0.07 higher z-scores, and a 14% higher risk of excessive GWG. Concordantly, higher intake of carbohydrate-rich foods was associated with higher z-scores (P-trend=0.042), but higher fruit and vegetables intake was associated with lower risk of inadequate GWG (P-trend=0.003). Compared to the lowest tertile, the highest tertile of dairy intake was associated with 0.18 lower GWG z-scores, while the highest tertile of plant-based protein foods was independently associated with 60% and 34% lower risks of inadequate and excessive GWG respectively.

Conclusions: Energy intake is the main determinant of weight gain during pregnancy, but balancing the proportions of carbohydrates and fat may also be important. Higher intakes of plant-based protein foods, dairy and fruit and vegetables may be beneficial for achieving optimal weight gain during pregnancy.

Keywords: energy, macronutrient, food group, pregnancy, gestational weight gain

INTRODUCTION OF COMPLEMENTARY FOODS TO INFANTS AND CHILDREN BY AGE AND ETHNICITY; NATIONAL HEALTH AND NUTRITION EXAMINATION SURVEY 2011-2014

[1]Demmer, Elieke Demmer; [2]Cifelli, Christopher; [1]Houchins, Jenny; [3]Fulgoni III, Victor.

[1]PhD, RD. Nutrition Research. National Dairy Council. USA.; [2]PhD. Nutrition Research. National Dairy Council. USA.; [3]PhD. Senior Vice President. Nutrition Impact. USA.

Background and objectives: Dietary patterns that are developed during a child's first few years of life have been shown to impact dietary choices made later in life. Several authoritative sources provide recommendations regarding the introduction of complementary foods to infants and children. It is unclear if these recommendations are followed, how these early food choices impact nutrient intake, and what, if any, the differences are among ethnicities.

To examine the introduction of complementary foods, dietary patterns and nutrient adequacy during the first five years of American infants and children among varying ethnic groups.

Methods: Data from the 2011-2014 National Health and Nutrition Examination Survey were analyzed (n=2,431). Age groups were 0-5 months (n=229), 6-11 months (n=297), 12-23 months (n=394), 2-3 years (n=836) and 4-5 years (n=675). Ethnic groups were defined as Non-Hispanic White, Non-Hispanic Black, Hispanic, and Asian.

Results: At age 0-5 months, when exclusive breastmilk or iron-fortified infant formula are recommended, 41% of infants already consumed baby cereal, 19% consumed vegetables/fruit and 7% consumed snacks and sweets. By age 6-11 months, 45% consumed regular snacks and sweets and 35% consumed baby snacks and sweets. From 1–5 years none of the children met vegetable recommendations and from 4-5 years none of the ethnic groups met dairy or fruit recommendations either. Non-Hispanic Black children consumed the least amount of dairy, never meeting recommendations from 1-5 years. At 4-5 years, Asian children consumed the most yogurt and least cheese, while Hispanics consumed nearly double the amount of cheese. Total HEI score decreased from 59 to 51 from 1 to 5 years. This low diet quality score was reflected in low intakes of key nutrients. Over 80% of infants and children did not meet intake recommendations for vitamin D and over 14% did not meet calcium recommendations. Only 15% of the infants and children had an adequate intake of potassium.

Conclusions: Results showed that dietary recommendations for the introduction of complementary foods are not consistently followed for American infants and children and that ethnic disparities exist. Introduction of age-appropriate nutrient rich complementary foods can improve nutrient intake and diet quality.

FOOD INTAKE PATTERN OF SCHOOL GOING CHILDREN AGED 3-5 YEARS WITH AND WITHOUT AUTISM IN URBAN DHAKA, BANGLADESH

[1]Jahan, Dilara; [1]Atiya, Naushin; [1]Nourin, Israt; [2]Ratna, Moffashara Sultana; [3]Akter, Syeda Mahsina; [4]Roy, Swapan Kumar.

[1]BSc. Food & Nutrition. University of Dhaka. Bangladesh; [2]MSc. Food & Nutrition. Assistant Professor. Dept. of Food & Nutrition. College of Home Economics, University of Dhaka. Bangladesh; [3]MSc. (Food & Nutrition), MSc. (Nutrition & Health). Assistant Director. Bangladesh Breastfeeding Foundation. Bangladesh; [4]4MBBS, MSc, Dip in Biotech, PhD, FRCP, Senior Scientist, Chairperson, Board of Trustees. Bangladesh Breastfeeding Foundation, Chairperson. Nutrition Foundation. Bangladesh.

Background and objectives: Food intake pattern is one of the major contributors for child malnutrition. Inappropriate food consumption is leading to double-burden of malnutrition. Autistic

children are more vulnerable than normal children of same aged group. There is urgent need to improve the diet quality for improving their nutritional status. To the authors' knowledge, food intake pattern of the autistic children has not been described yet in Bangladesh. So, our objective was to assess the food intake pattern of autistic children and compare with that of normal children.

Methods: A cross-sectional study was conducted during April to December, 2016 among children aged 3-5 years with autism (n=53) and normal children (n=53), were selected from four schools in urban Dhaka city, Bangladesh. Data on food intake pattern was collected by food frequency questionnaire (with a reference period of 7 days) from the children's parents using a structured questionnaire. Statistical analysis was done by IBM SPSS software (version 20) and comparison between autistic and normal children were made by using Mann-Whitney-U test for non-normal distribution.

Results: Children with and without autism consumed 39 foods from six food groups (Cereals, Pulses, Egg, Meat & Fish, Organ Meat, Vegetables & Fruits, Dairy Products). The result revealed that five out of six food groups had significant difference in terms of food consumption (p<0.05). The food consumption was lower by autistic children than normal children. The food consumption were (autistic vs. normal children): unleavened bread (81.7% vs. 98.8, p=0.00); egg (53.2% vs. 98.8, p=0.00); chicken (93.1% vs. 100, p=0.002); beef (32.3% vs. 76%, p=0.004); pui leaf (72.2% vs. 81.7%, p=0.002); carrot (62.7% vs. 85.5%, p=0.00); tomato (66.7% vs. 83.6%, p=0.001); malta (30.4% vs. 70.3%, p=0.009); milk (95% vs. 98.8%, p=0.00).

Conclusions: Food from five out of six food groups was less eaten by autistic children than normal children. Autistic children had chewing problem, carbohydrate intolerance, sensitivity to some food items like gluten, casein, sugar, chocolate etc. and they were medically restricted for food.

Keywords: Food intake pattern, autistic children, normal children, food frequency questionnaire.

we aimed to investigate the potential effect of prenatal exposure to the 1959-1961 Chinese famine on adult cognitive impairment.

Methods: We obtained data from the second National Sample Survey on Disability implemented in 31 provinces in 2006, representing 1.9 per 1000 non-institutionalized inhabitants of China, and restricted our analysis to 387,093 people born from 1956 to 1965.The definition of disabilities was based on the WHO International Classification of Functioning, Disability, and Health (WHO-ICF). Cognitive impairment was defined as intelligence quotient (IQ<70) and adaptive behavior, and IQ for adults was evaluated by the Wechsler Adult Intelligence Scale-Revised by China (WAIS-RC). Famine severity was defined as cohort size shrinkage index, which has been widely used in previous Chinese studies.The famine impact on adult cognitive impairment was estimated by difference-in-difference models, which were established by the variations of famine exposure across birth cohorts.

Results: Compared with adults born in 1963, those who exposed to Chinese famine during gestation (born in 1959-1962) did not experience more risk of cognitive impairment in adulthood in the total sample. However, when excluding concurrent impairments (i.e. hearing, visual, speech, physical and mental disorders), we found individuals born in 1961 had more than two-fold (OR=2.18, CI: 1.15, 4.15) risk of cognitive impairment than their 1963-born peers even though adjusting for multiple demographic and socioeconomic variables. Stratified analyses showed that long-term impact of prenatal famine on cognitive impairment was evident in both male and female sample, but only in rural, not in urban area.

Conclusions: Prenatal exposure to Chinese famine had enduring deleterious effect on the risk of cognitive impairment and concurrent disorder of cognitive impairment may be one of important confounders in this long-term impact. Further studies need to explore the difference between Chinese and Dutch famine and the corresponding mechanism on this issue.

Keywords: Chinese famine, Cognitive impairment, Prenatal malnutrition

PRENATAL FAMINE EXPOSURE AND ADULT COGNITIVE IMPAIRMENT: NEW EVIDENCE FROM CHINA

[1]He, Ping; [2]Chen, Gong; [3]Song, Xinming; [4]Zheng, Xiaoying.

[1]PhD. Candidate. Institute of Population Research. Peking University. China; [2]PhD. Demographer. Institute of Population Research. Peking University. China; [3]PhD. Epidemiologist. Institute of Population Research. Peking University. China; [4]PhD. Demographer and Health Economist. Institute of Population Research. Peking University. China.

Background and objectives: A growing number of studies have focused on long-term impact of Dutch and Chinese famine on adult health during past decades. The current measures of cognitive functioning in adulthood do not indicate a long-run association with prenatal exposure to Dutch famine. However, whether such association emerges in China is still poorly understood. In this study,

Poverty, Health, and Nutrition Division. International Food Policy Research Institute. New Delhi. India.

Background and objectives: Maternal undernutrition contributes to poor child growth and development. Limited evidence exists on effective nutrition intervention packages and delivery platforms to improve maternal nutrition. We evaluated the feasibility and impact of a nutrition-focused Maternal, Neonatal and Child Health (MNCH) package compared with the standard MNCH package in Bangladesh. The standard MNCH package provides essential health services and sales of iron and folic acid (IFA) by frontline health workers [FHWs] through home visits. The nutrition-focused Alive & Thrive MNCH package was integrated into the MNCH platform, providing additional interpersonal counseling (IPC), community mobilization (CM), distribution of free IFA and calcium supplements, and weight-gain monitoring, with additional time from FHWs in home visits to discuss maternal and child nutrition.

Methods: We used a cluster-randomized design with cross-sectional surveys in 2015 and 2016 with FHWs and pregnant and recently delivered women (n~700, 600 and 2,000, respectively, per survey round). We examined operational feasibility, including FHWs' capacity, training, supervision, and service coverage. We derived difference-in-difference estimates (DDE) on maternal dietary diversity, micronutrient supplement intake, and breastfeeding practices.

Results: FHWs were committed and well-supervised, and covered a small catchment area. There were no major shifts in time in either group. FHWs in both groups had high knowledge about micronutrients, but FHWs in nutrition-focused MNCH improved knowledge about maternal dietary diversity compared to those in the MNCH group. Coverage of IPC and CM was higher in the nutrition-focused MNCH group than the MNCH group (97%

vs. 70% and 50% vs 30%, respectively). Improvements were significantly greater in the nutrition-focused MNCH, compared to MNCH group for consumption of IFA (DDE: 9.8 percentage point [pp], 46 tablets), and calcium supplements (DDE :12.8 pp, 50 tablets), maternal dietary diversity (DDE: 30.0 pp, 1.6 food groups), daily intakes of several micronutrients during pregnancy, and exclusive breastfeeding (DDE: 31 pp), but not for early initiation of breastfeeding.

Conclusions: Integrating intensified IPC and CM interventions addressing nutrition during pregnancy into an existing MNCH platform was feasible and effective, leading to improvements in multiple maternal nutrition outcomes. This effective model could be adapted into other health systems in similar contexts.

Keywords: Bangladesh, dietary diversity, interpersonal counseling, maternal undernutrition, micronutrient intake.

Conflict of Interest Disclosure: All authors declare no conflicts of interest. TS, ZM, BA, SS and KA were members of the program implementation team that designed and implemented the interventions studied and reported on in this manuscript. They reviewed the manuscript and provided interpretation of the results, but final decisions for manuscript content lay with the primary authors from the evaluation team (PHN, SSK, EAF, MTR and PM).

A PROGRAM IMPACT PATHWAYS MEDIATION ANALYSIS OF A MULTI-SECTORAL NUTRITION PROGRAM IN NEPAL

[1]Choufani, Jowel; [2]Kennedy, Andrew; [3]Cunningham, Kenda.

[1]MSc. Nutritionist/Senior Research Assistant. Environment and Production Technology Division. International Food Policy Research Institute. USA.; [2]PhD candidate. Department of Epidemiology and Population Health. London School of Hygiene & Tropical Medicine. United Kingdom.; [3]PhD. Senior Technical Advisor. Suaahara II. Helen Keller International. Nepal.

Background and objectives: As the importance of simultaneously addressing the diverse determinants of malnutrition grows, the complexity of nutrition programming increases. Evaluation of complex programs requires researchers to carefully unpack potential pathways to impact. This can be done using program impact pathways (PIPs), which map out program phases to assess each step in the intended pathways to impact. A PIP analysis was conducted to understand whether program inputs of Suaahara, a complex nutrition program in Nepal targeting the first 1,000 days, translated into intended outcomes and to identify gaps along theorised pathways to impact.

Methods: Regression analysis, using data from a cross-sectional household-level survey for a process evaluation (n=472) split evenly throughout 4 Suaahara and comparison districts, was used to test associations between residing in a Suaahara intervention area and six

ideal household health and nutrition behaviours. For positive, significant associations, structural equation modelling was used to empirically test hypothesized mediators along the pathways to impact.

Results: Belonging to the intervention arm was positively associated with optimal household WASH facilities and practices (b=0.69, p<0.001) and maternal diet during pregnancy (b=0.41, p<0.001). Exposure to specific WASH messages was found to be a positive mediator for how belonging to the intervention arm translated into ideal household WASH facilities and practices (b=0.18, p<0.001). Although being in the intervention arm influenced both maternal knowledge and practices related to diet during pregnancy, there was no association between knowledge and practices.

Conclusions: PIP analyses are useful for monitoring and evaluating the impacts pathways of complex nutrition programs. Evidence for a link between the intervention and WASH facilities and practices through direct and indirect pathways is encouraging and can be used to support the continuation of related intervention components. Further investigation into the reasons for a lack of translation of knowledge from exposure to Suaahara integrated messages to diet during pregnancy should be considered.

THE ROLE OF DAIRY FOR THE MANAGEMENT OF MUSCLE MASS AND FUNCTION IN PEOPLE AGED 50+ YEARS: A SYSTEMATIC REVIEW AND META-ANALYSIS

[1]Wycherley, Tom; [2]Riley, Malcolm; [2]Stonehouse, Welma; [2]Taylor, Pennie; [2]Brinkworth, Grant; [2]Luscombe-Marsh, Natalie.

[1]School of Health Sciences. University of South Australia. Adelaide. South Australia. 5000. Australia; [2]Commonwealth Scientific Industrial Research Organisation. Adelaide. South Australia. 5000. Australia.

Background and objectives: A meta-analysis of randomised controlled trials (RCT's) was performed to investigate the effects of whole dairy foods and supplements containing dairy ingredients, with and without resistance training (RT), on lean mass, strength, muscle size, muscle protein synthesis and physical function in people aged 50+ years.

Methods: RCT's published to March 1 2015 were identified by a comprehensive systematic search of scientific databases. Eligible reports were critically appraised in duplicate. Data were pooled using random-effects meta-analyses.

Results: 34 RCT's were eligible for inclusion. Dairy consumed in combination with RT resulted in a small increase in lean mass (weighted mean difference [95% CI]; 0.5 [0.02, 0.98]kg; P=0.04; I^2=68%) but had no effect on muscle size (P=0.80), leg press strength (P=0.40) or grip strength (P=0.29). Dairy consumed in the absence of RT had no effect on lean mass (P=0.58). There were insufficient data to analyse gait speed. Dairy protein supplements of different dosages (i.e. 20 vs. 40g/day) increased fractional synthetic rate of myofibrilliar protein both in the context of RT (0.03

[0.0, 0.06]%/hr; P=0.02; I^2=87%) and without RT (0.02 [0.01, 0.02]%/hr; P<0.001; I^2=0%).

Conclusions: Increased dairy intake (at least 20 g per day - particularly in the form of dairy protein supplements) when combined with RT, is an effective nutritional strategy to augment lean body mass in people aged 50+ years. While dairy protein acutely up-regulates muscle protein synthesis in this age group irrespective of RT, this effect does not directly translate into increases in regional muscle size, muscle strength or function.

Keywords: dairy. dairy supplements. muscle mass. body composition. ageing

DRIVERS OF NEPAL'S SUCCESS IN REDUCING THE PREVALENCE OF UNDERNUTRITION SINCE THE MID-1990S: VARIATION BY AGRO-ECOLOGICAL ZONE

[1]Cunningham, Kenda; [2]Singh, Akriti; [3]Pandey Rana, Pooja; [4]Karmacharya, Chandni; [5]Headey, Derek.

[1]DrPH. Helen Keller International. Nepal.; [2]PhD Candidate. Tufts University. USA.; [3]MSc. Helen Keller International. Nepal.; [4]MSc. Independent. Canada.; [5]PhD. International Food Policy Research Institute. USA.

Background and objectives: Nepal's rapid reductions in child undernutrition and the drivers of this progress have been well-documented. However, Nepal's three agro-ecological zones' (AEZ) – terai (plains), hills, and mountains – drastic differences (e.g. ethnic composition, population density, remoteness) may influence nutrition-related indicators. This study assesses commonalities and differences in drivers of Nepal's success in reducing child nutrition in Nepal's three AEZs.

Methods: Analyzing data from Nepal's 1996, 2001, 2006 and 2011 DHS, we used multivariate regression analysis and decomposition techniques to identify drivers of reductions in LAZ and WHZ. Explanatory variables included: household assets; maternal and paternal education; access to healthcare; WASH facilities/practices; household demography and non- time-varying factors (e.g. child age, residency, caste, maternal age and survey year).

Results: : Since 1996, child (<2y) stunting and wasting (<5y) declined rapidly. The terai experienced the fastest reductions in stunting, whereas wasting reductions were concentrated in the mountains and terai. During this time, asset ownership, education, and access to health and sanitation services improved, but with sub-national variation in magnitude and speed. Our linear decomposition approach showed the changes in LAZ and WHZ that were predicted by changes in the explanatory variables over time in each AEZ. Health services were the single largest contributor to change in LAZ in all three AEZs. Increased toilet use was moderately important in the hills and terai. For WHZ, toilet use

was very important: the single largest factor in the terai. Health services were a key driver in all three sub-samples. Asset accumulation was important in the hills and mountains only, whereas maternal education was only important in the terai.

Conclusions: Nepal's success in reducing undernutrition and the drivers differ across the strikingly diverse AEZs. Our findings of variation in the factors that best predict changes in outcomes over time by AEZ, suggest that some sub-national level policies and programs targeting location-specific obstacles may be necessary. There are indications that WASH investments may yield especially large returns in the humid and densely populated terai. Our findings highlight that a one-size-fits-all approach may not address persistent under-nutrition and targeted approaches may be more effective.

Keywords: Nepal, undernutrition

MATERNAL COTTON-PICKING DURING PREGNANCY IS ASSOCIATED WITH MATERNAL AND EARLY INFANCY NUTRITIONAL STATUS IN RURAL PAKISTAN

[1]Pradeilles, Rebecca; [2]Allen, Elizabeth; [3]Gazdar, Haris; [4]Mysorewala, Ayesha; [5]Mazhar, Sidra; [6]Dangour, Alan; [7]Ferguson, Elaine.

[1]BSc, MSc, PhD. Research Fellow in Global Health Nutrition. Department of Population Health. London School of Hygiene and Tropical Medicine. London. UK.; [2]MA, MSc, PhD. Professor in Medical Statistics. Department of Medical Statistics. London School of Hygiene and Tropical Medicine. London. UK.; [3]Senior Researcher. Collective for Social Science Research. Karachi. Pakistan.; [4]BSc. Research officer. Collective for Social Science Research. Karachi. Pakistan; [5]BSc, MSc. Research officer. Collective for Social Science Research. Karachi. Pakistan; [6]MSc, PhD. Professor in Food and Nutrition for Global Health. Department of Population Health. London School of Hygiene and Tropical Medicine. London. UK; [7]BSc, PhD. Associate professor in Nutrition for Global Health. Department of Population Health. London School of Hygiene and Tropical Medicine. London. UK.

Background and objectives: In rural Pakistan, the nutritional status of women of reproductive age and infants is poor. The agricultural workforce is becoming increasingly feminised, with 75% of women employed in agricultural labour. The impact of women's agricultural work, conducted during pregnancy, on maternal and early infancy nutritional status is not well documented. Thus, this study aimed to examine the relationship between cotton-picking during pregnancy, maternal body mass index (BMI) and infant growth. Cotton-picking involves long hours of intensive agricultural work.

Methods: A cross-sectional survey of a representative sample of rural mother-infant dyads was conducted in Sindh province in January to February 2016. Infants were 2-12 weeks of age. Interviewer-administered questionnaires and maternal and infant anthropometric measurements (weight and height/length) were collected. The primary outcomes were maternal BMI measured post-pregnancy (BMI; n=1146) and infant length-for-age zscore (LAZ; n=1143).

Associations between cotton-picking during pregnancy and maternal BMI and infant LAZ were examined using multivariable linear regression analysis; adjusting for potential confounders (i.e. household wealth index and education). Structural-equation based modelling was used to test whether maternal BMI mediated the association between cotton-picking and infant LAZ.

Results: Overall, 21.6% of women were underweight and 45.3% of the infants were stunted. Among the women, 29% were involved in cotton-picking during pregnancy. In the multivariable analysis, cotton-picking during pregnancy was negatively associated with both post-partum maternal BMI (β=-0.87 [-1.33; -0.45]) and infant LAZ (β=-0.34 [-0.54; -0.13]). The structural-equation based modelling results showed that cotton picking had a total negative effect (β=-0.35 [-0.53; -0.16]) on infant LAZ. 14% (-0.05/-0.35) of the relationship between cotton-picking and infant LAZ was mediated via maternal BMI.

Conclusions: This study has generated new evidence for link between maternal agricultural workload and maternal and infant nutrition in a sample of mother-infant dyads living in rural Pakistan. Maternal cotton-picking during pregnancy was negatively associated with both maternal BMI and their offspring's size at 2-12 weeks of age. The results of this study underscore the need to reduce agricultural workload demands during pregnancy to reduce the risk of negative energy balance and improve the nutritional status of mothers and new born infants.

Keywords: agricultural workload, nutritional status, women, infant, Pakistan

Brazil.

Background and objectives: In Ecuador, adolescents represent 19.3% of the population INEC-Ecuador (2010). This period is characterized by a stage of physical, psychological and psychological changes in which a child becomes an adult. This transition

requires an adaptation of the factors that allow the adolescent to develop all the normal functions with normality. Aims: To evaluate the dietary intake, eating disorders and physical activity of adolescents from a population of the Andean region of Ecuador and their difference between urban and rural areas.

Methods: Cross-sectional study (n = 131). It was applied: a 24-hour reminder and food consumption frequency questionnaire; It was evaluated anthropometry, physical activity and risk of eating disorder.

Results: 19.1% of the population presented short stature by age and 17.6% risk of overweight according to BMI//Age. Macronutrient adequacy percentages throughout the population were low (66.5% carbohydrate, 60.5% protein and 79.8% fat).

Statistically significant differences were found between protein (p = 0.012), fats (p <0.001) carbohydrates (p = 0.013) and energy (p <0.001) according to the zones; (Urban areas showed higher consumption compared to rural areas).

Statistically significant differences were found between the levels of physical activity of adolescents in urban areas (less activity) compared to adolescents in rural areas (greater activity). According to the Scoff questionnaire, 32.3% of adolescents were classified as having an Eating Disorder Risk, clinical differences were found by sex being greater in women than in men. However differences between sex and area were not statistically significant.

Conclusions: The adolescents' diet differs according to the geographical area, showing worse consumption in the rural area.

INVESTIGATING ATTRIBUTES CAREGIVERS ASSOCIATE WITH COMPLEMENTARY FEEDING TO PROMOTE SMALL QUANTITY LIPID-BASED NUTRIENT SUPPLEMENT (SQLNS) IN COLOMBIA: FORMATIVE RESEARCH FOR THE SPOON PROJECT

[1]Gust Duque, Tiffany; [2]Bernal, Ines Jennifer; [3]Gonzalez, Wendy; [4]Vossenaar, Marieke; [5]Bonvecchio, Anabelle; [6]Pelto, Gretel; [3]Tumilowicz, Alison.

[1]MPH RDN. Global Nutrition Consultant. Global Alliance for Improved Nutrition. Switzerland.; [2]PhD. Global Nutrition Consultant. Global Alliance for Improved Nutrition (GAIN). Switzerland; [3]PhD. Monitoring, Learning and Research. Global Alliance for Improved Nutrition (GAIN). Switzerland; [4]PhD. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM).; [5]PhD. Directora. Centro de Investigación en Nutrición y Salud (CINyS). Instituto de Salud Pública de México (INSP). México; [6]PhD. Division of Nutritional Sciences. Cornell University. USA.

Background and objectives: The SPOON project aims to design a social and behavior change communication (SBCC) strategy to prevent malnutrition among children 0-24 months through adequate infant and young child (IYC) feeding practices, including home-fortification with SQ-LNS. The SPOON SBCC strategy will build on extensive formative research in Colombia, as well as Guatemala and Mexico. We present an investigation of attributes and beliefs caregivers in Colombia associate with complementary foods in order to identify potential messages and actions for promotion of SQ-LNS.

Methods: Pile sorting, a cognitive mapping technique, was used to evaluate caregivers' knowledge and beliefs about selected foods and caregiving actions. A convenience sample of mothers (n=28) of children aged 0-24 months living in poor communities in Pasto, Colombia were presented with 25 cards with pictures of foods (n=18), and caregiving actions (n=7). Each respondent was asked to put the cards into piles based on what she felt 'go together'. The piles were then used for discussion to explore the rationale for the groupings.

Results: Caregivers made a distinction between food and non-food items, although there were overlaps between these categories, as well as inter-category variability. Foods were often grouped because they: i) relate to complementary feeding and timing of introduction of specific foods (theme used by 81% of mothers), ii) are seen as similar food types (71%), iii) are considered beneficial for child's health (50%), or iv) contain vitamins and minerals (38%). Caregiving actions cards were most commonly grouped into the following categories: i) childcare (42%), ii) affection (27%) and iii) illness prevention (31%).

Conclusions: The pile sorting demonstrates that mothers view foods and caregiving actions from multiple dimensions, with an emphasis on advantages for child's health. Mothers in Pasto are concerned with the health and wellbeing of their children, and are cognizant of topics including complementary feeding, illness prevention, affectionate care, growth and development, and vitamins. However, there are intragroup variations in how respondents interpret each topic. This exercise provides insights for the design of messaging and behavior change components for an SQ-LNS intervention.

Keywords: infant and young child feeding practices, formative research, cognitive mapping techniques, Colombia

FOOD ACCESS AND DIETARY INDICATORS ASSOCIATED WITH DEPRESSION IN WOMEN OF REPRODUCTIVE AGE IN SYLHET, BANGLADESH

[1]Sparling, Thalia; [2]Waid, Jillian; [3]Wendt, Amanda; [4]Gabrysch, Sabine.

[1]MPH. Doctoral candidate and researcher. Unit of Epidemiology and Biostatistics. Institute of Public Health. University of Heidelberg; [2]MSW. Research, Learning and Evaluation. Helen Keller International. Bangladesh.; [3]PhD. Unit of Epidemiology and Biostatistics. Institute of Public Health. Germany; [4]PD Dr. Dr. med. PhD. Unit of Epidemiology and Biostatistics. Institute of Public Health. Germany.

Background and objectives: Depression is common among women of reproductive age, especially in LMICs. Increased nutritional needs during pregnancy and lactation may deplete nutrients essential to neurotransmission and increase the risk of depression. Depression may conversely lead to poor self- and child care and reduce household food access and dietary diversity. We aim to examine the association between depressive symptoms and several indicators of food access and nutritional status in non-peripartum (NPW) and peripartum women (PW) in rural Bangladesh.

Methods: The Food and Agricultural Approaches to Reducing Malnutrition (FAARM) cluster-randomized field trial evaluates the impact of Helen Keller International's homestead food production program on undernutrition, including around 2700 young women in Sylhet, Bangladesh. We used cross-sectional FAARM baseline data to study the association of food access and nutritional status with depression in NPW and PW women using multivariable logistic regression.

Results: Of 2,599 women in the study, 1018 (39%) were pregnant or one year postpartum, while 1,581 (61%) were NPW. Overall, 20% of women screened positive for major depression (Edinburgh Postpartum Depression Scale ≥12). Both food insecurity (HFIAS) and poor household food consumption (FCS) were strongly associated with depression in fully adjusted models (NPW HFIAS: OR 2.59, 95% CI 2.02-3.30 and PW OR 3.60, 95% CI 2.46-5.27; NPW FCS: OR 2.63, 95% CI 1.80-3.86 and PW FCS: 2.67, 95% CI 1.58-4.53). Low dietary diversity (<5 food groups) was also associated with depression (NPW OR: 1.78, 95% CI 1.30-2.44 and PW OR: 2.11, 95% CI 1.32-3.39), and several distinct food groups lowered the odds of depression in women (dairy, eggs, fish, vitamin A-rich foods and vitamin C-rich foods). Anemia was not associated with depression. Chronic energy deficiency (BMI <18.5) was positively associated with depression in NPW (OR: 1.38, 95% CI 1.04-1.84).

Conclusions: In this large study from Bangladesh, depression was associated with household food insecurity, poor household food consumption, women's dietary diversity, and low BMI. Further studies should investigate the causal links of food access and nutrition with depression, and interventions to reduce poor diets and depression among women in LMICs should be considered.

Nutricia Research. Utrecht. Netherlands; [5]PhD. Nutricia Research. Utrecht. Netherlands; [6]PhD. Professor physiologist. Lab. Nutrition Physiology and Ingestive Behavior. AgroParisTech INRA University Paris-Saclay. Paris. France.

Background and objectives: Perinatal exposure via mother's diet induces imprinting that impacts longer term phenotype and health of the offspring. This study evaluates the consequences of a maternal high protein diet during gestation on food preference and health markers in rat pups exposed to two self-selection models (SSM).

Methods: Two groups of Wistar rat dams were fed a high-protein (HP; 55% protein) or a normal protein (NP; control; 20% protein) isocaloric diet during gestation and then switched to a NP diet during lactation. At 3 wk, female pups from the 2 dam groups were weaned and subdivided into 3 diet groups (i.e. six groups each n=8 pups). Each group was subjected to either the control NP diet, a C1 choice diet, or a C2 choice diet, respectively. C1 and C2 groups were exposed to a choice between 2 cups with either proteins (P) or a mix of carbohydrate (C) (88%) and lipid (L) (12%), or a choice between 3 cups, with either protein (P), carbohydrates (C) or lipids (L), respectively.

Results: Compared to the NP group and independent of maternal diet, C1 and C2 groups consumed 10% more energy as P and decreased C intake (P<0.0001). C2 groups compared to control NP group, increased L consumption up to 22% and energy intake (P<0.0001). C1 groups gained less weight than control NP groups (P<0.0001). In contrast, pups from dams fed HP diet during gestation (HP-C2) and subjected to C2 choice had a higher weight gain compared to NP-C2 group (P<0.0001). At 15 wk, HP-C2 group gained 13.5% more weight than NP-C2 group (NP-C2, 183.3+7.7 g; HP-C2, 208.1+11.5 g, P<0.06). In HP-C2 group, total and visceral adipose tissues weight were increased 41.2% (NP-C2, 44.2+2.8 g; HP-C2, 62.4+6.8 g, P<0.03) and 52.1% (NP-C2, 25.9+1.9 g; HP-C2, 39.4+4.5 g, P<0.01), respectively, compared to NP-C2 group.

Conclusions: The present study showed that programming by maternal HP diet during gestation does not affect food choice. But the consequence of a higher P and L intake in the C2 groups is emphasized in pups from dams subjected to a HP diet during gestation, causing increased adiposity. Metabolic pathways are currently explored.

RELATION BETWEEN DIET, NUTRITIONAL STATUS, AND STIMULATION AND CHILD DEVELOPMENT: A PATH ANALYSIS

[1]Larson, Leila; [2]Bauer, Patricia; [3]Martorell, Reynaldo.

[1]MPH. PHD Candidate. Nutrition and Health Sciences Doctoral Program. Emory University. USA.; [2]PhD. Asa Griggs Candler Professor of Psychology. Department of Psychology. Emory University. USA.; [3]PhD. Robert W. Woodruff Professor of International Nutrition. The Hubert Department of Global Health & Nutrition and Health Sciences program. Emory University. USA.

Background and objectives: Malnutrition is an important public health problem with implications for child development. We examined the direct and indirect effects of diet on memory and overall mental development in young children in rural Bihar India.
Methods: A cross-sectional survey of 4292 children 6 to 18 months of age in 70 health sub-centers of West Champaran, Bihar was conducted in February-March 2016 as part of an endline to a randomized cluster multiple micronutrient trial. Motor and mental development was assessed using the Developmental Milestones Checklist-II, a 75-item parental report. In a subsample of 1179 children 12 to 18 months, memory was assessed using four Elicited Imitation tasks (measured as correctly imitated sequences of actions). Path analyses investigated the pathways through which diet, nutritional status, hemoglobin, stimulation, and motor skills are associated with memory or mental abilities. Standardized coefficients are reported.
Results: Mean motor and mental development scores were 18.6 (SD 6.5) out of 32 and 25.8 (SD 7.5) out of 50; mean number of pairs of actions complete in the correct order was 1.7 (SD 1.2). Fit indices for path models were acceptable. Motor development was significantly ($p<0.05$) directly associated with memory (standardized $\beta=0.13$) and mental development ($\beta=0.53$), and indirectly associated with mental development through stimulation in the home ($\beta=0.01$). Length-for-age z-score (LAZ) and weight-for-length z-score (WLZ) were indirectly associated, through motor development, with memory ($\beta=0.03$ for LAZ, $\beta=0.01$ for WLZ) and mental development ($\beta=0.14$ for LAZ, $\beta=0.04$ for WLZ). Hemoglobin was directly associated with memory ($\beta=0.07$), but not mental development. Dietary diversity (score out of 7) was not significantly associated with either outcome.
Conclusions: Nutritional status, stimulation, motor development and hemoglobin status in early life may have important implications for foundational mental and memory abilities.
Keywords: child development, cognition, nutritional status, diet, path analysis

Consultant for Global Alliance for Improved Nutrition (GAIN). Switzerland.

Background and objectives: Recent evidence suggests that point-of-use fortification using small quantity - lipid-based nutrient supplements (SQ-LNS) improves the nutrient adequacy of infant and young child (IYC) diets in resource-constrained settings. In the context of the nutrition transition in Latin America, and evidence linking IYC feeding to future risk of overweight and obesity, the Inter-American Development Bank initiated a project ("SPOON") in Mexico, Colombia, and Guatemala to evaluate the effectiveness of point-of-use fortification of complementary foods using unsweetened SQ-LNS and promotion of WHO recommended IYC feeding practices for children aged 0-23 months. We describe the methods used by a multi-cultural team of researchers trained in anthropology and communication to conduct formative research with the aim of developing a social and behavior change communication (SBCC) strategy to promote exclusive breastfeeding (EBF), appropriate complementary feeding practices and the use of unsweetened SQ-LNS.
Methods: The main research questions included:
1. How can SQ-LNS be integrated into existing complementary foods and feeding practices?
2. What are the positive attributes that caregivers associate with complementary foods and feeding that could be used to promote SQ-LNS?
3. What instructions and messages can be communicated to promote utilization of SQ-LNS?
4. What are the most effective communication strategies?
We created a common protocol which consisted of two streams of inquiry: (a) focused ethnographic study (FES) to obtain localized knowledge related to IYC feeding, and (b) 14-day home feeding trial to explore the acceptability and use of unsweetened SQ-LNS.
Results: A common protocol ensured consistency in research questions, approach and data collected across settings. However,

adaptations were necessary due to variations in the characteristics of the study populations, setting-specific SPOON project designs and methodological preferences of country-level researchers. In Mexico, the FES sampling design was changed to account for multiple ethno-linguistic groups. In Colombia, more emphasis was given to collect data on EBF, a priority for SPOON project in this setting. In Guatemala, focus group discussion was added to FES data collection.

Conclusions: Multi-country research studies benefit from a common protocol. However, some local adaptations are necessary to ensure that methods and results reflect differences across contexts.

Keywords: small quantity - lipid-based nutrient supplement (SQ-LNS), formative research, Colombia, Guatemala, Mexico

Conflict of Interest Disclosure: The authors declare no conflicts of interest. SPOON was financed by the Inter-American Development Bank.

