School of Life and Environmental Sciences. University of Sydney. Australia.

Background and objectives: More than half of Australian adults aged 65 years and older have moderate to severe periodontal disease. Yet in the older population, research specifically examining the association between diet and periodontal health is limited. The aim of this study was to examine the association between dietary intake of nutrients and periodontal health in older men participating in the Concord Health and Ageing Men Project (CHAMP) study.

Methods: A preliminary analysis was conducted on the 294 men, (mean age: 84 years, SD: ±3.7 years), who had completed a standardised validated dietary assessment and had a comprehensive oral health examination during the CHAMP 8-year follow up. Having three or more teeth with at least one site with a Probing Depth (PD) ≥3mm, or at least one site with an Attachment Loss (AL) of ≥5mm were used as indicators of compromised periodontal health. Nutrients were categorised into quartiles and logistic regression was used for all statistical analysis.

Results: The prevalence of compromised periodontal health was high, with 64% of men had three or more teeth with at least one site that had a PD ≥ 3mm, while 85% of men had three or more teeth with at least one site that had an AL ≥ 5mm. After adjustment for potential confounders, men in the lowest quartile of percentage of energy from protein intake were much more likely than those in the highest quartile to have PD ≥ 3mm: OR 2.59(95% CI:

1.14 – 5.88). Men in the lowest quartile of folate intake were much less likely to have AL ≥ 5mm: OR 0.35(95% CI 0.12 – 0.99). The mean percentage of energy from protein intake was 18.4% (SD: ± 3.7%), and the mean intake of folate was 407.1µg (SD: ± 202.1µg). Beef was the main food source contributing to protein intake and vegemite was the main food source contributing to folate intake.

Conclusions: These preliminary results highlight that there is a complex association between the dietary intake of nutrients and the periodontal health of older men.

Keywords: Nutrition. Periodontitis. Diet. Older adults.

IMPROVING THE MANAGEMENT OF SEVERE ACUTE MALNUTRITION AMONG INFANTS AND CHILDREN THROUGH CAPACITY BUILDING: FINDINGS FROM AN EVALUATION STUDY WITH MALNUTRITION ELEARNING

[1]Choi, Sunhea; [2]Yuen, Ho-Ming; [3]Annan, Reginald; [4]Monroy Valle, Michele; [5]Pulman, Andrew; [6]Aduku, Nana Esi; [6]Kyeiboateng, Samuel; [7]Pickup, Trevor.

[1]University of Southampton; [2]MSc. Lecturer and Senior Statistician. Faculty of Medicine, University of Southampton, Southampton, United Kingdom; [3]PhD. Lecturer and Nutritionist. Department of Biochemistry and Biotechnology. Kwame Nkrumah University of Science and Technology. Ghana.; [4]ND and MEd. Nutritionist. FUniversidad Rafael Landívar. Guatemala; [5]PhD. Researcher. Faculty of Medicine, University of Southampton, Southampton, United Kingdom; [6]BSc. Nutritionist. Department of Biochemistry and Biotechnology. Kwame Nkrumah University of Science and Technology. Ghana.; [7]BSc (Econ). Researcher. Faculty of Medicine, University of Southampton, Southampton, United Kingdom.

Background and objectives: The University of Southampton and International Malnutrition Task Force developed Malnutrition eLearning to reduce child mortality by Severe Acute Malnutrition (SAM) through training health professionals globally. Since made available in 2010, over 14,000 from 100+ countries used the course. To investigate its effectiveness, a 2-year evaluation study was conducted from 2015, face-to-face in Ghana and Central America (CA), and online in other countries.

Methods: Using a mixed method approach, the study explored if and how Malnutrition eLearning supported knowledge gain and behavioural change (application of knowledge in clinical practice), and resulting clinical outcomes in the management of SAM. Assessments, questionnaires and interviews/focus groups were conducted with individual in-service and pre-service participants pre- and post-training, and 12 months of medical records data collection, observations and hospital personnel interviews were carried out from participating healthcare institutions.

Results: Total 1,261 health professionals (Ghana:915, CA:142, other countries:201), and 10 hospitals and 2 community health centres in Ghana and 2 hospitals in CA participated in the study.

3,955 (pre:01/08/2014–31/07/2015) and 3,737 (post:01/08/2015–31/07/2016) medical records of children (0-60 months) were collected from the hospitals, and summary data on malnutrition cases (pre:76, post:67) from community health centres.

Individual participants scored significantly higher in the post assessment (mean difference(SD): 14.0(12.5), 95%CI(12.7, 15.2), p<0.001). 87% of in-service health professionals (102/117) applied their knowledge and changed clinical practice in screening, assessment, diagnosis and management of SAM. This group demonstrated retained knowledge 6-month after the training (mean difference from pre-assessment(SD): 12.7(11.7), 95%CI(10.4, 15.0),p<0.001). Significant increases (p<0.001) in recording malnutrition-markers, i.e. length/height and weight-for-length/height z-score, and diagnosed SAM cases (pre: 491(12.4%), post: 810(21.7%)) were observed. Mortality by SAM was declined from 26(5.9%) to 14(1.9%) (p<0.001). The community centres initiated the management of SAM (pre:0/32, post:7/21).

Conclusions: The results suggest that Malnutrition eLearning is effective in training the WHO guideline on the management of SAM. After a 2-day self-directed training with Malnutrition eLearning, the participants not only gained knowledge but were also able to apply the knowledge in their clinical practice, leading to significant impacts on clinical outcomes.

Keywords: Management of Severe Acute Malnutrition, capacity building, nutrition sensitive intervention, eLearning, WHO guidelines on SAM management.

EFFECTS OF BIOTIN STATUS ON GLYCEMIC CONTROL IN RATS

Wang, Zhu; Xiang, Xuesong; Wei, Jiuling; Zhang, Xuesong.

National Institute for Nutrition and Health. Beijing. China

Background and objectives: Biotin, as a coenzyme of carboxylases, plays an important role in the process of neoglycogenesis, amino acid decomposition, fatty acid synthesis and energy metabolism in humans and mammals. In recent studies, it has showed that large dose of biotin supplement can be taken as drug to treat hyperglycemia, through potential mechanism of mediating gene regulation of histone biotinylation. The main source of body biotin are main from dietary intake and intestinal bacterial synthesizing, so biotin deficiency is rare, the relationship between biotin status and glycemic control should be studied.

Methods: 60 healthy SD rats (F/M half to half) weighting (100±10) grams were fed with non-biotin diet with raw egg white replacing casein to induce biotin deficiency model (NB), then divided into 6 test groups, daily oral given 0, 2, 4, 10 µg biotin, 1g resistance dextrin (RD, as a stimulant of intestinal source) or mix-

ture of 4 μg biotin and 1g RD respectively. Additional 20 rats fed with diet based on AIN-93 as blank control. After 8 weeks intervention term, blood biotin and 3HIA-carnitine, glucose and lipid level, organ pathology, intestinal bacterial were evaluated.

Results: From the 2nd day of NB diet feeding, serum biotin immediately appeared lower than the control group, while 3HIA-carnitine increased (P<0.05) . Till 10 w, serum glucose and insulin level significantly decreased in NB rats, in comparison with control (5.67±2.08 mmol/L vs. 7.51±1.28 mmol/L, 83.22±13.06 mIU/L vs. 95.47±17.74 mIU/L , respectively, P<0.05), especially in female rats. Blood triglyceride trendsed to increase.

After biotin intervention, both biotin status and glucose and insulin back to normal level (4, 10 μg/d). Fatty liver and kidney damage with failed function induced by biotin deficiency did not recover after intervention. In this study, wide-range genome expression profile analysis showed the great differences in the pathways related to fatty acid degradation, PPAR signaling pathway, fatty acid metabolism, arachidonic acid metabolism and biosynthesis of unsaturated fatty acids between control and NB rats, indicating the potential effects of biotin status on glycemic control. Resistance dextrin did not show any effect in this study,

Conclusions: Biotin may be an essential factor for glycemic control.

Keywords: Biotin, 3HIA-carnitine, glycemic control, gene express

WOMEN'S EMPOWERMENT AND THE NUTRITIONAL STATUS OF CHILDREN AGED BETWEEN 6-59 MOTHS

[1]Chipili, Given; [2]Msuya, John.

[1]Mukuba University,Department of Nutrition Sciences. Kitwe. Zambia.; [2]PhD. Associate professor. Department of Food Technology. Nutrition and Consumer Sciences. Sokoine University of Agriculture. Morogoro. Tanzania.

Background and objectives: The Central Province of Zambia contains the majority of the nation's malnourished children, despite being the most productive province in terms of Agriculture. Most studies in the province have not paid attention to the importance of women empowerment and the nutrition outcomes of the population. In light of this knowledge gap, this study focused on the Women's empowerment and the nutrition status of children. The overall objective of the study was to determine the extent to which women are empowered in agricultural activities in Kapiri-Mposhi district in the Central Province of Zambia.

Methods: The study assessed the extent to which women are empowered in agricultural activities. This study sought to determine the association of women empowerment and nutritional status of children aged 6-59 months in Kapiri-Mposhi district in the Central Province of Zambia. A cross-sectional descriptive study was conducted using a structured questionnaire. A total of 100 households were randomly sampled and the nutritional status of one child from each household assessed using anthropocentric measurements. A total of 100 children were included in the study.

Results: Up to 21% of the children were stunted; 2% were wasted; and 9% underweight. There was a significant relationship between access to credit or income opportunities and Z-scores for stunting (HAZ) and wasting (WHZ) (p< 0.05).

Conclusions: This study has established that most women are not empowered.

WHAT IS NUTRITIONAL STATUS? PERSPECTIVE OF WOMEN IN IBADAN NIGERIA

[1]Okekunle, Akinkunmi Paul; [2]Omotosho, Melefa Moses; [3]Odok, Godwin Etta; [4]Akpa, Onoja Matthew; [5]Akinyele, Isaac Olaoluwa.

[1]Doctoral Student. Department of Nutrition and Food Hygiene. Harbin Medical University. China.; [2]BA. MA. PhD. Lecturer. Department of English and Literary Studies. University of Nigeria Nsukka. Nigeria.; [3]BSc. MSc. PhD. Lecturer. Department of Sociology. Federal University Dutsin-Ma Katsina. Nigeria.; [4]BSc. MSc. PhD. Senior Lecturer. Department of Epidemiology and Medical Statistics. University of Ibadan. Nigeria.; [5]BSc. MSc. PhD. Professor of Nutrition. Department of Human Nutrition. University of Ibadan. Nigeria.

Background and objectives: Good understanding of nutrition is fundamental to adequate nutritional status, health and well-being. In spite of several efforts to address malnutrition in Nigeria, the burden of poor nutritional status remains largely unfettered, especially among women. The burden obesity and underweight is prevalent in urban and rural settings respectively. This study explores the perspectives and understanding of nutritional status among women in Ibadan, Nigeria using qualitative approaches.

Methods: Four (4) focus groups were conducted among 27 women (15-49 years) identified by a multi-recruitment strategy from 285 households in urban and rural areas of Ibadan Nigeria, after duly informed consent. Using a predefined protocol, discussants' responses were explored with semi-structured but moderator-led discussions centred on 3 main themes; understanding of nutritional status, the type of food eaten to enhance good nutritional status and what major factor influences food choices in households. Responses were digitally recorded and professionally transcribed; all discussion transcripts were checked for accuracy and completeness, edited before analysis to directly include content pertaining to the themes and analysed using team-based qualitative analysis methods.

Results: Though discussant responses varied by age and region of residence, most discussants' consider the type of body shape they possess and avoidance of foods made up of fat as their indicator for good nutritional status. In addition, while young women and those residing in urban neighbourhoods consider taste and appetite, older and married women consider their spouse's food choices and stage of growth as a major factor that influences their food choices. The economic power of household is a major motivation that informs food choices of discussants and their households. Furthermore, most discussants were unfamiliar with the concept of food intakes and its implication on their nutritional status.

Conclusions: Nutrition education intervention strategies that integrate adequate management of monetary resources to promote consumption of right combination of foods is indispensable in enhancing the good nutritional status of women.

MULTIFORTIFICATION OF BOUILLON IN CENTRAL AND WEST AFRICA: FEASIBILITY & IMPACT

[1]Habeych, Edwin; [2]Galaffu, Nicola; [2]Detzel, Patrick; [3]Prieto Patron, Alberto; [4]Messier, Marie-Chantal; [5]Duboc, Philippe.

[1]PhD. Scientist. Nestlé Research Center. Switzerland.; [2]PhD. Scientist. Nestlé Research Center. Lausanne. Switzerland; [3]PhD. Scientist. Nestlé Research Center. Lausanne. Switzerland.; [4]MSc. Nutritionist. Nestec S.A. Vevey. Switzerland.; [5]PhD. Scientist. Nestlé Product Technology Center-Singen. Singen. Germany.

Background and objectives: Up to 38% of schoolchildren in West Africa suffer from goiter and iron deficiency anemia, which leads to early mortality, impairment of physical/cognitive development and poor school performance. Condiments such as bouillon are regularly use by families across the region to enhance the taste of home-cooked meals, making this product a useful vehicle for delivering micronutrients. Homogeneous, stable, and impacful multifortification bouillon is challenging as color, aroma, and flavor of the condiment can easily change during manufacturing, shelf-life and consumption.

The aim of this work is to develop a stable multifortified (iron and iodine) Maggi® bouillon cubes for industrial scale production and commercialization in Central and West Africa and assess its impact on the reduction of micronutrient deficiencies.

Methods: Stability of multifortified Maggi® bouillon cubes was extensively studied through assessment of color, aroma, flavor, and texture of the condiment during manufacturing, shelf-life, and consumption. Local preparations rich in polyphenols were tested to ensure stability. Process adaptation and optimization for proper micronutrients homogeneity were implemented. Nutritional impact was assessed through the development of a statistical model based on the principles of the Global Burden of Disease using nutritional data from Ivory Coast.

Results: Commercialization of stable multifortified Maggi® bouillon cubes was accomplished in 2012 as a mean to complement mass fortification programs. Key points for its industrializations and acceptability by consumers were: 1) product stability and sensory properties in traditional African recipes; 2) safety and nutritional relevance; 3) ensuring micronutrient homogeneity and safety; 4) no price increased. Multifortified Maggi® bouillon cubes was estimated in Ivory Coast to reduce by 4.7% the economic burden and 5.7% health burden in DALYs.

Conclusions: Multifortification of Maggi® bouillon cubes is an effective approach to reduce malnutrition in Ivory Coast (reducing by 4.7% the economic burden and 5.7% health burden in DALYs). Its implementation was challenging as stability, homogeneity, safety, cost, consumer acceptance, and nutritional impact were critical to ensure successful acceptance by consumers. Challenges going forward includes: bioavailability and density of micronutrients

COMPARISON OF OBESITY STATUS OF SCHOOL CHILDREN BY BODY MASS INDEX AND BY BODY COMPOSITION USING A STABLE ISOTOPE DILUTION TECHNIQUE IN NAIROBI CITY COUNTY, KENYA

[(1)]Kigaru, Dorcus Mbithe; [(2)]Loechl, Cornelia; [(3)]Ndung'u, Zipporah W.

[(1)]PhD. Nutritionist. Department of Foods,, Nutrition & Dietetics. Kenyatta University. Kenya; [(2)]PhD. Department of Nuclear Sciences and Application. Division of Human Health. Nutritional and Health-Related Environmental Studies Section. International Atomic Energy Agency. Vienna. Austria.; [(3)]Msc. Dept of Food Science and Technology. Jomo Kenyatta University of Agriculture and Technology. Kenya.

Background and objectives: Changes in dietary intake, lifestyle and low physical activity contribute to obesity, the new silent killer which increases the risk of non-communicable diseases that threaten to burden already overstretched health services. Accurate and reliable indicators are required for early detection of childhood obesity and related health risks, for optimal nutrition intervention planning, monitoring and informing policy. Body Mass Index (BMI)-for-Age Z scores is widely used in epidemiological studies and screening for childhood obesity, however, it does not distinguish between body fat free mass and fat mass. Body fat accumulation and distribution is a better indicator of the risk of obesity and related diseases. This study assessed the accuracy of the BMI-based WHO classification of obesity for defining children as excessively fat by comparing it to the measure of body fatness using the criterion stable isotope method for body composition in school children in Nairobi City.

Methods: A cross-sectional study was conducted among 202 schoolchildren aged 8-11 year systematically sampled. A structured questionnaire was used to collect data on demographics, perceptions and knowledge about healthy habits, eating patterns, and physical activity. Anthropometry (BMI-for-Age Z scores) and body composition (fat mass and fat-free mass by deuterium dilution technique) was used to assess body fatness. Data was analysed using SPSS at significance $p<0.05$ at 95%CI.

Results: The prevalence of underweight, normal, overweight/overfat and obese/excessive fat in school children was 3.4%, 39.7%, 33.0% and 24.0% versus 6.9%, 84.2%, 5.6% and 3.3% by body composition using the deuterium dilution technique and BMI-for-Age Z scores respectively.

Conclusions: It is apparent that the WHO recommended BMI-for-age to classify overweight and obesity underestimates the prevalence of overweight and obesity based on measures of body fatness. This needs to be confirmed in a larger study. Evidence-informed interventions should be based on more accurate estimates of the prevalence of overweight and obesity than can be provided by BMI.

Keywords: Obesity, nutrition assessment, anthropometry, body composition.

NUTRITION-FOCUSED PROGRAM IMPROVES READMISSION RATES OF MALNOURISHED HOSPITALIZED PATIENTS REGARDLESS OF DISCHARGE DISPOSITION

[(1)]Sulo, Suela Sulo; [(2)]VanDerBosch, Gretchen; [(3)]Summerfelt, Wm. Thomas; [(4)]Partridge, Jamie; [(5)]Hegazi, Refaat; [(6)]Sriram, Krishnan.

[(1)]PhD. MSc. Research & Development. Abbott Nutrition. Columbus. USA; [(2)]RD. Research & Innovation. Advocate Health Care. Downers Grove. IL. USA.; [(3)]PhD. Research & Innovation. Advocate Health Care. Downers Grove. IL. USA.; [(4)]PhD. MBA. Research & Development. Abbott Nutrition. Columbus. OH. USA.; [(5)]MD. PhD. Research & Development. Abbott Nutrition. Columbus. OH. USA.; [(6)]MD. Research & Innovation. Advocate Health Care. Downers Grove. IL. USA.

Background and objectives: Well defined discharge planning processes are key in limiting unwarranted hospital readmissions. Malnourished hospitalized patients are more likely than their well-nourished counterparts to experience readmissions if their nutritional needs are not appropriately addressed while in the hospital. We aimed to assess the impact of a hospital-based, comprehensive nutrition-focused quality improvement program (QIP) on readmission rates of malnourished patients discharged home with and without home health care services.

Methods: Data from 2588 patients (1269 QIP patients enrolled October 2014-April 2015, and 1319 retrospective historical controls admitted in the QIP hospitals October 2013-April 2014) were categorized into three discharge disposition categories including home without home health care (1266/48.9%), home with home health care (1043/40.3%), and other health care facility (e.g., inpatient rehabilitation, skilled nursing facility) (279/10.8%) patient subgroups. No patients going to other health care facilities were included in the pre-QIP cohort; therefore, no comparative analyses were pursued for this subgroup. QIP patients were admitted in four hospitals where electronic medical record (EMR) was upgraded to include Malnutrition Screening Tool (MST), and condition-specific oral nutritional supplements (ONS) were administered to all patients at risk for malnutrition (MST ≥ 2). In addition, nutrition education was provided to patients and caregivers during the inpatient stay and at discharge.

Results: Pre-QIP historical controls readmission rates were 22.2% (141/635) for patients discharged home without home health care, and 21.9% (150/684) for patients discharged home with home health care. Post-QIP readmission rates were 14.7% (93/631) and 18.7% (67/359) for the two patient groups; thus resulting in statistically significant relative risk reductions of 33.7% and 14.6% (p values < 0.05), respectively. These results were observed regardless of hospital length of stay, which was significantly reduced for both groups.

Conclusions: Unplanned 30-day readmissions among malnourished hospitalized patients discharged to home with and without home health care services can be significantly decreased through a nutrition-focused QIP that aims to screen, promptly administer ONS, and educate patients throughout their hospital stay and at dis-

---

EFFECTS OF PHOTO-VOICE APPROACH ON 24-HOUR DIETARY RECALL ACCURACY AMONG UNIVERSITY OF IBADAN UNDERGRADUATE STUDENTS

[1]Ariyo, Oluwaseun; [2]Oloyede, Fiyinfoluwa.

[1]BSc. MSc. PhD. Nutritionist. Department of Human Nutrition. University of Ibadan. Nigeria; [2]BSc. Nutritionist. Department of Human Nutrition. University of Ibadan. Nigeria.

Background and objectives: The 24-hour recall is frequently used dietary assessment yet misreporting is common; therefore new approaches harnessing mobile technology are presently being explored. Photo-voice is an innovative qualitative method of participatory action research based on health promotion principles. However, it has not been used to its full potential in nutrition and dietetics. This study was designed to assess the effect of photo-voice approach on 24-hour dietary recall accuracy among undergraduate students.

Methods: This study was descriptive cross-sectional in design. Two hundred undergraduate students of University of Ibadan were selected using a simple random procedure from a pool of consenting students using WhatsApp-enabled smart phones. A semi-structured questionnaire was used to obtain information on socio-demographic characteristics and dietary intake. Respondents were prompted to capture and send every meal, snack and drink consumed daily and randomly selected for assessment over a 30-day period. Dietary intake was assessed using 24-hour multiple recall procedure, conducted using conventional approach and with the aid of photo-images. Nutrient intake was calculated using adapted Total Diet Assessment software and percentage difference in nutrient intake was calculated. Data were analysed using descriptive statistics and Chi-square test at p=0.05.

Results: Age was 21.0±1.8years, 57.5% were males and 95.0% lived on-campus. Intake of energy (1701.2±795.3; 1684.4±774.4) Kcal; protein (50.6±29.1; 50.1±28.1)g; fat (42.1±31.4; 41.6±27.2) g; and cholesterol (198.8±174.0; 188.4±172.0)g were higher with photo-voice than conventional approach respectively. Intake of Vitamin A (2149.5±1747.4; 2712.5±1903.4)RE; thiamin (1.1±1.0; 1.9±1.0)mg; and niacin (12.0±9.7; 12.4±10.4)mg were lower with conventional than photo-voice respectively. However, riboflavin (0.9±0.8; 0.8±0.6)mg; Vitamin B6 (0.9±0.7; 0.6±0.5)mg and B12 (1.7±1.1; 1.4±0.8)mcg were higher in conventional than photo-voice. Recall accuracy for intake of calorie (+15.2%; -8.2%); thiamin (+21.4%; -58.5%); riboflavin (+27.3%; -24.2%) and niacin (+17.6%; -12.3%) was significantly different in female and male respondents respectively. Also, recall accuracy for intake of folate (+27.8%; -12.2%); B12(-58.3%; +13.3%); Calcium(+11.3%; -17.9%); phosphorus(+11.9%; -9.3%); sodium(-8.2%; -10.9%); potassium(+20.4%; -17.3%); zinc(+10.9%;-2.6%); iron(+14.1%; -8.2%) and magnesium(+16.9%; -8.2%) was significantly different in female and male undergraduates.

Conclusions: Photo-assisted 24-hour recall shows mis-reporting of micronutrients intake masked in conventional 24-hour recall. Recall accuracy differ significantly by gender with over-reporting of nutrients intake among female students.

Keywords: Dietary assessment, innovative methodology, nutrient intake; over-reporting; underreporting.

VALIDITY OF BIOELECTRICAL IMPEDANCE ANALYSIS IN PREDICTING ADIPOSITY AMONG 8-11 YEARS OLD SENEGALESE SCHOOL-AGED CHILDREN

[1]Diouf, Adama; [2]Diongue, Ousmane; [2]Mégné, Ndé; [3]IDOHOU-DOSSOU, Nicole; [2]Thiam, Mbeugué; [4]Sembéne, Pape Malick; [3]Wade, Salimata.

[1]PhD. Nutritionist. Laboratoire de Nutrition. Faculté des Sciences et Techniques. University Cheikh Anta Diop de Dakar. Senegal; [2]Ms. Nutritionist. Laboratoire de Nutrition. Faculté des Sciences et Techniques. Université Cheikh Anta Diop (UCAD) de Dakar, BP 5005, Dakar-Fann. Senegal; [3]PhD. Nutritionist. Laboratoire de Nutrition. Faculté des Sciences et Techniques. Université Cheikh Anta Diop (UCAD) de Dakar, BP 5005, Dakar-Fann. Senegal; [4]MD. PhD. Physician. Division du Contrôle Médical Scolaire. Ministère de l'Education Nationale. Camp Jeremy Avenue Cheikh Anta Diop. BP 35 453. Dakar. Senegal.

Background and objectives: Childhood obesity is a serious public health challenge. Therefore accurate measurement of adiposity is essential to monitor the trend of child obesity in developing countries. This study aimed to develop and validate, for the first time, a bioelectrical impedance analysis (BIA) predictive equation for the assessment of adiposity among Senegalese school-aged children.

Methods: The study involved 151 pupils, 8-11 years old (74 boys, 77 girls) randomly selected from 4 elementary public schools in urban area of Dakar (Senegal). Weight and height were measured. Body composition: total body water (TBW), fat free mass (FFM) and percentage body fat (%BF) were determined by deuterium dilution method (DDM) used as the reference method. BIA was measured using multi-frequency analyzer and impedance index (height²/Z50 kHz) calculated. Stepwise backward multiple lin-

ear regression model was performed to develop the %BF equation in a subsample then validated it in the rest of the sample. Bland and Altman approach was used to assess the concordance between the two methods (bias and limits of agreement).

Results: Mean age (9.6±1.0 years) was comparable between boys and girls. FFM was higher in boys (24.6±6.9 kg) compared to girls (21.2±3.3 kg; P<0.001) and %BF lower in boys (5.1±4.6 kg) than in girls (5.3±3.8 kg; P<0.05). Overall, 11.3% of the children were obese (%BF ≥25% in boys, and ≥30% in girls). With BMI-z score, the prevalence of overweight/obesity was 4.6% (BMI>+1). The equation newly developed for the prediction of adiposity was: %BF= -1.10*height^2/Z50+3.14*sex+1.57*weight-4.347 (RMSE=4.5%, pure error=5.5%). The %BF estimated with the equation was highly and significantly correlated with the reference method (R^2=0.76; P<0.001). Bland-Altman analysis showed non-significant mean bias (0.19±5.6% fat; P=0.764) and limits of agreement ranged from -10.7 to 11.1%. When the equation was applied to the whole sample, there were non-significant difference between %BF measured by DDM (18.7%±9.7) and that predicted by BIA (18.2%±7.5).

Conclusions: The %BF equation developed in the present study could be used as an alternative and accurate tool for the measurement of adiposity among school-aged children. Further cross-validation studies in a larger independent sample of African pupils is suitable.

Keywords: Adiposity, BIA, deuterium, school-aged children, Senegal.

PERCEPTION OF PRINTED AND DIGITIZED PHOTOS IN THE QUANTIFICATION OF THE GLOBODIET-BRAZIL FOOD PORTIONS – RESULTS FROM THE VALIDA STUDY

[1]Nichelle, Pryscila Gharib; [2]Fisberg, Regina; [3]Almeida, Claudia Choma Bettega; [4]Maurício, Angelica; [5]Garmus, Lenine Maria; [5]Mendes, Vanessa Cardoso; [6]Slimani, Nadia; [3]Marchioni, Dirce; [7]Camey, Suzi Alves; [8]Crispim, Sandra.

[1]Federal University of Paraná; [2]D.Sc. Nutritionist. Departament of Nutrition. Public Health School. University of São Paulo. Brazil.; [3]D.Sc. Nutritionist. Departament of Nutrition. Federal University of Paraná. Brazil.; [4]D.Sc. Nutritionist. Departament of Nutrition. Federal University of Paraná. Brazil.; [5]Nutritionist. Departament of Nutrition. Federal University of Paraná. Brazil.; [6]Independent researcher. France.; [7]D.Sc. Statistician. Departament of Statistics. Federal University of Rio Grande do Sul. Brazil.; [8]PhD. Nutritionist. Departament of Nutrition. Federal University of Paraná. Brazil.

Background and objectives: This validation study is a major component of an international 24-hour dietary methodology adapted for Latin-American countries, starting with Brazil. The objective was to evaluate the perception of food portion quantification using printed and digitized photos.

Methods: The study was developed in Curitiba/PR (Brazil) with 58 adults. A total of 20 foods were evaluated from the GloboDiet Brazilian Album (n=96 foods). Each food had a series with up to six portion sizes. Three photos of each food were selected, representing small, medium and large portion sizes. Participants visited the study site in two moments, with a minimum of one-week interval, to evaluate the same food for both printed and digitalized photos (either in computer screen or tablet). Each participant evaluated on average 12 foods per session, randomly allocated, and had up to two minutes to choose the picture that best represented each pre-determined portion presented to them, which could be: exactly as the original photo, differing in size or in format. The difference between the correct and chosen portion (i.e., error) was analyzed, as well as concordance in using the photos and Spearman correlations.

Results: The percentage of the mean error was -1.1% (DP=11,2) for printed photos and -3.6% (DP=14,3) for digitized ones, showing no statistically significant difference (p=0.27). The concordance in using the photos was 91% and 90% for the printed and digitized photos, respectively. The foods with the highest number of distal chosen portions were the popcorn and feijoada. The correlation between correct and the estimated portions varied from 0.68 (scrambled egg) to 0.95 (noodles and popcorn) for printed and from 0.51 (feijoada) to 0.97 (potato) for digitalized photos. Tablet evaluations presented the largest errors, especially in the group of people with less years of education (p<0,05) and when the portions were presented in a different format (p<0,001) than shown in the photo.

Conclusions: As conclusion, the perception of using food portion printed photos was, in general, satisfactory although some foods were not very well evaluated. Furthermore, the evaluations using tablet resulted in worse results. We hope such results will contribute to future developments of dietary methodologies in Latin America.