PRE-AND POST-NATAL LIPID-BASED NUTRIENT SUPPLEMENTS AND COGNITIVE, SOCIOEMOTIONAL AND MOTOR FUNCTION IN PRESCHOOL-AGED CHILDREN IN GHANA

[1]Ocansey, Maku Eugenia; [2]Prado, Elizabeth; [3]Young, Rebecca R.; [4]Adu-Afarwuah, Seth; [5]Kumordzie, Sika; [6]Okronipa, Harriet; [7]Oaks, Brietta; [8]Dewey, Kathryn G.

[1]Mphil. Nutrition. University of California, Davis. USA.; [2]PhD. Assistant Project Scientist. Department of Nutrition. University of California, Davis.; [3]MSc. Statistician. Department of Nutrition. University of California, Davis.; [4]PhD. Lecturer. Department of Nutrition and Food Science. University of Ghana, Legon. Ghana.; [5]MPhil. Nutritionist. Department of Nutrition. University of California, Davis.; [6]MSc.Nutritionist. Department of Nutrition. University of California, Davis.; [7]PhD. Nutritionist.Department of Nutrition. University of California, Davis.; [8]PhD. Distinguished Professor. Department of Nutrition. University of California, Davis.

Background and objectives: Adequate nutrition is necessary for brain development during pregnancy and infancy. There is a dearth of evidence from randomized controlled trials of combined supplementation during both pre- and postnatal periods on developmental outcomes in later life. We aimed to investigate the effects of provision of pre- and postnatal lipid-based nutrient supplements (LNS) on cognitive, motor and socio-emotional function at preschool age.

Methods: We performed a follow-up study of children aged 4-6 years in 2016, born to women who participated in the International Lipid-Based Nutrient Supplements (iLiNS)-DYAD trial (n=1320) conducted in Ghana in 2010-2014. Women had been randomized to daily LNS or multiple micronutrient (MMN) tab-

lets during pregnancy through 6 months postpartum or iron and folic acid (IFA) during pregnancy and calcium placebo through 6 months postpartum. Children in the LNS group received LNS from 6 to 18 months.

Primary outcomes were (1) a cognitive factor score based on a test battery adapted from sub-tests of the Developmental Neuropsychological Assessment, Parent's Evaluation of Developmental Status, and other sources, (2) motor score from the NIH Toolbox 9-hole pegboard test, and (3) socioemotional difficulties based on the Strengths and Difficulties Questionnaire (SDQ). Eight secondary outcomes were calculated in specific cognitive and other domains (e.g., language, SDQ prosocial). Analysis was by intention to treat and a 2-group comparison (LNS vs non-LNS (MMN+IFA)).

Results: Developmental results represent 76% of live births from the main trial (n=965). Preliminary analyses in the 2-group comparison show that children in the LNS group had a significantly lower socioemotional difficulties score than children in the non-LNS groups after adjusting for child age, factors at baseline (e.g., maternal BMI, age, education) and factors at follow-up (e.g., maternal cognition). Adjusted and unadjusted differences in mean z-score (95% CI) were: −0.15 (-0.27, -0.02), p = 0.026; and -0.12 (0.21, 0.02) p = 0.084 respectively. Cognitive, motor and secondary outcomes did not significantly differ by intervention group in either 3- or 2-group comparisons (ps > 0.1).

Conclusions: Provision of LNS during the first 1000 days of development may improve behavioral function but did not affect cognition at preschool age in this setting.

Keywords: Cognitive development, Preschool development, lipid-based nutrient supplementation, multiple micronutrients, maternal nutrition

THE EFFECT OF IODINE SUPPLEMENTATION IN MILDLY IODINE-DEFICIENT PREGNANT WOMEN ON CHILD DEVELOPMENT: A RANDOMIZED CONTROLLED TRIAL

[1]Gowachirapant, Sueppong; [2]Jaiswal, Nidhi; [3]Melse-Boonstra, Alida; [4]Galetti, Valeria; [4]Stinca, Sara; [1]Winichagoon, Pattanee; [5]Srinivasan, Krishnamachari; [6]Zimmermann, Michael Bruce.

[1]PhD. Institute of Nutrition. Mahidol University Bangkok. Thailand.; [2]PhD. St. John's Research Institute Bangalore. India.; [3]PhD. Division of Human Nutrition. Wageningen University and Research. The Netherlands.; [4]PhD. Laboratory of Human Nutrition. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland.; [5]MD. St. John's Research Institute Bangalore. India.; [6]MD. Laboratory of Human Nutrition. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland.

Background and objectives: Iodine deficiency during pregnancy may be associated with lower IQ in offspring. It is unknown whether iodine supplementation in mildly iodine-deficient pregnant women improves cognitive function in their children.

Methods: We randomized Indian and Thai pregnant women to receive daily 200 μg oral iodine or placebo until term. Primary outcomes were child development assessed at 1 and 2 years using the Bayley Scales of Infant Development (BSID)-III and at 5-6 years using the Wechsler Preschool and Primary Scale of Intelligence (WPPSI)-III. Secondary outcomes were maternal and infant thyroid function, pregnancy outcomes and child hearing performance. The trial was double-masked and analysis was by intention-to-treat using mixed effects models.

Results: Pregnant women (n=832) entered the trial at a mean±SD gestational age of 10.7±2.7 weeks; their median (IQR) urinary iodine concentration (mUIC) was 131 (81, 213) μg/L, indicating mild iodine deficiency. Compliance with supplementation was 87%; mUICs in the 2nd and 3rd trimester were higher in the iodine group (p<0.001). There were no significant group differences in the cognitive and the combined motor and language BSID-III scores at 1 or 2 years. At 5.4 years, mean differences (95% CI) between iodine and placebo for WPPSI-III scores were: -0.7 (-2.9,1.4), p=0.87 for verbal IQ; -1.6 (-4.5,1.3), p=0.60 for performance IQ; -1.7 (-4.3,0.9), p=0.39 for processing speed; and -1.3 (-3.6,1.1), p=0.63 for full scale IQ.

Conclusions: Daily supplementation with 200 μg iodine in mildly iodine deficient pregnant women increased iodine intakes into the sufficient range but had no effect on child neurodevelopment.

Keywords: iodine, pregnancy, cognition, children, supplementation

MACRONUTRIENT COMPOSITION OF EARLY CHILDHOOD DIET IS RELATED TO GROWTH AND ADIPOSITY DURING CHILDHOOD

[1]Voortman, Trudy; [2]Jaddoe, Vincent; [3]Franco, Oscar.

[1]Postdoctoral scientist. Department of Epidemiology. Erasmus University Medical Center Rotterdam. The Netherlands; [2]Professor of Pediatric Epidemiology. Department of Pediatrics. Erasmus University Medical Center. Rotterdam. The Netherlands; [3]Professor of Preventive Medicine. Department of Epidemiology. Erasmus University Medical Center. Rotterdam. The Netherlands.

Background and objectives: Previous studies suggest that high protein intake in infancy leads to a higher body mass index. However, it is not clear whether this reflects a higher fat mass and hence more adiposity, or a difference in lean mass, as observed in adults. Furthermore, it is not clear what the role is of other macronutrients and whether effects are independent of diet in later childhood. We examined associations of macronutrient composition of the diet in early childhood with growth and detailed measures of body composition up to the age of 10 years.

Methods: This study was performed among 3,564 children participating in a population-based cohort study in the Netherlands. Dietary intake was assessed with food-frequency questionnaires at age 1 year. We calculated intakes of total protein and protein from different sources; of total carbohydrates, fiber, polysaccharides, monosaccharides and disaccharides; and of total, saturated, monounsaturated and polyunsaturated fat. Height and weight were repeatedly measured during childhood. Fat and fat-free mass were measured at 6 and 10 years using dual X-ray absorptiometry. We calculated body mass index (BMI), fat mass index (FMI), and fat-free mass index (FFMI). Macronutrient intakes were expressed in energy percentages and entered in multivariable linear mixed models in which we examined different macronutrient replacement effects independent of total energy intake. Models were adjusted for several parental and child sociodemographic and lifestyle factors.

Results: Results from multivariable models showed that higher intake of total and animal protein (both dairy and non-dairy) was associated with a higher height, weight and BMI up to the age of 10 years, irrespective of whether it was replacing carbohydrates or fats in the diet. Further analyses showed that the positive association with BMI was completely explained by a higher FMI and not FFMI and that this was irrespective of later diet. No significant associations were observed for the other macronutrients.

Conclusions: Our results suggest that high protein intake, particularly animal protein, in early childhood is associated with higher body fat mass, but not fat-free mass. Future studies are needed to examine the optimal range of protein intake for infants and young children.

School of Nutrition, Food Science and Technology. Hawassa University. Ethiopia.; [3]Desalegn Kuche. Nutritionist. Ethiopian Public Health Institute. Ethiopia.; [4]Tsehai Assefa. Nutritionist. Ethiopian Public Health Institute. Ethiopia.; [5]Tadese Fikre. Food Engineer. School of Nutrition, Food Science and Technology. Hawassa University. Ethiopia.; [6]Tesfaye Hailu. Nutritionist. Ethiopian Public Health Institute. Ethiopia.; [7]Menen Zegeye. Nutritionist. School of Nutrition, Food Science and Technology. Hawassa University. Ethiopia.

Background and objectives: Prevalence of stunting in Southern Ethiopia is equal to the national average, 44%. Poor infant and young child feeding practices, household food insecurity, poor maternal and child caring practices, poor water and san-

itation, etc were causes of child malnutrition in Ethiopia (CSA, 2014). The objective of the study was to assess under-2 children feeding practices and nutritional status at Demba Gofa and Geze Gofa Woredas of Gamo Gofa Zone, Ethiopia.

Methods: Community-based cross sectional survey was conducted to collect data on 520 samples. Multistage cluster sampling technique was employed. A pretested structured questionnaire was used to collect data on household socio-demographic and economic characteristics, food security level and infant and young child feeding practices. Child weight, height and MUAC were taken following standard procedure. Data were analyzed using WHO Anthro version 3.2.2 and SPSS Version 16.0. Binary logistic regression was used to identify predictors of stunting, underweight and wasting among study participants. Cut off point for significance test was p-value < 0.05.

Results: It was found that majority, 91%, of mothers initiate breast feeding immediately after delivery. Majority of children, 93.8%, ever breast feed. Only 37.9% of children received minimum diet diversity required. The stunting, underweight and wasting prevalence was 18.5%, 9.1% and 3.9 % respectively. As age increases, chance for a child to be stunted increases [AOR (95% CI) = 2.69 (1.27, 5.67). Father's educational status predicted stunting [AOR (95% CI) =0.28 (0.11, 0.73). Breast feeding was also a predicator of stunting in the study area with 2.92 (95% CI, 1.25, 6.85) less likely to be stunted than none breast fed one. Compared with male children, females were less likely to be underweight [AOR (95% CI) = 0.44 (0.23, 0.85). Underweight prevalence increased with the age of children [AOR (95% CI) = 25.53 (1.16, 8.04).

Conclusions: Stunting, underweight and wasting prevalence among under-2 years is relatively better in study areas compared with the criteria of WHO for assessing severity of malnutrition.

Keywords: Feeding practice, stunting, underweight, wasting.

Spanish Agency for Health Protection in Sport (AEPSAD). Madrid. Spain.; [3]PhD. NUCOX Research Group. Fundamental Biology and Health Science. University of the Balearic Islands. Spain.; [4]MSc. NUCOX Research Group. Fundamental Biology and Health Science. University of the Balearic Islands. Spain.; [5]PhD. ImFINE Research Group. Department of Health and Human Performance. Universidad Politécnica de Madrid. Spain.

Background and objectives: Physical fitness (PF) is an independent predictor of all-cause mortality. Biomarkers are the main key to evaluate the influence of PF on the human body. The aim of this study was to investigate the association between PF levels and biomarkers in older adults.

Methods: 429 non-institutionalized Spanish older adults (57% females), aged over 55 years were included in this multicenter study. Each participant performed a battery of validated PF tests (EXERNET). The score for each test ranged from 0 (worst) to 3 (best) points. The maximum score was 12 points. Scores of PF tests were added together to create a cluster. After that, participants were divided into 3 groups (low, medium and high). Fasted blood samples were collected and concentrations of routine biochemistry, vitamins, and homocysteine were analysed. Biomarkers were coded as 0 (out of reference range) and coded as 1 (within reference range). Dietary intake was assessed by two non-consecutive 24h recalls and nutrient intake was calculated using a computer program (ALIMENTA;NUCOX,Spain). Data was analysed using generalized linear model.

Results: A total of 68% and 59% of the participants showed vitamin 25(OH)D deficiency and excessive total cholesterol (TC), respectively. A total of 38.3%, 32.3%, 27.7% and 24.3% of the participants presented high glucose, uric acid, LDL-cholesterol (LDL-c) and total homocysteine (tHcy) concentrations, respectively. More subjects from the low PF group were significantly out of the reference range for tHcy, TC, HDL-cholesterol and creatinine than those in the high PF group (p<0.05). However, less subjects from the low PF group presented vitamin B12 levels out of range (p<0.05). Subjects in the low PF group presented greater LDL-c and triglycerides risk taking into account lipid intake.

Conclusions: Participants included in the high PF group had a better blood markers profile than those included in the other PF groups. PF can have an impact on biomarkers concentrations. Only lipid blood markers seem to be influenced by nutrient intake. Thus, PF has an essential role in the studied population.

VEGETARIAN AND VEGAN DIETS IN PRE-PUBERTAL POLISH CHILDREN: ELUCIDATING BENEFITS AND COSTS IN GROWTH, METABOLISM AND CARDIOVASCULAR RISK

[1]Malgorzata, Desmond; [2]Sobiecki, Jakub; [3]Jaworski, Maciej; [4]Ksiazyk, Janusz; [5]Fewtrell, Mary; [6]Wells, Jonathan.

[1]PhD candidate. Dietitian. 1. UCL Great Ormond Street Institute of Child Health. University College London. United Kingdom. 2. Department of Paediatrics, Nutrition and Metabolic Diseases. Children's Memorial Health Institute. Poland.; [2]MSc. 1. Department of Epidemiology and Biostatistics. Imperial College London. United Kingdom. 2. Department of Paediatrics, Nutrition and Metabolic Diseases. Children's Memorial Health Institute. Poland.; [3]PhD. Department of Biochemistry, Radioimmunology and Experimental Medicine. Children's Memorial Health Institute. Poland.; [4]MD. PhD. Department of Paediatrics, Nutrition and Metabolic Diseases. Children's Memorial Health Institute. Poland.; [5]MD. UCL Great Ormond Street Institute of Child Health. University College London. United Kingdom.; [6]PhD. UCL Great Ormond Street Institute of Child Health. University College London. United Kingdom.

Background and objectives: In adults, the health effects and safety of appropriately planned vegetarian and vegan diets have been evaluated, and some benefits, mainly cardio-metabolic, have been established. However, equivalent evidence in children is sparse, and relates mainly to anthropometric outcomes and nutrient intakes. More detailed information on cardio-metabolic outcomes, growth parameters and micronutrient status are lacking.

We aimed to assess the associations of vegetarian and vegan diets in children with a range of anthropometric, nutritional and cardio-metabolic outcomes.

Methods: We conducted a cross-sectional study in 188 healthy prepubertal Polish children aged 5 - 10 years: 52 vegans, 64 vegetarians, and 72 omnivores matched for socio-economic status (SES). We ascertained SES using electronic questionnaires, dietary intakes by food records and dietary screener questionnaires. We analysed fasting blood for lipids, vitamin B12, homocysteine and complete blood count (including haemoglobin and mean corpuscular volume (MCV)); and measured bone mineral density by DXA, anthropometry, blood pressure (BP) .

We calculated internal z-scores – adjusting for age and sex – for height, skinfold thicknesses and bone mineral content (BMC); BMC was additionally adjusted for bone area. We used external reference data for BMI and systolic BP. ANOVA was used to compare group means of all outcomes except vitamin B12, where the Kruskall - Wallis test was used to compare medians.

Results: Omnivores were significantly taller than vegetarians (0.41 SDS, 95%CI 0.01, 0.82) and vegans (0.55 SDS, 95%CI 0.13, 0.98). Vegans had significantly lower BMC (-0.61 SDS, 95%CI -1.02, -0.19), haemoglobin (-0.39 g/dl, 95%CI -0.73, -0.05), vitamin B12, LDL-cholesterol (-23.4 mg/dl, 95%CI -33.0, -13.6), mean of 4 skinfolds, BMI, and significantly higher homocysteine and MCV compared to omnivores. Vegetarian values were in between those of vegans and omnivores. Vegans had non-significantly lower systolic BP than the other two groups.

Conclusions: Vegan diets in childhood are associated with increased risk of deficiencies in B12 and iron, and negatively affect linear growth and bone mineral accretion. The same diet is beneficial for cardio-metabolic health, by reducing blood lipids, body fat and blood pressure. Both these costs and benefits are of smaller magnitude in vegetarian children.

Keywords: vegetarian diet, children, growth, cardiovascular risk, nutrient deficiency

Pontificia Universidad Católica de Chile. Chile.; [4]Nutritionist. PhD. Faculty of Medicine. Pontificia Universidad Católica de Chile. Chile.; [5]Nutritionist. MSc. Faculty of Medicine. Pontificia Universidad Católica de Chile. Chile.; [6]Nutritionist. Division of Obstetrics and Gynaecology. School of Medicine. Faculty of Medicine. Pontificia Universidad Católica de Chile. Chile.

Background and objectives: Maternal obesity (MO) is associated with increased risk of long term metabolic risk in the offspring (REF), probably involving mechanisms such as early programming of insulin resistance in fetal and neonatal tissues. On the other hand, exposure to the polyunsaturated acid Docohexaenoic acid (DHA) has been related with increased insulin response in multiple cell types. The aims of our study were to evaluate the in vitro effect of DHA on vascular response of umbilical vein to insulin, and the role of the intracellular inhibitory phosphorylation of the insulin receptor substrate-1.

Methods: Umbilical cords from normal and MO pregnant woman attending to obstetrics service at the Clinical Hospital of Pontificia Universidad Catolica de Chile were obtained after informed consent. Isolated rings of umbilical vein were used to evaluate vasodilatation capacity by wire-myography, in absence or presence of insulin (10-10 to 10-6 uM, 0-20 min) and DHA (100 uM, 12 h). Primary cultures of human umbilical vein endothelial cells (HUVEC) were used to evaluated phosphorylated and total protein levels of IRS-1 in cells exposed or not to insulin (1 nM, 30 min), in absence or presence of DHA (100 uM, 12 h).

Results: Insulin produces a significant vasodilation (20%) in umbilical vein rings from normal pregnancies, an effect that was absent in MO-derived umbilical rings. This vasodilator effect of insulin was recovered in umbilical vein rings from MO pregnancies pre-incubated with DHA. In addition, HUVEC from MO pregnancies showed increased levels of IRS-1 phosphorylated in serine307, compared with normal cells, a difference that was reduced by DHA, even in presence of insulin.

Conclusions: In vitro addition of DHA recovers the reduced vascular response to insulin in umbilical vein from MO pregnancies, involving a reduction of the inhibitory phosphorylation of IRS in serine307.

OFFSPRING DNA METHYLATION CHANGES IN RESPONSE TO MATERNAL FOLIC ACID SUPPLEMENTATION IN THE SECOND AND THIRD TRIMESTERS: EVIDENCE FROM A RANDOMIZED CONTROLLED TRIAL

[1]Caffrey, Aoife; [2]Irwin, Rachelle; [3]McNulty, Helene; [2]Walsh, Colum; [2]Lees-Murdock, Diane; [3]Strain, Sean JJ; [3]Pentieva, Kristina.

[1]MSc. NICHE. Biomedical Sciences Research Institute. Ulster University. Northern Ireland.; [2]PhD. Genomic Medicine Group. Biomedical Sciences Research Institute. Ulster University. Northern Ireland.; [3]PhD. NICHE. Biomedical Sciences Research Institute. Ulster University. Northern Ireland.

Background and objectives: Folic acid is widely recognised for its role in the prevention of neural tube defects and other congenital malformations. There is also emerging evidence that maternal folate status during pregnancy is associated with cognitive development in childhood. Folate dependent DNA methylation may provide a potential biological mechanism to link folate status during pregnancy with cognition in the offspring but this remains to be confirmed. Observational studies using candidate-gene or genome-wide analysis have linked maternal folate status with offspring DNA methylation of specific genes, including those related to neurodevelopmental pathways. This study aimed to investigate the effect of maternal folic acid supplementation on cord blood DNA methylation of genes related to brain function.

Methods: Samples for the current study were obtained from a randomized controlled trial in pregnancy which investigated the effect of Folic Acid Supplementation in the Second and Third Trimesters (FASSTT). Cord blood (n 86) taken at the time of delivery was assessed for DNA methylation of the retrotransposon LINE-1 (indicative of global DNA methylation) and the following genes associated with brain function and growth: RBM46, PEG3, IGF2, GRB10, BDNF, GRIN3B, OPCML and APC2.

Results: The results showed that compared with placebo, the newborns of mothers who received folic acid during pregnancy had significantly lower DNA methylation (%) of LINE-1 (57.2±2.1

vs 56.3±1.7; P=0.024), IFG2 (51.2±5.1 vs 48.9±4.4; P=0.021) and BDNF (3.1±0.8 vs 2.7±0.7; P=0.003). The effect of folic acid on IGF2 methylation was however significant only in female offspring (52.1±5.5 vs 48.5±5.3; P=0.028) but not in males (50.2±4.6 vs 49.3±3.4; P=0.201). In contrast, for the BDNF gene, folic acid treatment had a significant effect in male (3.2±0.8 vs 2.7±0.7; P=0.012) but not female (2.9±0.7 vs 2.6±0.7; P=0.212) offspring.

Conclusions: These results indicate that folic acid supplementation (400 µg/d) in trimesters 2 and 3 of pregnancy exerts significant changes in DNA methylation of genes related to offspring brain function and growth, which appear to be sex-specific. These findings require further investigation using genome-wide approaches.

EFFECT OF MULTIPLE MICRONUTRIENT SUPPLEMENTATION IN LACTATING WOMEN ON INFANT GROWTH AND MORBIDITY: A DOUBLE-BLIND RANDOMIZED CONTROLLED TRIAL IN RURAL BURKINA FASO

[1]Lanou, Hermann Bienou; [2]Bouckaert, Kimberley; [3]Roberfroid, Dominique; [2]Kolsteren, Patrick; [4]Kouanda, Seni; [5]Huybregts, Lieven.

[1]MD. Département Biomédical et Santé Publique. Institut de Recherche en Sciences de la Santé. Burkina Faso.; [2]PhD. Department of Food Safety and Food Quality. Ghent University. Belgium.; [3]PhD. Belgian Health Care Knowledge Centre. Belgium.; [4]PhD. Département Biomédical et Santé Publique. Institut de Recherche en Sciences de la Santé. Burkina Faso.; [5]PhD. Poverty, Health and Nutrition Division. International Food Policy Research Institute. USA.

Background and objectives: Micronutrient deficiencies contribute to the vicious cycle of growth restriction in low and middle-income countries. Lactating women and their infants are at risk of inadequate intakes and deficiencies in multiple micronutrients due to the imbalance between their high requirements and a typical low intake of micronutrient-dense foods. Infants born small-for-gestational age (SGA) or preterm may be particularly vulnerable. However, there currently is no evidence on the effect of multiple micronutrient supplementation in lactating women on infant growth and morbidity. The objective of this study is to test the efficacy of supplementation with the UNICEF/WHO/UNU International Multiple Micronutrient Preparation (UNIMMAP) compared to iron and folic acid (IFA) on growth and morbidity of infants, and particularly those born SGA or preterm.

Methods: In a randomized controlled trial in rural Burkina Faso, 1426 pregnancies were allocated to daily supplementation with either UNIMMAP (intervention) or IFA (control) for three months after delivery. In total, 1296 mothers with live births were enrolled in the study. Daily tablet intake was directly observed by trained community workers. Anthropometry, morbidity and he-

moglobin concentration of infants were measured monthly until the first birthday.

Results: Infant linear growth and relative weight gain remained suboptimal despite supplementation of lactating mothers. The linear growth rate of infants in the UNIMMAP group increased compared to IFA (Beta coef = 0.0117 length-for-age Z-score/month; 95% CI: -0.0022 - 0.0256; P interaction = 0.099). Infants who were born SGA had significantly higher linear growth rates (Beta coef = 0.0217 length-for-age Z-score/month; 95% CI: -0.0012 - 0.0447; P interaction = 0.063), but did not show significant reductions in stunting. Preterm infants had increased hemoglobin concentration rates (Beta coef = 0.1569 g/dL/month; 95% CI: - 0.0208 - 0.3346; P interaction = 0.084). Infants in the UNIMMAP group had a reduced relative weight gain rate (Beta coef = -0.0179 weigth-for-length Z-score/month; 95% CI: -0.0355 - 0.0002; P interaction = 0.047).

Conclusions: Supplementing UNIMMAP instead of IFA during the first three months of lactation promotes overall infant linear growth, and shows a larger effect in those born SGA. However, UNIMMAP reduced ponderal growth compared to IFA.

PRENATAL SUPPLEMENTATION WITH SMALL-QUANTITY LIPID-BASED NUTRIENT SUPPLEMENTS OR MULTIPLE MICRONUTRIENTS INCREASES URINARY IODINE CONCENTRATION IN SEMI-URBAN GHANA: A RANDOMIZED CONTROLLED TRIAL

[1]Adu-Afarwuah, Seth; [2]Lartey, Anna; [3]Okronipa, Harriet; [4]Ashorn, Per; [5]Arimond, Mary; [6]Dewey, Kathryn G.

[1]PhD. Senior Lecturer. Dept. of Nutrition and Food Science. University of Ghana. Legon. Accra. Ghana; [2]President, IUNS 2013-2017; [3]MSc. Department of Nutrition and Food Science. University of Ghana. Ghana; [4]MD. Center for Child Health Research. University of Tampere School of Medicine and Tampere University Hospital. Finland; [5]MSc. Department of Nutrition. University of California, Davis. USA; [6]PhD. Department of Nutrition. University of California, Davis. USA.

Background and objectives: In many developing countries, the iodine intakes of pregnant women may be low. Consumption of small-quantity lipid-based nutrient supplements (SQ-LNS) providing macro- and micronutrients including iodine may impact iodine status. We examined urinary iodine concentration (UIC) as a secondary outcome among 3 groups of pregnant women enrolled in the iLiNS (International Lipid-based Nutrient Supplements)-DYAD Ghana trial.

Methods: Women (n =1320, <20 weeks of gestation) were randomized to consume during pregnancy 60 mg iron and 400 μg folic acid/d (IFA); or multiple micronutrient supplements containing 18 vitamins and minerals including 250 μg iodine/d (MMN); or 20 g/d SQ-LNS with 22 vitamins and minerals including the same iodine content as MMN (LNS). In a sub-sample (IFA, 92; MMN, 102; LNS, 101), we measured UIC in spot urine samples at enrolment and 36 weeks of gestation, compared UIC among groups at 36 weeks gestation by using the Kruskal-Wallis test, and assessed adequacy of iodine intakes by using WHO cut-off levels: median UIC <150 μg/L representing inadequate iodine intakes, median UIC 150–249 μg/L representing adequate iodine intakes, and UIC ≥500 μg/L representing excessive iodine intakes.

Results: In this subsample of women, mean ± SD age was 26 ± 5 years, and 37% were first-time mothers. At baseline, the overall median (interquartile range) UIC was 137 μg/L (78 – 221 μg/L). At 36 weeks of gestation, median (interquartile range) UIC was lower (overall P = 0.011) in the IFA group [120 μg/L (95 – 258 μg/L)] than in the MMN group [172 μg/L (97 – 266 μg/L)] or LNS group [151 μg/L (95 – 258 μg/L)]. This suggests insufficient iodine intakes in the IFA group, and adequate intakes in the MMN and LNS groups.

Conclusions: We conclude that on the basis of UIC, the iodine intakes of pregnant women in this semi-urban setting in Ghana appear to be inadequate despite a national salt iodization program, and that the consumption of SQ-LNS or multiple micronutrient supplements providing iodine at the WHO-recommended daily dose increases the likelihood of adequate iodine status. This trial was registered at clinicaltrials.gov as NCT00970866.

Keywords: iLiNS Project; iLiNS DYAD Ghana; small-quantity lipid-based nutrient supplements; urinary iodine concentration; iodine intakes

Nutritionist. Rollins School of Public Health. Emory University. Atlanta. GA. USA.

Background and objectives: Infection is associated with impaired nutritional status especially of infants under 5 years old. We assessed the impact of infection indicated by both acute phase proteins (APP), C-reactive protein (CRP) and α-1-acid glycoprotein (AGP), and as reported by maternal recall, on the nutritional status of infants.

Methods: 505 pregnant women were enrolled into a nested longitudinal cohort study of vitamin A. Data analysis was restricted to infant data at 4-months (n=400 mother-infant-dyads) and 9-months (n=385 mother-infant-dyads) postpartum. Incidence and severity of respiratory infection and diarrhea over the previous 14 days were assessed by maternal recall; information on infant/child feeding practices were also collected. Infant weight, recumbent length and heel-prick capillary blood collection were taken at 4- and 9-months postpartum. Indicators of VA status [(retinol binding protein (RBP)], iron status (Hb, ferritin) and subclinical inflammation APP, CRP and AGP were determined. Subclinical inflammation was defined as CRP >5mg/L and/or AGP >1g/L. Impacts of infection on infant nutritional status were estimated with random effect logistic models adjusted for clustering and differences at enrollment.

Results: Infection prevalence, based on elevated CRP and AGP levels, was 36.7%. For diarrhea reported symptoms, 67.4% at 4-months and 42.4% at 9-months had no indication of infection as indicated by CRP and AGP; whilst for acute respiratory reported symptoms, 54.5% at 4-month and 42.6% at the 9-month visit had no indication of infection. There was significant positive association with infection among VA deficient infants based on maternal reported symptoms. The odds of having infection in underweight infants was 3.7 times higher (OR: 3.7; P=0.019); this attenuated after adjusting for inflammation. Infants with iron deficiency were less likely to have infection (OR: 0.40; P=0.001); after adjusting for inflammation, this effect disappeared (OR: 1.11; P=0.607). Infants with VA deficiency were 5 times more likely (OR: 5.06; P=0.0001) to have infection, but after adjusting for inflammation they were less likely to have infection (OR: 0.55; P=0.002).

Conclusions: Acute phase proteins are more useful in defining infection in a population compared to reported symptoms of illness. Not controlling for inflammation in a population while assessing nutritional status might result in over reporting or underreporting prevalence.

Background and objectives: The WHO recommends exclusive breastfeeding during the first six months of life. Data from developing countries on breast milk adequacy and its association with body composition and energy expenditure of lactating mothers are scarce. We aimed to compare the breast milk output of lactating mothers in Rwanda and the Netherlands.

Methods: We used a convenience sample of 8 Rwandan and 5 Dutch mother-infants pairs (child's age 2-4 months) who fed their infants exclusively with breast milk. Rwandan mothers were recruited from a deprived rural area with a high level of childhood stunting, whereas Dutch mothers were all affluent. The dose-to-mother technique with doubly labelled water was used to assess child's breast milk intake, body composition and energy expenditure. After dosing, saliva samples from mothers and infants were collected over a 14-day period and analyzed for deuterium (2H) and 18-oxygen (18O) abundance by Isotope Ratio Mass Spectrometry. Data were fitted to model water turnover using the multi-point protocol in the mother and infant by using the solver function in Microsoft Excel.

Results: The estimated mean (±SD) daily breast milk output was 902±261 g/d among Rwandan mothers and 848±205 g/d among Dutch mothers (P= 0.706). The percentage of body fat was not significantly different between Rwandan and Dutch mothers (33% vs. 32%, P=0.759), but the total daily energy expenditure was much higher in Rwandan mothers compared to Dutch mothers (3214 kcal vs. 2338 kcal, P=0.004).

Conclusions: Despite their very high total energy expenditure, Rwandan mothers had similar breast milk output compared to Dutch mothers.

IODINE STATUS IN BREAST MILK DURING THE FIRST 12 WEEKS POSTPARTUM IN TIANJIN, CHINA

[1]Wang, Wei; [2]Zhang, Wanqi; [3]Sun, Yu; [1]Chen, Wen; [1]Zhang, Yixin; [4]Tan, Long; [5]Shen, Jun; [6]Zhao, Zhuo.

[1]PhD. School of Public Health. Tianjin Medical University. China.; [2]PhD. Professor. School of Public Health. Tianjin Medical University. China.; [3]MSc. School of Public Health. Tianjin Medical University. China.; [4]PhD. Lecturer. School of Public Health. Tianjin Medical University. China.; [5]MD. Associate Professor. School of Public Health. Tianjin Medical University. China.; [6]PhD. Entry-Exit Inspection and Quarantine. China.

Background and objectives: The present study investigated the iodine status of breast milk and breastfed infants during the first 12 weeks postpartum in Tianjin, China.

Methods: A total of 175 pregnant women were recruited before delivery. Their breast milk and 24-h urine samples were collected at 4, 8, and 12 weeks postpartum; spot urine samples were simultaneously collected from their infants. The iodine content of the samples was measured.

Results: The mean breast milk iodine concentrations (BMICs) at 4, 8, and 12 weeks were 221.7 ± 103.5 μg/L, 175.2 ± 76.2 μg/L, and 148.1 ± 66.2 μg/L, respectively. Significant differences existed between the mean BMICs of the three sampling times ($F = 12.449$, $p < 0.001$). The BMIC showed a decreasing trend during the first 12 weeks postpartum. The median urinary iodine concentrations (UICs) of the mothers were 152, 112, and 109 μg/L at the different sampling times. The BMIC and UIC were not correlated in the mothers. The median UICs in the infants were 251, 183, and 164 μg/L. The infant UICs were statistically different at the three sampling times ($p = 0.001$). Moreover, the infant UICs correlated with the BMICs ($Rs = 0.205$, $p = 0.010$) but not with the maternal UICs ($Rs = 0.131$, $p = 0.067$).

Conclusions: The BMIC in and infant iodine intake from breast milk decreased in the first 12 weeks. Breastfed infants could receive adequate iodine from breast milk in Tianjin City.

10-YEAR RISK ESTIMATION FOR TYPE 2 DIABETES MELLITUS IN UNIVERSITY STUDENTS IN ASUNCIÓN, PARAGUAY

Gonzalez Cañete, Natalia Elizabeth.

MSc. Nutritionist. School of Medicine. Human Nutrition Career. Universidad del Pacífico Privada. Paraguay.

Background and objectives: The beginning of university life implies an important change in the life of the individual. According to research, university life is characterized by limited time for meals and for the practice of physical activity, lack of main meals, excess weight, preference for junk food, and few hours of sleep, among other factors. Objectives: To estimate the risk of 10 years of type 2 diabetes in university students.

Methods: Observational, descriptive, cross-sectional study with non-probabilistic sampling for convenience, carried out in 106 students of Medicine, Dentistry, Nutrition, Accounting, Administration, Audiovisual Sciences and Graphic Design of the Universidad del Pacífico Privada, of Asunción, Paraguay, recruited from October to December 2015. All subjects underwent for weight and height measures for nutritional status assessment, and body fat was also determined; cardiovascular risk by abdominal circumference, daytime somnolence by Epworth sleepiness scale, and some dietary and physical activity (FA) habits described by survey. The 10-year risk of developing type 2 diabetes was assessed through the Findrisk survey. The protocol was approved by the Ethics Committee of the Universidad del Pacífico Privada.

Results: 69% of the population were women. 68% belonged to health careers, with 50% in their second year of university. The median age was 21 years. 59% were with normal weight, and 63% had normal abdominal circumference. 62% had body fat at a high acceptable level. "Low risk" of developing diabetes was found in 65% of cases, and a slightly elevated risk in 31% of the subjects. 73% presented normal daytime sleepiness, 50% reported sleeping 7 hours. 5% smoked and 55% performed AF; however, the median time spent on this was 25 minutes / week. Lunch was the most consumed meal (91%). 54% added additional sugar to their juices and infusions, while 74% reported consuming sugary beverages.

Conclusions: Interventions should be implemented at the university level, increasing the time spent on scheduled physical activity and improving the quality of beverages ingested by this population.

Keywords: Students, education, diabetes mellitus, habits, nutritional status.

DEVELOPMENT OF MULTI-SECTORAL NUTRITION ACTION PLAN; TANZANIA EXPERIENCE

[1]Kaganda, Joyceline; [2]Kavishe, Festo.

[1]PhD. Nutritionist. Tanzania Food and Nutrition Centre. Dar es salaam. Tanzania; [2]D.MSc,MSC,MD. Independent Human Development Consultant.

Background and objectives: Multisectoral actions is needed to elimination malnutrition in the world. However, developing the multi-sectoral nutrition action plan has been a challenge to most countries. Tanzania is ready to show an example on how to develop the National Multisectoral Nutrition Action Plan (NMNAP).

Methods: The process started by developing a road which provided for a "steering structure" for policy guidance, sectoral and partner coordination, strategic decisions and quality assurance.

Structurally, the NMNAP steering committee was chaired by the Scaling Up Nutrition (SUN) Country focal point. The steering committee established six task teams with the mandate to develop costed implementation plans for actions in the key result areas (KRA). In forming the task teams, the steering committee used the 2013 Lancet Conceptual Framework for addressing malnutrition and categorized the KRAs into three categories: nutrition specific, nutrition sensitive and enabling environment interventions.

A senior level nutrition expert was consulted as lead facilitator whose role was to provide technical harmonization, coordination, quality assurance and cross-theme conceptual standardization. Tanzania Food and Nutrition Centre (TFNC) facilitated all the technical meetings on key milestones.

Evidence was collected using desk reviews, and where appropriate new operational evidence was collected through bottleneck analysis. The process engaged all key actors in the multisectoral, multi-layer and multi-stakeholder nutrition system at all levels. Consultations were based on the SUN stakeholder platforms. In process, stakeholders did a working session to articulate the desired change and to understand how to relate in productive ways with different stakeholders through a common vision and action.

Results: The task teams consolidated their work in a workshop facilitated by the Lead Facilitator who then used the output from the workshop to develop draft-1 of the NMNAP. This draft was peer reviewed and validated in a second workshop. The Lead Facilitator incorporated inputs from the reviewers and the validation workshop into draft-2, which was then submitted to the High Level Steering Committee for Nutrition (HLSCN) for final inputs.

Conclusions: It took one year for the multi- sectoral plan to be developed and finally indorsed by the HLSC

EARLY-LIFE RISK FACTORS AND THEIR COMBINED EFFECTS AS PREDICTORS OF OVERWEIGHT IN SPANISH CHILDREN

[1]Iguacel Azorín, Isabel; [2]Escartín, Laura; [3]Fernández-Alvira, Juan Miguel; [4]Iglesia, Iris; [5]Layabén, Idoia; [6]Moreno, Luis A.; [7]Samper, María Pilar; [7]Rodríguez, Gerardo.

[1]MSc. Nurse. Psychologist. Economist. Department of Physiatry and Nursing. University of Zaragoza. Spain; [2]MD. Paediatrician. Institute of Aragonese Health Research. University of Zaragoza. Spain.; [3]PhD. Nutritionist. Psychologist. Spanish National Center for Cardiovascular Research. Spain.; [4]PhD. Nutritionist. Deparment of Physiatry and Nursing. University of Zaragoza. Spain.; [5]PhD. Biologist. Department of Nutrition and Bromatology. University of the Basque Country. Spain.; [6]PhD. Paediatrician. Nutritionist. Deparment of Physiatry and Nursing. University of Zaragoza. Spain.; [7]PhD. Paediatrician. Deparment of Paediatrics, Radiology and Physical Medicine. University of Zaragoza. Spain.

Background and objectives: Early-life risk factors have been associated with subsequent childhood obesity. However, most of the studies did not consider important confounders to disentangle the contribution of each factor and their cumulative effects. We aimed to explore pre-, peri- and postpartum risk factors on the risk of overweight/obesity at age 6y and to investigate the cumulative effect of early life risk factors on overweight/obesity at ages 2-,4- and 6y.

Methods: A total of 1,031 children were evaluated at birth and re-examined during a 6-year follow-up in a representative cohort of Aragon (Spain). Maternal smoking during pregnancy, gestational weight gain, gestational age, birth weight, caesarean section, breastfeeding practices and rapid infant weight gain from birth to 6 months of age were the factors studied. Parental body mass index (BMI), maternal education, parental/ethnicity origin were defined as main confounders. We used logistic mixed-effects models to assess the associations investigated.

Results: Parental BMI and parental ethnicity/origin were the strongest predictors and they confounded several associations. Rapid infant weight gain (OR=2.29;[1.54-3.42]99%CI) and smoking during pregnancy (OR=1.61;[1.01-2.59]99%CI) remained statistically significant after adjusting for confounders. A higher number of early-life risk factors was associated with higher odds of being overweight or obese at the age of 6, where the OR increased with the number of early-life risk factors: two early-life risk factors (OR=2.72; [1.54-3.42]99%CI); three early-life risk factors (OR=5.02;[2.28-11.04]99%CI) and four to six early-life risk factors (OR=7.33 ;[3.01-17.84]99%CI). No significant associations were found at the age of 2 or 4 years.

Conclusions: Rapid infant weight gain, parental BMI and origin/ethnicity are important determinants of childhood obesity. Those with a higher number of early risk factors had elevated odds for obesity at age 6 suggesting cumulative effects. Monitoring children with rapid infant weight gain is especially important for childhood obesity prevention.

Keywords: Overweight, children, early life risk factors; socio-economic status

HOW DOES THE HEALTHINESS OF THE US FOOD SUPPLY COMPARE TO INTERNATIONAL GUIDELINES FOR MARKETING TO CHILDREN?

[1]Dunford, Elizabeth; [2]Ng, Shu Wen; [3]Taillie, Lindsey Smith.

[1]PhD. Research Fellow. The George Institute for Global Health. Australia.; [2]PhD. Research Associate Professor. The University of North Carolina at Chapel Hill. USA; [3]PhD. Research Assistant Professor. The University of North Carolina at Chapel Hill. USA.

Background and objectives: Background: Food marketing to children is pervasive and has been linked to increased preference and intake of unhealthy foods. The World Health Organization has developed the only multi-country nutrient criteria to identify foods that should not be marketed to children. However, it is unclear what proportion of the US food supply would be eligible/ineligible for marketing under these criteria.

Objective: To examine the proportion of US food and beverage products eligible for marketing to children under the WHO Europe Nutrient Profile Method (NPM).

Methods: Data for this study are from Label Insight's Open Access branded food database and were extracted in December 2016. Each product was assigned to one of the 21 NPM categories, and nutritional content of the food product cross-checked against the NPM criteria. As added sugars and non-sugar sweeteners are not declared in the Nutrition Facts Panel for US products, each item's ingredient list was checked for the presence of these ingredients. The number and proportion of US products meeting the NPM criteria for marketing to children was examined overall and by category.

Results: Out of 172,842 products, only 22% of US food and beverage products were eligible to be marketed to children. 100% of 'Fresh and frozen fruit, vegetables and legumes', and 0% of 'Chocolate and sugar confectionery, energy bars, and sweet toppings and desserts', 'Cakes, sweet biscuits and pastries', 'Edible ices', 'Juices' and 'Energy drinks' were eligible. Excluding those categories that the criteria specify are 100% eligible, 'Processed meat, poultry, fish' had the highest proportion of products eligible for marketing to children (56%) and 'Savory snacks' the lowest proportion.

Conclusions: The WHO Europe multi-country NPM does not allow the marketing of confectionery or sugar-sweetened beverages, and restricts less healthy non-discretionary items from being advertised, with only 22% of all packaged food products eligible

for marketing to children. This method would be a useful way to determine whether food and beverage products can be marketed to US children.

Keywords: Food marketing; processed foods; public health nutrition; nutrient profiling.

WATCHING TV AND FOOD CONSUMPTION AMONG BRAZILIAN ADOLESCENTS: PENSE, 2015

[1]Enes, Carla Cristina; [2]Nucci, Luciana Bertoldi.

[1]PhD. School of Nutrition. Professor of postgraduate program in Health Sciences. Pontifical Catholic University of Campinas. Brazil.; [2]PhD. School of Medicine. Professor of postgraduate program in Health Sciences. Pontifical Catholic University of Campinas. Brazil.

Background and objectives: Evidence from cross-sectional studies has shown that excessive time in front of the TV has been associated with overweight and obesity in children and adolescents, since this practice has a negative influence on the dietary pattern of young people. The aim of this study was to investigate whether sedentary leisure time was associated with increased regular consumption of unhealthy foods, independently of socio-demographic indicators and family context.

Methods: We used data from the National School Health Survey (PeNSE 2015) conducted by a partnership between the Brazilian Institute of Geography and Statistics (IBGE) and the Brazilian Ministry of Health. The analysis included 101,807 students living in all regions of Brazil, including urban and rural areas and attending public and private schools. The outcome variable was sedentary leisure time, defined as watching more than two hours of TV daily. The target explanatory variables were regular consumption (≥5days/week) of sweets, soft drinks and processed meat. Odds ratios (OR) and 95% confidence interval (95%CI) were obtained by multiple logistic regression. Gender, participant's age, skin color, maternal education, administrative classification of the school and living with their mother and father were used as adjustment variables. All statistical analyses were performed using SAS® Studio, version 3.6 and commands were performed taking into account the complex sample design of PeNSE.

Results: Prevalence of sedentary leisure time was 59.8% (95% CI: 59.2-60.3). The regular consumption of sweets, soft drinks and processed meat was reported by 41.6% (95%CI: 41.1-42.2), 26.7% (95%CI: 26.2-27.2) and 31.3% (95%CI: 30.8-31.8) of adolescents, respectively. Regular consumption of unhealthy foods was statistically higher among adolescents who reported watch TV for more than two hours daily. The associations between the regular consumption of sweets, soft drinks and processed meat and watching more than two hours of TV daily were statistically significant be-

---

fore and after adjusting for sociodemographic characteristics and family composition.

Conclusions: The results highlight the need for integrated interventions to promote healthy leisure-time activities and healthy eating habits among adolescents to prevent negative health effects, particularly overweight and associated morbidities.

Keywords: Adolescent, food consumption, sedentary lifestyle

UNMETABOLIZED FOLIC ACID AND ITS ASSOCIATIONS WITH GLOBAL DNA METHYLATION, OXIDATIVE STRESS AND INFLAMMATORY MARKERS: ANALYSIS AFTER MANDATORY FORTIFICATION OF FLOUR WITH FOLIC ACID

[1]Steluti, Josiane; [2]Carvalho, Aline M.; [2]Rogero, Marcelo M.; [2]Fisberg, Regina; [2]Marchioni, Dirce.

[1]PhD.Department of Nutrition. School of Public Health. University of São Paulo. Brazil; [2]PhD. Department of Nutrition. School of Public Health. University of São Paulo. SP. Brazil.

Background and objectives: Folic acid fortification has increased dietary intake of folic acid and folate status, but it is also associated with the presence of unmetabolized folic acid (UMFA). Brazil has mandatory fortification of flours with folic acid since 2012 and recent study showed that 80% of population in São Paulo had presence of UMFA in plasma. Although the biological effects of UMFA are not well known, in the past several years, many researchers have reported potential adverse effects associated with high intake of folic acid. The present study aims to assess new associations with UMFA and health outcomes, considering oxidative stress (MDA and 8-oxo-dG), inflammatory markers (cytokines, CRP and adhesion molecules) and Global DNA methylation.

Methods: Data was from a cross-sectional population-based survey conducted in São Paulo, Brazil. UMFA was assayed by the affinity-HPLC method with electrochemical detection. Oxidative stress was estimated by malondialdehyde (MDA) concentration in the plasma using derivatisation with thiobarbituric acid and quantification by HPLC/diode array, and 8-OH-dG was assayed using ELISA kit. The CRP was determined by IMMAGE® system. We used the MILLIPLEX MAP 13-plex Cytokine Kit and Human CVD Magnetic Bead Panel 2 from Merck Millipore Corp to analyze the cytokines (IL-1β, IL-6, IL-8, IL-10, IL-12) and adhesion molecules (ICAM and VCAM), respectively. The global DNA methylation was estimated using hydrolysis of genomic DNA followed by specific detection and quantification of the 5-methylcytosine content. Analyses were performed using multivariate logistic regressions adjusted for smoking, sex, age and BMI.

Results: The odds ratios (95% CIs) in logistic regression were 1.02 (0.65;1.59) for MDA, 1.32(0.45;3.88) for 8-oxo-dG, 0.85 (0.54;1.33) for CRP, 1.79 (0.95;3.37) for ICAM, 0.95 (0.52;1.74) for VCAM, 0.44 (0.23;0.84) for IL-1β, 0.57 (0.31;1.07) for IL-6, 1.23 (0.66;2.26) for IL-8, 0.55 (0.29;1.02) for IL-10, 0.58 (0.31;1.07) for IL-12 and 0.65 (0.40;1.08) for Global DNA methylation.

Conclusions: After multivariate adjustment, significant association was observed between IL-1β and UMFA. Although the vitamin is not metabolized, the presence of UMFA may indicate an adequate status because this form is only identified with saturation of the folate metabolism due to the excessive intake of this vitamin.

Sorbonne Paris Cité Epidemiology and Statistics Research Center (CRESS) Inserm U1153 Inra U1125 Cnam Paris 13 University. France.

Background and objectives: Dietary supplements (DS) are largely consumed in occidental countries without having demonstrated their nutritional benefits and safety.

In a large population-based study of French adults: 1) to compare the prevalence of nutrient inadequacy and the proportion of individuals exceeding tolerable upper intake levels (UL) between DS users and non-users, and 2) to quantify the extent of potentially "at risk" DS use practices (e.g. DS/drugs contraindicated associations).

Methods: 76,925 participants to the NutriNet-Santé cohort completed a quantitative DS questionnaire and three 24h dietary records. A composition database including >8000 DS was developed. Variance reduction was applied to estimate usual intakes and analyses were weighted according to the French census data.

Results: DS highly contributed to total intakes among DS users of the specific nutrient (e.g. 52% for vitamin D, 21% for pyridoxine). Compared to dietary intakes only, their prevalence of inadequacy was reduced by 11% for vitamin C, 9% for magnesium, 6% for pyridoxine in men, and 19% for calcium, 12% for iron, 11% for magnesium in women (p<0.0001). The proportion of subjects exceeding UL reached 6% for iron and 5% for magnesium in men, and 9% for iron in women. 7% of DS users had potentially "at-risk" practices, such as DS-drugs contraindicated associations (e.g niacin DS/anticoagulant drugs) or use of beta-carotene DS in current/past smokers.

Conclusions: While DS use contributed to decrease the prevalence of insufficient intakes for several nutrients, it also conveyed excessive intakes for iron and magnesium. Besides, a substantial proportion of potentially "at-risk" DS use practices was reported.

Keywords: Dietary supplements, nutrient inadequacy, tolerable upper intake levels, drug interactions

SCIENTIFIC PRODUCTION OF THE NATIONAL SCHOOL FOOD PROGRAM IN BRAZIL: A SYSTEMATIC REVIEW

[1]Canella, Daniela; [2]Quadros, Jhenifer; [3]Bandoni, Daniel.

[1]Department of Applied Nutrition. Rio de Janeiro State University. Rio de Janeiro. Brazil.; [2]Nutritionist, BSc. Department of Applied Nutrition. Rio de Janeiro State University. Rio de Janeiro. Brazil.; [3]Professor, PhD. Department of Health, Clinics and Institutions. Federal University of São Paulo. Santos. Brazil.

Background and objectives: The National School Food Program (Programa Nacional de Alimentação Escolar – PNAE) is one of the oldest nutrition programs in Brazil and is internationally recognized in the food and nutrition security area. The program offers meals free of charge to every student enrolled in public schools, as a strategy to guarantee the human right to adequate food. The objective of this study was to map, systematize and evaluate the scientific production about school food in Brazil.

Methods: A systematic review of literature was performed with the following guiding question: How is the scientific production on the National School Food Program in Brazil characterized?. The search for articles was made on Pubmed and Lilacs databases, using keywords related to school food and food and nutrition public policies. Studies made in Brazil were gathered, covering different aspects of PNAE. References of the selected articles were consulted in order to identify other relevant papers. The articles published until February 2016 were systematically reviewed and grouped in analytical categories. The results were described through relative frequency.

Results: From the articles found (2,839 non duplicated articles), 97 full articles were eligible and 16 were identified on references lists, adding up to 113 articles analyzed. The articles are mostly originals (85,8%), quantitative (56,6%), conducted in the Southeast (31,8%) and the South (20,3%), and published from 2010 (67,2%). Six Brazilian public universities were responsible for 50,0% of the manuscripts analyzed. The objects studied were acceptability and adherence to school food (29.2%), evaluation of menu (27,4%), management and operation of the program (25,7%), professional training and action (14.2%), acquisition of products from family farmers (12.4%), sanitary aspects (8.8%) and others (8.0%).

Conclusions: The scientific production related to PNAE is growing, concentrated in some regions of the country, addresses several aspects even in different proportions, but is centered in quantitative approach.

IDENTIFYING SOURCES AND VARIABILITY OF IODINE IN COW'S MILK TO ENSURE ADEQUATE DIETARY IODINE INTAKES BY THE SWISS POPULATION

[1]Van der Reijden, Olivia; [2]Galetti, Valeria; [1]Hulmann, Marie; [3]Haldimann, Max; [4]Schlegel, Patrick; [5]Kreuzer, Michael; [5]Bérard, Joël; [6]Manzocchi, Elisa; [7]Zimmermann, Michael Bruce; [2]Herter-Aeberli, Isabelle.

[1]MSc. Laboratory of Human Nutrition. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland.; [2]PhD. Laboratory of Human Nutrition. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland.; [3]MSc. Division of Risk Assessment. Federal Food Safety and Veterinary Office. Switzerland.; [4]PhD. Agroscope Posieux. Switzerland.; [5]PhD. Animal Nutrition. Institute of Agricultural Sciences. ETH Zurich. Switzerland.; [6]MSc. Animal Nutrition. Institute of Agricultural Sciences. ETH Zurich. Switzerland.; [7]MD. Laboratory of Human Nutrition. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland.

Background and objectives: Like in many industrialized countries, the main dietary iodine sources in Switzerland are iodized salt and dairy products, with an estimated contribution of 54% and ≈30-40%, respectively. Current health policy calls for a reduction in per capita salt consumption from 9 to 5 g per day; thus, the dietary iodine contribution from dairy products will likely become more important. However, milk iodine concentration (MIC) varies widely, making milk an unpredictable source. Therefore, our research aim was twofold: 1) to survey the MIC from farms throughout Switzerland to determine the main factors determining MIC; and 2) to establish the dose-response relationship of iodine intake of cows and MIC at five different supplementation levels feeding a forage-based diet.

Methods: In study 1, we collected bulk milk samples from 32 farms (n=126) over a period of one year. From each farm, prior to the milk samplings, we sampled all diet components (n=305) including water and completed a questionnaire regarding feeding

and practices of disinfection with an iodine containing teat dip. In study 2, we supplemented 5×5 lactating cows with either 0 or 0.5, 0.7, 1 and 2 mg I/kg dietary dry matter (DM) for 21 days, and weekly collected milk (n=125) and feed samples (n=10).

Results: In study 1, the overall median (IQR) MIC was 87 (42–134) µg/L. Season had a significant effect on MIC, with the lowest and highest concentration found in September and March, respectively (p<0.001). Furthermore, MIC was elevated (p<0.01) by the use of iodine containing teat disinfectants. In study 2, dietary and milk iodine correlated strongly and positively on each sampling day ($r^2 > 0.89$, p<0.001). The milk iodine concentration was ≈150 µg/kg at a dietary iodine concentration of 1 mg I/kg dietary DM of the cow.

Conclusions: We will use these data with current estimated milk and dairy product intakes in target groups (young women and children) to model iodine intakes to set feeding recommendations for dairy cows and revise guidelines for milking to ensure milk and milk products remain reliable sources of dietary iodine.

COMPLEMENTARY FEEDING IN RURAL BANGLADESH: OUTCOMES FROM THE IMPROVING MATERNAL, NEONATAL AND CHILD SURVIVAL PROGRAMME

[1]Mohammed, Mahmood Kazi; [2]Hossain, Elora; [3]Khanam, Reshma; [4]Afsana, Kaosar.

[1]MBBS MPH. Senior Medical Officer. Health, Nutrition and Population Programme. BRAC. Bangladesh; [2]BDS MPH. Senior Sector Specialist. Health, Nutrition and Population Programme. BRAC. Bangladesh; [3]MBBS MPH. Manager. Health, Nutrition and Population Programme. BRAC. Bangladesh; [4]MBBS MPH PhD. Director. Health, Nutrition and Population Programme. BRAC. Bangladesh.

Background and objectives: Improving maternal, neonatal and child survival (IMNCS) programme of BRAC is a comprehensive community based health intervention focusing on preventive and curative care with a group of trained community health workers with the goal to reduce maternal, neonatal and child mortality, particularly among the poor and socially excluded populations in rural Bangladesh. The programme is reaching 25 million people living in 14 districts of Bangladesh with reproductive, maternal, neonatal child and adolescent health (RMNCAH) services.

This abstract intends to demonstrate the achievement of nutritional interventions of the programme of 2015. Principal nutritional interventions of the programme includes initiation of exclusive breast feeding, tracking of continuation of breast feeding, initiation of complementary feeding, tracking of consumption of adequate amount of food and consumption of animal protein by the community health workers.

Methods: The data indicated here are taken from the management and information system of the IMNCS programme.

Results: Data from January to December of 2015 reveals that, 501,834 (93%) of the neonates were successfully initiated breast feeding within one hour of their birth. However, 346,105 (83%) infants continued exclusive breast feeding.

The Shasthya Kormis (SKs) who are the community health workers of BRAC, counsel the mothers and her relatives about complementary feeding and consumption of different animal proteins for the development of the child through regular household visits. 404,166 (83%) children were successfully initiated complementary feeding in the catchment area of the programme. 290,135 (60%) children aging 6 months and above consumed appropriate amount of food. 325,558 (67%) children aging 6 months and above consumed animal protein which is a remarkable achievement despite prevailing superstitions in the community to feed different animal proteins to the children.

Conclusions: The impact of 9 years of the nutritional interventions of IMNCS programme on 25 million people shows clear evidence on improving the status of child nutrition which proves the interventions promising. Scaling up of the programme intervention to other regions will have a substantial effect in ensuring healthy lives for millions of children.

NUTRITIONAL KNOWLEDGE SCALE FOR EUROPEAN ADOLESCENTS USING ITEM RESPONSE THEORY

[1]Sabrina Souza Santos, Thanise; [2]Julian Almarcegui, Cristina; [3]Slater Villar, Betzabeth; [4]Widhalm, Kurt; [5]Gonzalez Gross, Maria Marcela; [6]Piccinelli, Raffaela; [7]Moreno, Luis A.

[1]MSc. Nutritionist.; [2]MSc. Nutritionist. Growth, Exercise, Nutrition and Development (GENUD) Research Group. University of Zaragoza. Spain.; [3]PhD. Nutritionist. Public Health Faculty. University of São Paulo. Brazil.; [4]PhD. President. Academic Institute for Clinical Nutritional. Austria.; [5]PhD. Teacher. Department of Health and Human Performance. Universidad Politécnica de Madrid. Spain.; [6]Council for Agricultural Research and Economics. Research Center on Food and Nutrition. Italy.; [7]PhD. Researcher. Growth, Exercise, Nutrition and Development (GENUD) Research Group. University of Zaragoza. Spain.

Background and objectives: The item response theory (IRT) has several advantages compared with classical test theory approaches and can be used to evaluate the precision of tests in Nutritional Sciences. The aim of the study was to develop a nutritional knowledge scale from a validated nutritional knowledge test (NKT) using the IRT.

Methods: 3215 adolescents of the HELENA study, 12.5-17.5 y, who completed >75% of the NKT and did not answer all the questions right or all the questions wrong were included in the analyses. The NKT consisted of twenty-three multiple-choice questions with four possible answers including the 'don't know' category. The dimensionality of the questionnaire was analyzed by the polychoric correlation matrix in factorial analysis with estimation by principal components analysis. The answers were analyzed by the three parameters logistic model. Discrimination, difficulty and guessing parameters and scores (measure of the construct) were estimated in scale (0,1). IRT parameters were estimated using Bilog-MG software. Other analyses were performed using Stata version 14.

Results: NKT was related to a single dimension scale. Twelve questions presented low discrimination of nutritional knowledge and were excluded from the scale. The discrimination, difficulty and guessing parameters varied from 0.88 to 1.65, from -2.13 to 1.50 and from 0.09 to 0.01, respectively. The scores estimates varied from –0.83 to 0.83. 11 questions showed a good empirical reliability (0.69) and were appropriate in classifying adolescents who present median nutrition knowledge scores.

Nutritional knowledge scale was classified in three different levels: 1) basic, including knowledge about energy expenditure and ingredients from recipes; 2) adequate, including knowledge about nutrients from foods and their role on health; and 3) advanced, including basic and advanced nutritional terms.

Conclusions: The IRT gives guidance in tailoring nutrition knowledge among adolescents. An 11 multiple-choice questions NKT is proposed as a new approach when aiming to classify adolescents according to their nutrition knowledge.

Keywords: Nutritional knowledge, IRT, Multiple choice-test.

ASSOCIATION OF DIETARY INTAKE OF POLYUNSATURATED FATTY ACIDS AND MORTALITY: A SINO-AMERICAN NATIONAL JOINT STUDY OF CHNS AND NHANES

[1]Jiao, Jingjing; [2]Zhuang, Pan; [3]Wang, Wenqiao; [2]Wang, Jun.

[1]PhD. Nutritionist. Department of Nutrition. School of Public Health. Zhejiang University School of Medicine. China.;
[2]BSc. Department of Food Science and Nutrition. College of Biosystems Engineering and Food Science. Zhejiang University. China.; [3]MD. Department of Nutrition. School of Public Health. Zhejiang University School of Medicine. China.

Background and objectives: Polyunsaturated fatty acids (PUFA) may contribute beneficially to cardiovascular health, intellectual development and cognitive function. However, epidemiologic evidence is limited and inconsistent for PUFA intake and mortality, especially in a worldwide comparative study level. Our aim is to systematically evaluate associations between dietary intake of PUFA and mortality in a Sino-American national joint study.

Methods: We utilized data from the China Health and Nutrition Survey (CHNS, 1989-2011, n=14,323) and American National Health and Nutrition Examination Survey [NHANES, 1988-1994 (III), continuous 1999-2010 (n=36,032)]. Participants with cardiovascular disease or cancer at baseline were excluded. A median follow-up duration of 14 and 9.8 years was conducted for CHNS and NHANES, respectively. Cox proportional hazards regression was used to estimate hazard ratios (HRs) and 95% confidence intervals (CIs).

Results: A total of 4826 and 1009 deaths accrued over 378,359 person-years of follow-up in NHANES and 199,091 person-years in CHNS, respectively. Intake of marine long-chain n-3 PUFA [eicosapentaenoic (EPA) + docosahexaenoic acids (DHA)] was significantly associated with a reduced risk of all-cause mortality in CHNS. In multivariable-adjusted model, the HRs across increasing intake levels were [0.63 (95% CI, 0.52-0.75), 0.72 (95% CI, 0.60-0.87), 0.74 (95% CI, 0.61-0.89); P<0.001 for trend] as compared with the lowest level. However, this inverse association was only observed in certain category of marine long-chain n-3 PUFA intake in NHANES. A weak inverse association was found between α-linolenic acid (ALA) intake and mortality in NHANES (P=0.04 for trend), whereas high intake level of ALA was related to an increased risk of mortality in the fourth quartile compared with first quartile [1.23 (95% CI, 1.01-1.51); P=0.05 for trend] in CHNS. Increment of arachidonic acid was associated with lower risk of mortality both in NHANES and CHNS, whereas linoleic acid intake was inversely linked with mortality only in NHANES. Importantly, a U-shape association of n-6/n-3 intake ratio with mortality was observed in CHNS.

Conclusions: Different types of dietary PUFA have divergent associations with mortality. The associations also vary between the two different ethnic populations. Our findings highlight preventive maintenance of n-6/n-3 balance diet and provide evidence-based insights into dietary PUFA recommendations for both Chinese and Americans.

Keywords: Polyunsaturated fatty acids; n-3 PUFA; n-6 PUFA; Mortality; Sino-American joint study

Background and objectives: Ultra-processed food consumption has increased in the past decade and evidence has shown that higher intake is associated with obesity and poor diet quality. The aim of this study was to describe how ultra-processed food consumption, as defined by NOVA classification, varied according to sex, age, and household income in UK.

Methods: Analysis of data from the UK National Diet and Nutrition Survey (2008–12). Dietary information was collected using four-day, unweighted, food-diaries. Ultra-processed foods were defined as formulations mainly or solely of industrial ingredients. Percentage of energy intake provided by ultra-processed foods was compared by sex, age group and income quintiles.

Results: Ultra-processed food consumption did not significantly differ between men (57.1% of total energy) and women (56.4%). Adolescents (68.3%) and children (64.2%) consumed a higher percentage of energy from ultra-processed foods than adults (54.9%) and elderly (52.1%). Adolescents obtained significantly more energy than others age groups from French fries, soft and fruit drinks, packaged salty snack, and pizza; while children obtained significantly more energy from breakfast cereal, sausage, confectionary, biscuits, and milk-based drinks. The consumption of ultra-processed foods significantly decreased from the lowest (57.2%) to the highest quintile (53.5%) of household income. Among the subgroups, the energy contribution of French fries, soft and fruit drinks, margarine, and packaged salty snacks significantly decreased across quintiles of the household income.

Conclusions: Consumption of ultra-processed foods in UK was significantly higher among those with lower income levels. It was particularly higher in children and adolescents for whom they made up 2/3 of total energy intake.

Keywords: Food processing; ultra-processed food; NOVA; UK.

CHANGES IN ANAEMIA PREVALENCE AND PROGRAMMATIC COVERAGE AMONG CHILDREN AGED 6 TO 59 MONTHS IN KARAMOJA BETWEEN 2006 AND 2016

[1]Mokori, Alex; [2]Mokori, Alex; [3]Kwagala, Rebecca; [4]Ahumuza, Gracious.

[1]MSc. Nutrition Specialist. UNICEF Uganda; [2]Kampala; [3]MSc. UNICEF. Uganda; [4]BSc. Nutritionist. Department of Human Nutrition and Technology. Makerere University. Uganda.

Background and objectives: Karamoja, an agro-pastoralist semi-arid region in Uganda has the highest prevalence of anaemia in the country. Although the region recorded a reduction in anaemia in 2016, there is no evidence of what could have contributed to this reduction. The study explored the plausible programmatic packages that reduced anaemia in Karamoja between 2006 and 2016.

Methods: Secondary analysis data from Uganda Demographic and Health Surveys 2006, 2011 and 2016. Children aged six to 59 months living with their mothers in Karamoja were studied.

Results: Anaemia decreased from 82.2 percent in 2006, 69.5 percent in 2011 to 67.7 percent in 2016. DPT3 and measles immunization increased by 12.2 percent in 2011. The proportion of children who had had diarrhea together with malaria and cough decreased by 1 percent from 10.2 percent in 2006 to 9.2 percent in 2011. Coverage with all three programs of bednets, deworming and vitamin A supplementation increased from 8.5 percent in 2006 to 23.0 percent in 2011. The proportion of children benefitting from one program decreased from 47.8 in 2006 to 30.5 percent in 2011, those from two programs increased from 21.7 to 25.9 percent. The percentage which never benefitted from any preventative program decreased from 21.7 in 2006 to 17.8 percent in 2011. Children who benefitted from more programs were less likely to have anaemia (p<0.005, OR=0.797). Although consumption of minimum acceptable diet improved, it was not significantly associated with anaemia between 2006 and 2011.

Conclusions: Although anaemia among children aged six to 23 months reduced in Karamoja in 2016, it remains of a high public health significance. The increased coverage with packages of programs has contributed to this reduction. Improved coverage with immunization, deworming, vitamin A supplementation, bed nets and adequate complementary feeding will likely reduce anaemia in Karamoja.

Keywords: Childhood anaemia, immunization, programs, vitamin A supplementation

Research Assistant. McCourt School of Public Policy. Georgetown University. USA.; [6]PhD. Associate Professor. Department of Health Sciences, Wilfrid Laurier University, Waterloo, ON, Canada; [7]PhD. Assistant Professor. Department of Economics. Georgetown University. USA.; [8]MSPH. Research Assistant. School of Public Health. National University of Rwanda. Rwanda.; [9]PhD. Provost's Distinguished Associate Professor. McCourt School of Public Policy. Georgetown University. USA.; [10]PhD. Professor. Department of Environmental Health. Emory University. USA.

Background and objectives: Community health clubs (CHCs)—multi-session village-level gatherings led by trained facilitators, designed to promote healthful behaviors primarily related to water, sanitation, hygiene—have been implemented in several African and Asian countries but have never been rigorously evaluated.

Methods: We conducted a cluster-randomised trial to evaluate the health impact of two versions of the CHC model in Rusizi district, western Rwanda. We randomly selected 150 villages and enrolled 8734 households with children under five years of age in a baseline survey in 2013. We randomly allocated villages to three groups: no intervention (control, n=50), eight sessions (Lite, n=50), or 20 sessions (Classic, n=50). We re-enrolled 7934 (91%) of the households in an endline survey in 2015. The primary outcomes were caregiver-reported diarrhea within the previous seven days in children under five years of age and nutritional status of children under two years of age at baseline, measured through length-for-age (LAZ) and weight-for-length (WLZ) z-scores. We measured intermediate outcomes related to water, sanitation, and hygiene. Analysis was by intention to treat and per-protocol. The trial is registered with ClinicalTrials.gov (NCT01836731).

Results: We observed no impact on caregiver-reported diarrhea in the Lite (PR=0·97, 95% CI: 0.81-1.16) or the Classic group (PR=0·99, CI: 0·85-1·15). We observed no impact on LAZ in the Lite (β=0·05, 95% CI: -0·07-0·17) or the Classic (β=-0·03, 95% CI: -0·08-0·14) group, nor on WLZ in the Lite (β=-0·002, 95% CI: -0·08-0·07) or the Classic (β=-0·02, 95% CI: -0·06-0·09) group. The Classic intervention had a positive impact on reported household water treatment (RD=0·086, 95% CI: 0·029-0·14), use of improved sanitation facilities (RD=0·085, 95% CI: 0·015-0·16), and presence of structurally complete sanitation facility (RD=0·065, 95% CI: 0·0013-0·13). There was no impact on the remaining intermediate outcomes, including improved microbiological water quality, in the Lite or the Classic group.

Conclusions: CHCs, in this setting in western Rwanda, had no impact on caregiver-reported diarrhoea among children under five years of age, LAZ or WLZ among children under two years, or water quality. Our results call into question the value of implementing this intervention at scale for the purposes of achieving health gains in the short term.

DOES CONTEXT INFLUENCE BRAZILIAN WORKERS' BODY MASS INDEX? RESULTS FROM THE ELSA-BRASIL STUDY BASELINE

[1]Pereira de Castro Junior, Paulo Cesar; [2]Araújo Nobre, Aline; [3]Rugani Ribeiro de Castro, Inês; [4]Chor, Dora; [5]Härter Griep, Rosane; [6]de Oliveira Cardoso, Letícia.

[1]PhD student, Nutritionist, National School of Public Health, Oswaldo Cruz Foundation, Rio de Janeiro, RJ, Brazil; [2]PhD, Researcher, Scientific Computing Programme, Oswaldo Cruz Foundation, Rio de Janeiro, RJ, Brazil; [3]PhD, Nutritionist, university professor, Institute of Nutrition, Rio de Janeiro State University, Rio de Janeiro, RJ, Brazil; [4]PhD, Researcher, National School of Public Health, Oswaldo Cruz Foundation, Rio de Janeiro, RJ, Brazil; [5]PhD, Researcher, Laboratory of Health and Environmental Education, Oswaldo Cruz Institute, Oswaldo Cruz Foundation, Rio de Janeiro, Brazil; [6]PhD, Nutritionist, Reseacher, National School of Public Health, Oswaldo Cruz Foundation, Rio de Janeiro, RJ, Brazil.

Background and objectives: There is growing recognition of environmental effect on obesity by scientific community. In middle and low-income countries there are few studies evaluating the influence of contextual factors on obesity, especially regarding the perception about food and physical activity environments. This study investigates how food and physical activity environments associate, separately and jointly, with body mass index (BMI) in 10,445 adult Brazilians, from 35 to 74 years old, who participated in the longitudinal study of adult health (Estudo Longitudinal de Saúde de Adulto, ELSA-Brasil).

Methods: Food environment and physical activity environment were evaluated separately and jointly (combined environment) on a neighbourhood perception scale adapted to the Brazilian context. First, individual scores were calculated for perception of the environments, then an aggregate score was constructed for each of the three dimensions from the mean perceptions of ELSA participants residing in the same neighbourhood. BMI was analysed in continuous form, and gamma regression models with linked identify function were used.

Results: After adjustment for study centre, age, income, schooling, self-reported health, length of time physically active and consumption of vegetables, an inverse association between BMI and physical activity environment (β = -0.063 kg/m² CI: -0.106: -0.020)

and food environment (β = -0.175 kg/m² CI: -0.299: -0.051) was observed among the women, indicating that the better the environment, the smaller the BMI. Also, a stronger inverse association between BMI and favourable combined environment (β = -0.864 kg/m² CI: -1.343: -0.387) was identified, also among the women. Among the men, no association was found between exposures and outcome of interest.