Keywords: Food portion, photos, perception, food consumption.

DEVELOPMENT OF CHINESE DIETARY INDEX FOR PREVENTING NON-COMMUNICABLE CHRONIC DISEASES AND ITS RELATIONSHIP WITH UNDERLYING RISK OF MAJOR CHRONIC DISEASES

[1]Su, Xiaoming; [2]Duan, Ruonan; [3]Zhang, Yanbo; [3]Lu, Weijia; [4]Yang, Mingzhe; [5]Xue, Hongmei; [6]Liu, Yan; [7]Cheng, Guo.

[1]B.Med. West China School of Public Health. Sichuan University. China.; [2]MSc. Clinical Nutritionist. Jincheng People's Hospital. China.; [3]BMed Candidate. West China School of Public Health. Sichuan University. China.; [4]MSc. Researcher. Science and Technology Center, By-Health Co.,Ltd. China.; [5]PhD candidate. West China School of Public Health. Sichuan University. China.; [6]MSc. Clinical Nutritionist. Chengdu First People's Hospital. China.; [7]PhD. Professor. West China School of Public Health. Sichuan University. China.

Background and objectives: To develop the Chinese Dietary Index for Preventing Non-communicable Chronic Diseases (CDI-NCD), to investigate the association between overall diet quality and underlying risk of major chronic diseases.

Methods: Based on the current Chinese Dietary Guidelines, Chinese Dietary Reference Intakes (DRIs) and literature on development of dietary indices and association between diet and non-communicable diseases, CDI-NCD consists of 18 components. Diet quality of 572 healthy adults aged 25-65 years from Chengdu was evaluated using the scoring system of CDI-NCD. Differences in indicators for underlying risk of obesity, diabetes, dyslipidemia and hypertension among participants with higher, moderate and lower diet quality were tested.

Results: The mean CDI-NCD score for our population was 103.5±15.1. The diet quality of females was higher than that of males (P=0.001). Participants with normal weight had better diet quality than those with excess weight (P=0.004). Participants with higher diet quality had the lowest values of body mass index, insulin, triglycerides, low density lipoprotein and highest value of high density lipoprotein.

Conclusions: The CDI-NCD could evaluate the overall diet quality among Chinese adults. High diet quality, indicated by a high CDI-NCD score, was associated with lower underlying risk of major chronic diseases like obesity and dyslipidemia.

Keywords: Nutrition, dietary assessment, chronic disease, diet, dietary index.

NUTRITIONAL STATUS OF BELOW 3 YEARS CHILDREN AND INFANT AND YOUNG CHILD FEEDING PRACTICES IN INDIA-FINDINGS OF NATIONAL NUTRITION MONITORING BUREAU (NNMB) SURVEY

[1]Meshram, Indrapal; [2]Balakrishna, Nagalla; [3]R, HariKumar; [4]K, Mallikharjun Rao; [1]Arlappa, Nimmathota; [5]A., Laxmaiah.

[1]MD (SPM), National Institute of Nutrition, Hyderabad; [2]PhD (Bio-statistics), National Institute of Nutrition, Hyderabad; [3]DPh (Public Health), National Institute of Nutrition, Hyderabad; [4]PhD (Anthropology), National Institute of Nutrition, Hyderabad; [5]PhD (Public Health), National Institute of Nutrition, Hyderabad.

Background and objectives: Undernutrition is an important public health problem in India in spite of several nutrition intervention programs in operation since last 4 decades. The study was undertaken to assess infant & young child feeding practices and nutritional status of under 3 year children in rural area in 10 stated of India

Methods: A community-based, cross-sectional study was carried out in 10 states of India, using multistage random sampling method. Nutritional assessment was done using WHO Child Growth standard. Conceptual hierarchical framework was used as a basis for controlling for the explanatory factors in multivariate analysis

Results: A total of 4038 children below 3 years of age were covered. The study revealed that only 36% infants received breast feeding within 1 hour, while 37% received within 1-3 hours of birth. About 50% infants were exclusively breast feed up to 6 months. About 61% children of 6-11 months received complementary feeding at 6-8 month, 19% received before 6 months, while 17% has not yet received complementary feeding.

The prevalence of underweight, stunting and wasting was 38%, 42% and 22% respectively among less than 3 year children. It was observed that the risk of undernutrition among <3 year children was significantly (p<0.01) higher among boys, among children belonging to Scheduled caste and scheduled tribe communities, children from low income groups, among children of illiterate mothers and children without the facility of sanitary latrine. Among infants, the risk of underweight was significantly (p<0.01) higher among children belonging to scheduled tribe communities, children from low income groups, among children of illiterate mothers' children without the facility of sanitary latrine and among low birth weight babies, while the risk of stunting was higher among children belonging to low income groups, among children of illiterate mothers and children without the facility of sanitary latrine and among low birth weight babies.

Conclusions: Undernutrition is still an important health problem and is associated with income, community, literacy of mother, birth weight and sanitary latrine. Improving literacy status of mother thus improving socioeconomic condition and maternal nutrition during pregnancy and also sanitation & hygiene may improve the nutritional status of children

Keywords: Conceptual framework, Infant & young child feeding practices, income, nutrition assessment, undernutrition.

CEU San Pablo University. Spain; [7]Professor. Department of Biochemistry and Molecular Biology II. Institute of Nutrition and Food Sciences. University of Granada. Granada. Spain.

Background and objectives: Zinc, selenium, and the vitamins A (retinol and carotenes), E and C, all have specific biological functions that are involved mainly in the antioxidant defence system that has important implications for the development of chronic diseases. We aimed to assess the reported intake of these six nutrients, as well as the food that contributes to their sources of intakes.

Methods: Data were obtained from the Spanish ANIBES (Anthropometry, Intake and Energy Balance in Spain: anthropometric data, macronutrients and micronutrients intake, practice of physical activity, socioeconomic data and lifestyles) study, n=2009 (9–75 years old). The analyses were performed in the whole population and also in the plausible reporters after a misreporting analysis according to EFSA protocol. A three-day food record was used to collect the data.

Results: Mean reported intake for the whole population of zinc was 8.1±0.1 mg/d, (2.3-27.3 mg/d), selenium 75±1 μg/d, (14-265 μg/d), vitamin A 668 μg RE/d (2-11017 μg RE/d), retinol 364 ± 18 μg/d (0-10881 μg/d), carotenes 1735 ± 35 μg/d (13-13962 μg/d), vitamin E 7.0 ± 0.1 mg α-TE/d (0.7-55.2 mg α-TE/d) and vitamin C 84.4±1.4 mg/d (5.0-802.7 mg/d). The main source intakes for zinc were meat and meat products, for selenium were cereals and grains, for vitamin E oils and fat and for vitamin A and C vegetables.

Conclusions: There is an important percentage of the Spanish ANIBES population not meeting the recommended intakes for zinc, vitamin A and E, a reasonable percentage of people not meeting the recommendations of Vitamin C and a low percentage of people not meeting the selenium recommendations.

Keywords: ANIBES study, trace elements, vitamins, misreporting, food intake

VITAMIN A AND IRON CONTENT IN COMMON COMPLEMENTARY AND WEANING FOODS FOR CHILDREN IN NORTH WESTERN TANZANIA AND CENTRAL UGANDA

[1]Ekesa-Onyango, Beatrice; [2]Nabuuma, Deborah; [3]Pamminger, Linda; [4]Namsifu, Godson; [5]Kennedy, Gina.

[1]PhD. Associate scientist-Nutrition. Healthy diets for sustainable food systems. Bioversity International.Kampala. Uganda.; [2]Msc. Research Fellow-Nutrition. Healthy diets for sustainable food systems. Bioversity International. Kampala. Uganda.; [3]Msc. Department of Nutritional sciences. University of Vienna. Vienna. Austria.; [4]Msc. Department of Food Nutrition and Consumer Studies. Sokoine University of Agriculture. Morogoro. Tanzania; [5]PhD. Senior Scientist-Nutrition. Healthy diets for sustainable food systems. Bioversity International. Rome. Italy.

Background and objectives: The prevalence of Vitamin A and iron deficiencies among preschool children are 43% and 58.6% In Tanzania and 39% and 49% in Uganda respectively. These values are way beyond the WHO acceptable levels. The purpose of this work was to establish the vitamin A and iron adequacy of the most common weaning and complementary foods given to children in North western Tanzania and Central Uganda.

Methods: A cross-sectional study where 425 households selected through multistage sampling techniques were interviewed on the foods given to preschool children. Follow up home visits to randomly selected households were done to confirm details on preparation procedures. Six most common meals given to children were identified. Ingredients were obtained from the sites and transported to Department of food science, Universität für Bodenkultur (BOKU) Vienna, Austria within 48hours. Within 24hours of arrival, the meals were prepared following procedures validated by community and stored under refrigeration (-18 degrees C) to await analyses (<14days). HPLC analysis and microwave digestion followed by a flame atomic absorption spectroscopy were then used in establishing the content of provitamin A carotenoids (precursors of vitamin A) and iron content respectively. All the extractions and analysis were carried out in triplicate.

Results: Findings indicated that the six most common foods were maize-base porridge, steamed-mashed banana served with beans, boiled banana served with beans; boiled banana served with groundnut sauce, stiff porridge (Ugali) served with beans and boiled cassava served with beans.Analysis showed no trace of ei-

ther vitamin A or iron was observed in the maize-based porridge. Some iron 2.28mg/100gfw and 1.18mg/100gfw were observed in the stiff-porridge served with beans and small fish and boiled banana served with red kidney beans respectively. The banana-based foods showed some content of vitamin A ranging from 23 to 43 RAE ug/100gfw.

Conclusions: Considering the estimated average requirements of iron and vitamin A for children being 4.1mg/d and 210-275 RAE ug/day respectively, these foods are poor sources of these nutrients in their current form. There is therefore need to explore opportunities of either modifying the preparation methods and incorporating more nutritious and diverse ingredients for better nutrition content.

NUTRITIONAL QUALITY OF DRIED VEGETABLES AND VEGETABLE SOUPS

[1]*van het Hof, Karin;* [2]*Grün, Christian;* [3]*Basendowski, Silke;* [4]*Spraul, Martin;* [5]*van Buren, Leo;* [3]*Vollmer, Gabi;* [2]*Newson, Rachel.*

[1]PhD. Nutritionist. Unilever R&D Vlaardingen. The Netherlands; [2]PhD. Unilever R&D Vlaardingen. Vlaardingen. The Netherlands; [3]Unilever R&D Heilbronn. Heilbronn. Germany; [4]PhD. Unilever R&D Heilbronn. Heilbronn. Germany; [5]Unilever R&D Vlaardingen. Vlaardingen. The Netherlands.

Background and objectives: Dehydration of food has been used for centuries as a technique to increase shelf life and preserve nutrient quality during storage. However, degradation or loss of nutrients may occur during the drying process, either due to applied heat or leaching due to water removal. Therefore, we investigated nutrient retention during pre-processing and drying of vegetables used to prepare dry vegetable soups in 2 studies.

Methods: First, nutrient levels were determined in fresh industrial tomato, onion, and lentil produces, as well as in the industrially dried products obtained from the same batches. Vitamin C and lycopene were selected as representatives for heat- and storage-labile nutrients in tomato. For onion, vitamin C and flavonols were taken, whereas folates were chosen as nutrient markers for lentils. Potassium contents were determined for all vegetables. Second, the overall nutritional quality of dry vegetable soups was assessed and compared with recommended dietary allowances (RDAs) and nutrition databases. Nutrients, including dietary fiber, minerals, vitamins, and carotenoids were determined in ten commercial dry vegetable soup varieties.

Results: During the pre-processing and dehydration of tomato, lycopene remained stable, whereas 70% of vitamin C was retained. With regard to onions, 29% of vitamin C and 51% of flavonols were retained. Losses of folates during processing of lentils was between 10-25%, depending on the process applied. Potassium levels remained largely unaltered for all vegetables, indicating limited losses attributable to leaching. The nutritional profile of dry vegetable soups aligned well with nutritional databases and

the profile of nutrient contribution from dry soups was consistent with the expected RDAs contribution from vegetables.

Conclusions: A notable amount of nutrients are retained in vegetables after pre-processing and dehydrating and dry vegetable soups can therefore be considered a relevant source of vegetables and nutrients.

Keywords: Vegetables, nutrient composition, dehydration, nutrient retention.

Brazil.; [5]Coordination of food and nutrition. Ministry of Health. Brasilia-DF. Brazil.; [6]Department of Nutrition. Federal University of Paraná. Curitiba-PR. Brazil.

Background and objectives: Anemia is one of the major nutritional deficiencies in children under five years old, with consequences for growth and development. In Brazil, the National Iron Supplementation Program (PNSF) was introduced in 2005, aiming at controlling and preventing anemia in children by administering prophylactic doses of sulfate ferrous to those of 6-24 months. The objective of this study was to evaluate the prevalence of anemia and its association with the of iron supplementation among children aged 12-59 months residing in cities that are part of Brazilian plan without extreme poverty from South of Brazil.

Methods: The study comprised children from 48 municipalities. Blood sampling was collected by peripheral venous puncture, followed by measurement of hemoglobin (Hb) using HemoCue®. Weight and length/height measurements were measured and face-to-face interviews were performed, using a structured questionnaire to obtain complementary information (e.g., socioeconomic, demographic and supplement use). Anemia was diagnosed when levels of Hb<11g/dL. Children were grouped according to the administration of sulfate ferrous: "using/used" (n=688) and "never used" (n=708). Double data entry and validation was done using

Epi-Data®. To evaluate the statistical association, chi-square test was performed in SPSS version 22, considering p<0,05.

Results: A total of 1511 children participated in the study with levels of Hb. The mean Hb was 12.8±1.13 g/dL. The majority of the children were male (51.5%), aged ≥24 months (71.4%), had a monthly family income of ≤1 minimum wages (32.7%) and were being monitored in health services since birth (93.1%). From the total sample, 49.3% were never supplemented and the prevalence of anemia was 4.9% (n=74). While the prevalence for children aged 12-24 months was 9.9% (n=43), for those with more than 24 months was 2.9% (n=31). When we compared the prevalence of anemia between those that were supplemented and those who were not, the prevalence were 4,2% (n=30) and 5.5% (n=38), respectively, with no statistical difference (p=0.26).

Conclusions: We conclude that the prevalence of anemia is considered acceptable, according to the World Health Organization. Furthermore, the determinants that are associated to this prevalence deserves further investigation, which seems not to be related to iron supplementation.

DIET QUALITY INDEX ASSOCIATED WITH DIGITAL FOOD GUIDE – 2017: UPDATE AND VALIDATION

Domene, Semiramis; Caivano, Simone.

PhD. Department of Public Policies and Collective Health. Federal University of São Paulo. Brazil.

Background and objectives: Background. Inadequate eating habits represent one of the main factors associated with chronic non-communicable diseases and nutritional deficiencies; food guides provide guidelines aiming to contribute to the promotion of health. The Diet Quality Index associated with the Digital Food Guide (DQI-DFG) was developed in 2011 from guidelines of School of Public Health at Harvard University, with adjustments for the Brazilian food habits. Objective. Analyze, improve and validate the Diet Quality Index associated with the Digital Food Guide, as a tool for food intake and diet quality assessment.