Conclusions: The study findings indicate that contextual factors associate with obesity, demonstrating that choice of health-related habits is not solely a matter of individual responsibility, and that public policies should be implemented to favour healthier food and physical activity environments.

Keywords: Neighbourhood, Food environment, Physical activity environment, BMI.

German Institute of Human Nutrition Potsdam-Rehbruecke. Nuthetal. Germany; [3]PhD. Department of Epidemiology. German Institute of Human Nutrition Potsdam-Rehbruecke. Nuthetal. Germany; [4]Department of Epidemiology. German Institute of Human Nutrition Potsdam-Rehbruecke. Nuthetal. Germany; [5]Department of Food Safety. Federal Institute for Risk Assessment. Berlin. Germany; [6]Prof. Department of Epidemiology. German Institute of Human Nutrition Potsdam-Rehbruecke. Nuthetal. Germany; [7]Prof. Department of Molecular Epidemiology. German Institute of Human Nutrition Potsdam-Rehbruecke. Nuthetal. Germany.

Background and objectives: The Mediterranean Diet (Med-Diet) has been established as a healthy dietary pattern. However, its relation with risk of major chronic diseases in non-Mediterranean countries is still under debate. A healthy alternative proposed in Northern Europe is the Nordic Diet, although its beneficial effects on different chronic disease have been controversially demonstrated. We aimed at investigating the association between the Nordic Diet and the MedDiet and the risk of major chronic disease (type 2 diabetes (T2D), myocardial infarction (MI), stroke, and cancer) in the EPIC-Potsdam cohort.

Methods: The EPIC-Potsdam prospective cohort recruited 27,548 participants between 1994 and 1998. After exclusion of participants with prevalent T2D, MI, stroke, or cancer, we evaluated the adherence at baseline to a score reflecting the Nordic diet and two different MedDiet scores; one based on the one created by Trichopoulou et al. (tMDS), and the other one based on the Mediterranean pyramid (MedPyr). Habitual diet intake was measured using food-frequency questionnaires. Multivariable-adjusted Cox regression models were applied to examine the association between the different diet scores and the incidence of T2D, MI, stroke, and cancer.

Results: During follow-up, 1,337 cases of T2D, 297 of MI, 331 of stroke, and 1,619 cases of cancer, were identified. Higher adherence to the Nordic diet showed an inverse association with the incidence of MI in the overall population and of stroke in men, although not statistically significant. Adherence to the MedDiet was associated with lower incidence of T2D for both scores (HR: 95%CI per 1 SD; 0.92: 0.87-0.98 for the tMDS, and HR: 0.91: 0.86-0.96 for the MedPyr score). The MedPyr score was also associated with lower incidence of MI in women, but not in men

Conclusions: In the EPIC-Potsdam cohort the Nordic diet showed a trend to decrease the risk for MI in the overall population and for stroke in men. Higher adherence to the MedDiet was associated with a decreased risk of T2D in the overall population and with a decreased risk of MI in women.

THE CONTRIBUTION OF MICRONUTRIENT DEFICIENCIES TO ANEMIA AND RED BLOOD CELL (RBC) FOLATE INSUFFICIENCY AMONG NON-PREGNANT WOMEN OF CHILDBEARING-AGE (WCBA) IN BELIZE

[1]Rosenthal, Jorge; [2]Alverson, CJ; [3]Cannon, Michael; [4]Largaespada, Natalia.

[1]Ph.D.. M.C. Epidemiologist. National Center on Birth Defects and Developmental Disabilities. Centers for Disease Control and Prevention. United States; [2]M.Sc..National Center on Birth Defects and Developmental Disabilities. Centers for Disease Control and Prevention. Atlanta. United States.; [3]Ph.D..National Center on Birth Defects and Developmental Disabilities. Centers for Disease Control and Prevention. Atlanta. United States.; [4]MD. Chief. Maternal and Child Health Department. Ministry of Health. Belmopan. Belize.

Background and objectives: Although iron deficiency (ID) and other nutritional-related anemia is a significant public health concern among WCBA, relevant biomarkers are rarely concurrently measured. Iron and other nutritional deficiencies can have adverse effects on birth outcomes.

To estimate the population-attributable risk fractions (PARF) associated with risk factors for anemia and RBC folate insufficiency among non-pregnant WCBA in Belize.

Methods: In 2011, a national probability-based survey was completed among non-pregnant Belizean WCBA, 15-49 years. Blood samples to determine hemoglobin, ferritin, alpha-glycoprotein 1 (AGP), folate (RBC and serum) and vitamin B-12 and socio-demographic and health information were collected from 937 women. Adjusted prevalence risk ratios (PRRs) were estimated from logistic regression models to determine PARF contributing to anemia and RBC folate insufficiency.

Results: The overall prevalence of anemia (<12 g/dL) was 21.8% (95%CI 18.3, 25.8), ID (<15 μg/L) 12.0% (95%CI 9.0, 15.8);

AGP-adjusted ID (<15 µg/L) 15.0% (95%CI 11.60, 19.2); serum folate deficiency (<14 nmol/L) 11.0 (95%CI 8.3, 14.4); RBC folate deficiency (<624 nmol/L) 35.1% (95%CI 30.8, 39.8); RBC folate insufficiency (<748 nmol/L) 50.3% (95%CI 45.4, 55.1); and vitamin B-12 deficiency (<221 pmol/L) 49.8% (95%CI, 45.0, 54.6). We estimated that 30.2% (95%CI 20.4, 41.3); 8.0% (95%CI 1.9, 17.8) and 1.8% (95%CI 0, 11.4) of anemia cases were attributable to iron deficiency, serum folate and vitamin B-12 deficiency, respectively. We also estimated that 13.9% (95%CI 4.1, 24.0) and 6.2% (95% CI 2.8, 10.8) of RBC folate insufficiency cases were attributed to vitamin B-12 and serum folate deficiency, respectively.

Conclusions: To our knowledge, this is the first national study to present data on the substantial contribution of iron deficiency, folate deficiency and vitamin B-12 deficiency to the reduction of anemia and RBC folate insufficiency among women of childbearing-age in a a low or medium income country.

Keywords: Population-attributable risk fractions, Micronutrient deficiencies, Anemia, Iron deficiency, Folate deficiency and insufficiency

IMPLEMENTING FOOD-BASED DIETARY GUIDELINES TO GUIDE POLICIES, PROGRAMMES AND NUTRITION EDUCATION

[1]Wijesinha Bettoni, Ramani; [2]Khosravi, Ashraf; [3]Hernandez-Garbanzo, Yenory; [4]Sherman, Jane; [5]Vargas, Melissa; [3]Islas Ramos, Ana.

[1]PhD; [2]BSc. Student (former volunteer at FAO), Metropolitan University College, Copenhagen, Denmark.; [3]PhD. Nutrition Officer. Food and Agriculture Organization of the United Nations. Italy.; [4]MSc. Independent Nutrition Education Consultant. Italy.; [5]MSc. International Nutrition Consultant. Food and Agriculture Organization of the United Nations. Italy.

Background and objectives: The need for food-based dietary guidelines (FBDGs) to guide national food-related policies and programmes including nutrition education programmes is increasingly recognized. Several sources such as the Framework for Action from the Second International Conference on Nutrition, the Global Nutrition Report 2015, and the Foresight Report, 2016, published by the Global Panel on Food Systems for Nutrition have highlighted the potential role for FBDGs in shaping healthy diets. However, there has been a lack of information on how FBDGs are actually implemented by national entities, and a lack of guidance on carrying out implementation. The aim of this study was to obtain a snapshot of country actions of FBDGs implementation.

Methods: To explore if current implementation covers the different levels of influence on people's food choices, namely personal/interpersonal factors, institutional/community, and the enabling environment, the "social-ecological" framework was used. A literature review covering key scientific databases and grey literature was carried out in 2016. The findings helped shape questions for a key informant survey. Responses were received from 47 key informants in 27 of the 34 countries contacted, mostly from de-

veloped countries. Key informants included staff and researchers in government ministries, national nutrition organizations and academia. Responses therefore built a picture mainly of government-led activity rather than of informal actions and impacts.

Results: Implementation activities that had a direct link to the FBDGs were identified from various countries. These included some policy actions (such as school meal/institutional food standards and vending machine/cafeteria food standards in line with FBDGs), programmes (e.g. food assistance programmes, two examples of agriculture programmes, examples of food labelling/food advertising guided by the FBDGs, and reformulation of food to comply with the FBDGs), and many consumer education programmes. Information on evidence of effectiveness was collected, where available.

Conclusions: Some preliminary recommendations on how to maximize the impact of FBDGs are given, which include the need for a consumer-centred approach; an implementation plan with built in monitoring, evaluation, and funding; the need to target all policies/programmes that influence food, and the need to target policymakers as well as educators and the general public.

Keywords: Food-based dietary guidelines, implementation, food-systems.

THE EFFECTS OF THE DANISH TAX ON SATURATED FAT ON NUTRIENT INTAKE AND MODELLED HEALTH OUTCOMES FOR DIFFERENT SOCIO-DEMOGRAPHIC GROUPS: AN ECONOMETRIC AND COMPARATIVE RISK ASSESSMENT EVALUATION

[1]Smed, Sinne; [2]Dejgård Jensen, Jørgen.

[1]Department of food and research Economics, University of Copenhagen; [2]Professor. Economist. Department of Food and Ressource Economics. University of Copenhagen.

Background and objectives: The WHO recommends the use of fiscal policies to promote healthy eating, but underline that the use of fiscal instruments might have potential regressive effects. However, there is very limited real-life evidence of the effect of food taxation, and even less on the potential regressive effects,

as most evidence is based on simulation studies. The objective of this study is to evaluate the effect of the Danish tax on saturated fat in terms of changes in nutritional quality of the diet i.e. changes in saturated fat consumption as well as other non-targeted dietary measures and to model the associated changes in NCD mortality for different socio-demographic groups.

Methods: Based on household scanner data we estimate the impact of the tax on consumption of saturated and unsaturated fat, salt, fruit, vegetables and fiber. The resultant changes in dietary quality are then used as inputs into a comparative risk assessment model (PRIME) to estimate the effect of these changes on Non-Communicable Disease mortality. We estimate the effects for four different educational groups; no education, vocationally trained, short tertiary education and long to medium tertiary education, using education as a proxy for socio-demographic status.

Results: The tax resulted in a 4.0% reduction in saturated fat intake on average with largest decrease among those with no education or medium to long tertiary education. Vegetable consumption increased especially for vocational trained and short educated. Salt consumption increased for most individuals, but mostly for short educated. We find a modelled reduction in annual NCD mortality per 100.000 persons of 3 lives saved for those with no education, 5.1 lives saved for the vocationally trained, 1.7 lives extra lost for the short educated and no change for the medium to long educated. All educational groups experience an increase in food-expenditure due to the tax. Largest increases are found for short and medium to long educated.

Conclusions: Modelling the effect of the changes in diet on health outcomes suggests that the saturated fat tax made a positive contribution to public health in Denmark. The effects are regressive in terms of NCD mortality, but progressive economically

Keywords: Fat tax, progressivity, NCD mortality

Background and objectives: Dairy food is a major energy and nutrient source in many cultures. Studies assessing associations of milk and dairy intake with mortality and cardiovascular disease (CVD) have been inconsistent, in part possibly due to poor intake estimation. Circulating pentadecanoic acid (15:0) is commonly utilized as an objective biomarker of dairy fat intake. Here we evaluated associations of serum 15:0 with incident CVD and all-cause mortality in a Swedish population-based cohort study.

Methods: Serum cholesterol ester 15:0 was measured at baseline in 60-year-old men (n=2017) and women (n= 2133). With use of national registers, 578 incident CVD events and 568 deaths were identified during a median follow-up of 16.6 y in participants with no prevalent CVD at baseline (n=3785, 53% women). Associations of 15:0 with incident CVD and all-cause mortality were evaluated using Cox proportional hazard models. Serum 15:0 (expressed as proportion of total fatty acids) was assessed as a continuous variable and in quintiles. Nonlinear associations were evaluated by using restricted cubic splines.

Results: In multivariable-adjusted models (including sex, BMI, physical activity, smoking habits, alcohol intake, education, prevalent type-2 diabetes, and drug treated hypertension and hyperlipidemia), serum 15:0 was inversely associated with incident CVD in a linear dose-response manner: hazard ratio (95% CI) of the top vs bottom quintile, 0.75 (0.57-0.98). A nonlinear associa-

tion was identified for serum 15:0 and all-cause mortality, with initially steeply declining risk that plateaued at 15:0 levels above the median (>0.22% of total fatty acids). The hazard ratios (95% CI) of the third and fifth quintiles compared to the first quintile were 0.67 (0.52-0.88) and 0.79 (0.61-1.03), respectively, when evaluated in multivariable-adjusted models.

Conclusions: Serum 15:0, a biomarker of total dairy fat intake, was associated with lower risks of incident CVD and all-cause mortality among older Swedish men and women.

THE DIFFERENCES OF LIPID PROFILES BETWEEN THE ONLY CHILDREN AND NON-ONLY CHILDREN: A NATIONAL SURVEY IN CHINA

[1]Ma, Bingjie; [1]Lin, Lizi; [2]Jing, Jin; [2]Cai, Li.

[1]MSc. School of Public Health. Sun Yat-sen University. China.;
[2]PhD. School of Public Health. Sun Yat-sen University. China.

Background and objectives: Although the lifelong effects of childhood dyslipidemia have been identified, the differences of lipid profiles between the only children and non-only children are still unclear. As the one-child policy had been implemented for 35 years in China, it is important to investigate that whether the only-child factor is associated with dyslipidemia.

Methods: 65347 Chinese children aged 6 to 18 years from 7 provinces were participated in this study, in which 16100 lipid profiles were available. Children's height, weight, total cholesterol (TC), triglycerides (TG), high-density lipoprotein cholesterol (HDL-C) and low-density lipoprotein cholesterol (LDL-C) were measured. Questionnaires were used to assess the demographic information. Covariates selected a priori included age, gender, living in urban or rural areas, provinces, parental educational levels, monthly family incomes and body mass index z-score. General linear model and logistic regression were used in the comparison of lipid profiles and prevalence of dyslipidemia, respectively. Subgroup analysis was applied to further explore the gender and urban-rural disparity between only- and non-only children.

Results: The only children were more likely to be boys and lived in urban areas than non-only children (53.76% VS 44.10%, 65.44% VS 40.97%, respectively). After adjusted for all covariates, the only children showed higher concentration of TC and LDL-C when compared with the non-only children (3.97±0.78 VS 3.89±0.77, 2.12±0.65 VS 2.06±0.64, all P<0.010). In the subgroup analysis, the differences were only found in children who lived in rural areas but not those in urban areas. Similarly, the raw prevalence of hypercholesterolemia and hyper-LDL-cholesterolemia were higher in only children (5.48% VS 4.43%, 3.97% VS 2.96%, all P<0.010). However, we only found higher prevalence of hyper-LDL-cholesterolemia in only-child girls who lived in rural areas when adjusted for all covariates (Odd Ratio: 2.58; 95% Confidence Interval: 1.29-5.14).

Conclusions: Higher levels of TC and LDL-C were found in only children especially for those who lived in rural areas. Higher prevalence of hyper-LDL-cholesterolemia was found in only-child girls who lived in rural areas. The gender and urban-rural disparity of lipid profiles between only- and non-only children should be well considered in the preventive guidelines and public health policies for childhood dyslipidemia.

IMPACT OF THE FARMER NUTRITION SCHOOL INTERVENTION ON IMPROVED DIETARY DIVERSITY OF WOMEN: RESULTS OF A COHORT STUDY FROM THE USAID SPRING PROJECT IN BANGLADESH

[1]Hawkins, Aaron; [2]Waid, Jillian; [3]Hasan, Md. Mehedi.

[1]USAID SPRING Project/Helen Keller International; [2]Director of Research, Learning and Evaluation, Helen Keller International, Bangladesh; [3]Senior Program and Research Analyst, Helen Keller International.

Background and objectives: The USAID funded Strengthening Partnerships, Results, and Innovations in Nutrition Globally (SPRING) project implemented a nutrition activity called Farmer Nutrition Schools (FNS) to improve dietary practices in selected areas of Bangladesh. This study aimed at examining changes in women's diet diversity and other nutrition-related indicators following FNS participation in the implementation areas.

Methods: SPRING designed a cohort study to measure changes plausibly brought about by the SPRING FNS program when implemented at scale. This study surveyed a cohort of pregnant and lactating women (PLW) who participated in an FNS beginning in November 2014. The FNS curriculum includes modules on vegetable gardening, native chicken rearing and pond fish culture, among other key nutrition topics. Data were collected from a cohort of 440 PLW enrolled in 44 FNS of 38 sub-districts under Barisal and Khulna divisions. Participants were interviewed three times: 1) before beginning the FNS sessions (Phase 1); 2) immediately after the FNS sessions were completed (Phase 2); and 3) one year after the completion of FNS activities (Phase 3). We used adjusted Wald test to examine changes in diet diversity among the 386 women who were surveyed in all three phases. Multiple linear regression analysis was used to find the effect of FNS elements on women's dietary diversity scores.

Results: The proportion of households that cultivated vegetables in the homestead, reared chicks and cultured fish, increased significantly between phases 1 and 2 (95%, p<0.0001; 87%, p<0.001; 95%, p<0.05) and was sustained in phase 3. We observed significant improvements in women's consumption of legumes, eggs, flesh foods, vitamin-A rich fruits and vegetables after phase 1. The mean dietary diversity score of women increased from 3.9 in phase 1 to 6.0 in phase 2 (p<0.0001) and 5.6 in phase 3 (p<0.0001). Multiple linear regression revealed that the dietary diversity score

---

increased on average by 0.22 (p<0.05), 0.26 (p<0.05) and 0.32 (p<0.001) among women who cultivated vegetables in the homestead, reared chickens and cultured fish respectively compared to women who did not follow these practices.

Conclusions: SPRING's FNS intervention enhanced food production practices, resulting in a diversification of women's diets among FNS participants.

MULTISECTORAL NUTRITION IN PRACTICE: ACCELERATING STUNTING REDUCTION THROUGH DECENTRALIZED MULTISECTORAL PLATFORMS IN YOROSSO DISTRICT, MALI

[1]Sanou, Dia; [2]Sodjinou, Roger; [3]Coulibaly, Bernard; [4]M'Mbakwa, Bienfait Eca; [5]Traore, Amadou; [6]Traore, Ousmane; [7]Diarra, Modibo; [8]Touré, Sidi El Moctar; [9]Zagre, Noel Marie; [10]Gervais, Suzanne; [11]Pelletier, David.

[1]Food and Agriculture Organization of the United Nations (FAO); [2]UNICEF, New York City. USA; [3]Administrateur Civil Premier adjoint du Prefet, Yorosso, Sikaaso, Mali; [4]Nutrition Officer, UNICEF Mali, sous bureau de Sikasso, Mali; [5]PhD, Assistant Professor, University of Segou, Segou, Mali; [6]PhD, Executive Director, Association de Soutien au Développement des Activités de Population et Developpement (ASDAP), Bamako, Mali; [7]Point Focal SUN Mali, Bamaki, Mali; [8]Conseiller Technique, chargé des activités communautaires, ASDAP, Bamako, Mali; [9]PhD, Regional Advisor, UNICEF regional office for Western and Central Africa (WCARO), Dakar, Senegal; [10]PhD, Extension Associate, Cornell University, Ithaca, NY, USA; [11]PhD, Professor, Cornell University, Ithaca, New York, USA.

Background and objectives: Despites a decrease in the stunting rates in Mali, the estimated number of stunted children has increased from 0.90 to 0.94 million between 2012 and 2015. Sikasso, the Mali's most fertile region, was the most affected by stunting. Thus, the Government of Mali in collaboration with UNICEF and European Union has targeted Sikasso for the Africa Nutrition Security Partnership aimed at strengthening the enabling environment for multisectoral nutrition (MSN) focusing on stunting in Africa. This paper describes the project achievements with district MSN platform in Yorosso

Methods: A triangulation of methods were used including: a) documentation of workshop and meetings; b) key informant interviews; and c) SMART survey data to assess the impact of the intervention.

Results: Following a district multi-stakeholder workshop on nutrition, participants committed to implement key nutrition actions, which were compiled to form the district MSN road map. The road map was validated by the high level political authority at this level. An administrative decision was issued to officially establish the MSN platform with the mandate to coordinate, monitor and evaluate nutrition related plans of various actors; facilitate joint planning and implementation of high impact interventions; and advocate for mainstreaming nutrition into development plans. Platform members were capacitated in multisectoral planning and implementation. The platform increased awareness and understanding of multidimensional nature of nutrition and stimulated coordinated implementation of nutrition sensitive interventions from health, agriculture, education and WASH. Overall nine sub-district platforms and 94 village MSN support groups were operationalized. There was a significant reduction in stunting rate in the district (30.2% in 2012 to 15.4% in 2016). Budgeting for nutrition in the local development plan was a major challenge. Additional challenges include staff turn-over requiring continuous renewal of advocacy/sensitization efforts and capacity building and capacity gaps within government and other stakeholders.

Conclusions: Involvement and leadership of the high level authority was crucial for the involvement of all stakeholders while commitment of the participating stakeholders to the platform principles and road map has accelerated improvement in nutrition indicators.

Keywords: Multisectoral nutrition; stunting; coordination, Sikasso, intervention

ALIGNMENT OF WHEAT AND MAIZE FLOUR FORTIFICATION STANDARDS WITH WHO RECOMMENDATIONS IN COUNTRIES WITH MANDATORY FORTIFICATION

[1]Bobrek, Katya; [2]Broersen, Britt; [3]Aburto, Nancy; [4]Garg, Aashima; [5]Serdula, Mary; [6]Beltran Velazquez, Filiberto; [7]Wong, Eugene C.; [8]Pachón, Helena.

[1]BS Student. Emory College of Arts and Sciences. Emory University. USA.; [2]MSc. Nutritionist. Nutrition Division. World Food Programme. Italy.; [3]PhD, MSc. Chief. Nutrition Division. World Food Programme. Italy.; [4]PhD. Nutrition Specialist. Nutrition Section. UNICEF. USA.; [5]MD, MPH. Medical Epidemiologist. National Center for Chronic Disease Prevention and Promotion. Centers for Disease Control and Prevention. USA.; [6]MSc. Technical Officer, Regulatory Affairs. Evidence and Program Guidance, Department of Nutrition for Health and Development. World Health Organization. Switzerland.; [7]MPH. ORISE Fellow. National Center on Birth Defects and Developmental Disabilities. Centers for Disease Control and Prevention. USA.; [8]PhD, MPH. Senior Nutrition Scientist & Research Associate Professor. Food Fortification Initiative & Emory University. USA.

Background and objectives: In 2009, the World Health Organization issued wheat and maize flour fortification recommendations for five micronutrients (iron, folate, vitamin B12, vitamin A, zinc). In 2016, WHO updated maize flour fortification recommendations for the same nutrients plus thiamine, riboflavin, niacin, pyridoxine, and pantothenic acid. WHO recommendations include fortification compounds and nutrient levels that, based on

per capita flour intake or availability, should be considered when only one food is fortified. This review evaluated alignment to WHO recommendations of flour fortification standards in countries with mandatory fortification.

Methods: Countries' grain availability and fortification standards were obtained from the Food and Agriculture Organization, the Food Fortification Initiative, and WHO. For each nutrient, countries' standards were assessed against WHO recommendations for compounds (e.g. recommended or not, not specified) and nutrient levels (e.g. less than, equal to, greater than).

Results: Official fortification standards were obtained for 61 of 85 countries with mandatory wheat flour fortification and for 15 of 16 countries with mandatory maize flour fortification. The number of standards with nutrients specified ranged from 60 for iron to 14 for vitamin B12 in wheat flour, and from 14 for iron to 0 for pantothenic acid for maize flour.

For wheat flour, among countries with standards, the number of standards with nutrient levels equal to or greater than WHO recommendations were 23 of 56 (folic acid), 3/21 (zinc), 2/14 (vitamin B12), and 2/14 (vitamin A). For maize flour, the corresponding numbers were 5/14 (folic acid), 0/13 (thiamine), 9/13 (riboflavin), 4/13 (niacin), 2/7 (vitamin B12), 2/10 (zinc), 3/9 (vitamin A), and 0/5 (pyridoxine).

For countries that included recommended iron compounds in their standards, 20/60 wheat flour and 3/14 maize flour standards had nutrient levels equal or greater than WHO recommendations for all iron compounds.

Conclusions: Preliminary results suggest that for most nutrients in countries' wheat and maize flour fortification standards using the suggested fortification compound, nutrient levels are lower than WHO recommendations. If these flours are the only fortified foods in countries, this may affect the public health impact of flour fortification in countries.

Research Assistant. World Health Organization (WHO) Collaborating Centre for Obesity Prevention. Deakin University. Australia.; [5]PhD. Senior Research Fellow. Global Health, Food Policy, Obesity and NCD prevention. Department of Epidemiology and Biostatistics. University of Auckland. New Zealand.; [6]MD. MB ChB. FRACP. Department of Epidemiology and Biostatistics. University of Auckland. New Zealand.; [7]PhD. Earle W. McHenry Professor and Chair. Department of Nutritional Sciences. University of Toronto. Canada.

Background and objectives: Food company policies play an integral role in influencing the quality of the food environment and overall dietary habits. The objective of this study was to test methods to evaluate restaurant company commitments relating to the food environment, obesity and non-communicable diseases (NCDs).

Methods: This study builds on work of the International Network for Food and Obesity / non-communicable Diseases Research, Monitoring and Action Support (INFORMAS) to monitor and benchmark food environment policies globally. The Business Impact Assessment – Obesity and related population-level nutrition (BIA-Obesity) tool adapts methods to evaluate nutrition-related commitments, performance and disclosure practices of the largest global food companies and distributors across four sectors (packaged food manufacturers, beverage manufacturers, restaurants and supermarkets). This preliminary study examined company commitments of the ten largest restaurant chains in Canada across eight domains (corporate nutrition strategy, relationships with external organizations, policy positions, product reformulation, product and menu labelling, promotion to children, product pricing and availability and selection) using company websites, social media accounts, annual reports, and media releases were scanned to identify policies.

Results: Ten top companies representing a total of 30% of the Canadian foodservice market share were included in this preliminary evaluation, including national and multinational companies. Of the ten companies, six mentioned 'nutrition' or 'health' in their mission statement or had a nutrition strategy; however, none mentioned obesity or NCDs. Eight companies reported having reformulated products for one or more nutrient, five reported ongoing reformulation, and two provided specific targets for future reformulation. Two chains published commitments to limit advertising to children, varying in strength. While all companies had nutrition information available on websites, only one company voluntarily listed calorie information on menu boards. No companies pub-

lished availability and selection policies, and few details on policies regarding funding relationships with external organizations or company policy positions were published on websites. Company scores according to the BIA-Obesity tool will be discussed.

Conclusions: Few major restaurant companies in Canada have published policy commitments to improve the food environment. Future work will include verifying policies with companies, testing these methods for scale up in other countries, and comparing company commitments to actions.

THE DOUBLE BURDEN OF MALNUTRITION IN COLOMBIAN PREGNANT WOMEN

[1]*Gaitan-Charry, Diego;* [2]*Vasquez, Efrain;* [3]*Gonzalez, Laura;* [4]*Perez, Eliana;* [5]*Cediel, Gustavo.*

[1]MD, PhD. Assistant Professor. Nutrition And Dietetics School. University Of Antioquia. Colombia; [2]Bsc. National Faculty Of Public Health. University Of Antioquia. Medellin; [3]Phd. Professor. Nutrition And Dietetics School. University Of Antioquia; [4]Phd. Assitant Professor. Nutrition And Dietetics School. University Of Antioquia; [5]Phd. Postdoctoral Fellow. Faculty Of Public Health. University Of São Paulo.

Background and objectives: In Colombia, double burden of malnutrition (DB) has been evaluated by the coexistence of overweight and anemia at family level and at individual level in non-pregnant woman and children under 5 y old. However, DB has not been evaluated in pregnant population. Our goal was to estimate prevalence of DB in Colombian pregnant women.

Methods: We analyzed data from the Food and Nutrition National Survey 2010. Sample for this analysis comprised healthy pregnant women with available data of height, weight, hemoglobin, ferritin and C reactive protein. Nutritional status of participants was classified based on BMI for gestational age proposed by Atalah et al. Hemoglobin and ferritin were corrected based in WHO recommendation. The criteria for the evaluation of DB were coexistence of: 1) overweight and anemia, 2) overweight and iron deficiency anemia, or 3) overweight and iron deficiency (low ferritin).

Results: Data from 1761 pregnant woman were obtained; 15.9%, 52.3 %, and 31.8% in first, second and third trimester of gestation, respectively. Prevalence of DB according with criteria 1, 2, and 3 were, respectively: 6.1% (95%CI: 5.1-7.3), 4.4% (95%CI: 3.6-5.5), and 16.9% (95%CI: 15.2-18.7). By criteria 1, DB was 0.7% (95%CI: 0.2-2.9) first, 6.3% (95%CI: 4.9-8.0) second and 8.3% (95%CI: 6.3-10.9) third trimester of gestation. By criteria 2, DB was 0% first, 4.0% (95%CI: 2.9-5.4) second and 7.2% (95%CI: 5.3-9.7) third trimester of gestation. By criteria 3, DB was 4.3% (95%CI: 2.5-7.5) first, 16.4% (95%CI: 14.1-18.9) second and 23.1% (95%CI: 19.8-26.8) third trimester of gestation.

Conclusions: In Colombian DB in pregnant women increased during gestation course. Furthermore, DB evaluated by coexist of overweight and iron deficiency affects at least one of four women during gestation. Because the potential health implications of DB on the life course, it is necessary that national surveys focus some analysis on this condition.

INITIAL SITUATION ASSESSMENT ON SCHOOL FOOD AND NUTRITION IN AFRICA

[1]*Polo Galante, Andrea;* [2]*Kiamba, Josephine;* [3]*Mireles, Mauricio;* [4]*Sablah, Mawuli;* [5]*AgBendech, Mohamed;* [6]*Sanou, Dia.*

[1]Senior Nutrition Consultant FAO Nutrition and Food Systems Division. Rome. Italy; [2]Consultant FAO Regional Africa; [3]Regional Project(s) Coordinator, FAO Regional Africa; [4]Director FAO Nutrition and Food Systems Division. Rome. Italy; [5]Former Senior Nutrition Officer FAO for Regional Africa; [6]Nutrition Officer, FAO Sub Regional for Africa.

Background and objectives: The United Nations Food and Agriculture Organization (FAO) is working to promote sustainable school food and nutrition in Africa. Recently FAO Africa undertook a regional situational analysis of school food and nutrition with the objectives to provide a regional perspectives of SFN programmes and policies in Africa and identify main gaps, challenges and opportunities in the delivery of SFN programmes in Africa, with particular reference to the nutrition and agriculture linkages.

Methods: A quantitative questionnaire was sent out to 46 African Union member states with FAO country offices where a team of stakeholders completed the survey. Forty one countries complete the questions.

Results: 90% of African countries are running at least one form of School feeding programme. However only four countries have universal programmes and most programmes are highly targeted. Four countries out of 41 have no school feeding programmes. Countries have prioritized school feeding objectives in in term of educational outcomes and hunger and secondly to deal with nutrition. Over-nutrition is not considered an important issue for consideration. About 54% of the Countries do not have dietary guidelines and 12% need to revise their guidelines. Ten specific challenges were highlighted by the survey: (1) Low coverage of schools; (2) Lack of policy or legal framework; (3) Weak political will and government ownership; (4) Lack of nutrition guidelines/standards for school meals; (5) Weak institutional arrangements and multi-sectoral coordination; (6) Insufficient financial, human, and technical capacities; (7) poor linkages with nutrition education; (8) Inadequate quantity and quality of school meals; 9) Poor infrastructure/facilities and 10) Lack of monitoring and evaluation mechanism.

Conclusions: Despite the fact that providing healthy, diversified, safe and nutritionally balanced meals in African schools is

recognized as a vital intervention to alleviating hunger & malnutrition and for children to grow well and learn well, current SFN have several weaknesses. Sustainable School Food and Nutrition should be re-designed to ensure sustainability, and improve nutrition knowledge.

MONITORING OF THE NATIONAL OIL AND WHEAT FLOUR FORTIFICATION PROGRAMME IN CAMEROON: APPLICATION OF A PROGRAMME IMPACT PATHWAY FRAMEWORK

[1]Mark, Henry; [2]Guintang Assiene, Jules; [3]Luo, Hanqi; [2]nankap, Martin; [4]Pattar, Amrita; [5]Killilea, David; [6]Engle-Stone, Reina.

[1]MSc. Nutrition Section. UNICEF. Nigeria.; [2]MSc. Nutrition. Helen Keller International. Cameroon.; [3]MSc. Graduate Group in Epidemiology. University of California, Davis. United States.; [4]BS. Department of Nutrition. University of California, Davis. United States.; [5]PhD. Nutrition & Metabolism Center. Children's Hospital Oakland Research Institute. United States.; [6]PhD. Department of Nutrition. University of California, Davis. United States.

Background and objectives: Since 2011 Cameroon has mandated the fortification of refined vegetable oil with vitamin A (target=40 IU/g, range=33-50 IU/g), and wheat flour with iron (60 mg/kg) and zinc (95 mg/kg). A 2012 interim impact assessment in Yaoundé and Douala indicated 76% of wheat flour samples were fortified and indicators of iron and zinc status in women and children were greater relative to prefortification values. However, only 44% of oil samples were fortified and indicators of vitamin A status were unchanged. We assessed Cameroon's food fortification programme using a programme impact pathway framework to identify barriers to optimal programme performance.

Methods: Using semi-structured interviews, data on inputs and processes were collected from factories of all active domestic producers of refined vegetable oil (n=9) or wheat flour (n=10). Twelve sentinel sites were selected for market and household surveys, including assessment of frequency of fortified food consumption by women and children (600 households total). Food samples were collected from factories, markets, and households for measurement of vitamin A (iCheck) and iron and zinc (ICP-OES) content.

Results: All factories had in-house methods (mostly qualitative) for testing the micronutrient content of fortified products, while 68% presented quality certificates for recent premix purchases. Industries cited premix import taxes and access to external laboratories as constraints. All but one factory oil sample had vitamin A content > 33 IU/g. Among the sentinel sites, 87% of n=393 market oil samples contained detectable vitamin A; 43% had levels > 33 IU/g. Among household oil samples, 86% contained detectable vitamin A; 46% contained > 33 IU/g. All factory flour samples appeared to be fortified, but only ~18% had mineral levels within 10% of the target. Among composite flour samples from markets

and households the mean iron and zinc content was 25 mg/kg and 43 mg/kg, respectively, ~45% of target levels.

Conclusions: The availability of fortified oil is encouraging and may partially reflect recent growth in the share of domestic oil production. The low levels of iron and zinc in wheat flour indicate the need for programme support, possibly through premix procurement and technical support for micronutrient analysis.

DUTCH FOOD-BASED DIETARY GUIDELINES: HEALTH AND SUSTAINABILITY COMBINED IN THE WHEEL OF FIVE

[1]Brink, Elisabeth; [2]Postma-Smeets, Astrid; [2]Stafleu, Annette; [2]Wolvers, Danielle; [3]Van Dooren, Corné; [4]Van Rossum, Caroline; [5]Geurts, Marjolein; [4]Toxopeus, Ido; [5]Van de Kamp, Mirjam; [4]Ocke, Marga.

[1]PhD. The Netherlands Nutrition Centre. The Hague, The Netherlands.; [2]PhD. The Netherlands Nutrition Centre (Voedingscentrum). The Hague. The Netherlands.; [3]MSc. The Netherlands Nutrition Centre (Voedingscentrum). The Hague. The Netherlands.; [4]PhD. National Institute for Public Health and the Environment (RIVM). Centre for Nutrition, Prevention and Health Services. Bilthoven. The Netherlands.; [5]MSc. National Institute for Public Health and the Environment (RIVM). Centre for Nutrition, Prevention and Health Services. Bilthoven. The Netherlands.

Background and objectives: End 2015 the Health Council of The Netherlands published the Dutch dietary guidelines 2015 which focus on dietary patterns and foods related to the prevention of chronic diseases, and take sustainability into account. The Netherlands Nutrition Centre (NNC) translated these guidelines to the general public, in order to offer practical tools that support behavioral change towards a healthier and more sustainable diet. The Wheel of Five (WoF) is the national counselling model.