Methods: Method. The following psychometric properties were used: (a) content validation by building a consensus on healthy eating and diet quality index among experts; (b) construct validation through enhancement of a reference diet to determine recommended serving sizes and consumption ranges; correlation between each food group score and energy value; comparative analyses between menu assessment by experts and DQI-DGF application results to confirm the score criterion; (c) reliability from agreement analyses between the result shown by the evaluators and result presented by DQI-DFG; correlation between each food group score and total score Index to understand the relationship among this variables.

Results: The Index score is not dependent on energetic value (r=0.24). There is a high correlation between the score assigned by experts and the DQI-DFG result (r=0.78 until r=0.97).

Conclusions: Consensus result performed among experts legitimates the concepts that justify DQI-DFG; there was an agreement between menu quality evaluation by experts and the results shown by DQI-DFG; the correlation between food groups scores were weak and Index application result by evaluators agreed with the final DQI-DFG. The DQI-DFG update satisfied validation and reliability criteria.

University of British Columbia. Vancouver. Canada.; [6]PhD. Department of Pediatrics. University of British Columbia. British Columbia Children's Hospital Research Institute. Vancouver. Canada.; [7]PhD. Department of Nutrition and Dietetics. Universiti Putra Malaysia. Selangor. Malaysia.; [8]PhD. South Australian Health and Medical Research Institute, and the Women's and Children's Health Research Institute. Adelaide. Australia.

Background and objectives: Anemia affects 1.65 billion individuals worldwide, especially young children and women of reproductive age. Anemia prevalence in pregnant women (hemoglobin <110 g/L) in Malaysia is estimated to be 38%. However, there is limited evidence on the prevalence of anemia and iron deficiency anemia (IDA) in non-pregnant Malaysian women and no studies have adjusted ferritin values for inflammation. This cross-sectional study aims to determine the prevalence of anemia and IDA in a sample of healthy non-pregnant Malay and Chinese women (19-45 years) living in Kuala Lumpur, Malaysia.

Methods: Fasting blood samples were collected from women living in Kuala Lumpur, Malaysia (n=210) and, for comparison purposes, from women living in Vancouver, Canada (n=206). Malaysian participants were of Malay (n=105) and Chinese (n=105) descent; Canadian participants were of European (n=110) and Chinese (n=96) descent. Samples were analyzed for hemoglobin, plasma vitamin B12, serum retinol binding protein (RBP), serum iron biomarkers (soluble transferrin receptor [sTfR] and ferritin),

and acute and chronic inflammation biomarkers (C-reactive protein [CRP] and α-1 acid glycoprotein [AGP]).

Results: Anemia (hemoglobin <120 g/L) prevalence was higher in Malaysian women compared to Canadian women (18% and 7%, respectively; p=0.001). In Malaysia, 11% (n=24) of women had IDA (based on hemoglobin <120 g/L and either inflammation-adjusted ferritin <15 µg/L or sTfR >8.3 mg/L), compared to 3% (n=6) of Canadian women. No significant ethnic differences were found among women in anemia or IDA prevalence. Depleted iron stores (inflammation-adjusted ferritin <15 µg/L) were found in 21% of Malaysian women and in 15% of Canadian women. The prevalence of acute (CRP >5 mg/L) and chronic (AGP >1 g/L) inflammation was 7% and <1%, respectively, in Malaysian participants, compared to 4% and <1% in Canadian participants. Adjustment for inflammation (using AGP and CRP biomarkers) did not change the prevalence of IDA in Malaysian or Canadian women. There was no biochemical evidence of vitamin A deficiency (RBP <0.7 µmol/L) and <1% of women had vitamin B12 deficiency (B12 <148 pmol/L) in both populations.

Conclusions: These findings suggest that over half the anemia in Malaysian non-pregnant women is attributed to iron deficiency. Further research is required to investigate the prevalence of IDA in a nationally representative sample.

Keywords: anemia, hemoglobin, iron, Malaysia, women

NEW MIDDLE EUROPEAN REFERENCE VALUES FOR DIETARY PROTEIN INTAKE IN THE ELDERLY

[1]*Stehle, Peter;* [2]*Oberritter, Helmut;* [3]*Richter, Margrit.*

[1]PhD. Prof. Nutritionist. Institute for Nutrition and Food Sciences. University of Bonn. Germany; [2]PhD. Nutritionist. German Nutrition Society. Bonn. Germany; [3]PhD. Nutritionist. German Nutrition Society. Bonn. Germany.

Background and objectives: Physiological aging is characterized by a steadily reduced protein synthesis capacity, a decreased postprandial amino acid availability and a diminished peripheral blood flow. We hypothesize that these age-dependent impairments in protein/amino acid metabolism can be slowed down by a nutritive protein intake >0.8 g/kg bw.d as recommended for younger adults.

Methods: In the obligatory updating of the D-A-CH Reference Values (RDAs) for Nutrient Intake we conducted a systematic literature review (PubMed, Embase; last entry: December 2016) identifying observational and clinical studies. The selection of and data extraction from studies included in the review were performed by two independent reviewers. The Working Group Of the German, Austrian and Swiss Societies evaluated the results obtained and draw conclusions with respect to the revision of RDAs for older adults.

Results: In several prospective cohort studies and a single cross-sectional trial, a positive correlation between protein intake and functionality was observed in older adults. In women aged 60 to 72 y, a protein intake of at least 1.2 g/kg bw.d showed an improved muscle strength and better mobility compared with participants consuming not more than 0.8 g/kg bw.d. A protein consumption of 1.2-1.6 g/kg bw.d was associated with an increased lean body mass compared with 0.8-1.0 g/kg bw.d in women aged 68 y (median). In postmenopausal women (75 y, median), a protein intake of 81 g/d was associated with a higher bone-free lean body mass and body cell mass than in those participants only consuming <66 g/d. Two recent prospective cohort studies showed within the 3y observational period a lower incidence of frailty in the quartile withthe highest protein intake (1.27 g/kg bw.d and 1.2 g/kg bw.d, respectively) compared to the quintile with lowest intake (<1.0 g/kg bw.d)

Conclusions: The results of our systematic evaluation of actual research work confirms our working hypothesis that a protein intake >0.8 g/kg bw.d can slow down impairments in protein/amino acid metabolism during aging. The working group, thus, recommend to increase the RDA for older adults (>65 y) for protein up to 1.0 g/kg bw.d.

Keywords: Protein intake, dietary allowances, elderly, systematic review.

UK; [9]MSc. Senior Research Specialist. Save the Children. USA; [10]PhD. Professor. Michigan State University. USA.

Background and objectives: Anaemia is common in preschool African children, and is mostly due to iron deficiency and Plasmodium infection. Combining iron interventions with interventions against malaria may be more efficacious and safer than

iron interventions alone. We examined the impact of home fortification with micronutrient powders, delivered alongside seasonal malaria chemoprevention, parenting education and community based preschools in rural communities in Southern Mali over a two year period.

Methods: Sixty communities with community preschools were randomly allocated to the intervention and control group. All 60 study communities received two rounds of seasonal malaria chemoprevention during the peak malaria season (Oct-Dec), targeting all children aged 3-59 months. The 30 intervention communities then received daily home fortification with micronutrient powders containing 12,5 mg of elemental iron for four months (Jan-April) targeting all children aged 6-59 months. Two cross sectional surveys were conducted at baseline (May-June 2014) and endline (May-June 2016) to compare Plasmodium infection, nutritional indices and cognitive performance in children aged 3 and 5 years (N=1,105 and N=1,033 respectively).

Results: At baseline in 2014, 63% and 53% of children aged 3y and 5y were anaemic, 49% and 60% had Plasmodium infection and 43% and 34% were stunted. Despite high reported coverage for both chemoprevention and home fortification, the preliminary results from June 2016 found that after three years of intervention there was little discernible difference in anaemia (<110g/L) between the two intervention groups; 51.8% vs 48.9% in children aged 3 years, and 46.6% vs 40.6% in children aged 5 years; and negligible effects for stunting . The full results of the 2016 survey will be presented at ICN meeting.

Conclusions: Home fortification with iron-containing micronutrient powders is recommended by WHO where the prevalence of anaemia is over 20%.. This study found that micronutrient supplementation, when combined with seasonal chemoprevention against malaria, had limited impact on childhood anaemia in an area of high prevalence, despite good uptake of both interventions.

Keywords: Micronutrient, anaemia, malaria, home fortification, iron.

A NOVEL 129I TRACER METHOD FOR THE ASSESSMENT OF IODINE FRACTIONAL ABSORPTION AND THYROIDAL UPTAKE IN HUMANS

[1]Galetti, Valeria; [2]van der Reijden, Olivia; [3]Mannhart, Andrea; [4]Krzystek, Adam; [4]Zeder, Christophe; [5]Andersson, Maria; [5]Herter-Aeberli, Isabelle; [6]Zimmermann, Michael Bruce.

[1]PhD. Laboratory of Human Nutrition. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland; [2]MSc. Laboratory of Human Nutrition. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland.; [3]BSc. Laboratory of Human Nutrition. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland.; [4]Laboratory of Human Nutrition. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland.; [5]PhD. Laboratory of Human Nutrition. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland.; [6]MD. Laboratory of Human Nutrition. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland.

Background and objectives: Thyroidal iodine uptake and turnover has been measured in adults using radioactive iodine tracers, but these cannot be used safely in women of reproductive age, pregnant women or children. Iodine 129 (129I) is a semi-stable isotope that is considered safe for use in human trials. Our objective was to assess 129I as a novel tracer for the assessment of fractional absorption (129IFA) and thyroidal uptake (129ITU).

Methods: We administered an oral physiological dose of 129I (129I Dose) to euthyroid young adults with adequate iodine intake. We collected baseline complete urines, complete feces and spot plasma samples. After tracer consumption, we collected complete urines (over seven days), complete feces (three days), and spot plasma (five days, with eight withdrawals on first day). The subjects followed an iodine-standardized diet from three days before until three days after tracer consumption. We measured 129I in alkaline-extracted plasma (129IP), urine (129IU) and feces (129IF) samples by a multicollector ICP-MS by use of isotope dilution analysis with 127I. 129IFA is evaluated as 129I Dose minus 129IF; 129ITU is evaluated as 129IFA minus 129IU; 129IP kinetics allows the evaluation of thyroid uptake patterns.

Results: Four male and four female euthyroid (mean±SD TSH 1.3±0.5 mU/L; T4 110.0±19.7 nmol/L) participants with a median (IQR) urinary iodine concentration of 118 (101-140) µg/L consumed 12.42±0.05 µg 129I. 129IU was first detected ≈1 hour after administration and a median cumulative 129IU of 6.9 (6.4-7.4) µg was excreted within 48 hours; this corresponds to 54.8±10.6 % of the 129I Dose. Results: **Conclusions:** A novel 129I-tracer based method successfully quantified 129I renal excretion patterns, showing that ≈55% of ingested oral iodine is excreted in the subsequent 48 hours. Quantification of 129IFA and 129ITU thyroidal uptake patterns are pending. This promising and safe tracer methodology can safely be used in all age groups to investigate a variety of research questions on thyroid health and iodine nutrition, including iodine requirements in pregnancy, lactation and infancy.

Keywords: 129I, mass-spectroscopy, dietary iodine, thyroid uptake, iodine kinetic.

Department of Public Health and Caring Sciences, Clinical Nutrition and Metabolism. Uppsala University. Sweden.

Background and objectives: Fatty acid (FA) proportions in cholesterol esters (CE) and phospholipids (PL) are widely used as biomarkers of dietary fat quality. Information on how proportions in these fractions correlate could have implications for interpretation and use of FA biomarkers in observational and interventional studies. The objectives of this study were to investigate correlations between FA proportions in CE and PL among free-living individuals and to assess how diet-induced alterations of FA proportions correlate between fractions.

Methods: Spearman's rank correlation coefficients (rs) between FA proportions (% of total FA) in circulating CE and PL were calculated separately in 8 individual study populations (total n=2052) and pooled by inverse-variance weighted meta-analysis. Additionally, each study population was stratified by age, sex, BMI, and type 2 diabetes status and strata-specific rs were pooled by meta-analysis. Furthermore, rs between FA changes in CE and PL during isocaloric dietary interventions were calculated separately per treatment in two randomized controlled trials (total n=79).

Results: Overall, FA proportions in CE and PL ranked individuals similarly. Polyunsaturated FA proportions correlated especially strongly between fractions, with pooled rs (95% CI) ranging from 0.74 (0.72; 0.76) for α-linolenic acid to 0.92 (0.91; 0.93) for eicosapentaenoic acid. Weak correlations (pooled rs< 0.4) were only observed for, palmitic acid and stearic acid, with pooled rs (95% CI): 0.29 (0.24; 0.33) and 0.30 (0.26; 0.34), respectively. Correlations were not evidently affected by age, sex, BMI, or type 2 diabetes. Strong correlations (rs≥ 0.6) between diet-induced FA changes in CE and PL were observed for most PUFA and especially eicosapentaenoic acid , where rs ranged 0.85-0.94 after different treatments.

Conclusions: Correlations between FA proportions in CE and PL were generally strong, suggesting that FA proportions in these fractions can be used interchangeably in diverse populations.

However, caution is advised when comparing results from studies assessing palmitic acid or stearic acid in different lipid fractions.

Keywords: Biomarker; Fatty acid; Cholesterol ester; Phospholipid; Meta-analysis.

ZINC INTAKES AND DIETARY SOURCES IN AN IRISH ADULT POPULATION

[1]Lenighan, Yvonne; [2]Nugent, Anne P.; [3]Walton, Janette; [4]Flynn, Albert; [5]Roche, Helen; [6]McNulty, Breige A.

[1]Research Nutritionist. UCD Conway Institute and UCD Institute of Health. University College Dublin. Ireland.; [2]Lecturer in Nutrition. UCD Institute of Food and Health. University College Dublin. Ireland; [3]Research Fellow. School of Food and Nutritional Sciences. University College Cork. Cork. Ireland.; [4]Professor in Nutrition. School of Food and Nutritional Sciences. University College Cork. Cork. Ireland.; [5]Professor in Nutrition. UCD Conway Institute and UCD Institute of Food and Health. University College Dublin. Dublin. Ireland.; [6]Lecturer in Nutrition. UCD Institute of Food and Health. University College Dublin. Dublin. Ireland.

Background and objectives: Adequate zinc intakes are important for growth, immune function and cognitive health. Zinc deficiency affects approximately 17% of the global population, with young children and older adults at increased risk. There is currently limited data on zinc intakes in the Irish population. Therefore the aim of this analysis is to determine zinc intakes and sources in Irish adults using data from the cross-sectional National Adult Nutrition Survey (NANS).

Methods: The NANS assessed habitual food and beverage intake between 2008 and 2010 for 1500 Irish adults (18-90 years) using a 4-day semi-weighed food diary. 2552 food codes were aggregated into 33 food groups, representative of the overall diet. Differences in zinc intakes were assessed using one-way ANOVA and independent t-tests.

Results: Mean daily zinc intakes were 10.3mg in the total population. Males (11.6mg) presented greater intakes than females (9.0mg) (P<0.001). In comparison to the younger males (12.4mg), intakes of zinc were significantly lower in older males (10.2mg) (P=0.004). Smokers presented significantly lower zinc intakes than non-smokers in the total population, while intakes were significantly greater in supplement users than non-supplement users (P<0.05). Similar differences were observed when the population was split by gender (P<0.05). The Institute of Medicine recommend daily zinc intakes of 11mg and 8mg in males and females, respectively. These intakes were achieved by the current population. The dominant food groups contributing to zinc intakes were unprocessed red meat (22.3%), wholemeal/brown bread and rolls (10.1%), processed red meat (7.5%), white meat (5.7%) and white bread, rolls, scones and croissants (5.1%).

Conclusions: In summary, zinc intakes are adequate in this Irish population; however, they should be monitored continuous-

ly, particularly in older men as they presented significantly lower intakes.

Keywords: Zinc, dietary intakes, dietary sources.

Hyderabad.; [4]Phd. Micronutrient Research Division . National Institute of Nutrition. Indian Council of Medical Research. Hyderabad.India.; [5]Director In- Charge. National Institute of Nutrition. Indian Council of Medical Research. Hyderabad. India.

Background and objectives: Biofortification envisages identification, selection and stabilization of genotypes with higher nutrient contents. However ensuring bioavailability of nutrients is required for the intended beneficial outcome in target population. The objective of the present study is to understand the relationships amongst iron content, iron bioavailability and phytic acid content among wheat genotypes.

Methods: Iron and phytic acid content in 22 different wheat genotypes were estimated using standard methods. The iron dialyzability after simulated digestion of wheat flour was performed in a 6-well plate format. The iron content in the digesta and dialysable fraction were estimated by atomic absorption spectrometry.

Results: The iron and phytic acid content of wheat genotypes varied from 3.3 to 4.9mg/100g and 2.2 to 8.9mg/100g dry weight, respectively. The dialyzable iron and percent dialyzability are in the range 0.24 to 0.72mg/100g and 7.4 to 16%, respectively among the 22 wheat genotypes tested. There was no significant correlation amongst iron content with that of either iron dialyzability or phytic acid content. However, phytic acid content negatively correlated with that of dialyzable iron content (correlation coefficient-0.0641 p=0.0013)

Conclusions: The above results suggest significant variability in iron, phytic acid content and bioavailable iron among wheat genotypes. The phytic acid but not total iron appears to determine the extent of iron dialyzability. These results suggest that iron and phytic acid content alone appear to provide the key selection marker for breeding wheat to improve iron status

MEASUREMENT OF HUMAN MILK INTAKE USING STABLE ISOTOPE IN INDIAN RURAL INFANTS FROM BIRTH TO 24 MONTHS: A LONGITUDINAL STUDY

[1]*Deshmukh, Urmila;* [2]*Thomas, Tinku;* [3]*Swaminathan, Sumathi;* [4]*Kurpad, Anura.*

[1]MD. Pediatrician. Division of Nutrition. St John's Research Institute. St. John's National Academy of Health Sciences. Bangalore. India.; [2]PhD. Biostatistician. St John's Research Institute. St. John's National Academy of Health Sciences. Bangalore. India.; [3]PhD. Nutritionist. St John's Research Institute. St. John's National Academy of Health Sciences. Bangalore. India.; [4]MD. Physiologist. Division of Nutrition. St John's Research Institute. St. John's National Academy of Health Sciences. Bangalore. India.

Background and objectives: Exclusive breastfeeding for first six months of life, followed by complementary feeding and continuation of breastfeeding is advocated by international health agencies. In this study, human milk intake from birth to 24 months was measured, and its associations with maternal and infant factors were studied.

Methods: In this community based, longitudinal study data collected were: Socio-demographics, anthropometry (weight, length and skin-folds of mother and offspring), morbidity and diet recall. Using deuterium oxide (30g) dose-to-mother technique, saliva samples of mother and infant were collected (on day 0, 1, 2, 3, 4, 13, and 14) at 1, 3, 6, 12, 18 and 24 months post-partum, and were analyzed by Fourier transform infrared spectroscopy. The human milk intake and non-milk oral water intake were estimated using a standardized method. Associations between human milk intake and maternal and infant factors were studied using correlations and linear mixed models. Approval from the Institutional Ethics Committee was obtained.

Results: Thirty rural mother-offspring pairs (age 29±3y and 30±7d, respectively) were enrolled. The mean human milk intake increased from 1st to 6 months from 686 ±162 to 844 ±117 g/d (p<0.001), and then decreased to 534 ±239 and 380 ±239 g/d at 18 and 24 months respectively. Rate of breastfeeding fell from 100% at one month to 97% at 6, 78% at 12 and 52% at 24 months. The human milk intake in first six months was positively associated with maternal fat mass, infant weight, length, sum of skin-folds and anthropometric z scores. After controlling for parity, birth weight, age and gender, human milk intake was associated with only infant's weight (p<0.001).

Conclusions: The HMI increased from first to sixth month, and then decreased significantly after 12 months till 24 months of age in infants who continued to be breastfed. High rate of breastfeeding beyond six months underpins need to assure adequacy of maternal nutrient stores, in this population.

Funding agency: The International Atomic Energy Agency, Vienna, Austria.

Keywords: Human milk intake, breastfeeding, infants, India.

VALIDATION OF THE DIETARY REFERENCE INTAKES FOR PREDICTING ENERGY REQUIREMENTS IN ELEMENTARY SCHOOL-AGE CHILDREN

[1]Kim, Eun-Kyung; [2]Ndahimana, Didace; [3]Kim, Ye-Jin; [4]Park, Jonghoon; [5]Ishikawa-Takata, Kazuko.

[1]PhD. Department of Food and Nutrition. Gangneung-Wonju National University. South Korea.; [2]PhD student. Department of Food and Nutrition. Gangneung-Wonju National University. South Korea.; [3]MSc student. Department of Food and Nutrition. Gangneung-Wonju National University. South Korea.; [4]PhD. Professor. Department of Physical Education. Korea University. South Korea.; [5]PhD. Head of Section of Nutritional Care and Management. Department of Nutritional Education. National Institute of Health and Nutrition. Japan.

Background and objectives: Accurate assessment of children energy requirements is important for the prevention of pediatric obesity, which has been a big public health challenge in recent years. The purpose of the present study was to examine the accuracy of Dietary Reference Intakes for predicting energy requirements in elementary school-age children, by using the doubly labeled water as a reference method.

Methods: The doubly labeled water (DLW) method was used to measure total energy expenditure (TEE) in 25 elementary school children aged 9-11 years. The accuracy of DRI predictive equations for TEE was assessed by comparing the predicted TEE (TEE_{DRI}) to the measured TEE (TEE_{DLW}), based on the mean percentage error (bias), the Root Mean Squared prediction Error (RMSE) and the percentage subjects predicted within 10% of TEE_{DLW}. The Bland-Altman plot was used to assess agreement between the two methods.

Results: The DRI predictive equation overestimated TEE by 242.7 kcal/ day (12.6%) in boys, and underestimated TEE by 31.2 kcal/ day (-1.6%) in girls, with the RMSE of 376.7 and 216.8 kcal/ day, respectively. The percentage of accurate predictions was 28.6% in boys and 63.6% in girls. The bland-Altman plot showed larger limits of agreement in boys compared to girls. In addition, there was a proportional bias in case of boys, with a tendency of underprediction in subjects with low TEE and overprediction in subjects with high TEE. On the contrary, no proportional bias was observed in case of girls.

Conclusions: These results suggest that in elementary school-age boys, the DRI predictive equation could be inaccurate in predicting energy requirements. In girls, the present study indicates that the DRI equation could be used accurately at the group level. However, caution should be taken when estimating energy requirements for individual girls as this equation may result in inaccurate estimation in a large percentage of subjects. More studies are required to confirm our findings, and to assess the accuracy of the DRI equations in other groups including obese children, younger children and adolescents.

Keywords: Children, energy metabolism, dietary recommended intake.

ESTIMATION OF PROTEIN REQUIREMENTS IN INDIAN PREGNANT WOMEN USING A WHOLE BODY POTASSIUM COUNTER (WBPC)

[1]Kuriyan Raj, Rebecca; [2]Naqvi, Saba; [2]Josephine D'Souza, Ninoshka; [3]Singh, Meenu; [4]Bhat, Kishor; [5]Mendiratta, Gaurav; [6]HPS, Sachdev; [7]Preston, Thomas; [8]Kurpad, Anura.

[1]Associate Professor. India.; [2]PhD student, Division of Nutrition. St. John's Research Institute (SJRI). Bangalore. India; [3]Post-doc student, Division of Nutrition. St. John's Research Institute (SJRI). Bangalore. India; [4]Assistant Professor, St. John's Research Institute (SJRI). Bangalore. India; [5]PhD student, Centre for High Energy Physics. Indian Institute of Science. Bangalore. India; [6]Professor, Sitaram Bhartia Institute of Science and Research. New Delhi. India; [7]Professor, Stable Isotope Biochemistry Laboratory. Scottish Universities Environmental Research Centre. Glasgow. Scotland. UK; [8]Professor, St. John's Research Institute (SJRI). Bangalore. India.

Background and objectives: The diets of Indian pregnant women do not often meet their increased gestational protein requirement, as defined by the WHO/FAO/UNU. Since the occurrence of low birth weight is high in India, it is critical to examine how the quantity/ quality of protein intake affects gestational body and fetal protein accretion. While body composition measurements during pregnancy are limited by hydration status and radiation exposure, measuring the naturally occurring radioactive isotope of potassium (40K) in the body, by a Whole Body Potassium Counter (WBPC), is independent of assumptions of the hydration status, and gives accurate estimates of Body Cell Mass (BCM) and further, the fat free mass (FFM). Accurate measurements of gestational BCM, as an indicator of protein accretion, will also define gestational protein requirements. The objective of the present study was to build a WBPC and use it to arrive at protein requirements for Indian pregnant women.

Methods: A state of the art WBPC was constructed in Bangalore, using a shadow shield, with alternate layers of steel and lead to shield four Sodium Iodide (NaI) crystal detectors from natural background radiation. Gamma spectra obtained were used to estimate total body potassium using phantoms of varying shapes/ sizes with known concentrations of potassium chloride and Monte Carlo simulations to adjust for body geometry. Fifty pregnant women were recruited in their first trimester and measurements of anthropometry, body composition and dietary intakes were performed at each trimester.

Results: The WBPC had an accuracy of 3%. Estimates of FFM from the WBPC correlated well with the FFM obtained by deuterium dilution and Dual Energy X-ray Absorptiometry (DEXA). The preliminary results suggest that the protein requirement is 14.2 ± 5.5 g/day in the 2nd trimester and 15.9 ± 7.0 g/day in the 3rd trimester, for a gestational weight gain of 12.5 kg in Indian women.

Conclusions: The results from this first facility in Asia will provide critical data with regard to protein requirement in pregnancy and will address several questions around pregnancy nutrition and birth outcomes in India.

MATERNAL IRON ABSORPTION AND IRON TRANSFER TO THE FETUS DURING PREGNANCY IN NORMAL-WEIGHT AND OVERWEIGHT/OBESE WOMEN AND THE EFFECTS ON INFANT IRON STATUS

[1]*Stoffel, Nicole Ursula;* [2]*Zimmermann, Michael Bruce;* [3]*Zeder, Christophe;* [4]*Quack-Loetscher, Katharina;* [5]*Herter-Aeberli, Isabelle.*

[1]Msc. Department of Health Science and Technology. Laboratory of Human Nutrition. ETH Zürich. Switzerland.; [2]MD. Department of Health Science and Technology. Laboratory of Human Nutrition. ETH Zürich. Switzerland; [3]Msc. Department of Health Science and Technology. Laboratory of Human Nutrition. ETH Zürich. Switzerland; [4]MD. Department of Obstetrics. University Hospital Zürich. Switzerland; [5]PhD. Department of Health Science and Technology. Laboratory of Human Nutrition. ETH Zürich. Switzerland.

Background and objectives: Overweight/obesity causes low-grad systemic inflammation and thereby an up-regulation of the iron regulator hepcidin and a reduction in fractional iron absorption (FIA) even when iron stores are low. Pregnancy increases iron needs because of the expansion of maternal blood volume and fetal needs. It is unclear whether and/or to what extent overweight/obese pregnancy influences FIA, iron supply of the fetus and risk of iron deficiency in mother and newborn. In this case-control study, we (1) determined the impact of maternal overweight/obesity on FIA in pregnancy and on the transfer of iron to the fetus and newborn iron status; (2) confirmed the relationship between BMI, hepcidin, plasma ferritin (PF) and inflammatory markers; and (3) determined differences in women's iron needs during the 2nd and 3rd trimester.

Methods: In this ongoing multicenter case-control study (normal-weight n=36; overweight/obese n=36) we have administered labeled [57Fe]- or [58Fe]-FeSO4 to women during the 2nd and 3rd trimester of pregnancy. We measured FIA determining erythrocyte incorporation of iron stable isotopes 14 days after administration. From pregnancy week (PW) 12 until PW 36 iron-, inflammation and hepcidin were monitored. Iron transfer to the fetus was determined as iron stable isotope concentration in cord blood.

Results: Subject characteristics (mean±SD) in PW 12 for the normal-weight/obese were: age: 32±6/33±5years, BMI: 20.8±2.5/41.0±7.4kg/m2, hemoglobin: 12.1±0.9/13.5±0.8g/dL and PF: 61±23/47±24μg/L. Preliminary data showed an 83% and 24% lower FIA in the 2nd trimester compared to the 3rd in nor-

mal-weight and overweight/obese pregnant women, respectively. Iron isotopes were highly detectable in cord blood. The [58Fe]/[57Fe]-ratio determined in cord blood corresponded to the [58Fe]/[57Fe]-ratio determined in the mother in the 3rd trimester.

Conclusions: In normal pregnancy, FIA increases over time to support increased iron needs of mother and fetus. This is consistent with decreasing hepcidin concentrations during pregnancy. Our preliminary data show a dramatically reduced increase in FIA in overweight/obese pregnant women indicating hepcidin may still play an important role in this group even in the 3rd trimester. Thus, even though iron demands are strongly increased, overweight/obesity may prohibit an adequate iron supply to the expecting mother and the fetus due to persistent subclinical inflammation.

Keywords: Overweight/obese pregnancy, hepcidin, subclinical inflammation, iron absorption, iron transfer to the fetus.

RETENTION, IRON BIOAVAILABILITY AND SENSORY EVALUATION OF EXTRUDED RICE FORTIFIED WITH IRON, FOLIC ACID AND VITAMIN B12

[1]*Madhari, Radhika Madhari;* [2]*WJ, Yvette;* [3]*Pullakhandam, Raghu;* [4]*P, Elumalai;* [5]*B, Swetha;* [6]*B, Naveen kumar;* [7]*T, Longvah.*

[1]PhD. Nutrition Scientist. Division of Community Studies. National Institute of Nutrition. India; [2]MSc. Nutrition. Micronutrient Research Group. National Institute of Nutrition. India; [3]PhD. Micronutrient Research Group. National Institute of Nutrition. India; [4]Suvarnabhoomi Enterprises Private Limited. Tamil Nadu. India; [5]MSc. Nutrition. Division of Community Studies. National Institute of Nutrition. India; [6]PhD. Division of Biostatistics. National Institute of Nutrition. India; [7]MSc. Director Incharge. National Institute of Nutrition. India.