Methods: With a mathematical approach (using Optimeal®) that takes multiple criteria into account the RIVM calculated optimal diets for different target groups (based on age, gender, activity level, preference and ethnicity). Criteria for this optimization were: complying with the Dutch dietary guidelines 2015, meeting the dietary reference values for energy and nutrients and fitting in with the different target groups' customary dietary patterns. Composition of foods consumed by each target group, and a ratio for foods inside and outside the WoF were considered. Maximum levels were set for the use of animal products. Based on the optimal diets the NNC established recommendations for daily amounts of

various food groups for the different target groups. RIVM calculated the nutrient content and greenhouse gas emissions (GHGE) of the recommendations.

Results: The Wheel of Five shows recommended dietary patterns that combine health benefits and nutrient provision, based on foods that are customarily eaten in the Netherlands, taking sustainability into account. Foods high in saturated fatty acids, trans fatty acids, sodium, sugar or low in fiber are outside the WoF. The advice is to eat mainly foods from the WoF. Foods outside the WoF should be eaten neither too often nor in large quantities. GHGE was reduced by around one third in diets omitting meat or by chosing diets that contain more sustainable products within each food group.

Conclusions: The translation of the Health Councils' dietary guidelines resulted in a renewed Wheel of Five, the national counselling model. Using the Wheel of Five as a frame of reference, people can get an impression of their own dietary pattern, and an understanding of those areas in which they could make improvements.

CHANGES IN THE COMPOSITION OF THE FOOD SUPPLY IN ANTICIPATION OF THE IMPLEMENTATION OF THE CHILEAN LAW OF FOOD LABELLING AND ADVERTISING: AN INFORMAS-BASED APPROACH

[1]Kanter, Rebecca; [2]Reyes, Marcela; [3]Swinburn, Boyd; [4]Vandevijvere, Stefanie; [2]Corvalan, Camila.

[1]PhD. Unit of Public Health. Institute of Nutrition and Food Technology-University of Chile. Chile.; [2]MD, PhD. Unit of Public Health. Institute of Nutrition and Food Technology-University of Chile. Chile.; [3]MD. Department of Epidemiology and Biostatistics. University of Auckland School of Population Health. New Zealand.; [4]PhD. Department of Epidemiology and Biostatistics. University of Auckland School of Population Health. New Zealand.

Background and objectives: In 2012 Chile passed the Law of Food Labeling and Advertising (Law 20.606). The study objective was to evaluate potential anticipatory changes in the composition of the food supply ahead of the implementation of this law in June 2016. The law specifies limits for solids (per 100g) and liquids (per 100ml) in a 4-year increasingly stricter implementation, applying only to products with added sodium, sugars and/or saturated fat ("critical nutrients"). A product can have up to four "High in" front-of-pack warning labels, one for each critical nutrient and calories.

Methods: The INFORMAS framework for monitoring the composition of the food supply was used. In February 2015 and 2016, fieldworkers photographed a representative sample of pack-aged food products (n=5421 and n=5479) from 6 different supermarkets in Santiago, Chile. Foods were excluded if they required reconstitution, had missing information or if total labelled energy was estimated as incorrect (n=942). The initial (2016) and final (2019) limits were used to evaluate if foods would receive a "High in" Calories, Sodium, Sugars and/or Saturated Fats (initial/final, solids: >350/275 kcal; >800/400 mg; >22.5/10 g; >6/4 g; liquids: >100/70 kcal; >100/100 mg; >6/5 g; >3/3 g).

Results: Seven percent of foods had no added critical nutrients (n=720). In both 2015 and 2016, 63% of products had critical nutrients exceeding at least one initial limit indicative of a "high in" warning. Over 80% of snack foods, breakfast cereals/bars, sweet bakery goods and sweets would be classified as "high in calories", and over 80% of the latter two categories also as "high in sugars". Many (75%) savory sauces/spreads would be classified as "high in saturated fat". In 2015, only processed meats had >50% of products (54%) that surpassed the initial "high in sodium" limits that declined to 45% in 2016. Under the final phase limits, 17% of foods would have zero warning labels.

Conclusions: Between 2015 and 2016, only slight anticipatory changes in the food supply were detected. Most products will have to be reformulated or removed from the market if to avoid at least one front-of-package warning label.

PARENTS' COOKING SKILLS REDUCE CHILDREN'S CONSUMPTION OF ULTRA-PROCESSED FOODS

[1]Adriano Martins, Carla; [1]Machado, Priscila Pereira; [2]Louzada, Maria Laura da Costa; [3]Monteiro, Carlos.

[1]PhD candidate. Nutritionist. School of Public Health. Center for Epidemiological Studies in Health and Nutrition. University of Sao Paulo, Brazil.; [2]PhD. Nutritionist. Center for Epidemiological Studies in Health and Nutrition. University of Sao Paulo, Brazil.; [3]Professor. Departament of Nutrition. School of Public Health. Center for Epidemiological Studies in Health and Nutrition. University of Sao Paulo, Brazil.

Background and objectives: The consumption of ultra-processed foods is increasing in many countries and one of the possible determinants is the decrease of home cooking. Considering that parents are key people for children's health, this study analyzed the influence of parents' cooking skills on the children's consumption of ultra-processed foods.

Methods: Cross-sectional study with 657 child-parent pairs from nine private schools in São Paulo, Brazil. Food consumption data were collected through children's dinner dietary recall and food items were classified according to the 'NOVA Classification'. The parents' ccooking skills were evaluated using the Cooking Skills Index – Brazil (CSI-Brazil), a 0-100 index specially designed

for this research and based on the Brazilian's Dietary Guidelines (2014). Linear regression analysis was used to test associations between the parents' cooking skills and the ultra-processed foods contribution on the total dinner energy intake, adjusting for socio-demographic variables: parent's age, gender, race, marital status, education, employment status; per capita family income and number of children in the house.

Results: The average age of the parents was 38.3 years old (SD 6.3) and the children's was 7.8 (SD 1.1). The parents were mostly women (93.2%), white (62.2%), married (88.3%), with incomplete higher education or more (51.4%), employed (71.4%), with per capita family income of up to ~USD 320.00/month (37.8%). These parents reached an average of 78.8 points (SD 14.8) according to the Cooking Skills Index – Brazil. Children's average dinner energy intake was 672.2 kcal, with 31.3% coming from ultra-processed foods. The average intake of ultra-processed foods ranged from 37.2% of total energy in the first quintile of the CSI-Brazil to 28.1% of total energy in the last quintile. The analysis showed that the increase of the parents' cooking skills was directly associated with the decrease of consumption of ultra-processed foods (β=-0.18 by quintile of the CSI-Brazil; p=0.008), remaining after adjustment (β=-0.16; p=0.020).

Conclusions: The findings of this study, the first that explores that relationship in Brazil, suggest that parents' cooking skills protect their children against the consumption of ultra-processed foods, indicating the need for a revaluation of cooking in order to promote adequate and healthy eating.

EFFICACY OF A LOCALLY-PRODUCED MULTIPLE MICRONUTRIENT-FORTIFIED READY-TO-USE SUPPLEMENTARY FOOD (RUSF) FOR CHILDREN UNDER TWO YEARS IN CAMBODIA

[1]Borg, Bindi; [2]Sok, Daream; [3]Mihrshahi, Seema; [4]Griffin, Mark; [5]Chhoun, Chamnan; [6]Laillou, Arnaud; [7]Berger, Jacques; [8]Wieringa, Frank.

[1]PhD Candidate. School of Public Health. University of Sydney. Australia; [2]PhD Candidate. Department of Nutrition, Sport and Exercise. Copenhagen University, Denmark.; [3]PhD. Senior Research Fellow. School of Public Health. Sydney University. Australia.; [4]PhD. Adjunct Fellow. School of Public Health. University of Queensland. Australia.; [5]PhD. Director. Department of Post-Harvest Technologies and Quality Control. Ministry of Agriculture, Forestry and Fisheries. Cambodia.; [6]PhD. UNICEF. Cambodia.; [7]PhD. Director of Research. 5UMR-204 Nutripass. IRD. IRD/UM/SupAgro. Montpellier. France.; [8]PhD. Senior Researcher. 5UMR-204 Nutripass. IRD. IRD/UM/SupAgro. Montpellier. France.

Background and objectives: Cambodia's progress in combatting malnutrition has stalled. In 2014, 32% of all children under five years were stunted, 24% were underweight and 10% were wasted. This is due in part to poor quality complementary foods leading to insufficient nutrient intakes. Therefore, UNICEF, the Cambodian Ministry of Agriculture, Forestry and Fisheries and IRD developed a locally-produced multiple micronutrient fortified lipid-based nutrient supplement (LNS) that can be used as a Ready-to-Use Supplementary Food (RUSF). The novel RUSF can be given to children to increase their intake of protein, energy and micronutrients.

This trial assessed the RUSF's efficacy in reducing growth faltering in comparison to CSB++, Sprinkles and a control group.

Methods: The trial was a nonblinded, cluster-randomised control trial. Healthy children aged 6-17 months (n=486) were allocated to one of three intervention groups or the control group for six months. The main outcome was anthropometric status (WHZ, HAZ, WAZ, MUAC).

Results: None of the interventions could completely prevent growth faltering, but children consuming the novel RUSF appeared to falter at a lower rate. The lowest decreases in base-endline z-scores were for the RUSF group, for WAZ [RUSF: -0.01 (-0.14, 0.11); control: -0.14 (-0.26, -0.01)]; HAZ [RUSF: -0.27 (-0.49, -0.05); control: -0.36 (-0.57, -0.15)]; and WHZ [RUSF: 0.00 (-0.17, 0.17); control: -0.10 (-0.28, 0.07)]. Increases in MUAC (cm) were greatest for CSB++ [CSB++: 0.27 (0.08, 0.47); RUSF: 0.22 (0.03, 0.42)].

Older children had slightly better outcomes, and children with lower anthropometric measures at baseline had larger increases over the intervention period, showing that the interventions were helpful for children with poorer nutritional status. Children who consumed more had better weight-related outcomes (WAZ and WHZ), but not HAZ, suggesting that weight is more amenable to intervention than height.

Conclusions: These results suggest that neither the commonly used supplements (Sprinkles and CSB++) nor the novel RUSF could prevent growth faltering. However, in comparison to the control group, all the supplements (particularly the novel RUSF, but also CSB++ and to a lesser extent, Sprinkles) contributed to improved nutritional status.

Keywords: Ready-to-use supplementary food (RUSF), lipid-based nutrient supplement (LNS), complementary feeding, CSB++, Sprinkles.

COMPATIBILITY BETWEEN DIMENSIONS OF SUSTAINABLE DIETS (NUTRITIONAL ADEQUACY, EXPOSURE TO FOOD CONTAMINANT AND 30% REDUCTION OF GREENHOUSE GAS EMISSION): AN ANALYSIS BASED ON INDIVIDUAL DIET MODELING

[1]Maillot, Matthieu; [1]Vieux, Florent; [2]Gazan, Rozenn; [3]Darmon, Nicole.

[1]PhD. MS-Nutrition. France; [2]MSc. MS-Nutrition. France; [3]PhD. Unité Mixte de Recherche 1110 Markets, Organizations, Institutions and Stakeholders Strategies (UMR MOISA). INRA, CIRAD CIHEAM and Montpellier SupAgro. France.

Background and objectives: To test the compatibility between nutritional adequacy, acceptable exposure to food contaminant and 30% reduction of greenhouse gas emissions at individual level.

Methods: Dietary data from the French national survey (2006) were crossed with the "SUStable" database (Gazan et al., 2016) which summarizes, for 204 representative food items, nutritional composition, 27 contaminants (including pesticides, heavy metals, mycotoxins, non dioxin-like polychlorinated biphenyls (NDL-PCBs) and dioxin-like compounds) and GreenHouse Gas Emissions (GHGE). Intakes of nutrients and contaminants, and GHGE were estimated for each adult (n=1808). For each individual, 4 iso-caloric modeled diets departing the least from his/her observed diet were designed to fulfill i) French nutrient recommendations (NUT model), ii) French recommendations and a 30% reduction of GHGE from observed (NUT_30%GHGE model), iii) French recommendations without exceeding observed contaminant exposures (NUTOX model) and iv) all together (NUTOX_30%GHGE). In each scenario, the percentage of individuals for whom it was not possible to model a diet was estimated. In case of infeasibility, the incompatible constraints (i.e. the constraints that made the model infeasible) were identified.

Results: The percentage of infeasible modeled diets was 1.4%, 25.3%, 2.7% and 27.5% in the NUT, NUTOX, NUT_30%GHGE and NUTOX_30%GHGE models respectively.

In infeasible NUT models, the constraint on energy (i.e. isocalory) was always incompatible with constraints on fiber, vit E and vit B1. In the NUT_30%GHGE models, constraints on energy and GHGE (i.e. 30% reduction) were always incompatible with each other.

Among infeasible NUTOX_30%GHGE models, the most frequent infeasible constraints were water (99.6%), GHGE (99.6%), fibre (96.4%), energy (95.9%), inorganic mercury (95.8%), calcium (93.4%), Methylmercury (89.6%), Non dioxin-like PCBs (89.4%), hexachlorobenzene (75.7%), PB (73.5%), potassium (65.7%) and CD (62%), DHA+EPA (60.2%).

Conclusions: For the first time, nutritional, toxicological and environmental dimensions were combined to design sustainable diets with individual diet modeling. The results showed that all dimensions are compatible for a majority of French adults. Compatibility between nutritional and environmental goals would be feasible for the majority of French adults. However, reaching those goals without exceeding observed contaminant exposures would be difficult or even infeasible, underlining the need to decrease the contamination of food to promote diet sustainability.

Keywords: Individual diet modeling, contaminant exposure, sustainable diet, nutritional adequacy, greenhouse gas emissions

DIETARY CHANGES NEEDED TO REACH NUTRITIONAL ADEQUACY AND REDUCE GREENHOUSE GAS EMISSIONS BY 30% WITHOUT INCREASING CONTAMINANT EXPOSURE: AN ANALYSIS BASED ON INDIVIDUAL DIET MODELING

[1]Maillot, Matthieu; [2]Vieux, Florent; [3]Darmon, Nicole.

[1]MS-Nutrition; [2]PhD. MS-Nutrition. France; [3]PhD. Unité Mixte de Recherche 1110 Markets, Organizations, Institutions and Stakeholders Strategies (UMR MOISA). INRA, CIRAD CIHEAM and Montpellier SupAgro. France.

Background and objectives: To identify individual dietary changes that simultaneously combine nutritional adequacy, acceptable exposure to food contaminant and 30% reduction of greenhouse gas emissions.

Methods: Dietary data from the French national survey were crossed with the "SUStable" database (Gazan et al., 2016) which summarizes, for 204 representative food items, nutritional composition, 27 contaminants (including pesticides, heavy metals, mycotoxins, non dioxin-like polychlorinated biphenyls (NDL-PCBs) and dioxin-like compounds) and GreenHouse Gas Emissions (GHGE). Intakes of nutrients and contaminants, and GHGE were estimated for each adult (n=1808). For each individual, 4 iso-caloric modeled diets (using linear programming) departing the least from the observed diet were designed to fulfill i) French nutrient recommendations (NUT model), ii) French nutrient recommendations and a 30% reduction of GHGE from observed (NUT_30%GHGE model), iii) French nutrient recommendations without exceeding observed contaminant exposures (NUTOX model) and iv) all together (NUTOX_30%GHGE). The sub-sample of adults having a feasible diet for each model was kept for analyses. Solid energy density (SED), diet cost and food content were compared in observed and modeled diets.

Results: Seventy-two percent of adults had a feasible solution for each model. In nutritionally adequate diets (NUT model) SED decreased compared to observed diets (144 vs 179kcal/100g) and diet cost and GHGE increased (8.3 vs 7.2 euros/d; 4574 vs 4325 g CO_2eq/d, in NUT and observed diets, respectively). In the NUTOX_30%GHGE diets, SED (178kcal/100g) did not differ from the observed and diet cost (6.7 euros/d) decreased. Compared to observed diets, vegetables, refined starches, meats and tea-coffee increased or remained stable in the NUT diets (+55g/d, +3g/d, +3g/d, +73g/d respectively) but decreased in NUTOX_30%GHGE diets (-22g/d, -18g/d, -49g/d, -306g/d respectively) due to contaminant constraints for refined starches and tea-coffee, GHGE reduction constraint for meats and both constraints for vegetables. Fresh fruits, fish and water increased in NUT diets (+148g/d, +21g/d, °561 g/d, respectively) but that increase was attenuated in the NUTOX_30%GHGE diets (+104g/d, +1.5g/d and 450g/d, respectively), mainly due to contaminant constraints.

Conclusions: Nutritional, environmental, toxicological, cultural and economic goals should be considered simultaneously when designing sustainable diets, as the food choices needed to achieve them separately aren't necessarily the same.

NUTRITIONAL STATE, NUTRIENT INTAKE AND PHYSICAL ACTIVITY IN PRIMARY SCHOOL CHILDREN: A REPRESENTATIVE SAMPLE FROM SAO PAULO, BRAZIL

[1]Dan, Milana; [2]Eldridge, Alison.

[1]PhD. Nutritionist. Nestle Brazil. Sao Paulo. Brazil; [2]PhD. Nutritionist. Institute of Nutritional Science. Nestle Research Center. Lausanne. Switzerland.

Background and objectives: There is growing interest in investigating the prevalence and factors associated with obesity in children. Brazil is experiencing a nutritional transition characterized by a reduction in the prevalence of nutritional deficits and an increase in overweight and obesity. However, there are only limited data on dietary habits and behaviors of Brazilian children. Our objective was to evaluate nutrient intakes, eating patterns, weight status, level of physical activity and associated demographic characteristics of primary school children in the metropolitan region of Sao Paulo, Brazil.

Methods: A cross-sectional study in 1000 children aged birth-12y was conducted in the metropolitan region of Sao Paulo, including 439 7-9y olds. Participants were randomly selected and stratified by sex, age and social class. Weight status (underweight, normal, overweight or obese) was calculated based on measured height and weight and evaluated using the Body Mass Index, according to World Health Organization criteria (WHO, 2007). Physical activity and screen time were measured using the Children Physical Activity Questionnaire adapted to the recommendations of the Brazilian Society of Pediatrics (SBP, 2008). Two non-consecutive 24-hour recalls were conducted to estimate food and nutrient intakes. Energy, macronutrient and micronutrient intakes were calculated using Brazilian and American food composition tables. Statistical analysis were performed using SPSS version 18.0.

Results: Almost 50% of the primary school children aged 7-9y in the metropolitan region of Sao Paulo were found to be overweight (25.6%) or obese (23.6%) and also to have unhealthy lifestyles. We observed high levels of sedentary behavior (prevalence of low physical activity was 49% and 75.3% of school children reported screen-time of more than four hours daily). Caloric intakes were high (1728 ± 680 kcal / day) and were above recommendation for children at this age-range with a low physical activity level. In general, the children had inadequate daily intakes of calcium (62%) and vitamin D (90%).

Conclusions: The prevalence of overweight and obesity among primary school-aged children in Sao Paulo is already high, with low levels of physical activity, high screen-time, and an energy rich diet. Prevention strategies are needed to reverse this trend, with opportunities for school-based interventions and improved parental education.

IMPACT OF A DIGITAL FACEBOOK CAMPAIGN ON THE PURCHASE AND CONSUMPTION OF FOOD IN MEXICAN FAMILIES WITH CHILDREN UNDER 12 YEARS: A SOCIAL MARKETING STRATEGY

[1]Anzo, Anahi; [2]Klassen-Wigger, Petra; [3]Luna-Carrasco, Javier; [4]Monroy-Gómez, Jimena.

[1]Msc. Nutritionist. Methodology Department. National Institute of Pediatrics. Mexico; [2]PhD. Scientific Advisor. Corporate Nutrition Health and Wellness Unit. Nestlé. Switzerlad; [3]MSc. Nutritionist. Nutrition Health and Wellness. Nestlé. México.; [4]BsC. Nutritionist. Nutrition Health and Wellness. Nestlé. México.

Background and objectives: Social networking sites have been widely used in public health and prevention interventions to change behavior and improve healthy habits. The nutrition transition in Mexico has been associated with a sharp rise in obesity rates. Whereas traditional foods continue to be consumed, urban dwellers have adopted diets with more animal products, vegetables, fruits, fast foods and soft drinks. Among the drivers of food choice are availability, cost, cultural norms, personal beliefs and the proximal food environment. Higher obesity ratesare being observed in urban areas.

The emergence of social media has transformed health-related communication and changed the way people consume health information. This intervention study aimed to evaluate the impact of a digital campaign on changes in the habits of purchase and food consumption of Mexican families in urban areas.

Methods: A quasi-experimental study wasimplemented around a locally-designed digital campaign. It lastedfive months with pre and post campaign evaluations. The intervention consisted of a United for Healthier Kids online campaign to promote healthy eating habits. Selection criteria: A subset of households with children under 12 years of age, desktops or laptops with access to the Internet, socioeconomic level a/c and c +, belonging to nationally representative consumer panel of Kantar in Mexico. They are chosen to represent and reflect consumer behavior.

Results: Pre-intervention households with higher socioeconomic levels spent more on low nutritious foodsof whichcaloric beverages wereconsumed most. After three months of interventionconsumption of fruits and vegetables was increased, especially in households with children under 4 years old (p <.001) where 1 in2 consumed these foods 3 or more times per week and 9 of every 10 households consumed them during lunch.

Conclusions: A locally designed digital campaign to encourage the purchase and consumption of healthy foods resulted in increased consumption of vegetables and fruits and decreased consumption of pastry and fast food among the target group. This digital campaign with appropriate customization offers the possibility of being a useful addition to existing efforts that could be implemented in other communities to promote healthy eating habits.

CAN CONDITIONAL CASH TRANSFER COMBINED WITH NUTRITIONAL SUPPLEMENTATION PLAY A ROLE IN REDUCING CHILD STUNTING IN RURAL MALI?

[1]Adubra, Laura; [2]Fortin, Sonia; [2]Kameli, Yves; [3]Le Port, Agnes; [4]Kodjo, Niamke Ezoua; [5]Savy, Mathilde; [6]Martin-Prével, Yves.

[1]MSc. UMR 204 Nutripass IRD UM Supagro. Institut de Recherche pour le Développement (IRD). France.; [2]MSc. UMR 204 Nutripass -IRD-UM-Supagro. Institut de Recherche pour le Développement (IRD). Montpellier. France.; [3]MSc, PharmD, PhD. Poverty, Health and Nutrition Division (PHND), International Food Policy Research Institute (IFPRI). Dakar. Senegal.; [4]MSc. World Food Program. Bamako. Mali.; [5]MSc, PhD. UMR 204 Nutripass -IRD-UM-Supagro. Institut de Recherche pour le Développement (IRD). Montpellier. France.; [6]MSc, MD, PhD. UMR 204 Nutripass -IRD-UM-Supagro. Institut de Recherche pour le Développement (IRD). Montpellier. France.

Background and objectives: The World Food Program implemented a conditional cash transfer intervention (~€2.30 per month) coupled with a nutritional supplementation (Plumpy'doz®), targeting pregnant women and children under two during the 1,000-day window of opportunity, to prevent stunting in Kayes region, Mali. The objective of this study was to assess the impact of the intervention on child stunting.

Methods: We conducted a cluster randomized trial, with health community centers (CHCs) randomized in 4 intervention arms: Arm 1, control; Arm 2, cash to women attending prenatal follow up and postnatal visits (childhood immunization and growth monitoring); Arm 3, distributions of Plumpy'doz® (PPDoz) to children attending growth monitoring sessions and Arm 4, cash and PPDoz. In all 4 arms, the program provided health and nutrition education activities as a basis. We compared repeated cross-sectional samples of 12-42 months old children surveyed before the intervention (2013, n=5046) and at the end of the intervention (2016, n=5098), through a difference-in-differences approach using logistic or linear regression. A qualitative process evaluation (PE) study conducted one year before the end of the program provided insights on program implementation.

Results: In arms 2 and 3, the prevalence of stunting decreased from 36% to 32% and 34% to 29%, respectively, while it remained stable in the control arm as in arm 4. The interaction was not statistically significant (p-value=0.10). Significant impact of the program was measured on secondary outcomes: mothers' knowledge (p-value<0.001), growth monitoring: number of weighing (p-value <0.01), percentage of women having slept under insecticide-treated mosquito net during pregnancy (p-value=0.01) and proportion of women having experienced fever during pregnancy (p-value<0.001). The PE identified program complexity, implementation delays at the start of the program, irregular distributions and a low amount of the cash as the main barriers for achieving impact.

Conclusions: Positive trends have been observed and some indicators have improved significantly through the program. However, a complex intervention, as well as a difficult implementation context may explain the modest impact on children's anthropometrics.

MTHFR GENOTYPE AND ITS INTERACTION WITH RIBOFLAVIN AS DETERMINANTS OF BLOOD PRESSURE IN PREGNANT AND NON-PREGNANT WOMEN

[1]O'Sullivan, Emma; [2]Pentieva, Kristina; [3]Ward, Mary; [4]McAuley, Amy; [3]Strain, Sean JJ; [3]McNulty, Breige A.; [3]Walton, Janette; [3]Flynn, Albert; [3]McNulty, Helene.

[1]PhD Student. Nutritionist. United Kingdom; [2]PhD. MD.; [3]Professor of Human Nutrition. School of Biomedical Sciences. Ulster University. Northern Ireland; [4]MSc.

Background and objectives: Several meta-analyses have reported that the common 677C→T polymorphism in the MTHFR gene is associated with an increased risk of hypertension in pregnancy. Previous trials from this center in non-pregnant hypertensive adults have shown that riboflavin can lower blood pressure specifically in those with the MTHFR 677TT genotype. However, this relationship has not been examined in relation to pregnancy. The study aimed to investigate the MTHFR 677C→T polymorphism and its interaction with riboflavin in pregnant and non-pregnant women.

Methods: Data for this study were generated from two existing cohorts, namely the Irish National Adult Nutrition Survey (NANS) and participants from a trial of Folic Acid Supplementation in the Second and Third Trimester (FASSTT) in pregnancy.

Results: In non-pregnant women from NANS (n=347), those with the MTHFR 677TT genotype compared to the CC genotype had significantly higher mean±SD systolic (117.2±13.5 vs 110.5±11.6 mmHg; P=0.002) and diastolic (78.3±11.4 vs 73.3±9.6 mmHg; P=0.003) blood pressure; CT genotype had intermediate blood pressure values. This genotype effect was influenced by prevailing riboflavin status, such that blood pressure differences among the three genotypes were greatest in those with lower riboflavin status, and not significant among participants with higher riboflavin status. When pregnant women from the FASSTT trial (n=226) were examined at the 14th gestational week (GW), those with the TT genotype compared those with CC/CT genotypes were found to have significantly higher blood pressure. In addition, the TT genotype group showed a greater increase in mean ±SD blood pressure from the 14th to the 36th GW (increase in diastolic blood pressure of 11.0±7.9 vs 4.2±11.1mmHg; P=0.013).

Conclusions: These results suggest that the MTHFR 677TT genotype adversely influences blood pressure in women of repro-

ductive age and during pregnancy. A higher riboflavin status can however attenuate the effect of this genetic variant on blood pressure. A randomized controlled trial in pregnant women is necessary to investigate the effect of riboflavin on blood pressure during pregnancy in women stratified by MTHFR genotype and such a study is underway at our center.

Keywords: Blood pressure. pregnancy. MTHFR 677 C→T. riboflavin.

VEGANISM, VEGETARIANISM AND BONE MINERAL DENSITY: A SYSTEMATIC REVIEW AND META-ANALYSIS

[1]Iguacel Azorín, Isabel; [2]Miguel-Berges, María Luis; [3]Gómez-Brutón, Alejandro; [4]Moreno, Luis A.; [5]Julian Almarcegui, Cristina.

[1]MSc. Nurse. Psychologist. Economist. Department of Physiatry and Nursing. University of Zaragoza. Spain; [2]MSc. Nutritionist. Physiatry and Nursing. University of Zaragoza. Spain.; [3]PhD. Physical activity and sports sciences. Physiatry and Nursing. University of Zaragoza. Spain.; [4]PhD. MD. Physiatry and Nursing. University of Zaragoza. Spain.; [5]MSc. Nutritionist. Physical activity and sports sciences. Physiatry and Nursing. University of Zaragoza. Spain.

Background and objectives: The number of vegans and vegetarians has increased in the last decades. However, the impact on these diets on health, particularly on bone mineral density (BMD) is still under debate.

The aim of this systematic review and meta-analysis was to provide an overview of the current knowledge of vegetarian and vegan diets on BMD in children and adults.

Methods: A systematic search of Pubmed, Scopus, and Science Direct was conducted from 1988 to March 2017, with data extraction and quality assessment performed independently by two researchers following the PRISMA methodology. Two meta-analyses were performed comparing omnivorous to vegetarians and to vegans. Effect sizes with the Hedges g in random effect models were carried out and beta coefficients according to the method of moments were calculated to test possible influences of age, sex and ethnicity. Fourteen observational studies met the inclusion criteria and were included in the meta-analyses.

Results: Vegetarians presented lower BMD compared to omnivorous in femoral neck (g= -0.202; CI -0.45, -0.015) and lumbar spine (g=-0.308; CI -0.555, -0.060). Vegans also presented lower BMD compared to omnivorous in femoral neck (g=-0.494; CI -0.799, -0.189) and lumbar spine (g=-0.674; CI -1.152, -0.195) (p<0.05). The coefficient of heterogeneity varied between 0% and 83%. For the lumbar spine, Asians had smaller differences on BMD between vegetarians and omnivorous (B=0.360; p=0.005) and between vegans and omnivorous (B=1.139; p<0.001) than Caucasians.

Conclusions: Vegetarians and vegans present lower BMD values when compared to omnivorous suggesting additional control over this population.

Keywords: Vegeterians, vegans, omnivorous, bone mineral density, meta-analysis.

IMPACT OF A CASH TRANSFER PROGRAM TARGETING THE "1000 DAYS PERIOD" ON LOW BIRTH WEIGHT AND GROWTH RETARDATION: A CLUSTER RANDOMIZED TRIAL IN TOGO

[1]Briaux, Justine; [2]Carles, Sophie; [1]Kameli, Yves; [1]Fortin, Sonia; [1]Rollet, Pascaline; [3]Becquet, Renaud; [4]Martin-Prével, Yves; [5]Savy, Mathilde.

[1]MSc. UMR 204. Nutripass. Institut de Recherche pour le Développement. IRD. UM. Supagro. Montpellier. France.; [2]PhD. UMR 204. Nutripass. Institut de Recherche pour le Développement. IRD. UM. Supagro. Montpellier. France.; [3]MSc. PhD. Team IDLIC. UMR 1219. Inserm. Bordeaux Population Health Research Center. University of Bordeaux. F-33000 Bordeaux. France.; [4]MSc. MD. PhD. UMR 204. Nutripass. Institut de Recherche pour le Développement. IRD. UM. Supagro. Montpellier. France.; [5]MSc. PhD. UMR 204. Nutripass. Institut de Recherche pour le Développement. IRD. UM. Supagro. Montpellier. France.

Background and objectives: In northern Togo, the Government, the World Bank and Unicef have implemented an intervention program in two rural regions aiming at promoting children's nutrition, health and rights. The program consisted of a monthly cash transfer (CT) of 8.40 USD given to women during the "1,000 days period" (from conception until the child reaches the age of two), combined with Behavior Change Communication activities (BCCA). The program's impact on growth retardation and low birth weight was analyzed.

Methods: In both regions, 162 villages were randomized into either an intervention group (CT+BCCA) or a control group (BCCA). Two repeated cross-sectional surveys were conducted among random samples of 6-30 mo old children and their mothers before the intervention (baseline, n=2,658) and two years after the start of the intervention (endline, n=2,031). Standardized anthropometrics of children were measured to determine growth retardation prevalence, defined as a weight-for-height Z-score<-2 SD. Birth weights were collected from health cards to determine low birth weight (LBW) prevalence (birth weight<2500g). A difference-in-differences analysis was performed to assess the impact of the intervention on these indicators, using logistic regressions. First priority was given to intention-to-treat (ITT) analysis. Per protocol (PP) analysis was also performed due to program's implementation issues: at endline, only 400 mothers out of the 1396 surveyed from the intervention group actually received the CT.

Results: Using ITT analysis, the prevalence of growth retardation decreased from 30.3% to 26.7% between baseline and endline in beneficiaries, while it increased from 28.1% to 30.6% in non-beneficiaries, but the difference between groups was not statistically significant (p-value=0.12). The PP analysis showed

further decrease in growth retardation prevalence between the two rounds among beneficiaries (30.3% to 24.2%) and a statistical difference between the intervention and control groups (p-value=0.03). The CT program also had a positive impact on the proportion of children with LBW which dropped from 13.5% to 7.2% between baseline and endline among beneficiaries, and remained stable among non-beneficiaries (9.5% versus 11.6%) (p-value=0.02). Similar results were observed in PP analysis.

Conclusions: Despite implementation issues the CT program contributed to reduce low birth weight and growth retardation.

Keywords: Cash transfer program, growth retardation, low birth weight, Togo

CAN UNICEF'S COMMUNITY INFANT AND YOUNG CHILD FEEDING COUNSELLING PACKAGE BE SUCCESSFUL AT SCALE? RESULTS FROM A LARGE-SCALE EVALUATION IN NIGERIA

[1]Lamstein, Sascha; [2]Adeyemi, Susan; [3]Stammer, Emily; [4]Koniz-Booher, Peggy; [5]Kaligirwa, Christine; [6]Osa Isokpunwu, Chris; [7]Begin, France; [8]Adebisi, Babajide; [9]Perez-Escamilla, Rafael.

[1]SPRING Project, JSI Research & Training Institute, Inc. USA; [2]MPH. Study Coordinator. SPRING Project. Helen Keller International. Kaduna State, Nigeria; [3]MPH. Monitoring & Evaluation Advisor. John Snow, Inc. USA; [4]MPS. SPRING Project. JSI Research & Training Institute, Inc. USA; [5]MPH Human Nutrition and Public Health. Nutrition Specialist/IYCF Manager. UNICEF. Abuja, Nigeria; [6]MPH. Head of Nutrition / SUN Focal Point. Department of Family Health, Federal Ministry of Health. Abuja, Nigeria; [7]PhD. Senior Advisor, Infant & Young Child Nutrition. UNICEF. USA; [8]M.Sc Human Nutrition. Deputy Chief of Party. JSI Research & Training Institute, Inc. Ghana; [9]PhD. Professor & Director. SPRING and Yale School of Public Health. USA.

Background and objectives: In 2010 UNICEF developed the Community Infant and Young Child Feeding (C-IYCF) Counseling Package of generic materials to promote specific practices known to have an impact on nutritional status, morbidity, and mortality. Despite widespread uptake of the package by over 60 countries, very little research has been done to examine the impact of the package. To help fill this evidence gap, the USAID-funded Strengthening Partnerships, Results, Innovations in Nutrition Globally (SPRING) project, the Nigerian Federal Ministry of Health, and UNICEF have just completed an evaluation of the effectiveness of this package, implemented at scale in one local government area (LGA) where approximately 140,000 people live in Kaduna State, Nigeria.

Methods: The intervention included a series of sensitization meetings, training of health workers and community volunteers, support group meetings, review meetings, and community mobilization events. Implementation processes and costs were closely tracked. To evaluate the effectiveness of the C-IYCF package in changing IYCF knowledge, attitudes, and practices as well as nu-

trition outcomes we used a mixed methods approach. We conducted baseline (Dec 2014 – March 2015) and post-intervention (Jan – March 2017) household surveys in the intervention LGA and in one comparison LGA. We also conducted semi-structured interviews to collect information on IYCF knowledge and attitudes among local government, health workers, and community leaders.

Results: We observed significant improvements in knowledge and attitudes among pregnant women, mothers, and community leaders. As a result, practices changed. At baseline, 30.9% of children under 6 months old in the intervention site (N=366) were exclusively breastfed. After the intervention, 49.9% of children under 6 months old (N=709) were exclusively breastfed. The percentage of infants 6-8 months old who had received solid foods during the previous day increased from 56.0% (N=250) to 64.1% (N=287). Maternal nutrition practices also improved – the percent of women reporting that they ate more during her last pregnancy increased from 35.6% (N=1,752) to 50.0% (N=761).

Conclusions: After implementing the C-IYCF Counselling Package at scale in one LGA, knowledge, attitudes, and IYCF practices had improved. This study demonstrates that the C-IYCF package is an effective and feasible approach for implementation at scale.

Keywords: Nutrition, scale, community-based, infant and young child feeding (IYCF)

LEVEL OF IMPLEMENTATION OF BEST PRACTICE POLICIES FOR CREATING HEALTHY FOOD ENVIRONMENTS: AN ASSESSMENT BY INDEPENDENT (ACADEMIA, CIVIL SOCIETY AND LEGISLATORS), GOVERNMENT, AND PRIVATE SECTOR ACTORS

[1]Sánchez-Bazán, Karina; [2]Nieto, Claudia; [3]Rodríguez-Martínez, Estefanía; [2]Tolentino Mayo, María Lizbeth; [4]Vandevijvere, Stefanie; [5]Barquera, Simon.

[1]MPA. Researcher. Health and Nutrition Research Center. National Institute of Public Health. Mexico; [2]MSc. Health and Nutrition Research Center. National Institute of Public Health. Mexico.; [3]BA. Health and Nutrition Research Center. National Institute of Public Health. Mexico.; [4]PhD. Department of Epidemiology and Biostatistics. School of Population Health. University of Auckland. New Zealand.; [5]PhD. Health and Nutrition Research Center. National Institute of Public Health. Mexico.

Background and objectives: Unhealthy food environments are a major driver of obesity and non-communicable diseases (NCDs). Government actions are essential to prevent these conditions. The international network INFORMAS developed protocols to evaluate and benchmark these actions. The Food Environment Policy Index (Food-EPI) was created to assess them. The objective of the study is to determine the level of implementation of policies for healthy food environments in Mexico with reference to international best practice.

Methods: The Food-EPI tool and process were adapted to the Mexican context. 72 indicators were assessed. Evidence for imple-

mentation was gathered for all. An online questionnaire was answered by 70 actors. These actors were categorized into three groups: 1) independent(n=36 academia, civil society, and legislators), 2) government(n=28), and 3) private sector(n=6). After the online assessment, prioritization workshops were held for each group separately. A consensus workshop with independent and government actors was held to propose concrete actions to be implemented.

Results: 5 indicators were identified as priority: 1) labeling easy to interpret, 2) incentives to increase the supply of healthy foods, 3) guidelines to prevent conflict of interest, 4) budget to tackle obesity and NCDs, and 5) promotion of healthy foods in schools.

Four types of cases were identified: 1)The groups coincide: in the indicator on labeling in fast food restaurants, the groups rated with very little level of implementation. 2)Independent and government coincide: In the indicator on monitoring of overweight and obesity in children and adults, both rated with high level of implementation. 3)Independent and industry coincide: In the indicator on monitoring of food promotion, both rated with very little level of implementation. 4)Independent and government differ: In the indicator on presidential support to nutrition independent rated with very little level of implementation, and government rated with high level of implementation.

Conclusions: The food environment is a complex and multidimensional system. Therefore, when analyzing it, all actors that have influence should be considered. This assessment is useful to identify policy agreements and oppositions. The consensus is a platform for continued policy dialogue towards cross-sectoral coherence and effective actions to address the burden of NCDs and obesity in Mexico.

MAPPING THE AVAILABILITY OF HEALTHY FOOD IN BUENOS AIRES

[1]*Garipe, Leila Yasmin;* [2]*Santoruffo, Ornella;* [2]*Papurello, María Guadalupe;* [2]*Chiavassa, Sofía Belén;* [2]*Goldsztejn, Gabriela;* [3]*Pace, Natalia;* [4]*Giunta, Diego Hernán.*

[1]Nutritionist. Hospital Italiano de Buenos Aires. Universidad Isalud. Argentina.; [2]Nutricionist. Universidad Isalud. Argentina.; [3]Doctor. Hospital Italiano de Buenos Aires. Argentina.; [4]PhD. Doctor. Hospital Italiano de Buenos Aires. Universidad Isalud. Argentina.

Background and objectives: Dietary behaviors are a result of a complex relation between multiple factors: individual, mental, social and environmental. In recent years there has been a surge in interest in understanding how the environment influences the health of a population, both directly and also in forming the context in which decisions for it are made. It has been widely studied that availability and accessibility are key factors for the adoption of healthy lifestyles. The presence of food shops and the availability of healthy products at them are important contributors to the dietary

patterns of a population. Therefore, we proposed constructing a georeferenced map of healthy food in the city of Buenos Aires to facilitate its consumption.

Methods: This study is part of the #MeHaceBien project of the Hospital Italiano de Buenos Aires and was carried out together with Nutrition students at the Universidad Isalud. Taking into account the limitations on human resources initial we decided to include healthy food stores with low visibility, stores that would be accessible to vulnerable groups and/or shops promoting a non-industrialized and non-agrotoxic diet. The methods of the search used were virtual (websites), fieldwork and interviews with people knowledgeable in the area. Data collection was carried out between April and June 2016. All resources were validated. A georeferenced map was created on Google Maps indicating location, telephone number, website address, food offered with days and times.

Results: a total of 401 health food store were mapped, such as supply fairs neighborhood (110), fish markets (53), health food stores (100), organic food retailers (42), and restaurants that focused on healthy, gluten-free, vegan or organic foods (95). In addition vegetable garden and healthy cooking classes were identified.

Conclusions: We believe that healthy food mapping could be an innovative tool to facilitate accessibility and adherence to healthy eating, as well as a future opportunity for collaborative work with the community to map healthy foods in their neighborhoods.

RELIABILITY OF HEMOCUE ON THE ANEMIA DIAGNOSTIC IN UNDER FIVE YEARS OLD CHILDREN

[1]*Rugani Ribeiro de Castro, Inês;* [2]*Pereira, Alessandra Pereira;* [3]*Feldenheimer, Ana Carolina;* [4]*Moraes, Milena.*

[1]PhD. Associate professor. Department of Social Nutrition. State University of Rio de Janeiro. Brazil.; [2]Professor. UNIRIO. Rio de Janeiro. Brazil.; [3]Rio de Janeiro. Brazil.; [4]PhD. Nutricionist. Posdoctoral fellow. Department of Social Nutrition. State University of Rio de Janeiro. Brazil.

Background and objectives: Controlling iron deficiency anemia is a priority in the public health agenda. There are many methods for diagnosing anemia. However, some of them did not have their performances evaluated among children below five years of age. This study evaluated the reliability of portable hemoglobinometer HemocueÒ in the diagnosis of anemia in children.

Methods: This was carried out with children aged 6-59 months assisted at the Unified Health System in the city of Rio de Janeiro (n=357). Blood samples was collected by capillary puncture and placed in microcuvets for immediate hemoglobin (Hb) concentration assessment. From the first finger puncture two drops were taken (D1 and D2) for assessing instrument reliability and from the second finger puncutre, a third drop (D3) was taken to deter-

---

mine the reliability of the method. Values obtained with D1 were considered the reference and Hb=11g/dl was adopted as the cutoff point for anemia diagnosis. Mean and standard deviation of Hb values were calculated and the agreement analyses of the anemia diagnosis were made using Cohen's Kappa (k) and prevalence- and interviewer bias-adjusted kappa (ka). The values of k and ka were classified according to Byrt (1996).

Results: Mean and SD of Hb values of D1, D2 e D3 were 12,03±1,12, 11,90±1,15 e 12,00±1,10, respectively. By Cohen's Kappa the agreement of the diagnostics was fair comparing D1 with D2 (k=0.42) and D1 with D3 (k=0.36). Considering the ka, the agreement was good when comparing D1 with D2 (ka=0.62) and D1 with D3 (ka=0.60).

Conclusions: The reliability of both the instrument and the method was good, suggesting stability of the instrument in the diagnosis of anemia in children.

Keywords: Reliability; anemia; children; Hemocue.

FRUIT AND VEGETABLE CONSUMPTION IN EIGHT LATIN-AMERICAN COUNTRIES: RESULTS FROM ELANS STUDY

[1]Cortes, Lilia Yadira; [2]Nogueira Previdelli, Agatha; [3]Fisberg, Mauro; [4]Kovalskys, Irina; [5]Guajardo, Viviana Beatriz; [6]Gómez Salas, Georgina.

[1]PhD. Nutritionist. Departamento de Nutrición y Bioquímica. Pontifica Universidad Javeriana. Bogota. Colombia; [2]PhD. Nutritionist. Faculdade de Ciências Biológicas e da Saúde. Universidade São Judas Tadeu. São Paulo. Brazil; [3]MD. Instituto Pensi, Hospital Infantil Sabara, São Paulo 01239-040, Brazil; [4]MD. Commitee of Nutrition and Wellbeing. International Life Science Institute (ILSI-Argentina). Buenos Aires. Argentina; [5]BSc.Nutrition and health area. International Life Science Institute (ILSI-Argentina). Buenos Aires. Argentina.; [6]MSc. Departamento de Bioquímica. Escuela de Medicina. Universidad de Costa Rica. San José. Costa Rica.

Background and objectives: It has been recognized that fruit and vegetable intake (FVI) are important to prevent chronic diseases such as cancer, coronary heart disease and diabetes. World Health Organization (WHO) recommended a minimum of five servings of fruit and vegetables or 440 g per day. The aim of this study is to determine the intake of fruits and vegetable by sex, age and SES in eight Latin-American countries.

Methods: Data from the ELANS study, conducted in eight Latin-American countries (Argentina, Brazil, Colombia, Costa Rica, Chile, Ecuador, Peru and Venezuela) was analyzed using descriptive statistics. The ELANS study interviewed 9218 subjects (4409 males and 4809 females) of the main cities in each country. The FVI was collected using two 24 hours' dietary recall, following the multiple pass methodology. The analysis was performed by age group, gender and socioeconomic level (SES).

Results: The mean FVI in the eight countries was 200 g/day (males 202 g/day, females 198 g/d), being the highest in Ecuador

(282 g/day) and lowest in Colombia (161 g/day). It is important to highlight that the FVI is highest in males than females in all countries except Brazil, Peru and Argentina. The FVI increases with age, ranging from 176 g/day (CI 90.4–261.6) at 15-19 years of age to 226 g/day (133–319) at 50-65 years of age. Despite this increase with age, 70.99% of the 50-65y interviewed did not reached recommendations in any of the two days compared to 80.95% of the 15-19y group (p<0.001). As expected, the intake was lower in the low SES 180 g/day (CI 98.8 – 261.2) and higher in the high SEL 224 g/day (CI 128 – 320). Only 4.2% of overall population met the recommendation in both days of interview, and 19.13% did it in at least one day.

Conclusions: The findings reinforce the low intake of FIV by the Latin-American population, since 95.8% did not reach the recommendation in both days. In addition, this low intake was independent of sex, age or SES. Programs and policies to encourage FVI are required to help mitigate future health issues associated with inadequate FVI.

ADDRESSING DIETARY DIVERSITY BY SCALING UP MULTI-SECTORAL INTEGRATED NUTRITION INTERVENTIONS IN AFRICA

[1]Mukuria, Altrena; [2]Williams, Tim; [3]Du, Lidan; [4]Hogan, Sara; [5]Bonku, Edward; [6]de Wolf, Bob; [7]Adebisi, Babajide; [8]Mwadime, Robert.

[1]DrPH. Director of Country Initiatives. SPRING Project. Save the Children. Arlington. Va. USA; [2]MA MES. Sr. Evaluation Advisor. SPRING Project. JSI. Arlington. Va. USA; [3]PhD. Research Advisor. SPRING Project. JSI.Arlington. Va. USA.; [4]BA. Project Officer. SPRING Project. JSI. Arlington.Va. USA; [5]MD MSc. Chief of Party. SPRING/GHANA. JSI. Tamale. Ghana; [6]MPH. Chief of Party. SPRING/Senegal.JSI. Dakar. Senegal; [7]MSc. Deputy Chief of Party. SPRING/GHANA. Tamale. Ghana; [8]PhD. Chief of Party. SPRING/Uganda. Kampala. Uganda.

Background and objectives: Malnutrition is a contributing factor in 45% of deaths of children under 5 years, and in developing countries, more than 3.5 million children under 5 die each year with undernutrition as an underlying cause. In Africa, stunting rates average about 30% or higher. Complementary feeding can prevent 6% of all deaths in children 6-23 months. Improved

dietary diversity (DD) is one of the 10 proven nutrition-specific interventions as well as a measure of food security and agriculture practices to address stunting. The objective of this paper is to describe how the USAID-funded Strengthening Partnerships, Results, and Innovations in Nutrition Globally (SPRING) Project addressed DD through scale up of integrated multi-sectoral nutrition interventions in four African countries.

Methods: Targeting the first 1000 days, Ghana, Nigeria, Senegal and Uganda used slightly different approaches to scale up evidenced-base interventions. Using these examples, the paper describes experiences, successes, and challenges of SPRING programs in addressing dietary diversity. Where available, baseline and endline survey data and/or DHS data will be presented to complement programmatic experiences and routine data.

Results: In Nigeria where children's DD is 19.3%, IYCF training of facility and community-based health workers improves their counselling of mothers and family members. In Ghana (DD =28.1%), SPRING partners with the government to improve IYCF through WASH, mother support groups and nutrition-sensitive agriculture. In Senegal (DD = 27.4%), SPRING works through partnerships with government and NGOs to improve knowledge and practices in nutrition-sensitive agriculture. In Uganda (DD = 12.8%), to improve the provision and consumption of nutrient-rich fortified foods, SPRING works with government to strengthen national policies and practices. Previously in Uganda, SPRING supported IYCF at facility and community levels in three districts.

Conclusions: A transformation in nutrition programming is needed if malnutrition is to be addressed successfully. In order to sustain food and nutrition security, health, agriculture, and water and sanitation along with many other sectors must be mobilized in an integrated multi-sectoral way. Using evidenced-based approaches as well as building the evidence, we have begun to demonstrate how to promote dietary diversity to address chronic undernutrition within the African context.

Keywords: Multi-sectoral nutrition, Africa, diet diversity

against a variety of acute and chronic disorders. We here, share some of our observations reported in Lactation Management Center (LMC) established by Bangladesh Breastfeeding Foundation (BBF) to deliver different services on lactation management.

Methods: The BBF-LMC in a central area of Dhaka city included the services to the pregnant and lactating mothers are: mothers/family counseling on BF and on various aspects of maternal nutrition & demonstration on appropriate positioning & attachment during breastfeeding, solving difficulties, relactation, breast-milk expression & scientific method of breast massage 'OKETANI'.

Results: In BBF-LMC, 232 mothers aged (mean±SD) 29.0(±4.3) years with a child from 1 day to 2.5 years were served over the last 2 years from March, 2015 to March, 2017. Average birth weight of the children was 2.8(±0.4) kg and measured body weight of the children 4.8(±1.8) kg. About 78.4% (183) came in 1st visit, 15.5% (36) for 2nd, 4.3% (10) for 3rd and 1.2% (3) came for 4th visit. Most (32%) of the mothers were not confident to feed their baby while 21% didn't know appropriate positioning and attachment during breastfeeding. About 24% mothers had poor knowledge on BF and appropriate complementary feeding (CF) whereas 21% complained about low milk flow. Breast engorgement, flat/ inverted/cracked nipples were observed among 14% of the mother. Besides, 12% of mother came for relactation. In BBF-LMC, 72% received counseling on BF and CF while correct positioning & attachment demonstrated for 21% mothers. Oketani massage was given to 28% mother and 4% were taught milk expression. Seventeen who came with poor confidence & milk flow came in 2nd visit for demonstration and needed Oketani, 14 came for only follow-up while 5 came for recipe book for CF. In 3rd visit, 4 came for follow-up their inverted/cracked/engorged breast and 5 came for Oketani while in 4th visit all came for only follow-up who were doing successful BF.

Conclusions: Most of the mothers who have received the services at the BBF-LMC were satisfied both physically and mentally.

Woodruff Professor of International Nutrition. The Hubert Department of Global Health and the Nutrition and Health Sciences Program. Emory University.; [5]Phd. H.E. Babcock Professor of Food & Nutrition Economics and Policy. Divison of Nutritional Sciences. Cornell University. USA.; [6]PhD. Associate Professor. Department of Nutrition. St John's Research Institute. India.; [7]PhD. Director Monitoring, Learning and Research. Global Alliance for Improved Nutrition. Switzerland.

Background and objectives: Anemia affects more than half of Indian women and children but the contribution of its causes is unknown. We examined the contribution of nutritional, environmental, infectious, genetic, and social determinants of anemia in rural and urban women and children living in Uttar Pradesh (UP).

Methods: We conducted a state-representative, cross-sectional survey of rural and urban households in 25 districts of UP between October and December 2016. We collected information on socio-economic factors, diet, water and sanitation (WASH), household hunger, anthropometry, stool, and venous blood in 1238 non-pregnant women 18-49 years and children 6-59 months of age. We are analyzing venous samples for malaria, hemoglobin, ferritin, transferrin receptor, hepcidin, retinol, folate, zinc, vitamins B12 and D, C-reactive protein, α1-acid glycoprotein, and β-thalassemia. Blood laboratory analyses are ongoing and will be completed by May 2017. Preliminary statistical analyses use inflammation-adjusted iron biomarkers only from 10 of the 25 districts. We are using structural equation modeling to examine the pathways through which diet, household hunger, iron, WASH, and anthropometry are associated with hemoglobin concentrations. Preliminary models indicate appropriate fit and we report standardized coefficients.

Results: 36% of women and 54% of children were anemic; 42-50% of these women and children also had iron deficiency. In women, ferritin concentrations were more strongly and significantly ($p<0.05$) associated with hemoglobin in rural than in urban areas (standardized $\beta=0.33$ vs 0.28, respectively). In rural areas, dietary diversity and WASH were significantly directly associated with women's hemoglobin. In children, ferritin was more strongly associated with hemoglobin concentrations in urban than in rural areas ($\beta=0.38$ vs 0.17). WASH was significantly indirectly associated with hemoglobin through height-for-age z-scores.

Conclusions: Preliminary findings suggest a multi-causal etiology of anemia in women and children in UP. We will present an updated comprehensive analysis of blood indicators, stool parasites, dietary intake, and genetic factors that will clarify the contribution of the majors causes of anemia in this population that can be used to guide preventive measures.

INCREASING WAIST CIRCUMFERENCE OF INDIAN SCHOOL CHILDREN: WHERE SHOULD THE ACTION BE?

[1]Thomas, Tinku; [2]Kuriyan Raj, Rebecca; [3]Kurpad, Anura; [4]Subramanian, S.V.

[1]PhD. Department of Biostatistics. St John's Medical College. India; [2]Associate Professor. India.; [3]MD, PhD. Department of Physiology. St John's Research Medical College. India; [4]PhD. Department of Social and Behavioural Sciences. Harvard T H Chan School of Public Health, USA.

Background and objectives: Childhood obesity, accompanied by an increased waist circumference (WC), which is linked to an increased risk of adult chronic diseases, is rapidly increasing in urban India. The pathogenesis of childhood obesity is multi-factorial, combining genetic pre-disposition and environmental factors. Home and school are major contributors to the environmental factors. The objective of this study was to use a sibling-pair model to quantify the contribution of home environment to an increased waist circumference (WC) in children.

Methods: Children aged 3-16 years from middle income urban schools in Bangalore, India were measured between 2008 and 2011 and data on 2896 siblings were obtained. Anthropometric measurements of weight, height and waist circumference were performed according to standard protocols. Additional details on demographics, diet, lifestyle, behavior and reported parental anthropometrics were also collected. The intraclass correlation at the home level represented as sibling pairs (level 2) and school level (level 3) were obtained using multilevel modelling, Factors at individual (level 1) and home were also considered in the model. Parental weight and height were used to partly explain the genetic factors.

Results: The prevalence of abdominal obesity (waist circumference percentile>75) was higher at 20% than overweight/obesity prevalence which was only 12%. A multi-level linear regression model for WC percentile with no covariates (simple variance component model) gave an intraclass correlation of 0.36 such that 36% of the variability in WC of siblings could be attributed to the siblings living in the same house. The fractional variability attributed to the school was 16%. Maternal and paternal overweight status were positively associated with the waist circumference of the children. The percentage variability of BMI attributable to sibling pair was comparable to that of WC.

Conclusions: The maximum variability of waist circumference in children was attributed to them being siblings, thus ascer-

taining the importance of home based interventions. Schools also have a substantial role to play in bringing about positive changes and can be considered as another action point for intervention.

Keywords: Waist circumference, school age, siblings, multi-level model

ROLE OF FOLATE AND THE METABOLICALLY RELATED B-VITAMINS IN BRAIN HEALTH IN OLDER ADULTS: THE TUDA STUDY

[1]Moore, Katie; [2]Hughes, Catherine; [2]Hoey, Leane; [2]Ward, Mary; [2]Porter, Kirsty; [2]Strain, Sean JJ; [3]Molloy, Anne; [4]Cunningham, Conal; [5]Pentieva, Kristina; [2]McNulty, Helene.

[1]BSc. Registered Dietitian. Northern Ireland Centre for Food and Health. Ulster Univeristy Coleraine. Northern Ireland; [2]PhD. Northern Ireland Centre for Food and Health. Ulster University Coleraine. Northern Ireland.; [3]PhD. Institute of Molecular Medicine. Trinity College Dublin. Ireland; [4]MD. Mercers Institute for Research on Ageing. St James's Hospital Dublin. Ireland; [5]MD. Northern Ireland Centre for Food and Health. Ulster University Coleraine. Northern Ireland.

Background and objectives: Folate and the metabolically related B-vitamins involved in one-carbon metabolism may be important for maintaining brain health in aging but few studies have investigated the biomarker status of all relevant B-vitamins. The aim of this study was to examine the role of folate, vitamin B12, vitamin B6 and riboflavin in mental and cognitive health in older adults.

Methods: Participants were recruited (n 5186) to the Trinity, Ulster, Department of Agriculture (TUDA) Ageing Cohort study in 2008-2012, from across the Island of Ireland; of these, a sub-sample (n 587) of participants were reinvestigated 5 years after the initial TUDA study. Cognition was assessed using the Mini-Mental State Examination (MMSE), the Repeatable Battery for the Assessment of Neuropsychological Status (RBANS) and the Frontal Assessment Battery (FAB). Depression and anxiety were assessed using the Centre for Epidemiologic Studies Depression (CES-D) and the Hospital Anxiety and Depression (HADS) scales. Biomarkers of all the relevant B-vitamins were determined.

Results: At baseline, poor B-vitamin status (i.e. lowest 20%) was associated with an increased risk of depression (by 47-78%) for folate (p 0.003), vitamin B6 (p 0.034) and riboflavin (p 0.011), whereas only vitamin B6 deficiency was associated with anxiety (p 0.010) and cognitive dysfunction (p ≤0.001). Furthermore, at the 5 year follow up assessment, lower biomarker status at baseline (i.e. below median value) of vitamin B6 and riboflavin, but not folate or vitamin B12, were significant predictors of the rate of cognitive decline, as measured by change in MMSE (vitamin B6 p 0.020) and RBANS (vitamin B6 p 0.008; riboflavin p 0.018). Concentrations of all B-vitamin biomarkers increased significantly with increasing intake of fortified foods and with supplement use, while non-consumers of fortified foods or supplements had the lowest status of all B-vitamin biomarkers.

Conclusions: These results suggest that better B-vitamin status can have a positive impact on mental and cognitive health older adults. Optimization of B-vitamin status, via fortified foods or supplements, may offer a means of protecting brain health in aging.

Keywords: B-vitamins. One-carbon metabolism. Cognition. Depression. Aging.

PROTEIN INTAKE AND THE DEVELOPMENT OF TYPE 2 DIABETES

[1]Voortman, Trudy; [2]Chen, Zhangling; [2]Franco, Oscar; [2]Voortman, Trudy.

[1]Postdoctoral scientist. Department of Epidemiology. Erasmus University Medical Center Rotterdam. The Netherlands; [2]Department of Epidemiology. Erasmus University Medical Center. Rotterdam. The Netherlands.

Background and objectives: Short-term trials suggest a beneficial effect of high protein intake on obesity and other diabetes risk factors, however, epidemiological studies observed positive associations of dietary protein with type 2 diabetes (T2D) risk. We aimed to examine, in a large prospective cohort, associations of intake of different sources of protein with insulin resistance, prediabetes, and T2D; and the role of obesity in these associations.

Methods: This study has been performed in the Rotterdam Study, a prospective cohort of subjects ≥45 years in the Netherlands. Prediabetes and T2D were diagnosed on the basis of medical records and fasting glucose and insulin concentrations, which were measured every few years in our research. We included 6814 subjects who were free of T2D at baseline, of whom 5795 were without prediabetes. Protein intake was assessed with the use of validated food-frequency questionnaires and expressed in energy percentages (E%). We used multivariable cox proportional hazard regression to analyze the associations between protein intake and risk of prediabetes and T2D; multivariable linear mixed models to analyze the associations with insulin resistance; and joint models to examine the role of repeatedly measured obesity data in this association . For all models, we used nutrient density substitution models to examine macronutrient substitution effects.

Results: We documented 643 cases of T2D during a median 7.2 years of follow up; and 931 cases of prediabetes during 5.7 years. In multivariable models, higher intakes of total protein were positively associated with insulin resistance, risk of prediabetes (hazard ratio (HR)=1.35 (95%CI 1.20-1.51) per 5 energy-percent), and risk of T2D (HR=1.38 (95%CI 1.20-1.60)). Additional adjustment for repeatedly measured BMI or waist circumference atten-

uated these associations, but associations remained significant. Results: **Conclusions:** Our results suggest that a higher intake of protein, mainly from animal sources, is associated with insulin resistance, and a higher risk of developing prediabetes and T2D. Our findings also suggest that obesity partly but not fully mediates this association.

MULTISECTORAL ANEMIA PLATFORM STRENGTHENING: LESSONS LEARNED IN SIERRA LEONE AND UGANDA

[1]Sarkar, Danya Sarkar; [2]Fisseha, Teemar; [3]Murphy, Hillary; [4]Hodges, Mary; [5]Adero, Nancy; [6]Namaste, Sorrel.

[1]MHS. Nutrition Specialist. SPRING Project. JSI Research & Training Institute, Inc.; [2]MPH. M&E Officer. SPRING Project. JSI Research & Training Institute, Inc. Arlington. United States.; [3]MPH. Project Officer. SPRING Project. JSI Research & Training Institute, Inc. Arlington. United States.; [4]MBBS, MRCP. Hon DSc. Country Director. Helen Keller International. Freetown. Sierra Leone.; [5]MPH. Technical Advisor Anemia & Micronutrients. SPRING Project. John Snow, Inc. Kampala. Uganda.; [6]MHS. DrPH. Technical Advisor/Team Lead Anemia. SPRING Project. Helen Keller International. Arlington. United States.

Background and objectives: Reduction of anemia requires a multisectoral and country-driven approach. In order to understand how countries coordinate efforts across sectors to set agendas and develop anemia strategies, the USAID-funded Sustaining Partnerships, Results, and Innovations for Nutrition Globally (SPRING) Project documented the approach undertaken in Sierra Leone and Uganda.

Methods: We used an instrumental case study approach to document the country experiences in anemia coordination in Sierra Leone and Uganda. Data were collected between 2015 and 2017 via two rounds of semi-structured interviews with key stakeholders in each country, and participant observations from National Anemia Working Groups and National Anemia Stakeholder meetings. A total of 43 key informant interviews were conducted. Data were thematically coded to identify recurrent factors that facilitated or inhibited anemia coordination efforts. Codes were used to develop key findings, which were supported by illustrative quotes.

Results: Experiences in Sierra Leone and Uganda were unique to their context, but three overarching issues emerged with respect to creating an enabling environment. Use of data helped facilitate the creation of such an environment by serving as an advocacy tool, generating awareness, and helping to align sectoral and donor priorities. Second, collaboration through the establishment of a multisector National Anemia Working Group resulted in enhanced networking opportunities, stronger working relationships, and in some instances decreased duplication of efforts. Third, district representation as part of national level collaboration efforts was often lacking; there was a need for improved feedback loops between national and district efforts.

Conclusions: Commitment and active participation from all relevant sectors is critical to move efforts forward and strategically address anemia in Sierra Leone and Uganda. Fostering multisectoral collaboration and providing a structure for national strategy development was important to set the agenda at the national level, and results from these efforts will be translated to sub-national levels, where multisectoral planning and implementation can strengthen the delivery of anemia programs. The experiences in these two countries can help global and country stakeholders learn from and adapt their efforts to address anemia in their context.

Keywords: Anemia multisectoral planning coordination enabling environment

INCORPORATING FRESH FOODS IN DAILY MEAL IN NAIROBI URBAN SLUM SCHOOLS EFFORTS TO INCREASE DIETARY DIVERSITY

[1]Aburmishan, Dina; [2]Fossi, Lara; [3]Ndungu, Judy; [2]Hughes, Shaun; [4]Akunaye, Christine.

[1]United Nations World Food Programme; [2]MS. Humanitarian. World Food Programme. Nairobi. Kenya.; [3]BS. Humanitarian. World Food Programme. Nairobi. Kenya.; [4]BS. Nutritionist. World Food Programme. Nairobi. Kenya.

Background and objectives: School Meal Programmes in Kenya have aided in improving students nutrition status as an essential element to improve their health and well-being since inception in 1980. KDHS 2014 reported that only 21% of children in the lowest wealth quintile consumed 4 or more food groups. Traditionally the national school meal contributed to the reduced dietary diversity by providing the caloric requirement with only three food groups, grains, pulses and oil. Beginning May 2016, WFP began incorporating fresh fruits and vegetables as a fourth food group into the diets of over 7,000 students. Transition into Fresh Foods for School Meals Programme (FF4SMP) provides a diversified basket offering the required level of energy and meeting the dietary diversity of at least four food groups. We are going to highlight the operational aspect of the Fresh Foods for School Meal Programme for students in the urban slums of Nairobi.

Methods: WFP supports School Meals in seven of the poorest and most vulnerable unplanned urban settlements in Nairobi, Kenya; Kangemi, Kawangware, Mathare, Kibera, Kariobangi, Mukuru and Makandara. Piloting of the project by adding ksh 2 (0.02 USD) in 88 schools in a phased approached over a year. Two modalities were tested to obtain the fresh food ration, 1) through cash transfers and school self procurement and 2) fresh food through outside catering that uses repurposing cosmetically unacceptable fresh foods (CUFFs).

Results: The food basket piloted includes maize, beans, oil and salt complemented by a serving of fresh vegetables or fruit. The

diversified food basket is possible for under 11 ksh/meal/day. The food basket with avocado met 35% of daily kcal requirement while the vegetable option met 31%. The difference in cost for the two was 0.39 cents. The budget for this pilot reaching 77,000 students for term 3, 2016 and term 1, 2017 is $489,322 with expected challenges of control over food quality and safety and uncertainty in accessing resources.

Conclusions: Fresh Foods pilot baskets have high nutrition value than traditional basket benefiting kids highlighting the need for its roll out countrywide and contributed to a higher dietary diversity.

REPURPOSING COMMERCIALLY UNACCEPTABLE FRESH FOODS IN SCHOOL MEALS IN NAIROBI URBAN SLUM PRIMARY SCHOOLS

[1]Aburmishan, Dina; [2]Jones, CJ; [2]Castelijns, Marjon; [3]Fossi, Lara; [3]Hughes, Shaun.

[1]MPH. Nutritionist. World Food Programme. Nairobi. Kenya.; [2]MS. ENVIU. Nairobi. Kenya.; [3]MS. Humanitarian. World Food Programme. Nairobi. Kenya.

Background and objectives: Kenya's second largest horticultural export is fruits and vegetable, mainly to the UK and Europe. However, over 115,000 MT of cosmetically unacceptable fresh food (CUFFs) are discarded yearly due to strict standards set for export. Although the food is perfectly fit for human consumption, it doesn't meat the certain shape or color standards set for resale in the international markets and is then discarded in a variety of ways. WFP is aiming to develop an alternative market for these CUFFs by redistributing them into the school meals programme as an effort for students to receive a high quality low-cost fresh food ration.

School meals are a cost-effective safety net: they attract and retain learners in school, they contribute to alleviating short term hunger and for many children they constitute a significant portion of their daily energy and nutrient intake. Incorporating a fourth food group, consisting of fresh vegetables and fruits, contributes to improved dietary diversity and increased nutritional value.

Methods: Participants include 3 schools in the urban slums of Nairobi, Kenya, reaching almost 2,000 students daily. Schools receive a daily prepared hot meal that includes maize, beans, oil, salt and a fresh fruit or vegetable. The source of the fresh food ration comes from previously rejected fresh produce based on cosmetic standards only and is fit for human consumption. The cosmetically unacceptable fresh food (CUFF) would have been traditionally discarded by the packhouse.

Results: Contribute to the reduction of 115,000 MT of food annual food waste and increase the nutrition density of the school meals by diversifying the food basket. Increase access to low cost fresh nutritious foods. Contribute to the local economy by creating number of micro-entrepreneurial opportunities along the value chain. It will create a reproducible scalable model with global impact, particularly in countries with high horticulture exports and WFP supported school meals.

Conclusions: Developing a sustainable way to incorporate previously rejected food into Kenyan food systems, has the potential to create a reproducible scalable model with global impact, particularly in countries with high horticulture exports and WFP supported school meals.

Keywords: Food waste, schools, Kenya, dietary diversity.

EGG VS ORGANIC EGG PREFERENCES OF TURKISH CONSUMERS ACCORDING TO FOOD VALUE SCALE

[1]Ozturk-Duran, Elif Esra; [1]Erdinc, Ayse Seyma; [2]Dikmen, Derya; [3]Ellahi, Basma.

[1]BSc, Nutrition and Dietetics Department, Hacettepe University, Turkey.; [2]PhD, Nutrition and Dietetics Department, Hacettepe University, Turkey.; [3]Prof, PhD, Faculty of Health and Social Care, University of Chester, United Kingdom.

Background and objectives: People choice of healthier food have positive effects on healthy life. Therefore, the priorities of consumers varies and attitudinal, motivational, demographic and behavioural factors has impact on food choices. This study was designed to determine the food values when purchasing organic and non-organic eggs among Turkish consumers by food value scale.

Methods: In order to determine the values that consumers give importance in organic and non-organic egg , the food value scale was administered. The questions on on socio-demographic characteristics and organic food preferences were also included in the questionnaire. The sample comprised healthy adults, 385 women and 123 men, ranged from 19 to 64 years. The questionnaires were analysed with the statistical programme SPSS

Results: The vast majority of participants were normal weight (11% underweight, 60% normal weight, 22% overweight and 7% obese). More than half of the consumers were young adult individuals aged 19-24 years (56.9%). 17.1% of the population is between 25-34 years, 10.4% is between 35-44 years, 11.6% is between 45-54 years of age and 3.9% is between 55-64 years of age. Compare to unhealthy eaters, It has been shown that healthy eaters pay more attention to naturalness for eggs and organic eggs when compared with taste ($p<0.05$). Healthy eaters also pay more attention to naturalness for eggs and organic eggs when compared with price ($p<0.05$). Although there was no statistical difference in the price and nutritional value of egg and organic egg preferences in healthy eaters ($p>0.05$), but in organic egg consumers thought nutritional value was more important than the price when compared to egg ($p<0.05$). In addition there was a significant difference in the values of environmental impact when compared with price in egg preference but not in organic egg ($p>0.05$)

Conclusions: This study showed naturalness, nutritional value and environmental impact were the most important values for

consumers in egg preferences. Food values were related with the food preferences of consumers. Since food values have an influence on food choices, it can be use to identify effective strategy to promote healthy eating habits.

Keywords: Organic foods, Food value scale, food choice.

IMPACT OF METHODOLOGICAL CHOICES WHEN DEVELOPING A FOOD BASED DIETARY GUIDELINES WITH DIET OPTIMIZATION TECHNIQUES

[1]Van Rossum, Caroline; [2]Geurts, Marjolein; [2]Toxopeus, Ido; [2]Vennemann, Francy; [2]Buurma-Rethans, Elly; [3]Brink, Elisabeth; [2]Ocke, Marga.

[1]PhD, Nutritionist, Centre for Nutrition, Prevention and Health Services, RIVM, The Netherlands; [2]Centre for Nutrition Prevention and Health Services. RIVM. Bilthoven. The Netherlands.; [3]The Netherlands Nutrition Centre (Voedingscentrum). The Hague. The Netherlands.

Background and objectives: Diet optimization is a mathematical approach that simultaneously takes multiple factors into account (such as limits between which intake of foods and nutrients should satisfy, and an optimization function) and facilitates the development of food based dietary guidelines (FBDG). This approach can be used to reduce subjective decision-making in guideline development. However, also when using diet optimization, subjective choice options cannot be avoided.

Objective: To provide insight into the effects of methodological choice options when developing FBDG with diet optimization techniques.

Methods: With data from young men aged 19 to 30 years from the Dutch food consumption survey the impact of different choice options were illustrated, by calculating the optimal diet for nine scenarios compared to a reference scenario. The choice options were related to the selection of food groups, the determination of food composition per food group, the current consumption per food group, the criteria and the optimization function.