Background and objectives: Food fortification is considered a sustainable long term strategy for the prevention of micronutrient deficiencies in general population. Extrusion technologies enabled rice fortification with iron and other multiple nutrients. In the current study we have developed iron, folic acid and vitamin B12 fortified rice, and tested the retention, iron bioavailability and sensory properties compared to unfortified rice.

Methods: The rice flour is fortified with iron, folic acid and vitamin B12, and extruded rice kernels were prepared using a warm extrusion process. The iron, folic acid and vitamin B12 content were analyzed by HPLC methods before and after washing the fortified rice in water to test the retention. The iron dialyzability after simulated digestion of fortified rice was performed in a 6-well plate format. The iron content in rice, digesta and dialyzable fraction were estimated by atomic absorption spectrometry. The sensory evaluation was done in 84 adult human respondents using triangle test to evaluate if fortified rice was similar to unfortified rice both in the uncooked and cooked form.

Results: The iron (59.3mg±3.2/kg), folic acid (0.136±0.019mg/kg) and vitamin B12 (0.086±0.03 mcg/kg) of fortified rice, pre-

---

pared by 1:100 dilution of extruded rice mix with normal rice, is in agreement with expected fortification levels. The retention of iron, folic acid and B12 after incubation of fortified rice with excess water for a period of 1h, is more than 90% for all nutrients. The percent dialyzable iron from fortified rice (1.39%±0.3) was much lower compared to unfortified rice (6.79%±0.54), but net dialyzable iron content was 14 times higher in fortified rice. Triangle test revealed that 95% and 78% of the respondents were not able to distinguish the fortified rice from unfortified rice in uncooked (P=0.85) and cooked form (P=0.15) respectively.

Conclusions: These results suggest that rice fortified with iron, folic acid and vitamin B12 has high retention of nutrients during washing procedures at household levels, and provides more bioavailable iron compared to unfortified rice. Further, sensory studies also demonstrated acceptable similarity between fortified and unfortified rice and therefore can be used interchangeably. Nevertheless, further studies in human subjects are required to validate these in vitro findings.

Keywords: Food fortification, extruded rice, iron, folic acid, vitamin B12, bioavailability, sensory properties.

Consejo Superior de Investigaciones Científicas. Madrid. Spain; [8]PhD. Professor. Universidad de Zaragoza. President of the Spanish Nutrition Society (SEÑ). Spain.

Background and objectives: One of the health-transitions humans have passed during the XX Century related to nutrition is without doubt that from undernutrition to obesity, which persists in the ongoing years of the XXI Century. Energy intake (EI) is a contributing factor and therefore a "hot topic" in nutritional

sciences. The aim of this study was to review if studies including data on dietary intake, and specifically EI, also included data on energy expenditure (EE) and physical activity (PA).

Methods: A systematic search of PubMed from 1953 to December 2015 was conducted. Our systematic search consisted of keywords related to energy intake and nutrition ("nutritional requirements", "recommended dietary allowances" or "diet records"). We used MeSH and MaJR terms to build up a structured search and the final equation was: ("Recommended Dietary Allowances"[Majr] OR "Nutritional Requirements"[Majr] OR "Energy Intake"[Majr] OR "Diet Records"[Majr]) NOT ("Diseases Category"[Mesh] OR "Pregnancy"[Mesh] OR "Breast Feeding"[Mesh]). Filters were "Humans" and "Adults over >19 years".

Results: From 2229 identified articles, 933 articles were finally retained fulfilling inclusion and quality criteria. A total of 307543 adults were included, and most studies had been performed in EEUU, UK, Canada, Australia, Japan and Europe (mainly France, followed by Ireland and Denmark); only 9 studies were conducted in Spain. Few studies took place in Africa in comparison with other continents. Only 15% of the studies included both EI and EE. A great methodological variety was observed, with more than 14 different methods regarding EI, and more than 10 for EE. PA was only analysed in few studies, and mostly not considered for interpretation of data and conclusions. Moreover, PA was commonly measured by non- validated questionnaires.

Conclusions: A great diversity regarding the methodology was observed, which makes comparability among studies difficult. EE and PA are missing in around 80% of studies or not included in interpretation of results. Conclusions regarding EI in adults should not be taken without interpreting EE. We highlight the need for a methodological consensus and analyses standardization regarding dietary intake and energy expenditure in nutritional studies.

Keywords: Energy intake, energy expenditure, physical activity, energy balance.

THE PREVALENCE OF MALNUTRITION IN EN-RICH PROJECT SITES IN BANGLADESH, KENYA, MYANMAR, PAKISTAN AND TANZANIA

[1]Tolossa, Asrat; [2]Thomas, Abena; [3]Gillespie, Melanie.

[1]MD.MPH. Chief of Party. ENRICH Program. World Vision Canada. Canada; [2]Grant/DME advisor. World Vision Canada. Canada; [3]DME Team Leader. World Vision Canada. Canada.

Background and objectives: ENRICH is a Maternal Newborn and Child Health and Nutrition program funded by the Government of Canada and implemented in Bangladesh, Pakistan, Myanmar, Kenya and Tanzania. ENRICH will use nutrition pathway to reduce U5M by strengthening health systems and improving basic nutrition and nutrition sensitive services and addressing nutrition-related causes such as: poor breastfeeding, stunting, wasting, and vitamin A and zinc deficiencies (Lancet, 2013). One

of the strategies is promotion of production and consumption of biofortified micronutrient-rich crops which help to reduce vitamin A deficiency and improved iron status among CU5

Methods: The anthropometric assessment was done as part of the project baseline survey. Stratified multi-stage cluster sampling method was used to select households and respondents. ENA for SMART software was used to determine sample size and for data analysis. Children between 6-59 months were measured to determine their nutrition status. Mothers/caregiver's knowledge on Infant and Yong Child Feeding practices and status of household food security were also assessed using a structured questionnaire.

Results: The prevalence of stunting in ENRICH project sites in Bangladesh, Kenyan, Myanmar, Pakistan and Tanzania was 30.9%, 35.1% 39.0%, 33.8% 31.5% respectively. Prevalence of wasting was 6.5%, 5.3%, 7.0%, 10.2% and 4.9% in the same order. Undernutrition was also ranged from as low as 15.3% in Tanzania to 29.7% in Pakistan. The proportion of households with sever food insecurity in Bangladesh, Kenyan, Pakistan and Tanzania was 11.0% 23.0%, 15.5%, 32. 3% respectively. Food insecurity and poor infant and young child feeding practices are among the major underlying causes of malnutrition in the target communities.

Conclusions: Malnutrition is a major public health problem in implementing countries. Integrated nutrition specific and sensitive interventions are required to address the immediate and underlying causes of child malnutrition in the target communities. The project will implement food based interventions such as biofortification to improve availability of nutrient dense foods

Keywords: Stunting, Wasting, biofortification.

ADVERSE EFFECTS ON THYROID OF CHINESE CHILDREN EXPOSED TO LONG-TERM IODINE EXCESS: OPTIMAL AND SAFE UPPER INTAKE LEVEL OF IODINE FOR 7-14-YEAR-OLD CHILDREN

[1]Zhang, Wanqi; [2]Chen, Wen; [2]Wang, Wei; [3]Du, Cong; [3]Wu, Yalan; [4]Bian, Jiancao; [3]Shen, Jun; [2]Lin, Laixiang; [2]Tan, Long; [4]Wang, Xiaoming.

[1]Public Health College, Tianjin Medical University; [2]PhD, Department of Food nutrition and hygiene, Tianjin Medical University, Tianjin, China; [3]MD, Department of Food nutrition and hygiene, Tianjin Medical University, Tianjin, China; [4]The Shandong Institute for Endemic Disease Control and Research, Shandong, China.

Background and objectives: The adverse effects of iodine excess on thyroid in children were not well understood. This study aimed to assess the effects of iodine intake on thyroid and explore the safe iodine intake level (UL) for children.

Methods: A multi-stage cross-sectional study involved 2224 children from areas with high iodine content in drinking water.

Twice repeated samplings of 24-h urine and spot urine samples were collected to estimate habitual daily iodine intake of children. Thyroid volume of children was measured and blood samples were collected to determine thyroid function indicators.

Results: This study enrolled 2224 children including 1100 boys and 1114 girls. The median iodine content of water in this study was 181 (67.2-402) μg/L. In the first sampling, the median urinary iodine concentration (UIC) of spot urine and 24-h urine (24-h UIC) were 481 (218-818) μg/L and 380 (203-646) μg/L, while the spot UIC and 24-h UIC were 417 (195-753) μg/L and 397 (200-682) μg/L, respectively, indicating iodine status of children in this study was excessive. The habitual iodine intake (Best linear unbiased predicator, BLUP) of children was 298 (186-437) μg/d. The total goiter rate (TGR) was 9.7% and the incidence of subclinical hypothyroidism (SCH) was 237 (11.5%) in children. TSH of children increased as the increase of iodine intake (r=0.11, P<0.0001), while the incidence of SCH was 11.2% in children with iodine intake of 200-300μg/d and increased accordingly. Adjusted for age, sex, height, weight, logistical regression analysis shows that the risk of TGR significantly increased at iodine intake of 250-299μg/d in 7-10 year-old children and the risk of TGR increased at iodine intake of 300-399μg/d in 11-14 year-old children, and the risk increased as the increase of iodine intake. However, there were no differences in the risk of SCH among different iodine intake groups (P>0.05).

Conclusions: TGR may be a more sensitive indicator to reflect long-term iodine excess. We recommend the UL of iodine for 7-10 year-old children is 250μg/d and the UL of iodine for 11-14-year-old children was 300μg/d.

Keywords: Children, tolerable upper safe intake level, thyroid volume, subclinical hypothyroidism (SCH).

BIOINFORMATIC AND CHEMINFORMATIC APPROACHES IN STUDYING BIOACTIVE PEPTIDES DERIVED FROM FOOD PROTEINS

[1]Iwaniak, Anna; [2]Darewicz, Malgorzata; [2]Minkiewicz, Piotr.

[1]Professor.Warmia and Mazury University in Olsztyn. Faculty of Food Science. Chair of Food Biochemistry. Olsztyn. Poland; [2]Professor. Warmia and Mazury University in Olsztyn. Faculty of Food Science. Chair of Food Biochemistry. Olsztyn. Poland.

Background and objectives: There are few criteria to evaluate proteins originating from foods. One of them is resulted from the presence of peptide fragments generated upon the proteolytic enzymes action. These fragments are called bioactive peptides (biopeptides) because they can regulate body functions. Many peptides act as inhibitors of angiotensin converting enzyme (ACE inhibitors), antioxidant, antibacterial, antithrombotic etc. agents. as well as affect the quality of foods due to their taste properties.

The progress in the development of information technologies contributed to the massive growth of scientific interests in the application of computer methodologies in studying bioactive peptide sequences. These methodologies concerning the analysis of biopeptides include e.g.: elaboration of databases of information, development of criteria of evaluation of proteins as the potential source of bioactive peptides, and/or programs to simulate protein hydrolysis to generate biopeptides. This bioinformatic methods are suitable to study peptides especially when combined with the cheminformatic approach including the databases of chemical information about peptides as well as multivariate analyses like principal component analysis (PCA), partial least square methods (PLS) and artificial neural networks (ANN). Such approach is useful in prediction of relationship between the structure and bioactivity of peptides (QSAR approach).

Methods: The aim of the study was to present the methodology involving some examples of bioinformatic/cheminformatic analysis of peptides derived from food proteins. This approach includes the presentation of sources of information on peptides provided in bioinformatic/cheminformatic databases like BIOPEP, EropMoscow, ChemSpider or ChEMBL. Moreover, some examples of cheminformatics methods to study the properties of peptides in the context of their bioactivity will be presented.

Results: The results of such studies can be useful when combined with the research concerning generation of peptides with use of commercial enzymes or human digestive juices.

Conclusions: The approach presented above enables developing the knowledge on peptides derived from different foods.

Keywords: Bioactive peptides, proteins, bioinformatics, cheminformatics.

GINSENG OLIGOPEPTIDES PROTECT RATS AGAINST BINGE DRINKING–INDUCED LIVER INJURY

[1]Li, Yong; [2]Liu, Rui; [3]Mao, Ruixue; [3]Xu, Meihong.

[1]Prof. Nutritionist. Department of Nutrition and Food Hygiene, School of Public Health, Peking University, Beijing 100191; [2]Msc. Nutritionist. Department of Nutrition and Food Hygiene, School of Public Health, Peking University, Beijing 100191; [3]PhD. Nutritionist. Department of Nutrition and Food Hygiene, School of Public Health, Peking University, Beijing 100191.

Background and objectives: The present study aimed to investigate the effects and mechanism of ginseng oligopeptide (GOP) on acute alcohol poisoning in rats.

Methods: A total of 70 SD rats were randomly assigned to 7 groups, including a normal control group, a model group, a whey protein group (0.2500 g/kg) , and 4 GOP intervention groups (0.0625, 0.1250, 0.2500, 0.5000 g/kg). 7 g/kg/BW 50% v ethanol was given intragastriclly after the 30 days of rat stomach-gavaged continuously. The serum aminotransferase and inflammatory cytokine were assayed, the alcohol dehydrogenase (ADH) activity and oxidative stress and lipid peroxidation parameters in liver tissue were conducted.

Results: We found that the GOP treatment reduced the levels of TNF-α, IL-6,IL-1β in serum and MDA concentrations in liver ($p<0.05$), increased the levels of AST, ALT in serum and the contents of ADH, SOD, GSH and GSH-PX in liver tissue($p<0.05$).

Conclusions: These findings suggest that GOP have a significant protective effect on cute alcohol poisoning in rats and acute liver injury, and the underlying mechanism may be related to inhibit the inflammatory response and Lipid peroxidation reaction, and to improve the alcohol dehydrogenase activity and enhance anti-oxidative activities.

Keywords: Ginseng oligopeptide; Binge Drinking–Induced Liver Injury; Oxidative stress; Lipid peroxidation; Inflammatory response.

Further collaborators: Some issue about the peptide nutrition.

EICOSAPENTAENOIC ACID AND DOCOSAHEXAENOIC ACID HAVE ANTIDEPRESSANT EFFECTS WITH 17B-ESTRADIOL INJECTION VIA REGULATION OF A NEUROBIOLOGICAL SYSTEM IN OVARIECTOMIZED RATS

[1]Park, Yongsoon; [2]Choi, Jeongeun.

[1]PhD. Professor. Department of Food and Nutrition, Hanyang University. Seoul. Korea; [2]MSc. Graduate Stuent. Department of Food and Nutrition. Hanyang University. Seoul. Korea.