Results: The present study demonstrates that, even though diet optimization techniques are less prone to subjective decision-making, choice options encountered in the development process remain to affect the final FBDG. The impact of the different choices options varied. A substantial effect occurred when increasing the number of food groups and/or the nutrient density of food groups (by including only healthier foods). Whereas a minimal effect was observed for different weighing factor for the food composition and introducing additional constraints. In- or excluding fortified foods in the nutrient composition calculation had an unclear effect.

Conclusions: Various methodological choices impact the resulting optimized diet for FBDG when using optimization techniques. Considering the various choices and recording of the decisions made is therefore essential.

Keywords: Food-based dietary guidelines, health, food composition, food consumption, optimization.

FOOD AND BEVERAGE REFORMULATION WOULD MAKE IT EASIER TO REACH SIMULTANEOUSLY ALL NUTRITIONAL RECOMMENDATIONS IN THE FRENCH ADULT POPULATION

[1]Maillot, Matthieu; [2]Privet, Lisa; [3]Masset, Gabriel.

[1]PhD. MS-Nutrition. Marseille, France; [2]MD. MS-Nutrition. Marseille, France; [3]PhD. Nestlé Research Center. Lausanne, Switzerland.

Background and objectives: Reaching nutritionally adequate diet is possible but may require significant deviation from observed consumptions. The objective was to evaluate whether food and beverage reformulations following the Nestlé Nutritional Profiling System (NNPS) could reduce this necessary deviation in the French population.

Methods: Dietary data from the French national survey was crossed with the French food composition database (CIQUAL-2013). The category-specific NNPS classified all in-scope foods (70% of consumed foods) into "PASS" or "FAIL". Nutritional intakes were estimated for each adult (n=1808) according to 3 scenarios based on: i)the original food composition database (BASELINE), ii)a "reformulated" database in which the nutrient composition of FAIL products was adjusted to the NNPS standards (REFORMULATION) and iii) a replacement of FAIL products by the most nutritionally similar PASS products from the same category (SUBSTITUTION).

Mean Excess Ratio (MER,%/d) and Solid Energy Density (SED,kcal/100g) were calculated on observed diets. For each scenario, starting from each observed diet, a new iso-caloric modeled diet was designed (Maillot,PLoSOne,2017), to fulfill French nutrient recommendations and stay as close as possible to the observed one. The optimization process priorized the modification of the amount of foods already consumed (repertoire foods), and foods which were not consumed could be added if necessary (non-repertoire foods). The total dietary deviation (TDD) was calculated as the sum of the absolute difference between observed and optimized amount of repertoire foods plus the amount of non-repertoire foods added.

Results: The MER and SED were improved in REFORMULATION (100%/d and 154kcal/100g) and SUBSTITUTION (103%/d and 146kcal/100g) scenarios compared to BASELINE (130%/d and 165kcal/100g). The TDD was significantly reduced in the REFORMATION and the SUBSTITUTION scenarios compared to BASELINE (1253g/d, 1226g/d and 1412g/d respectively). This was explained by a smaller increase of repertoire foods (661g, 609g vs 742g respectively), a smaller decrease of repertoire foods (-474g, -503g vs -520g respectively) and less additions of non-repertoire foods (118g, 113g vs 152g respectively).

Conclusions: Nutritional reformulation of the food supply according to the NNPS profile reduces the dietary effort required to achieve nutritionally adequate diets.

Keywords: Individual diet modeling, Nestlé Nutritional Profiling System, substitution, reformulation, diet quality

GENDER SPECIFIC DETERMINANTS OF STUNTING AMONG RWANDAN CHILDREN 6-23 MONTHS OLD

[1]Matsiko, Eric; [2]Melse-Boonstra, Alida; [3]Ahishakiye, Jeanine; [4]Dandanell Garn, Kristine; [3]Iyakaremye, Damien; [5]Tuyisenge, Lisine; [2]Feskens, Edith.

[1]Msc. Division of Human Nutrition and Health. Wageningen University & Research. The Netherlands.; [2]PhD. Division of Human Nutrition and Health. Wageningen University & Research. The Netherlands.; [3]MSc. Department of Human Nutrition and Dietetics. University of Rwanda. Rwanda.; [4]MSc. Nutritionist. Unicef. Rwanda.; [5]MD. Department of Paediatrics. Kigali University Teaching Hospital. Rwanda.

Background and objectives: Stunting is a major public health concern in developing countries, with a disproportionate global burden affecting South-East Asia and Sub-Saharan Africa. Although a disparity in childhood stunting to the disadvantage of boys has been reported, it is not universal across countries. Moreover, the difference between the sexes seems rather extreme in Rwanda where boys have been affected more than girls for over a decade. We aimed to identify factors that explain the difference in stunting between boys and girls aged 6-23 months in Rwanda.

Methods: Cross-sectional data of 1533 children aged 6-23 months were collected from ten districts with a high burden of malnutrition in Rwanda. Predictors of stunting prevalence were modelled by Cox proportional hazard regression with robust variance, stratified for sex.

Results: Stunting significantly affected boys more than girls with a weighted prevalence of 43.3% vs. 28.0%, respectively. The multivariate analysis showed that living in a female-headed household (PR=1.20, 95% CI=1.09-1.31), off-farm occupation of the mother (PR=1.12, 95% CI=1.1.04-1.21), diarrhea (PR=1.07, 95% CI=1.01-1.13) and malaria (PR=1.27, 95% CI=1.16-1.39) were significant risk factors for stunting in boys solely. For both sexes, consistent significant risk factors were large household size (PR=1.20, 95% CI=1.11-1.30 in boys and PR=1.18, 95% CI=1.06-1.31 in girls), low wealth category (PR=1.17, 95% CI=1.10-1.1.24 in boys and PR=1.27, 95% CI=1.16-1.28 in girls), use of untreated drinking water (PR=1.15, 95% CI=1.09-1.22 in boys and PR=1.18, 95% CI=1.09-1.28 for girls) and dietary diversity below the minimum (PR:1.11, 95% CI= 1.03-1.21 in boys and PR=1.39, 95% CI=1.24-1.55 in girls).

Conclusions: The risk for stunting among boys remains substantially higher than among girls in Rwanda. This is most prominently related to morbidity, female headship of the household and off-farm occupation of the mother.

Keywords: Rwanda, Stunting, children of 6-23 month old, gender specific determinants.

UNDERSTANDING BARRIERS AND FACILITATORS FOR BREASTFEEDING, DONOR HUMAN MILK, AND KANGAROO MOTHER CARE AMONG MOTHERS AND INFLUENCERS OF PRETERM AND SICK NEONATES IN INDIA

[1]Chugh Sachdeva, Ruchika; [2]Mondkar, Jayashree; [3]Shanbhag, Sunita; [4]Sinha, Minu; [5]Khan, Aisha; [6]Wankhede, Maya; [7]Mahapatra, Sudip; [8]Dasgupta, Rajib.

[1]Team Leader- Nutrition. PATH.India; [2]MD. Neonatologist. Lokmanya Tilak Municipal Medical College and General Hospital. Mumbai. India.; [3]MD. Project Manager- MBFI+. Lokmanya Tilak Municipal Medical College and General Hospital. India.; [4]BSc. MBA. Research Officer-MBFI+. Lokmanya Tilak Municipal Medical College and General Hospital. India.; [5]BPT. MBA. Research Officer-MBFI+. Lokmanya Tilak Municipal Medical College and General Hospital. India.; [6]MD. Neonatologist. Rajawadi Hospital. Mumbai. India.; [7]M.Sc. Regional Monitoring and Evaluation Specialist. PATH. India; [8]PhD. Professor. Center of Social Sciences and Community Health. Jawaharlal Lal Nehru University. India.

Background and objectives: With the highest number of preterm, low birth weight, sick babies in the world, an integrated approach to newborn care is essential in India. Increasing access to human milk through human milk banks (HMB) has the potential to reach 5 million babies in India annually. Thus, assessment on knowledge of breastfeeding practices, kangaroo mother care (KMC) and perception of donor human milk among mothers and influencers of preterm and sick neonates was undertaken as a baseline prior to strengthening Mother Baby Friendly Initiative Plus (MBFI+) model that integrates breastfeeding promotion, KMC, and providing safe donor human milk to vulnerable babies.

Methods: Focus group discussions with mothers, influencers of preterm and sick neonates who have received donor milk, mothers who have donated milk and are potential donor and recipient at two facilities in Mumbai, India.

Results: More than half of the mothers were aware of the benefits of breastfeeding and nearly half were aware about the duration of exclusive breastfeeding. Most mothers and fathers were aware that colostrum should be fed to babies while few mothers stated that it is harmful. Most mothers mentioned that doctors during antenatal care told them about their diet, but no information was given on breastfeeding. Some mother shared challenges faced with feeding preterm, LBW babies. Only mothers who practiced KMC were aware of the practice and benefits. Overall, low awareness about human milk banking among mothers and influencers was found. Donor mothers and fathers were comfortable with donating milk once they knew it is life-saving and did not compromise supply for their own baby. All mothers accepted use of donor milk as per the unit norms, however, some parents had concerns about quality and safety as they were not aware of the process followed in a HMB. Most grandmothers were not comfortable with either donating or receiving donor human milk.

Conclusions: There is a need for capacity building and behavioral change communication strategies targeted at mothers and influ-

encers about MBFI+ interventions right from the antenatal period so that mothers receive adequate support and information to help increase access and uptake of human milk for vulnerable babies.

Keywords: Breastfeeding, human milk bank, preterm, kangaroo mother care, donor human milk.

USING TARGETED BENEFICIARY SURVEYS TO MEASURE NUTRITION OUTCOMES IN LOW-RESOURCE SETTINGS FOLLOWING INTENSIVE INTERVENTIONS: EXAMPLES FROM THE SPRING PROJECT IN BANGLADESH, GHANA, AND NIGERIA

[1]*Williams, Timothy;* [2]*Pomeroy-Stevens, Amanda;* [3]*Mukuria, Altrena.*

[1]MA. MEM. Senior Strategic Information Advisor. SPRING Project. John Snow Inc.; [2]MSc. Research and Evaluation Advisor. SPRING Project. John Snow, Inc. USA.; [3]DrPH. MPH. Director of Country Initiatives. SPRING Project. Save the Children. USA.

Background and objectives: Nutrition projects face challenges when measuring behavior change in low-resource settings. Projects often lack resources to carry out population-based surveys with comparison groups, and time lags between surveys can limit usefulness for program management. Further, projects may not reach enough people to enable dose-response surveys to detect significant behavior change at population level during project timeframes. Some of these issues can be addressed using "beneficiary surveys" among people reached by project interventions.

Methods: In Bangladesh, Ghana, and Nigeria, the SPRING Project used beneficiary surveys to measure select nutrition outcomes. In all cases, SPRING also used secondary analysis from existing large-scale surveys among similar populations and regions, before interventions began. Beneficiary survey results were compared against those population-based surveys, providing a rough indication of project effect on outcomes. In Bangladesh, SPRING surveyed a cohort of 386 women before and after nine-month "farmer nutrition schools" (FNS), and again one year later. In Ghana (N=420) and Nigeria (N=371), beneficiary surveys (endline only) were carried out after one+ years of exposure to SPRING activities.

Results: In Bangladesh, diet diversity and other indicators increased significantly among participants following the nine-month FNS program. Women consuming 5+ out of nine food groups increased from 29% to 83% immediately following FNS, remaining high (76%) one year later. Secondary analysis of existing survey data among similar populations and similar timeframe showed negligible change (20% to 21%). In Nigeria, exclusive breastfeeding among support group beneficiaries was 61%, compared to 29% in a comparable population-based survey in the same area before SPRING activities began. In Ghana, the percentage of households with handwashing stations near latrines was 62% in a survey of SPRING beneficiaries, compared with 2.5% in a population-based baseline.

Conclusions: Beneficiary-only surveys can be an economical way for projects to learn about behavior change in target populations, especially if results can be analyzed against population-based surveys with comparable indicators and sampling. SPRING's experience suggests that behavior change can occur rapidly in small populations reached with intensive, multifaceted interventions. Achieving population level change takes longer due largely to issues of scale.

THE CHALLENGES AND SUCCESSES OF SALT, SUGAR AND FAT REDUCTION PROGRAM TO PREVENT NCDS (IRAN EXPERIENCES)

[(1)]Hajifaraji, Majid; [(2)]Abdollahi, Zahra.

[(1)]National Nutrition & Food Technology Research Institute, Shahid Beheshti Univ. of Medical Sciences. Iran.; [(2)]PhD. in Nutrition, Dept. of Community Nutrition Development, Ministry of Health.

Background and objectives: In January 2015, WHO released a global estimate report which showed more than 1.9 billion overweight adults including 600 million obese people. Unbalanced diets and low physical activity can contribute to chronic diseases. % 65 of Iranian adults 40-64Y are overweight and obese, %45 with hypercholesterolemia and %47 are hypertensive, 16% identified and non-identified diabetes.

The studies show that %80 of CVD and Diabetes and %40 of cancers are preventable by controlling the above risk factors and dietary patterns have a pivotal role in the control of NCD's.

Methods: Two main restrictive policies which performed by Iranian authority to minimize the consumption of fat, salt and sugar: The first one is putting the tax for unhealthy food products and the updated list of unhealthy food products are published every year by Ministry of Health. In this program, tax of unhealthy foods spends on healthcare system. The second strategy is designing of a food traffic light labeling system which easily helps to estimate amounts of fat, salt, sugar and trans-fatty acids in one serving of food products.

Results: This system of labeling is mandatory for all of the industrial food products. We succeeded to reduce %1- 2.5 salt in bread, snacks, cheeses and sauces. The standard of salt in bread decreased from %2.3 to %1.8 and then %1 in 2016.

According to the legislation and operational plans SFA in oil products was reduced to <%25 and in food products such as snacks, biscuits and confections <%30. TFA was reduced from >%20 to <8% in food products and <%2 in edible oils in 2016.

Conclusions: As a Future plan, the road map in the national nutrition policy and food security in Iran by 2025 is mainly emphasizing on NCDs.

DIETARY INTAKE OF FIBRE AND GUT MICROBIOTA IS RELATED TO LOWER LEVEL OF GLYCOPROTEIN ACETYLATION, A MARKER OF LOW-GRADE INFLAMMATION, IN OVERWEIGHT PREGNANT WOMEN

[(1)]Mokkala, Kati; [(2)]Houttu, Noora; [(2)]Koivuniemi, Ella; [(3)]Laitinen, Kirsi.

[(1)]M.Sc, Institute of Biomedicine, Univeristy of Turku, Finland;
[(2)]MSc, Institute of Biomedicine, Univeristy of Turku, Finland;
[(3)]PhD, Institute of Biomedicine, Univeristy of Turku, Finland.

Background and objectives: Overweight may induce health complications during pregnancy. One suggested mechanism arises from low-grade inflammation that has been linked with aberrant metabolic responses such as deranged glucose metabolism. Diet and gut microbiota may regulate low grade inflammation. Therefore the objective was to explore the relation of dietary fibre intake and gut microbiota richness with serum markers of low-grade inflammation in pregnancy.

Methods: Overweight and obese women (BMI 30.7±4.4 kg/m2, n=100) were studied in early pregnancy (≤17 weeks). Intake of fibre was calculated from 3-day food diaries. Faecal microbiota composition was analysed using 16S rRNA gene sequencing. Glycoprotein acetylation (GlycA, determined by NMR) and high-sensitive C-reactive protein (hs-CRP) were used as markers for low-grade inflammation. The alpha diversity, measured as Chao1, observed OTUs, phylogenetic diversity and the Shannon index were calculated using alpha rarefaction values at sequence 36382. Spearman's correlation was used to evaluate the associations between the variables.

Results: Dietary fibre intake correlated inversely with GlycA (ρ=-0.316, p=0.002, n=95). Also, the gut microbiota richness indexes correlated inversely with GlycA; Chao (ρ=-0.281, P=0.007), phylogenetic diversity (ρ=-0.238, P=0.022) and observed number of OTUS (ρ=-0.271, P=0.009). No association were detected between fibre or gut microbiota with hs- CRP.

Conclusions: Higher dietary intake of fibre and gut microbiota richness were related to lower maternal inflammatory status, measured as glycoprotein acetylation. The suggested mechanism how fibre may induce beneficial effects on maternal metabolism may take place through fibre induced alterations in gut microbiota richness. This finding opens novel opportunities in designing approaches for modification of diet and microbiota to induce beneficial alterations in maternal inflammatory status with potential to improve the health of both the mother and child.

Keywords: Fibre, inflammation, GlycA, gut microbiota richness, pregnancy.

PhD. Department of Mathematics and Statistics. University of Reading. UK; [6]BSc (Hons). PhD. CBiol. MSB. Institute for Food, Nutrition and Health. University of Reading. UK; [7]BSc (Hons). Diet (Dip). PhD. RNutr. Hugh Sinclair Unit of Human Nutrition. University of Reading. UK. Institute for Food, Nutrition and Health. University of Reading. UK.

Background and objectives: Consumption of modified dairy products with a saturated fatty acid (SFA)-reduced, mono-unsaturated fatty acid (MUFA)-enriched content may have beneficial effects on the fasting cholesterol profile but their effects on metabolic perturbations during the postprandial state, a significant contributor to the pathogenesis of atherosclerosis, remain unknown. Specifically, it is important to consider the effects of sequential meals on postprandial metabolism, as this more accurately reflects Western dietary patterns. We investigated whether consumption of fatty acid (FA)-modified dairy products altered postprandial metabolic responses, when compared to dairy foods with a FA composition typical of retail products (control).

Methods: A 12-week, randomised, crossover, double-blinded controlled dietary intervention was conducted in fifty-one adults at moderate CVD risk (RESET study; NCT02089035). Using a food-exchange model, two iso-energetic high-fat (38% total energy (TE)), high-dairy diets that contained milk, cheese and butter: control (dietary target: 19%TE SFA; 11%TE MUFA) and modified (16%TE SFA; 14%TE MUFA) were implemented. Before and after each intervention period, a sequential two-meal, high-fat postprandial investigation was performed. Using mixed models, changes from the baseline study visit in postprandial serum tria-cylglycerol, glucose, apolipoprotein B (apoB) and insulin responses were reported as incremental area under the curve (iAUC) for 0-480min postprandially and following breakfast (0-330min) and lunch meals (330-480min), that were rich in control or modified dairy products.

Results: A differential effect was observed for the apoB responses from 0-480min and 0-330min, with attenuations observed in iAUC following the modified diet (P<0.01 and P<0.0001, respectively). No differences were evident between diets for other outcome measures.

Conclusions: Chronic consumption of FA-modified dairy products decreased postprandial apoB responses, suggesting a potentially beneficial acute effect of these foods on TAG-rich lipo-

proteins metabolism. Supported by the Medical Research Council (Ref: MR/K020218/1), with food in-kind from Arla Foods UK and AAK (UK) Ltd.

Paediatric Department of Lozano Blesa University Hospital, CIBEROBN. University of Zaragoza. Spain.; [6]MD. Growth, Exercise, Nutrition and Development, School of Health Sciences, CIBEROBN. University of Zaragoza. Spain.

Background and objectives: Childhood obesity is associated with metabolic complications that can derive into a higher risk of cardiovascular diseases (CVD). Some individuals with obesity do not display metabolic abnormalities, called metabolically healthy (MH), as opposed to those exhibiting metabolic alterations, called metabolically unhealthy (MU). The objective was to evaluate the association between CVD biomarkers and MU status in prepubertal children.

Methods: 930 Spanish prepubertal children (622 overweight/obese, 462 males) aged 5 to 10.9 years were recruited. Anthropometric measurements were taken and adiponectin, leptin, resistin, myeloperoxidase (MPO) and total plasminogen activator inhibitor 1 (tPAI-1) were analyzed. Children were classified as having normal-weight or overweight/obesity using age- and sex-specific BMI cut-off points. MU status was based upon fulfillment of one or more of the following criteria: ≥90th percentile of SBP and/or

DBP for age, sex, and height; >90th percentile of TG for age, sex, and race; <10th percentile HDL-C for age, sex and race; ≥100 mg/dL glucose; >2.5 HOMA. A general linear model adjusted for age and BMI was used to assess differences between groups and a linear regression analysis was performed to evaluate the association between biomarkers and MU obesity using the software SPSS.

Results: In children with overweight/obesity, MU prevalence was 62.5% and in normal-weight children, 23.9%. In children with overweight/obesity, plasma concentrations of resistin (P=0.010), leptin (P=0.022), tPAI-1 (P=0.011) and MPO (P=0.001) were higher and adiponectin (P=0.008) was lower in MU than in MH children, while adjusting for age and BMI. Linear regression analysis indicated an independent association between tPAI-1 (β=0.215, 95% CI: 0.085–0.167, P<0.001) and MPO (β=0.167, 95% CI: 7.607–18.742, P<0.001) and MU status.

Conclusions: MU obesity is associated with a high fibrinolytic and vascular stress in prepubertal children. The measurement of biomarkers such as tPAI-1 and MPO could aid in the detection of children at high CVD risk, for their inclusion in adequate prevention programs.

Keywords: Metabolically unhealthy obesity, children, prepubertal, cardiovascular diseases.

Methods: Randomized, simple-blind, placebo-controlled clinical trial, 54 patients with T2DM received 520mg DHA+EPA-enriched fish oil (FOG) or placebo (PG) daily for 24 weeks. Baseline and final anthropometric and biochemical measurements included leptin and adipokine concentrations. We obtained dietary intake by multiple 24-hour recalls.

Results: Waist circumference and glucose showed significant reductions in FOG (p=0.001 and p=0.011 respectively). Glycosylated hemoglobin (p=0.009 and p=0.004), leptin (p=0.000 and p=0.000) and leptin to adiponectin ratio (p=0.000 and p=0.000) decreased significantly in both groups after supplementation (FOG and PG respectively); while serum resistin levels (FOG p=0.000 and PG p=0.001), insulin (FOG p=0.000 and PG p=0.000), and HOMA-IR (FOG p=0.000 and PG p=0.000) increased significantly in both groups. EPA (p<0.000) and DHA (p=.001) intake was higher in FOG.

Conclusions: We found a significant beneficial effect of six-month n-3 PUFA supplementation only on waist circumference and glucose. Acknowledgments: This project was financed by CONACyT, and is part of JCMG's thesis to obtain the degree of Master in Health Science. Key words: type 2 diabetes mellitus, adipokines, n-3 PUFA.

Background and objectives: Background: Type 2 diabetes mellitus (T2DM) is associated with chronic low-grade inflammation, characterized by an increase in secretion of pro-inflammatory adipokines and a decrease of anti-inflammatory adipokines, worsening insulin resistance (IR). Omega-3 polyunsaturated fatty acids (PUFA), through their potent anti-inflammatory effects could help improve insulin sensitivity and the inflammatory profile, supplementation with PUFA in subjects with diabetes decreases inflammatory markers such as C-reactive protein and interleukin-2, little is known about their effects on adiponectin, resistin and leptin. Objective: Investigate the effect of n-3 PUFA on metabolic indicators of T2DM Mexican adults.

MUCOSAL LEVELS OF IGE+ AND IGA+ CELLS AND ANTIBODIES IN PROTEIN DEFICIENT RATS DURING TRICHINELLA SPIRALIS INFECTION

[1]Vila, Cecilia Celeste; [1]Saracino, María Priscila; [1]Falduto, Guido Hernán; [2]Calcagno, Marcela Adriana; [3]Pallaro, Anabel N; [4]Baldi, Pablo César.

[1]PhD Student. Biologist. Cátedra de Inmunología-IDEHU (UBA-CONICET). Facultad de Farmacia y Bioquímica. Universidad de Buenos Aires. Argentina.; [2]Biochemist. Cátedra de Inmunología-IDEHU (UBA-CONICET). Facultad de Farmacia y Bioquímica. Universidad de Buenos Aires. Argentina.; [3]PhD. Biochemist. Departamento de Nutrición. Facultad de Farmacia y Bioquímica. Universidad de Buenos Aires. Argentina.; [4]PhD. Biochemist. Cátedra de Inmunología-IDEHU (UBA-CONICET). Facultad de Farmacia y Bioquímica. Universidad de Buenos Aires. Argentina.

Background and objectives: This study was aimed to analyze, in Trichinella spiralis-infected rats, the effect of protein deficiency on antibody (Ab) levels and IgE+ and IgA+ cells counts in lung and intestine (relevant organs in protection against this pathogen).

Methods: Weaning Wistar rats received a protein-deficient diet (PD, 6.5% casein) or a control diet (C, 20% casein). After ten days, both groups were orally infected with T. spiralis muscle larvae (ML); non-infected rats served as controls.

The organs were obtained at different days post-infection (p.i.). The numbers of IgA+ and IgE+ cells were determined by immunofluorescence. Total and specific Ab (against ML) were determined by ELISA in tissue extracts. Data were analyzed using the two-way ANOVA.

Results: Total IgE and IgG1 increased in C group from day 9 p.i. in both organs. In lung also IgG2a increased from day 9 p.i. In intestine IgA decreased from day 3 p.i. Although the same kinetics were observed in PD group for all isotypes, Ab levels were lower than in C group and did not increase significantly compared to non-infected animals. Specific IgG1 was significantly lower in PD group in both organs.

In lung IgE+ cells increased, compared to non-infected controls, in C group from day 3 p.i. (p<0.05) and in PD group from day 33 p.i. (p<0.01). In intestine IgE+ cells increased in C group from day 3 p.i. (p<0.001) and in PD group from day 6 p.i. (p<0.01). C group presented more IgE+ cells in both organs. No significant changes were observed for IgA+ cells in any group.

Conclusions: Protein deficiency seems to affect the mucosal levels of Ab and IgE+ cells during Trichinella spiralis infection. Given the important role of IgE in helminthiases, this may explain the severe infection previously found in PD rats.

Keywords: Trichinella spiralis. Protein deficiency. IgE and IgA. Antibodies. Mucosal immunity.

Background and objectives: Combination of metabolomics and epidemiological approaches opens new perspectives for ground-breaking discoveries. The aim of the present study was to investigate for the first time whether plasma non-targeted metabolomic profiles, established from a simple blood draw from healthy women, could contribute both to predict the risk of developing breast cancer within the following decade and to better understand the etiology of this complex disease.

Methods: A prospective nested case-control study was set up in the SU.VI.MAX cohort, involving 206 breast cancer cases diagnosed during a 13y follow-up, and 396 matched controls. Non-targeted NMR metabolomic profiles were established from baseline plasma samples. Multivariable conditional logistic regression models were computed for each individual NMR variable and for combinations of variables derived by principal component analysis.

Results: Several metabolomic variables from 1D NMR spectroscopy were associated with breast cancer risk. Women characterized by higher fasting plasma levels of valine, lysine, arginine, glutamine, creatine, creatinine, and glucose and lower plasma levels of lipoproteins, lipids, glycoproteins, acetone, glycerol-derived compounds and unsaturated lipids had a higher risk of developing breast cancer. P-values ranged from 0.00007 (ORT-3vsT1=0.37[0.23-0.61] for glycerol-derived compounds) to 0.04 (ORT3vsT1=1.61[1.02-2.55] for glutamine).

Conclusions: This prospective study showed that baseline NMR plasma metabolomic signatures reveal predictive metabolites associated with long-term breast cancer risk. These results provide interesting insights to better understand complex mechanisms involved in breast carcinogenesis and evoke plasma metabolic disorders favorable for carcinogenesis initiation. This study may contribute to develop screening strategies for the identification of at-risk women for breast cancer well before symptoms appear.

Keywords: Metabolomics, breast cancer, NMR, plasma, prospective study.

EFFECT OF STIGMASTEROL ISOLATED FROM THE CALYXES OF BOMBAX COSTATUM ON HYPERLIPIDEMIC ALBINO RATS

[1]Nnam, Ngozi; [2]IOMBOR, TERHEMBA.

[1]PhD. Lecturer. Department of Home Science Nutrition and Dietetics. University of Nigeria Nsukka. Nsukka. Nigeria.; [2]M.Sc. Lecturer. Department of Home Science and Management. University of Agriculture. Makurdi. Benue State. Nigeria.

Background and objectives: Hyperlipidemia or hypercholesterolemia often occurs in conjunction with glucose intolerance, obesity, diabetes and metabolic syndromes. The study evaluated the effect of stigmasterol administration on total cholesterol, low density lipoprotein cholesterol, triglycerides and high density lipoprotein cholesterol contents of poloxamer-407 induced hyperlipidemic albino rats.

Methods: Thirty albino rats were divided into 6 groups of 5 rats each. Poloxamer-407 was dissolved in saline (1g/ml, 4 degree centigrade) and administered to the rats in group 2-6 by intraperitoneal injection at a dose of 1g/kg body weight to induce hyperlipidemia. The injections were given at days 1 and 3. Rats in group 1 were not induced and were fed rat chow and water only (control). On induction of hyperlipidemia, rats in group 2 were fed rat chow and water alone (2nd control). Rats in group 3 were fed rat chow, water and atorvastatin a standard drug (positive control) while rats in group 4-6 were fed rat chow, water and different doses (50, 100 and 200mg) of stigmasterol isolated from the calyxes of Bombax costatum, respectively. Blood samples were obtained from all the rats by cardiac puncture at baseline and endline. Total cholesterol (TC), triglyceride (TG) low density lipoprotein cholesterol (LDLC) and high density lipoprotein cholesterol (HDLC) were determined on the blood samples.

Results: The different doses of stigmasterol (50, 100, 200 mg) decreased TC, TG, LDLC and increased HDLC in the rats. The group given 50mg stigmasterol had the highest decrease in TC (12.99%) and TG (21.13%) relative to the group given standard drug atorvastatin, which had 7.2% decrease in TC and 6.31% decrease in TG. The group of rats given 200mg stigmasterol had the highest decrease in LDLC (13.55%) relative to the group given the standard drug atorvastatin (10.41%) while the group given 100mg stigmasterol had the highest increase in HDLC (11.86%) relative to the group given the standard drug atorvastatin (5.21%).

Conclusions: The different doses of stigmasterol were more effective in improving hyperlipidemia in albino rats relative to the standard drug atorvastatin.

Keywords: Hyperlipidemia, atorvastatin, stigmasterol, albino rats.

BLUE MUSSEL (MYTILUS EDULIS) INTAKE DECREASES DISEASE ACTIVITY (DAS-28 CRP) IN FEMALE PATIENTS WITH RHEUMATOID ARTHRITIS: RESULTS FROM A RANDOMIZED CROSS-OVER DIETARY INTERVENTION

[1]Lindqvist, Helen; [2]Gjertsson, Inger; [2]Eneljung, Tove; [3]Winkvist, Anna.

[1]PhD. Assistant Professor in Food Science and Biochemistry. Department of Internal Medicine and Clinical Nutrition. Institute of Medicine. Sahlgrenska Academy. University of Gothenburg. Sweden; [2]MD. Department of Rheumatology and Inflammation Research. Institute of Medicine. Sahlgrenska Academy. University of Gothenburg. Sweden; [3]PhD. Professor in nutrition. Department of Internal Medicine and Clinical Nutrition. Institute of Medicine. Sahlgrenska Academy. University of Gothenburg. Sweden.

Background and objectives: There is unfortunately an ambiguous evidence base for the relation between diet and Rheumatoid Arthritis (RA) and not possible to optimize treatment combining both pharmacological treatment and lifestyle factors. The aim of this study was to test whether a diet rich in blue mussels, an environment sustainable seafood option, in addition to conventional medical treatment could reduce disease activity and improve quality of life in patients with established RA.

Methods: Women with established RA and DAS28>3.0 were recruited to a randomized 2x11-week cross-over dietary intervention. The participants continued with their medication and habitual diet but exchanged one cooked meal a day, five days a week with a meal including 75 g blue mussels or 75 g meat. Diets were switched after an eight week washout period. Blood samples were collected and analysed for blood lipids, erythrocyte sediment rate (ESR) and C-reactive protein (CRP). Tender and swollen joints were also examined at start and end of each dietary period. Data regarding patient global health, pain and fatigue (Visual Analog Scales, VAS), disability (Health Assessment Questionnaire) and quality of life (SF36) were recorded. As primary outcome variable, the composite measure DAS28 including the number of swollen and tender joints out of 28, patients' estimation of global health on a visual analog scale (VAS) and ESR was chosen.

Results: Twenty-three women (n=14 seropositive, n=9 seronegative) completed the intervention. Intake of the blue mussel diet reduced DAS28 CRP significantly (p=0.048) compared to control diet. The positive effect was due to a combination of a decreased CRP, fewer tender joints and a significantly lower rating in VAS global health (p=0.041). The numbers of EULAR criteria responders, that is based on DAS28, were significant higher when consuming blue mussel diet compared to control diet (p=0.036). Further, several aspects of quality of life such as fatigue (p=0.021) and mental health (p=0.008) was significantly improved by the blue mussel diet.

Conclusions: A substitution of meat with blue mussels reduced disease activity and improved quality of life in women with RA. Further analysis on biomarkers explaining the results and larger trials including blue mussels is necessary to confirm the results.

Keywords: Rheumatoid arthritis, diet, shellfish, Mytilus Edulis, DAS 28.

VITAMIN D SUPPLEMENTATION ASSOCIATED WITH LIFESTYLE INTERVENTION ENHANCED THE LOSS OF ABDOMINAL FAT MASS IN OBESE ADOLESCENTS: A DOUBLE-BLIND RANDOMIZED CONTROLLED TRIAL (NCT02400151)

[1]Amiot-Carlin, Marie Josephe; [2]Morrissey, Christopher; [3]Vinet, Agnes.

[1]PhD, Nutritionist, Institut National de la Recherche Agronomique, MOISA, Montpellier, France; [2]UAPV; [3]PhD, Cardiology Physiologist, Université d'Avignon, Avignon, France.

Background and objectives: Obesity in children was associated with lower concentration of vitamin D and higher metabolic risk factors. In adults, adiposity loss was correlated with increase

of 25(OH)D level (Pannu et al, 2016, Nutr Res). We hypothesized that combining vitamin D intake with a weight loss program may have a stronger effect on adiposity. We aimed to examine the effect of cholecalciferol (VD) supplementation with a lifestyle intervention on body fat and inflammatory status in obese adolescents.

Methods: Twenty-six 12-17 yr-old obese adolescents (OA) (BMI-Z score=4.0±06) were randomized into two arms: OS (n=13) were supplemented during 3 months with 4000 IU/d of VD given in a fruit juice and, ONS (n=13) received a fruit juice without VD. All OA followed a weight-loss program consisting of a reduction of 500 kcal per day combined with 180 min/week of supervised moderate-to-vigorous intensity exercise. Serum 25(OH)D, body fat (DEXA), inflammation (IL-6 and hs-CRP) were measured at inclusion and after 3-months. Changes of the parameters (in %) were compared between the both arms.

Results: At inclusion, 70% OA were deficient in 25(OH)D (< 50 nmol L-1). The deficiency was similar between OS and ONS groups. After 3 months, 25(OH)D significantly increased without any difference between OS and ONS (59% vs 36%, p=0.08). 25(OH)D also increased in ONS group probably due to both sun exposure and outdoor physical activities during the intervention study. Abdominal fat mass decreased by 14% for the both groups. Interestingly, the change of 25(OH)D was strongly correlated with the change of abdominal fat mass in OS (r=-0,76, p<0.01), but not in ONS (r=-0,41, p=0.19). Note that inflammatory markers decreased in both groups without any significant difference between OS and ONS (-42% vs -33% for IL-6, -37% vs -61% for hs-CRP).

Conclusions: We showed that i) the loss of abdominal adiposity mediated by a lifestyle program (diet and exercise) was correlated to the increase of plasma 25(OH)D level in obese adolescents; ii) vitamin D supplementation enhanced the effect of a lifestyle program on abdominal fat mass loss. We concluded that vitamin D supplementation should be recommended with a weight loss program in obese adolescents.

Keywords: Cholecalciferol, obesity, adolescent, adiposity, inflammation.

CIBER Fisiopatología de la Obesidad y la Nutrición (CIBEROBN). Spain.

Background and objectives: Current genetic association studies are usually focused on autosomal variants only, and the sex chromosomes are often neglected. In recent years, a number of statistical techniques and strategies have been widely described making much easier overcoming X-chromosome technical hurdles and including this region within genetic studies. Tenomodulin (TNMD) is a Xq22 chromosome anti-angiogenic locus which has been recently linked to different obesity-related phenotypes. These results have not been replicated to date. Given these facts, we have conducted a genetic association analysis in Spanish children population including several TNMD SNPs as potential candidate markers for obesity and metabolic dysfunctions.

Methods: A total of 915 DNA samples from 258 normal weight, 177 overweight and 480 obese Spanish children (438 males, 477 females) were genotyped for seven TNMD SNPs and associations with anthropometric measurements and glucose metabolism were investigated. To handle with the X-chromosomal location of TNMD, specific association analysis design (Clayton's statistics and sex stratified regression analysis) as well as specific quality control

criteria were implemented in R code and PLINK software. Adjustments for BMI, age and sex were done when necessary.

Results: In our population, two previously reported linkage disequilibrium (LD) blocks were observed: haploblock-1 (rs2073162, rs2073163, rs4828038, and rs1155974) and haploblock-2 (rs11798018, rs5966709 and rs4828037). All markers are located through all of TNMD sequence domains and are representative for the region. Several obesity-related phenotypes were gender-specific and separately associated. We identified rs4828038_T as one of the tag SNPs within the haploblock-1 and the one with the strongest association signals. Particularly, this variant showed association with anthropometric measurements such as BMI (P=0.0099, BETA=1.466) and BMI z-score (P=0.0035, BETA=0.636) in males. Regarding to glucose metabolism phenotypes, genetic associations with insulin resistance were observed; HOMA index (P=0.0105, BETA=0.226) and insulin levels (P=0.0184, BETA=0.919) in the female-male mixed group; and glucose levels (P=0.0130, BETA=2.137) in males.

Conclusions: These data show that TNMD variants are associated with obesity and alterations in glucose metabolism in children population and, therefore, replicate some previous findings from adult human population.

Keywords: Childhood obesity, glucose metabolism, genetics, tenomodulin, X chromosome.

FUNCTIONAL BIOMARKERS OF VITAMIN B6 DEFICIENCY AND MORTALITY IN RENAL TRANSPLANT RECIPIENTS

[1]*Minovic, Isidor;* [2]*van der Veen, Anna;* [3]*van Faassen, Martijn;* [4]*van den Berg, Else;* [5]*Kootstra-Ros, Jenny;* [6]*Geleijnse, Johanna;* [7]*Eggersdorfer, Manfred;* [4]*Navis, Gerjan;* [5]*Kema, Ido;* [4]*Bakker, Stephan J.L.*

[1]PharmD. Isidor Minovic. Department of Nephrology. University Medical Center Groningen. The Netherlands.; [2]MSc. Department of Laboratory Medicine. University Medical Center Groningen. The Netherlands.; [3]BSc. Department of Laboratory Medicine. University Medical Center Groningen. The Netherlands.; [4]MD PhD. Department of Nephrology. University Medical Center Groningen. The Netherlands.; [5]PhD. Department of Laboratory Medicine. University Medical Center Groningen. The Netherlands.; [6]PhD. Division of Human Nutrition. Wageningen University. The Netherlands.; [7]PhD. Nutritional Products. DSM. Switzerland.

Background and objectives: Low plasma concentrations of the direct vitamin B6 status marker pyridoxal-5'-phosphate (PLP) are common in renal transplant recipients (RTR). It is not known whether a low direct vitamin B6 status has functional, i.e. intracellular, consequences and, if so, whether such consequences are associated with increased risk of mortality. Hence, we aimed to assess the association of plasma PLP with functional vitamin B6 status and to explore the potential association of functional vitamin B6 status with mortality in RTR.

Methods: In a longitudinal cohort of 687 stable RTR with a median [interquartile range (IQR)] follow-up of 5.4 [4.8-6.1] years, and 297 healthy controls, plasma PLP was measured by a validated high performance liquid chromatography assay. Vitamin B6 deficiency and sufficiency were defined as plasma PLP <20 and ≥20 nmol/L, respectively. In addition, 3-hydroxykynurenine (3-HK) and xanthurenic acid (XA) were analyzed by a validated liquid chromatography tandem mass spectrometry assay. As functional biomarker of vitamin B6, 3-HK/XA-ratio was assessed, with higher ratio reflecting worse functional vitamin B6 status. Cross-sectional and prospective associations were assessed by linear and Cox regression analyses, respectively, in which adjustments were made for potential confounders.

Results: Median plasma PLP was 29 [17-50] nmol/L in RTR (31% deficient) and 41 [29-60] nmol/L in healthy controls (11% deficient) (P<0.001). 3-HK/XA-ratio in RTR was 2.38 [1.68-3.49], compared to 2.13 [1.63-2.71] in healthy controls (P<0.001). The differences in plasma PLP and 3-HK/XA between controls and RTR were independent of age, sex, and kidney function. In RTR, 3-HK/XA-ratio was inversely associated with plasma PLP (β=-0.20, P<0.001). During follow-up, 147 (21%) RTR died. 3-HK/XA-ratio was associated with all-cause mortality (hazard ratios (HR) [95% confidence intervals] 1.31 [1.15-1.45], P<0.001). This prospective association was independent of age, gender, smoking, BMI, kidney function, alkaline phosphatase, high-sensitivity C-reactive protein, alcohol intake, energy intake, and plasma PLP (HR 1.26 [1.08-1.48], P=0.003).

Conclusions: Vitamin B6 deficient RTR have worse functional vitamin B6 status than healthy controls and vitamin B6 sufficient RTR. Importantly, worse functional vitamin B6 status in RTR is independently associated with increased risk of mortality.

Background and objectives: Evidence of effective obesity prevention interventions is limited, and hence new strategies are needed. This study reports the dietary intervention effects from the 15 month primary obesity prevention intervention (Healthy Start).

Methods: The "Healthy Start primary intervention study" aimed to prevent excessive weight gain among Danish obesity-prone normal weight preschool children. The intervention was conducted during 2009-2011, and focused on improving the child's diet, physical activity and sleep as well as managing stress in the families of the young children. Children were considered obesity prone if they had either a high birth weight ($\geq$ 4,000 g), a mother with a pre-pregnancy BMI$\geq$ 28 kg/m2), or low maternal education (<10 years of schooling). From a baseline population of 543 Danish normal weight preschool children, 285 completed the intervention with complete information on dietary intake at the baseline- and follow-up examination. Information on diet intake was obtained using a 4-day dietary record, from which a diet quality index assessing complance with the Danish national dietary guidelines was constructed. Linear regression per protocol and intention-to-treat analyses of differences in total energy-, macronutrients-, fruit-, vegetables-, fish- and sugar sweetened beverages intakes and diet quality index between the two groups were conducted.

Results: Children in the intervention group had a lower total energy intake after the 15-month intervention compared to the control group (Group mean: 5.3 vs. 5.6 MJ; p=0.02). We found no effect of the intervention on the individual macronutrients-, fruit-, vegetables-, fish- and sugar sweetened beverages intakes or the diet quality.

Conclusions: Our results suggest an overall effect of the Healthy Start primary intervention on total energy intake. However, no effects were seen for the individual components of children's dietary intake.

Keywords: Obesity, prevention, diet, children, intervention.

FASTING AND RESTRICTIVE DIET TO LOSE WEIGHT AMONG CANCER SURVIVORS: PROFILES, SOURCES OF NUTRITIONAL INFORMATION, KNOWLEDGES AND OPINIONS: RESULTS FROM THE NUTRINET-SANTÉ COHORT

Background and objectives: Cancer survivors need to get more actively involved in their disease, notably through their nutritional behavior. For instance restrictive diets may be considered, including fasting practice or restrictive diets to lose weight. For the moment, no previous study has investigated theses both types of restrictive diets among cancer survivors.

Aims of this study were to describe profiles of patients having practiced fasting or restrictive diet to lose weight after cancer diagnosis and to investigate knowledges/opinions of these patients and their sources of nutritional information, among cancer survivors in a large web based cohort.

Methods: In the NutriNet-Santé cohort, 10,309 cancer survivors received the "Sources of information and knowledges/opinions about nutrition" questionnaire in June 2016. Among them 2,942 completed it in October 2016. Associations were explored by multivariate logistic regression adjusted for socio-professional and lifestyle factors.

Results: 4.5% of participants had already practiced fasting practices since their diagnosis. They were more likely to be women (p=0.01), youngers (p=0.03), with higher educational level (p=0.003), lower incomes (p=0.004), to use dietary supplements (p=0.03) and practice higher physical activity (p=0.01). 32.2% of patients had practiced restrictive diet to lose weight since diagnosis with higher proportion of women (p<0.0001), professionally

active (p<0.05), breast cancer (p=0.0008), overweight (p<0.0001), and of patients using dietary supplements (p=0.0002). Logically, patients reporting believe to the effect of fasting on improved cancer prognosis were more likely to practice fasting (p<0.0001). Contrary, there was no relation between patient's knowledges of the links between overweight and cancer prognosis and tendency to practice restrictive diet (p=0.4). Patients who practiced fasting after cancer diagnosis were less likely to have receive nutritional information by a healthcare professional (p=0.001) and less likely to be proposed nutritional monitoring (p=0.002). Patients who practiced diet after cancer diagnosis were less likely to have received nutritional information by a healthcare professional (p<0.0001) and less likely to be proposed nutritional monitoring (p=0.0002).

Conclusions: These results show that fasting was practiced for its impact on their disease, while diet was not practiced to their cancer. Discussing this matter with a healthcare professional or following a nutritional program would have an impact on practicing a restrictive diet.

Keywords: Fasting, Diet, cancer survivors, nutritional knowledges, nutritional opinions.

REHABILITATION OF INFANTS UNDER-6 MONTHS OLD WITH SEVERE ACUTE MALNUTRITION: A RANDOMIZED, CLINICAL TRIAL OF THREE RECOVERY DIETS: INFANT FORMULA, F-100 DILUTED AND F-100

[1]Islam, M Munirul; [2]Huq, Sayeeda; [3]Hossain, Md Iqbal; [4]Ahmed, Tahmeed.

[1]MBBS. PhD. Scientist. Nutrition and Clinical Services Division. International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b). Dhaka. Bangladesh; [2]MBBS. MPH. Associate Scientist. Nutrition and Clinical Services Division. International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b). Dhaka. Bangladesh.; [3]MBBS. PhD. Senior Scientist. Nutrition and Clinical Services Division. International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b). Dhaka. Bangladesh.; [4]MBBS. PhD. Senior Director. Nutrition and Clinical Services Division. International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b). Dhaka. Bangladesh.

Background and objectives: Challenges in managing severe acute malnutrition (SAM) in infants under-6 mo (u6m) old have been widely reported over the past decade. Current guidelines do not explicitly mention about any specific dietary management of infants u6m olds. Both facility-based and community-based programs face difficulties in their management. Thus, information is required on effects of rehabilitation diets in u6m old infants suffering from SAM. The study was intended to compare the body weight gain, energy intake, and potential renal solute load of infants u6m old with SAM when fed F-100, diluted F-100 or infant formula during the rehabilitation phase.

Methods: Double blind randomized clinical trial comparing infant formula, F-100 diluted and F-100 was conducted at the Nutrition Rehabilitation Unit (NRU) of Dhaka Hospital, International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b), Dhaka, Bangladesh. One hundred and fifty-three u6m old infants with SAM were enrolled who were admitted for diarrhea and other illnesses. After recovering from illnesses, infants were randomly assigned to any of the three diets. During first 2 d, diets were fed at 130ml/kg/d in 12 feeds and then 10 ml more at each feed until some is left. Diets were offered in 8 feeds thereafter. Two ml blood was collected on study d 1, 3, and 7 for measuring serum electrolytes, creatinine and osmolality. Spot urine samples were also tested for specific gravity and osmolality:creatinine. Renal solute load and potential renal solute was calculated. Infants were discharged from NRU when gained 15% of the admission bodyweight or as soon as they became oedema free or had oedema free weight-for-length Z-score ≥ -2.

Results: There was no difference in dietary intake (g/d) across the study groups (p=0.18), but infants consumed more energy (kcal/d) who received F-100 (p<0.001). Infants gained significantly more weight when fed F-100 and F-100 diluted than those who received infant formula (p=0.023). Potential renal solute load was significantly more in those fed with F-100 (<0.0001), but was within normal limit.

Conclusions: Both F-100 diluted and F-100 and can be used as an effective rehabilitation diet in u6m old infants suffering from SAM.

Keywords: Infants under-6 months, severe acute malnutrition, F-100 diluted, F-100.

Background and objectives: Metformin has demonstrated to be efficacious in the treatment of obese adults. We have found lower BMI z-score in prepubertal obese children treated with metformin. It is known that genetic variation is one of the factors affecting the response to pharmacology treatment. PPARGC1A gene encodes transcriptional coactivators that regulate numerous metabolic processes. The presence of single-nucleotide polymorphisms (SNPs) of this gene modified the effects of metformin in adults at high risk of type 2 diabetes. The objective was to determine a differential response to metformin treatment on BMI z-score in obese children depending on the PPARGC1A genotypes.

Methods: A total of 134 obese children aged 7 to 14 (68 females; 66 males) from a randomized, prospective, double-blind placebo-controlled, multicenter trial (NºEudraCT:2010-023061-21) were included in this study. Patients received 1g/day of metformin or placebo along with healthy lifestyle recommendations for six months. Anthropometry measurements were taken in fasting at the beginning and at the end of the trial. Two PPARGC1A SNPs were analyzed, rs8192678_T and rs2970852_T (exonic and intronic, respectively). Multivariate linear regression model including a SNP*treatment interaction term and confounding factors was used to analyze differences in BMI z-score change between genotypes and treatment groups. Bonferroni correction for controlling for multiple testing was used.

Results: The BMI z-score decreased significantly after metformin treatment in comparison to placebo intervention (P=0.047). Regarding to genetics, an intriguing statistically significant association was found between the rs8192678_T and change in the BMI z-score (P=0.0095). Particularly, we reported a BMI z-score reduction of 0.432 greater for each minor T allele copy in comparison to non-carriers (95% CI:0.11-0.75; P=0.0095). Interestingly, in our population, this exonic SNP seems to be in linkage disequilibrium (D'=0.98) with the another analyzed variant, the rs2970852_T, which has already been associated with variability in metformin response.

Conclusions: The exonic rs8192678_T SNP of PPARGC1A is associated with a greater reduction in BMI z-score. These results suggest that the variability of PPARGC1A sequence may have an important role in the pharmacogenetic of metformin. Understanding how genetic variation affects metformin response could help to promote more effective use of the drug for the treatment of childhood obesity.

Keywords: Metformin, childhood obesity, PPARGC1A, single-nucleotide polymorphisms, pharmacogenomics.

POSTPRANDIAL BLOOD GLUCOSE, INSULIN AND GASTROINTESTINAL HORMONE RESPONSE TO STARCHY FOODS; RELEVANCE FOR TYPE 2 DIABETES

[1]Eelderink, Coby; [2]Priebe, Marion G.; [3]Vonk, Roel.

[1]MSc. Department of Internal Medicine - Nephrology. University Medical Center Groningen. The Netherlands.; [2]PhD. Department of Pediatrics. University Medical Center Groningen. The Netherlands.; [3]PhD. Department of Medical Biomics. University Medical Center Groningen. The Netherlands.

Background and objectives: Prolonged high blood glucose concentrations after the consumption of starchy foods are implicated in the development of metabolic diseases. Decreasing the glycemic and insulinemic response to these foods might be beneficial for both the prevention as well as management of type 2 diabetes. To elucidate underlying mechanisms, we investigated the glucose kinetics and metabolic responses of starchy foods with various food structures.

Methods: Healthy male volunteers were studied consuming different 13C-enriched wheat products while receiving a primed-continuous D-[6,6-2H2]glucose infusion. The dual-isotope technique enabled calculation of glucose kinetics: rate of ap-

pearance of exogenous glucose (RaE), endogenous glucose production, and glucose clearance rate (GCR). In addition, postprandial plasma concentrations of glucose, insulin, glucose-dependent insulinotropic polypeptide (GIP), glucagon-like peptide-1 (GLP-1) and bile acids (BA) were analyzed. Several fiber-rich wheat products were prepared with different structural features (pasta, bread with 85% broken wheat kernels, flat bread).

Results: When comparing a slowly and a rapidly digestible starchy food product, the digestibility of starch is not always reflected by the glucose response. Pasta was slowly digestible, but resulted in a similar high glycemic response as compared to control bread, but lower insulinemic response. Digestibility of starch, as reflected by the RaE, correlated very well with GIP. For GLP-1 this relationship was less clear, and the response was influenced by the presence of broken wheat kernels. BA may play a role in this regard. The influence of the incretins, mainly GIP, on insulin concentrations and thereby also on GCR could often explain the total glucose responses, although GCR was also regulated independently of insulin after flat bread consumption.

Conclusions: Slower intestinal uptake of glucose from a starchy food product can result in lower postprandial insulin and GIP concentrations, but not necessarily in a lower glycemic response, because of a slower GCR. Even without reducing postprandial glycemia, products with slowly digestible starch can have beneficial long-term effects. Food processing can be a relevant parameter to affect the metabolic outcome and thereby an important factor in the prevention of the development of metabolic diseases.

Keywords: Starchy foods, glycemic response, gastrointestinal hormones, type 2 diabetes, stable isotopes.

DIETARY APPROACH TO STOP HYPERTENSION (DASH) DIET IS ASSOCIATED WITH A LOWER RISK OF RENAL FUNCTION LOSS AND ALL-CAUSE MORTALITY IN RENAL TRANSPLANT RECIPIENTS

[1]Osté, Maryse; [2]Gomes Neto, António; [3]Corpeleijn, Eva; [4]Gans, Rijk O. B; [5]van den Berg, Else; [6]Soedamah-Muthu, Sabita S; [3]Postmus, Douwe; [7]Kromhout, Daan; [5]Navis, Gerjan; [5]Bakker, Stephan J.L.

[1]BSc. Department of Nephrology. University Medical Center Groningen. The Netherlands.; [2]MD. Department of Nephrology. University Medical Center Groningen. The Netherlands.; [3]PhD. Department of Epidemiology. University Medical Center Groningen. The Netherlands.; [4]MD PhD. Department of Internal Medicine. University Medical Center Groningen. The Netherlands.; [5]MD PhD. Department of Nephrology. University Medical Center Groningen. The Netherlands.; [6]PhD. Division of Human Nutrition. Wageningen University & Research. The Netherlands.; [7]PhD. Department of Epidemiology. University Medical Center Groningen. Division of Human Nutrition. Wageningen University & Research. The Netherlands.

Background and objectives: Incidences of renal function loss and all-cause mortality are high in renal transplant recipients (RTR), with high blood pressure as an important risk factor for both. The aim of this study is to investigate whether a dietary pattern resembling the Dietary Approach to Stop Hypertension (DASH) diet is associated with these adverse events in RTR.

Methods: In this prospective cohort study, we included adult RTR with a functioning graft for > 1 year. Dietary data were collected using a validated 177 item Food Frequency Questionnaire, with 632 RTR eligible for analyses. For each of the 8 dietary components of the DASH diet, a score was attributed to each subject according to sex-specific quintiles of dietary intake. The 8 component scores were summed up to calculate the overall DASH-score. Cox regression models were used to study the associations of the DASH-score in tertiles with renal function loss, defined as graft failure or doubling of serum creatinine, and all-cause mortality.

Results: Mean ± SD age was 53.0 ± 13.2 years, 57% were male. Median [interquartile range, IQR] time between baseline and transplantation was 5.7 [1.9-12.1] years. The DASH score varied between 12 and 37, with a median [IQR] score of 24.0 [20.0-27.0]. Both systolic and diastolic blood pressure were significantly lower in RTR in the highest tertile of DASH score compared to the lowest tertile. Use of antihypertensive drugs did not differ between the tertiles. During median [IQR] follow-up of 5.3 [0.2-6.8] years, 119 (18.8%) RTR had renal function loss and 128 (20.3%) RTR died. RTR in the highest tertile of DASH-score had a lower risk of renal function loss (HR: 0.59; 95% CI: 0.35-0.99, p=0.04) and all-cause mortality (HR: 0.50; 95% CI: 0.31-0.81, p=0.004) compared to the lowest tertile, independent of potential confounders including age, gender, eGFR, proteinuria, primary renal disease, and time between transplantation and baseline.

Conclusions: Adherence to the DASH diet is associated with a 40% lower risk of renal function loss and a 50% lower risk of all-cause mortality after renal transplantation. These data suggest that healthy nutrition is of paramount importance in renal transplant recipients.

Keywords: DASH, renal function loss, all-cause mortality, renal transplantation.

ADHERENCE TO THE 2015 DUTCH DIETARY GUIDELINES AND ITS ASSOCIATIONS WITH MORTALITY AND INCIDENCE OF NON-COMMUNICABLE DISEASES IN THE ROTTERDAM STUDY

[1]Schoufour, Josje; [2]Voortman, Trudy; [2]Kiefte-de Jong, Jessica; [2]Franco, Oscar; [2]Schoufour, Josje.

[1]PhD. Nutritionist. Department of Epidemiology. Erasmus MC Rotterdam. The Netherlands; [2]Department of Epidemiology. Erasmus MC Rotterdam. The Netherlands.

Background and objectives: In order to prevent chronic diseases in the general population, the Health council of the Netherlands recently presented new national food-based dietary guidelines, based on evidence from 29 systematic reviews of prospective cohort and interventional studies on effects of nutrients, foods and dietary patterns on risk of major chronic diseases. Although the

guidelines are based on extensive previous research, the association of adherence to these overall dietary guidelines with chronic diseases has not yet been evaluated. Therefore, we aimed to examine the criterion validity of these guidelines by examining the association of adherence with all-cause mortality and with the incidence of the ten chronic diseases on which the guidelines were based.

Methods: We studied 9,701 participants of the Rotterdam Study, a population-based prospective cohort in individuals aged 45+. Dietary intake was assessed at baseline with a food-frequency questionnaire. We examined adherence (yes/no) to fourteen items of the guidelines: sufficient vegetables, fruit, whole-grains, legumes, nuts, dairy, fish, and tea; high ratio whole:total grains and healthy:total fat; and low intake of red and processed meat, sugar-containing beverages, alcohol, and salt. Adherence was evaluated as sum-score of these components (0-14). Information on disease incidence (coronary heart disease, stroke, heart failure, type 2 diabetes mellitus, chronic obstructive pulmonary disease, breast cancer, colorectal cancer, lung cancer, cognitive decline, and depression) and all-cause mortality during a median follow-up period of 12.2 years (95%-range 2.3-23.0) was obtained.

Results: Using Cox proportional-hazards models adjusted for sociodemographics, lifestyle, and BMI, we observed that a one more component of the guidelines adhered to was associated with 3% lower risk of mortality (HR=0.97, 95%CI 0.96;0.99). Furthermore, adherence was associated with lower risk of stroke (HR=0.95, 95%CI 0.92;0.99), chronic obstructive pulmonary disease (HR=0.94, 95%CI=0.91;0.98), colorectal cancer (HR=0.91, 95%CI=0.85;0.97), and depression (HR=0.97, 95%CI=0.95;0.999), but not with incidence of coronary heart disease, type 2 diabetes, heart failure, lung cancer, breast cancer, or dementia.

Conclusions: To conclude, adherence to the Dutch dietary guidelines was associated with a lower mortality risk and a lower risk of developing some but not all of the chronic diseases on which the guidelines were based.

Keywords: Dietary guidelines, validation, diet quality, mortality, chronic diseases.

NUTRIENT PATTERNS WITH DIABETES AMONG ADULT RURAL POPULATION IN INDIA AND ITS ASSOCIATED FACTORS SOCIO-ECONOMIC STATUS, OBESITY AND PHYSICAL ACTIVITY – A CROSS SECTIONAL NATIONAL NUTRITION MONITORING

[1]Avula, Laxmaiah; [2]K, Sreeramakrishna; [3]Balakrishna, Nagalla; [4]Indrapal I, Meshram; [4]Arlappa, Nimmathota; [5]Rachakulla, Harikuumar.

[1]MBBS. MPH. PhD. Professor. Head. Division of Community Studies. NIN. ICMR. Hyderabad. India; [2]M.Sc. MPhil. Technical Assistant. Division of Community studies. NIN. ICMR. Hyderabad. India; [3]PhD. Scientist E. Division of Bio-statistics. NIN. ICMR. Hyderabad. India; [4]MD. Scientist E. Division of Community studies. NIN. ICMR. Hyderabad. India; [5]MBBS. DPH. Scientist E. Division of Community studies. NIN. ICMR. Hyderabad. India.

Background and objectives: A major proportion of Indian population are living in rural areas. The prevalence of diabetes is increasing in epidemic proportions even among rural population in India and its consequences are very severe on human body. The Objective of the study was to examine association of nutrients intake and diabetes, identify patterns of nutrients and determine whether these nutrient patterns are associate with socio-demographic, and body mass index, WHR and diabetes among rural adults in India.

Methods: It was a cross sectional study carried in 10 major states in India by NNMB among rural population. Fasting blood samples were collected in total of 13810 men and 18043 women of 18 year and above. Nutrients were calculated from 24hr recall diet survey. Factor Analysis was applied to study the nutrient patterns. Multiple linear regression models were fitted and computed respectively for each of the retained factor scores on socio-demographic and obesity variables. Prevalence of diabetes was calculated and associations computed with nutrient patterns by logistic regression.

Results: The prevalence of diabetes was significantly associated with BMI, WHR, physical activity, and socioeconomic factors. Three nutrient patterns were explained 70.7% of the total variance in men, while it was 78.1% in women. First factor explained 43.8% of variation in men by nutrients like zinc (0.91), thiamine (0.91) protein (0.82), energy (0.81), niacin (0.80), iron (0.78) and riboflavin (0.77). The Second factor explain 13.8% variations by nutrients like vitamin A and C, thiamine and niacin; 3rd factor 17% by Vitamin A & C and almost similar observations were made in case of women with 4 loading factors. The first component was significantly associated with wealth index, age of the subject, BMI and physical activity status. Similar findings also observed in case of women. Second factor analysis was significantly associated fat and B12 intakes. Wealth index and BMI were significantly associated with rest of nutrient patterns.

Conclusions: The prevalence of Diabetes is strongly associated with nutrient patterns, obesity, physical activity and socioeconomic status. Care may be taken to educate community on the risk of nutrients for development or control of diabetes among rural adults in India.

EFFECT OF CINNAMON ON MORPHOLOGY AND PHYSIOLOGY OF LIVER IN RATS

Safdar, Mahpara.

PhD. Department of Home & Health Sciences, Allama Iqbal Open University.

Background and objectives: The study on cinnamon was initiated to assess its overall effect on morphology and physiology of liver in rats and to extrapolate the results to humans.

Methods: The study was conducted in the department of Human Nutrition, Agricultural University, Peshawar, Pakistan. Seventy two female albino rats weighing 180-270g were divided into groups I, II and III, each having 24 rats. Group I was for placebo, II for 4mg and III for 12 mg cinnamon per day respectively. The total duration of the experiment was 60 days, out of which, 40 days were for cinnamon and the last 20 days were without cinnamon. Six rats from each group were sacrificed at day 0 to get the base line data for all groups prior to the start of experiment. Six rats from each group were sacrificed at days 20, 40 and 60 for obtaining blood sample for biochemical analysis and removing liver for viewing structural changes. Liver functions namely bilirubin, alkaline phosphatase (AP), alanine transaminase (ALT), albumin, globulin, albumin to globulin (A/G) ratio were determined by using standard methods. The changes in cellular structure of liver were viewed under Olympus BX51 microscope.

Results: Cinnamon did not significantly change the concentrations of AP, ALT, globulin and A/G ratio throughout the study period. Bilirubin was non-significantly (P>0.05) changed at day 20 but significantly (P<0.05) increased at days 40 and 60, as compared to the values at day zero. Also albumin was non-significantly changed at day 20 but significantly increased at day 40 but non-significant at day 60, as compared to the value of albumin at day zero.

The cellular structure of liver was normal showing normal portal tract, bile duct surrounded by cords and trabeculae of hepatocytes with intervening sinuses and kupffer cells up to day 20, but mild inflammation, showing increased lymphocytes was observed at days 40 and 60.

Conclusions: In the light of this study, if results of rats are valid for human, then cinnamon safety is doubtful for liver physiology and morphology. It is suggested that further studies may be conducted to verify the safety of cinnamon intake.

Federal University of Uberlândia, Uberlândia, Minas Gerais Brazil; [4]Nutritionist student. Federal University of Uberlândia, Uberlândia, Minas Gerais Brazil; [5]Nutritionist. Federal University of Uberlândia, Uberlândia, Minas Gerais Brazil; [6]Master Degree student. Nutritionist. Federal University of Uberlândia, Uberlândia, Minas Gerais Brazil; [7]Master Degree. Hospital e Maternidade Municipal de Uberlândia, Department of Obstetrics, Uberlândia, Brazil; [8]PhD. Nutritionist. Federal University of Uberlândia, Uberlândia, Minas Gerais Brazil.

Background and objectives: Studies have suggested that disruption of the circadian system, such social jetlag (a measure of the difference between sleep times on work days and days off) may lead to obesity and influence metabolic parameters. Although social jetlag have already been associated with overweight in other populations, little is known about the associate of these factors with chronic diseases commonly related to obesity. The objective of this study was to analyze the association of social jetlag between anthropometric and obesity status among individuals with chronic diseases.

Methods: The study was cross-sectional using volunteers [n=792, 581 (73%) female, average age 55.9 ± 12.4] with non-communicable chronic diseases: obesity, systemic arterial hypertension, type 2 diabetes mellitus or dyslipidaemia; who were attended at outpatient clinics of the public health service of the city of Uberlândia-MG (Brazil). The volunteers answered a questionnaire that assessed: demographic, physical activity and habitual sleep pattern; and anthropometric characteristics [height, weight, body mass index (BMI) and waist circumference] were determined. From the medical records of the volunteer clinical and biochemical information was collected. Obesity status has been classified in three levels: non-obese: BMI<30 kg/m2; healthy obese: BMI ≥ 30 kg/m2 and less than three high-risk biomarkers for metabolic syndrome; and unhealthy obese: BMI ≥ 30 kg/m2 and high-risk values on three or more biomarkers for metabolic syndrome. Social jetlag was calculated based on the absolute difference between mid-sleep time on weekends and weekdays.

Results: Multivariate logistic regression adjusted for possible confounding variables indicated a higher risk of being overweight (BMI > 25 kg/m2) for individuals that presented social jetlag (>1 h) (odds ratio [OR]= 2.0, confidence intervals [CI] = 1.2–3.6, p=0.006]; and a risk of being an unhealthy obese (OR=1.8, CI=1.1–2.8, p=0.01) for individuals that presented social jet lag (>1 h) in comparison with those without social jet lag (<1 h).

Conclusions: Social jet lag is associated with higher odds of being overweight and unhealthy obese, confirming that circadian misalignment may predispose improper weight gain and metabolic syndrome.

RECOVERY, RELAPSE, AND EPISODES OF DEFAULT IN THE MANAGEMENT OF ACUTE MALNUTRITION IN CHILDREN IN HUMANITARIAN EMERGENCIES: A SYSTEMATIC REVIEW

[1]Akparibo, Robert; [2]Booth, Andrew; [3]Lee, Andrew C.K.

[1]BSc, MSc, MPH, PhD. School of Health and Related Research. University of Sheffield. UK; [2]BA, Dip Lib, MSc, PhD. School of Health and Related Research. University of Sheffield. UK.; [3]MB ChB, MSc, MD. School of Health and Related Research. University of Sheffield. UK.

Background and objectives: This systematic review, commissioned by the Humanitarian Evidence Programme (HEP) and carried out by a research team from the University of Sheffield, represents the first attempt to apply systematic review methodology to establish the relationships between recovery and relapse and between default rates and repeated episodes of default or relapse in the management of acute malnutrition in children in humanitarian emergencies in low- and middle-income countries.

Methods: Quantitative, mixed methods academic literature and grey published programme reports were identified and reviewed. Peer-reviewed literature search was conducted in 14 academic databases. Grey literature, including programme reports, were searched in Google Scholar, websites of relevant organisations, and by engaging with stakeholders in the nutrition field. Studies published prior to 1980 were excluded, as were any papers not published in English.

Results: A total of 9,574 articles, studies and programme reports relating to acute malnutrition were retrieved from the searches conducted. Following the removal of duplicates, screening and quality appraisal, 24 articles and reports were eligible for review. 23 of these focused on sub-Saharan Africa: eight were conducted in Malawi, 5 in Ethiopia, 3 in Niger, 3 in Sudan and the remaining 4 in Angola, Chad, Kenya and Sierra Leone. One study was conducted in Afghanistan. Most studies and programme reports reported on quantitative outcomes and only two contained both quantitative and qualitative outcomes. The 22 quantitative studies included 8 clinical efficacy and effectiveness trials using randomized controlled designs, 7 observational cohort studies, and 7 programme evaluation reports. Only 6 of the 24 studies included in this review addressed the issue of relapse and/or reported relapse rates. None of the studies addressed the relationship between relapse and default or return default, and little evidence was found on the long-term impact of programmes implemented to manage MAM and SAM in emergencies.

Conclusions: This review provides further confirmation that RUTF used in an outpatient setting is effective at promoting recovery from SAM and reducing mortality. It could not be established whether default rates reported were lower according to the WHO 2013 protocol. Data relating to relapse is limited and need further research.

MOLECULAR BASES UNDERLYING THE CHEMO PREVENTIVE EFFECTS OF DOCOSAHEXAENOIC ACID

[1]Ajami, Marjan; [2]Pazoki Toroudi, Hamidreza.

[1]PhD. Nutritionist. Dept. of Food and Nutrition Policy and Planning Research, National Nutrition and Food Technology Research Institute, Faculty of Nutrition Sciences and Food Technology, Shahid Beheshti University of Medical Sciences, Tehran, Iran; [2]Associate Professor of Physiology/ Dept. of Physiology,Iran University of Medical Sciences.

Background and objectives: Colorectal Cancer (CRC) is the third most commonly cancer around the world. Nutraceutical are food products like drug which share health benefits in prevention and treatment of many diseases. The nutraceuticals like omega-3 Docosahexaenoic acid may have chemopreventive activities Docosahexaenoic acid (DHA) is an omega-3 fatty acid and it may be considered as potential therapeutic agent for colon cancer.

Methods: Colon cancer was induced by injecting 6-8-week-old, rats weighing 200-250 g (Pasteur Institute of Iran, Tehran) with 10 mg/kg 1,2-dimethylhydrazine (DMH) twice per week for 12 weeks. 26 male Wistar rats divided in to two groups. DHA group treated with 400 mg/kg DHA (n=13). VEGF (Vascular endothelial growth factor) and mTOR levels in colorectal cancer were examined by Western blotting.

Results: DHA reduced VEGF expression by 34.3 ± 1.7 vs. control group 71.2 ± 3.4 (Protein expression/b-actin expression). DHA reduced mTOR expression by 32.1 ± 1.2 vs. control group 65.2 ± 3.8 (Protein expression/b-actin expression).

Conclusions: mTOR dysregulation has a vital role to play in many types of cancers. The current study suggested that DHA is able to inhibit VEGF and mTOR expression in colon cancer cells and DHA is a potent therapeutic agent that can inhibit tumor growth and angiogenesis in vivo by decreased phosphorylation of mTOR and subsequently the blockage of VEGF secretion in tumor cells pathway.

Keywords: mTOR , VEGF, DHA, Colon cancer.

THE ASSOCIATION BETWEEN MINDFULNESS AND THE METABOLIC SYNDROME IS MODIFIED BY HISTORY OF DEPRESSION

Background and objectives: The Metabolic syndrome (MetS) is a major public health burden since it predisposes to cardiovascular diseases, which are leading causes of death in developed countries. In addition to lifestyle habits, specific psychological characteristics have been shown to be associated with the MetS. Dispositional mindfulness, which is defined as non-judgmental awareness of the present moment, has recently been associated with eating disorders and overweight and could therefore be associated with the MetS. We aimed to examine in a cross sectional design the relationship between mindfulness and the MetS in a large sample of the adult general population and the influence of history of depression on this association.

Methods: A total of 17,490 adults participating in the Nutri-Net-Santé study who had completed the Five Facets Mindfulness Questionnaire and attended a clinical and biological examination were included. Multivariable logistic regression models adjusted for socio-demographic and lifestyle factors were performed to assess the relationship between mindfulness (and its subscales) and the MetS and cardiovascular risk factors.

Results: Among individuals with a history of depression, those with higher mindfulness were less likely to have a MetS (OR: 0.73, 95% CI: 0.57-0.93), a high waist circumference (OR: 0.79, 95% CI: 0.67-0.95), a low HDL-cholesterol level (OR: 0.73, 95% CI 0.55-0.95) and a high fasting blood glucose level (OR: 0.69, 95% CI: 0.54-0.89) (all p < 0.05). In those without history of depression, individuals with higher mindfulness were less likely to have a high waist circumference (OR: 0.89, 95% CI 0.82-0.97) (p < 0.01).

Conclusions: These findings support the importance to take individual psychological factors into account, and in particular mindfulness, in relation with the MetS, especially in people with a history of depression.