Background and objectives: Our previous studies found that n-3 polyunsaturated fatty acids (PUFAs) and estrogen had

synergistic antidepressant-like effects. The purpose of the present study was to investigate the hypothesis that three major n-3 PUFAs, α-linolenic acid (ALA), eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA), individually had antidepressant effects combined with 17β-estradiol-3-benzoate (E) through a neurobiological pathway in ovariectomized (OVX) rats.

Methods: The experimental protocol was approved by the Institutional Animal Care and Use Committee of Hanyang University (HY-IACUC-16-0044). Rats were fed a modified AIN-93G diet with 0% n-3 PUFAs, and 1% ALA, EPA and DHA relative to total energy intake for 12 weeks, and were injected with corn oil or E every 4 days during the last 3 weeks.

Results: Regardless of E injection and sham surgery, supplementation with ALA increased the brain phospholipid proportion of 18:3n3 as compared to the NC diet and supplementation with EPA and DHA. Supplementation with ALA, EPA and DHA increased the brain phospholipid proportions of 20:5n3, 22:5n3 and 22:6n3; this increase was greater with EPA and DHA than ALA supplementation. Supplementation of EPA, DHA and E increased serum concentrations of serotonin and climbing behavior, and decreased immobility during a forced swimming test. Supplementation with EPA, DHA and E also decreased hippocampal expressions of interleukin-6 and tumor necrosis factor-α, and increased cAMP response element binding protein, brain-derived neurotrophic factor (BDNF) and estrogen receptor-α. Immunofluorescence staining consistently showed elevated expressions of BDNF. Magnetic resonance spectroscopy showed that E increased glucose and decreased glutamate, glutamine and myo-inositol concentrations regardless of n-3 PUFA supplementation. In addition, supplementation with EPA, DHA and E decreased levels of nitric oxide metabolite. However, ALA had no antidepressant effect.

Conclusions: The present study suggested that the antidepressant-like effects of EPA and DHA supplementation and E injection could be due to the regulation of serotonergic neurotransmission and inflammatory cytokines, rather than due to the anti-oxidative system. Supplementation with n-3 PUFA and E had the additional function of modulating neurometabolites in the hippocampus.

Keywords: BDNF. Depression. Estrogen. Neurometabolite. N-3 polyunsaturated fatty acids.

1'-ACETOXYCHAVICOL ACETATE AMELIORATES AGE-RELATED SPATIAL MEMORY DETERIORATION BY INCREASING SERUM KETONE BODY PRODUCTION AS A COMPLEMENTARY ENERGY SOURCE FOR NEURONAL CELLS

[1]Kojima-Yuasa, Akiko; [2]Yamamoto, Tomiya; [3]Yaku, Keisuke; [2]Hirota, Shiori; [4]Matsui-Yuasa, Isao.

[1]PhD. Associate Professor. Department of Food and Human Health Sciences. Graduate School of Human Life Science. Osaka City University. Osaka. Japan.; [2]MSc. Graduate student. Department of Food and Human Health Sciences. Graduate School of Human Life Science. Osaka City University. Osaka. Japan.; [3]PhD. Department of Food and Human Health Sciences. Graduate School of Human Life Science. Osaka City University. Osaka. Japan.; [4]DSc & PhD. Professor. Department of Food and Human Health Sciences. Graduate School of Human Life Science. Osaka City University. Osaka. Japan.

Background and objectives: Alzheimer's disease (AD) is the most common age-dependent neurodegenerative disorder and causes a progressive decline in cognitive function. Therefore, it has been highly desirable to find a method of preventing and treating AD. 1'-Acetoxychavicol acetate (ACA) is naturally obtained from the rhizomes and seeds of Alpinia galangal. The plants are used as a spice or Chinese medicine in Southeast Asia. ACA exhibits various biological activities. However, the effect of ACA on neuronal cells death remains unclear. Here, we examined the effect of ACA on learning and memory in senescence-accelerated mice prone 8 (SAMP8).

Methods: Eight age-matched SAM resistance/1 (SAMR1) mice and 24 SAMP8 mice (8 weeks old) were used. After the interval (2 weeks) of acclimation, SAMR1 mice were used as homologous controls and 24 SAMP8 mice were assigned randomly to the control group and the 0.02% ACA group and maintained for 25 weeks. After 25 weeks, the learning ability in the Morris water maze test and the Y-maze test were performed. Serum metabolite profiles were obtained by GC-MS analysis, and each metabolic profile was plotted on a 3D score plot.

Results: In mice that were fed a control diet containing 0.02% ACA, the learning ability in the Morris water maze test was significantly enhanced in comparison with mice that were fed the control diet alone. In the Y-maze test, SAMP8 mice showed decreased spontaneous alterations in comparison with senescence-accelerated resistant/1 (SAMR1) mice, a homologous control, which was improved by ACA pretreatment. Furthermore, the contents of betab-hydroxybutyric acid and palmitic acid in the serum of SAMP8-ACA mice were higher than those of SAMP8-control mice and SAMR1-control. We also found that SAMR1 mice did not show histological abnormalities, whereas histological damage in the CA1 region of the hippocampus in SAMP8-control mice was observed. However, SAMP8-ACA mice were observed in a similar manner as SAMR1 mice.

Conclusions: These findings confirm that ACA increases the serum concentrations of betab-hydroxybutyric acid and palmitic acid levels and thus these fuels might contribute to the maintenance of the cognitive performance of SAMP8 mice.

BREAD FORTIFICATION WITH MICROENCAPSULATED VITAMIN D

[1]Leiva Rodriguez, Carla Andrea; [2]Benavides, Sergio; [3]Franco, Wendy; [1]Rojas, Loreto.

[1]Msc. Nutricionista. Carrera de Nutrición y Dietética. Pontificia Universidad Católica de Chile. Chile; [2]PhD (C). Ingeniero en Alimentos. Facultad de Ingeniería Química y Bioprocesos. Pontificia Universidad Católica de Chile. Chile; [3]PhD. Ingeniero en Alimentos. Facultad de Ingeniería Química y Bioprocesos. Pontificia Universidad Católica de Chile. Chile.

Background and objectives: Vitamin D plays an important role in the health of the population, regarding bone metabolism, cardiovascular system, insulin resistance, diabetes, neurological development, immunomodulation and regulation of cell growth. Active Vitamin D can be derived from the skin, where 7-dehydrocholesterol or diet is formed from its precursor by the action of solar radiation. The evidence reveals that at national and international level, there is a generalized deficiency of Vitamin D. An alternative to diminish this deficiency is to incorporate vitamin D in food of habitual consumption. In our country, fortified wheat flour proves to be a good vehicle since it is of regular consumption and is considered a food of first necessity by the school and adult population. However, the incorporation of vitamin D into food matrices presents a disadvantage, since the thermal treatments that undergo these matrices can limit its bioavailability and bioactivity. Because of the above, microencapsulation is a very good alternative to protect vitamin D for later use in food processing.

The objectives of this research were to evaluate the effect of concentration and degree of dispersion of vitamin D on the quality of the process of encapsulation by ionic gelation.

Methods: Emulsions were prepared from alginate solutions incorporating vitamin D in three concentrations (1, 2 and 3% v / v). Emulsions were prepared at three speeds and a dispersion time of 5 min. Emulsions were evaluated by image analysis. The drop size of the dispersed phase was determined as well as the polydispersity. To obtain the microcapsules, each emulsion was dripped into a solution of $CaCl_2$ (1.0% w / v). The microcapsules were oven dried at 35 ° C for 12 hours. The efficiency of encapsulation and load capacity by spectrophotometry was determined.

Results: The results indicated that EE% and CC% are dependent on the concentration and degree of dispersion of vitamin D. In addition, it was determined that vitamin D concentration affects the size and shape of the microcapsule.

Conclusions: Therefore microencapsulation is a viable alternative for vitamin D. Future studies will analyze the organoleptic quality of bread and the bioavailability of microencapsulated Vitamin D.

Keywords: Vitamin D, fortification.

STIGMASTEROL SERUM ELECTROLYTES ELEVATING POTENTIALS IN POLOXAMER-407 INDUCED HYPERLIPIDEMIC ALBINO RATS

[1]Iombor, Terhemba; [2]Nnam, Ngozi.

[1]MSc. Nutritionist. Department of Home Sience and Management. University of Agriculture. Makurdi. Nigeria.; [2]PhD. Nutritionist. Department of Home Science, Nutritio and Dietetics. University of Nigeria.Nsukka. Nigeria.

Background and objectives: Hyperlipidemia often occurs in conjunction with other metabolic risk factors including glucose intolerance, obesity, diabetes and metabolic syndromes. The study investigated effect of stigmasterol administration on serum calcium, potassium, sodium and phosphorus levels of poloxamer-407 induced hyperlipidemia in albino rats.

Methods: Thirty albino rats were divided into six groups of five rats viz: normal, poloxamer, atorvastatin and 50, 100 and 200 mg stigmasterol treated animals. Poloxamer-407 was dissolved in saline (1g/mL, 40C) and administered by intraperitoneal injection at a dose of 1g/kg body weight. Injections were given at days 1 and 3. Blood samples were obtained by cardiac puncture at baseline, day 4 and post-treatment.

Results: Induction of hyperlipidemia significant decreased serum calcium in positive control (4.52-4.41 mg/dl), atorvastatin (4.34-4.18 mg/dl), 50 mg (5.08-4.46 mg/dl), 100 mg (4.46-4.10 mg/dl) and 200 mg (4.83-4.35 mg/dl) stigmasterol treated rats. Induction serum potassium decreased from 0.69-0.65 mg/dl (positive control), 0.85-0.82 mg/dl (atorvastatin), 0.90-0.79 mg/dl (50 mg), 0.82-0.68 mg/dl (100 mg) and 0.87-0.72 mg/dl (200 mg) stigmasterol treated rats. Induction serum sodium decreased from 55.23-54.97 mg/dl (positive control), 67.13-66.97 mg/dl (atorvastatin), 74.09-65.39 mg/dl (50 mg), 74.28-66.16 mg/dl (100 mg) and 66.35-65.16 mg/dl (200 mg) stigmasterol treated rats. Induction serum phosphorus decreased from 3.38-3.27 mg/dl (positive control), 4.60-4.24 mg/dl (atorvastation), 4.44-4.20 mg/dl (50 mg), 3.81-3.36 mg/dl (100 mg) and 3.51-3.10 mg/dl (200 mg) stigmasterol treated rats. Post-treatment serum calcium increased from 4.18-5.39 mg/dl (atoevastatin), 4.46-5.68 mg/dl (50 mg), 4.10-5.24 mg/dl (100 mg) and 4.35-5.72 mg/dl (200 mg) stigmasterol treated rats. The serum potassium levels at post-treatment increased from 0.82-0.85 mg/dl (atorvastatin), 0.79-0.90 mg/dl (50 mg), 0.68-0.82 mg/dl (100 mg) and 0.72-0.87 mg/dl (200 mg) stigmasterol treated rats. Post-treatment serum sodium increased from 66.97-122.91 mg/dl (atorvastatin), 65.39-123.65 mg/dl (50 mg), 66.16-127.71 mg/dl (100 mg) and 65.16-122.42 mg/dl (200 mg) stigmasterol treated rats. Post-treatment serum phosphorus increased from 4.18-5.51 mg/dl (atorvastatin), 3.69-4.57 mg/dl (50 mg), 4.28-5 mg/dl (100 mg) and 3.52-5.18 mg/dl (200 mg) stigmasterol treated rats.

Conclusions: Stigmasterol has electrolytes elevating potential in a dose dependent manner.

Keywords: Electrolytes, Stigmasterol, Poloxamer-407, Hyperlipidemia, Atorvastatin.

GLYCOGEN IMPROVES COGNITIVE FUNCTION IN HUMAN AND MICE

Furuyashiki, Takashi; Kato, Kazuko; Kakutani, Ryo; Kamasaka, Hiroshi; Kuriki, Takashi.

Institute of Health Sciences, Ezaki Glico Co., Ltd.

Background and objectives: Recently, we have developed the method of synthesizing glycogen from corn starch by using 3 enzymes, isoamylase, branching enzyme and amylomaltase. We named the product enzymatically synthesized glycogen (ESG), which is equivalent in the physicochemical properties to natural-source glycogen. It is confirmed that ESG possess health-beneficial functions such as immunomodulating effect and dietary fiber like effect. In this study, the effects of ESG on brain function were investigated in human clinical study and animal study.

Methods: Human clinical study: The study was approved by the ethics committee of Ezaki Glico Co., Ltd. and carried out with a placebo-controlled, double-blind, randomized, cross-over design. Thirty-eight healthy adult subjects ingested 5 g/day of ESG or maltodextrin as a placebo for 4 weeks. Before and after 2 and 4 weeks of starting ingestion, cognitive performances were detected by using CogHealth battery. Subjective fatigue and stress markers in saliva were measured simultaneously.

Animal study: The study was approved by the Institutional Animal Care and Use Committee of Ezaki Glico Co., Ltd. and performed in accordance with the Guidelines for Proper Conduct of Animal Experiments (Science Council of Japan). Senescence-accelerated mouse prone 8 (SAMP8) were fed 6.0% ESG containing feed or AIN-93M as a control for 6 month. After that, memory function was evaluated by Morris water maze.

Results: In the human clinical study, supplementation of ESG significantly improved the visual discrimination at 2 week and the memory function at 4 week compared with placebo control. On the other hand, subjective fatigue and stress markers were not changed by ESG. In the study of SAMP8 mice, the better memory function was observed in ESG ingestion group.

Conclusions: In this study, we confirmed that ESG ingestion improves cognitive function in human and mice.

Keywords: Glycogen, brain, cognitive function, human, mice

SUPPRESSION OF POSTPRANDIAL HYPERGLYCEMIA BY BUCKWHEAT ALBUMIN

[1]*Kumagai, Hitomi;* [2]*Yamaguchi, Yusuke;* [2]*Ninomiya, Kazumi;* [2]*Ina, Shigenobu;* [2]*Akao, Makoto;* [3]*Kumagai, Hitoshi.*

[1]Nihon University; [2]Department of Chemistry and Life Science, Nihon University, Fujisawa-shi, Japan; [3]Professor, Department of Food Science and Nutrition, Kyoritsu Women's University, Chiyoda-ku, Tokyo, Japan.

Background and objectives: Diabetes mellitus is a disorder of blood glucose regulation. Most of the patients are categorized into type 2 that shows a symptom of insulin resistance and/or deficiency. For the prevention of type 2 diabetes, it is important to control the postprandial blood glucose level by an appropriate food intake. The retardation of starch hydrolysis by inhibiting the α-amylase activity is one of the effective ways to suppress the elevation in blood glucose level. Wheat α-amylase inhibitor possesses the inhibitory activity against α-amylase and suppresses postprandial hyperglycemia after starch administration. It has been used as a functional component in Food for Specified Health Uses (FoSHU) in Japan. We have already reported that rice albumin is indigestible and effectively suppresses the elevation in blood glucose level not only after starch administration but also after glucose administration. However, the effect of other cereal protein on hyperglycemia has not been fully examined yet. Therefore, the present study was conducted to examine if buckwheat protein could suppress postprandial hyperglycemia.

Methods: Albumin was purified from buckwheat by ammonium-sulfate precipitation and gel filtration. First, the inhibitory activity of buckwheat albumin against α-amylase from human saliva, porcine pancreas and mealworm was evaluated in vitro. Next, rats were administered starch with and without the addition of buckwheat albumin. After the administration, the blood was collected from the tail vein at certain intervals. Then, the blood glucose level and the plasma insulin level were measured.

Results: Buckwheat albumin inhibited the activity of α-amylase from porcine pancreas and mealworm, but did not inhibit that of α-amylase from human saliva. Although buckwheat albumin was hydrolyzed by digestive enzymes, it suppressed the elevation in blood glucose level after carbohydrate administration. The plasma insulin level was also suppressed by the administration of buckwheat albumin.

Conclusions: Buckwheat albumin suppressed postprandial hyperglycemia in vivo though it was digestible indicating that peptides in the hydrolysate maintained the inhibitory activity against α-amylase even after digestion.

Keywords: Inhibition of α-amylase activity, suppression of postprandial hyperglycemia, buckwheat albumin, diabetes mellitus.

ADDRESSING FOOD, NUTRITION AND ECONOMIC SECURITY THROUGH IRON FORTIFIED RICE TECHNOLOGY

[1]Angeles-Agdeppa, Imelda; [2]Saises, Marcela; [3]Capanzana, Mario.

[1]Assistant Scientist. Food and Nutrition research Institute, Department of Science and Technology, Taguig City, Philippines; [2]Senior Research Specialist. Food and Nutrition Research Institute, Department of Science and Technology, Taguig City, Philippines; [3]Director. Food and Nutrition Research Institute, Department of Science and Technology, Taguig City, Philippines.

Background and objectives: The Philippine Food Fortification Law covers mandatory fortification of staples like rice with iron due to the alarmingly high prevalence of iron deficiency anemia (IDA) in 1998 (30.6%). Rice was used as a vehicle for fortification but was projected to be inadequate in 2025 to supply the growing population. During the milling process the recovery rate is estimated at 60% whole grain and 40% broken grain. Objective: This paper presents the results of the different studies of FNRI on iron-fortified rice addressing pronged issues: food, nutrition and economic insecurities besetting the Filipino population.

Methods: FNRI conducted Series of studies on rice fortification: (1) technology generation and product development of iron rice premix (IRP) and iron fortified rice (IFR); (2) efficacy trial; (3) pilot-scale field trials; (4) large-scale commercialization of IFR; and (5) scaling-up in Mindanao and national implementation.

Results: FNRI developed IRP from broken grains made into flour and blended with iron using hot extrusion technology which is stable for 24 months. The IRP is mixed with ordinary rice to produce IFR. An efficacy study among schoolchildren showed significant decline in anemia prevalence from 100% to 33%. The market trials studies in the municipality of Orion, Bataan and the province of Zambales showed that IFR is efficacious in reducing anemia and feasible to be sold in public markets. The FNRI has scaled-up the transfer of the IRP and IFR technologies to several private mills and investors. Currently, IFR is used in the Social Safety Net (SSN) programs of the government.

Conclusions: The technology of IRP addresses the 3 pronged issues: (1) food security by increasing rice supply because the broken rice which is usually used for animal feed is converted to whole grain rice for human consumption; and (2) nutrition security by increasing iron intake through fortification, and (3) economic security by converting broken rice which is a low priced rice (PhP 27.00) to high priced whole grain rice (Php 45.00). The proven significant benefits of fortifying rice merits to be scaled up to more millers and investors to make available ample supply of IFR for nationwide consumption.

Keywords: Food, nutrition, economic security, iron fortified rice.

ANTIOXIDANT ACTIVITY AND AVAILABILITY OF POLYPHENOLS IN FRUITS AND VEGETABLES OF MAJOR CONSUMPTION IN THE PERUVIAN POPULATION

[1]Fernández Condori, Roxana; [2]Ramos-Escudero, Fernando.

[1]MSc. Nutritionist. Roxana Fernández Condori. Carrera Profesional de Nutrición y Dietética. Facultad de Ciencias de la Salud. Universidad Católica Sedes Sapientiae-UCSS. Perú; [2]PhD. Chemistry. Carrera de Nutrición y Dietética. Facultad de Ciencias de la Salud. Universidad Peruana de Ciencias Aplicadas-UPC. Perú.

Background and objectives: In fact, a big variety of fruits and vegetables which differ in shape, color, taste and nutritional value are available in the market of the Peruvian population. In this study, the physicochemical characteristics (pH, °Brix and acidity), total phenol content and antioxidant activity of fruits (strawberry, grape, papaya, banana "seda", mango, apple "Israel", watermelon, orange, tangerine, lemon) and vegetables (celery, cabbage, pumpkin, tomato, garlic, onion, Peruvian yellow chili, carrot, baby corn, lettuce) were evaluated.

Methods: The fruits and vegetables were analyzed using physicochemical analysis (volumetric titrations, potentiometric and refractometry methods). The total polyphenol content by the Folin-Ciocalteu method and antioxidant activity by QUENCHER-CUPRAC method (visible molecular absorption spectroscopy).

Results: The strawberry and grape showed the highest total phenolic content in fruits while onion and Peruvian yellow chili showed higher content of polyphenols in vegetables. The highest antioxidant activity in the QUENCHER-CUPRAC assay was found for strawberry, grape, apple "Israel", orange and tangerine while the showed highest antioxidant activity in vegetables was for garlic, onion and Peruvian yellow chili. Additionally, the positive correlation between the phenolic compounds content and antioxidant activity of the studied samples has been noted. However, the linear correlation between the polyphenol content versus the antioxidant activity in fruits was higher than in the vegetables.

Conclusions: Our results revealed that the fruits presented highest availability of polyphenols and a great antioxidant activity in compared to vegetables.

Keywords: Fruits, vegetables, polyphenols, antioxidant activity, peruvian populations.
Conflict of Interest Disclosure: The authors have no conflicts of interest to declare. This study is the doctoral thesis of RFC that has been developed within the Doctoral Program in Biochemistry and Nutrition at the university San Martin de Porres, Lima, Peru

OXIDATION OF MAJOR CATECHINS IN GREEN, BLACK AND OOLONG TEAS AND THEIR CORRESPONDING BIOACTIVITIES

[1]Jiang, Heyuan; [2]Engelhardt, Ulrich H.; [3]Zhang, Jiangyong; [3]Wang, Weiwei; [4]Shi, Liting; [4]Su, Wei.

[1]Prof/PhD.Scientist.Tea Research Institute of Chinese Academy of Agricultural Sciences.China; [2]Prof/PhD.Institute of Food Chemistry of Technische Universität Braunschweig.Germany; [3]Assit Prof.Tea Research Institute of Chinese Academy of Agricultural Sciences.China; [4]Master Candidate.Tea Research Institute of Chinese Academy of Agricultural Sciences.China.

Background and objectives: Tea (Camellia sinensis L.O. Kuntze) is the most popular flavored and healthy beverage beyond water in the world. Catechins are the most important compounds in tea due to their physiological activity and the important effect on tea brew color and taste. In different kinds of teas, catechins might be kept, or be oxidized into dimers and other polymers, and could exhibit different bioactivities. This paper will figure out the major catechins oxides, and their corresponding bioactivities.

Methods: In this paper, we compared the content and composition of catechins and their major dimers including theaflavins and theasinensins, in green, black and oolong teas, based on UHPLC and HPLC assisted with electrospray tandem MS. The bioactivities of catechin oxides and the related tea samples were also analyzed based on in-vitro studies.

Results: Besides green teas as non-fermented teas, catechins encounters different degrees of catechins oxidation, whilst different kinds of oxidation pathways to form some kinds of catechin oxides, in black teas or oolong teas respectively as full- or partial- fermented teas. Results: **Conclusions:** Their compositions might induce differential biological activities from those tea samples due to variant oxidation pathways of catechins.

Keywords: Tea, catechin dimers, theaflavins, theasinensins, bioactivities.

ACCURATE QUANTITATION OF PLASMALOGEN AND RELATED PHOSPHOLIPIDS BY USING HIGH PERFORMANCE LIQUID CHROMATOGRAPHY COUPLED WITH MASS SPECTROMETRY

[1]Otoki, Yurika; [2]Kato, Shunji; [3]Miyazawa, Teruo; [2]Nakagawa, Kiyotaka.

[1]PhD. Agriculture. Graduate School of Agricultural Science. Tohoku University. Japan.; [2]PhD. Agriculture. Graduate School of Agricultural Science. Tohoku University. Japan.; [3]PhD. Agriculture. New Industry Creation Hatchery Center (NICHe). Tohoku University. Japan.

Background and objectives: Concentration of plasmalogen (Pls) in human plasma/serum have recently gained attention, since certain patients including those with neurodegenerative disorders have been reported to exhibit reduced levels of Pls. The possible cause of this reduction is the decline in synthesis activity and/or degradation of Pls, although it is still unknown due to the lack of a suitable analytical method. If we can characterize Pls together with its synthesis intermediates (Alkyl-phospholipid (Alkyl-PL), Lyso Alkyl-PL) and degradation products (Lyso Pls and Lyso Acyl-PL) in vivo, the cause of Pls reduction will be clarified. Therefore, in this study, we aimed to develop an accurate method to simultaneously quantitate Pls molecular species along with its synthesis intermediates and degradation products.

Methods: The standards (Pls, Diacyl-PL, Alkyl-PL, Lyso Alkyl-PL, Lyso Pls and Lyso Acyl-PL; Avanti Polar Lipid, Alabaster, AL, USA) were analyzed by mass spectrometry (MS/MS) in the presence of the sodium ion. The resultant product ion specific to each compound was used for the high performance liquid chromatography (LC-)MS/MS operated in multiple reaction monitoring mode. To quantitate the analytes in human plasma, analytical concerns including the extraction and matrix effect were evaluated.

Results: First, by the MS/MS analysis it was shown that Pls yielded a specific product ion in the presence of sodium ion. Similarly, each characteristic product ion from Diacyl-PL, Alkyl-PL, Lyso Alkyl-PL, Lyso Pls and Lyso Acyl-PL species was determined. Under the optimal LC-MS/MS conditions and with the use of the characteristic product ions, all analytes were detected with high sensitivity at femtomole levels. The extraction recoveries of all analytes from plasma were nearly 100%, and matrix effects were not observed. Moreover, as the intra-/inter-day precision and accuracy were sufficient (<20%), the present LC-MS/MS method enabled to accurately quantitate Pls, its synthesis intermediates and degradation products. We are currently applying the novel method to analyze clinical samples.

Conclusions: The herein developed method appears to be a powerful tool for analyzing Pls and may provide a better understanding of their physiological roles in vivo.

Keywords: Plasmalogen, Alkyl-acyl-phospholipid, Diacyl-phospholipid, Lyso phospholipid, LC-MS/MS.

MATÉ TEA AND LIPID PROFILE IN OVERWEIGHT WOMEN UNDER CALORIC RESTRICTION

[1]Messina, Diego; [1]Avena, Virginia; [1]Kemnitz, Carolina; [2]Corte, Carla; [2]Mussi, Jessica; [2]Perez Elizalde, Rafael.

[1]Nutritionist. Laboratorio de Enfermedades Metabólicas. Universidad Juan Agustín Maza. Argentina.; [2]Biochemist. Laboratorio de Enfermedades Metabólicas. Universidad Juan Agustín Maza. Argentina.

Background and objectives: Maté tea is a traditional beverage consumed in South America, made from roasted leaves of Ilex paraguariensis. Several studies have shown its hipolipemic properties, due to the presence of polyphenols and saponins. The objective of this research was to analize the lipid profile in overweight women with or without maté consumption and or caloric restriction.

Methods: 119 overweight women between 25 and 50 years old were included into three groups: maté and diet (MD), maté and no diet (M), water and diet (WD). "Maté" groups drank that beverage prepared with 100 g of yerba maté on a daily basis during 12 weeks, while "diet" groups followed a low-calorie diet during that time. Anthropometric measurements and blood tests (including lipid profile: Total Cholesterol, LDL Cholesterol, HDL Cholesterol and Triglycerides) were performed at the beginning and after 12 weeks. Statistical analysis was performed by Student t-test or Wilcoxon test for paired samples and ANOVA ($p < 0,05$ in all cases).

Results: After 12 weeks of treatment, Total Cholesterol fell in all groups (10,21 mg/dl in MD, 18,29 mg/dl in M, 17,63 mg/dl in W, no differences between groups). LDL Cholesterol fell in both maté groups (8,07 mg/dl in MD, 16,04 mg/dl in M group, no difference between groups); HDL Cholesterol lowered in M group (2,09 mg/dl). On the other hand, Triglycerides fell 10,74 mg/dl only in MD group.

Conclusions: Daily maté tea intake helps lowering Total Cholesterol and LDL Cholesterol, and provides a Triglycerid reduction together with a low-calorie diet.

Keywords: Ilex paraguariensis, cholesterol, dyslipidemia.

IRON AND ZINC CONCENTRATION IN WHEAT CULTIVARS FROM THE SOUTH BRAZILIAN RECOMMENDED LIST

[1]Scheeren, Pedro Luiz; [2]Carvalho, José Luiz Viana de; [2]Nutti, Marilia R; [2]Caierão, Eduardo; [3]Castro, Ricardo Lima de; [2]Silva, Marcio Só e; [2]Miranda, Martha Zavariz de.

[1]PhD. Geneticist and plant breeder. Embrapa Trigo. Embrapa. Brazil; [2]MSc; [3]PhD.

Background and objectives: Iron and zinc are important to human nutrition and for human health. The FAO Harvest Plus program is working on biofortification of human food with the objective to obtain biofortified agricultural products. In Brazil, the Embrapa's wheat breeding program begun the research of wheat biofortification in 2009. Since this time many genotypes were characterized for iron and zinc concentration in the grains. The previously results showed that levels above 40 ppm of iron and zinc are high for the evaluated material. On the other side, it is also important to know what we are consuming in our meals. So, the main objective of this research is to evaluate iron and zinc concentration in cultivars from the South Brazilian wheat recommended list.

Methods: Twenty nine cultivars were sowed in the field, in 2015, at the Embrapa's experimental Station. At maturity, spikes of each cultivar were harvested and threshed manually, to avoid iron and zinc contamination. The iron and zinc quantification was performed in an inductively coupled plasma optical emission spectrometer.

Results: For zinc, the results showed an average of 31,04 ppm of zinc. Twelve cultivars with similar concentration formed the highest group, including Vaqueano (the highest with 36,64 ppm of iron), TBIO Tibagi, BRS Parrudo, BRS Guamirim, BRS 327, Marfim, Estrela Atria, Jadeíte, FCEP 50, CD 1440, BRS Marcante and FCEP Campo Real. The lowest group was formed by TEC 10, Ametista, TBIO Sintonia, ORS Vintecinco and LG Prisma (which was the lowest with 23,82 ppm of zinc). For iron, the results showed an average of 35,10 ppm. The cultivar BRS Parrudo was superior in iron to all other cultivars, with 44,01 ppm, confirming previous evaluation. A second group was formed, in which iron concentration varied from 38,91 to 34,49 ppm. The lower group included TEC 10, BRS Marcante, TEC Frontale, Celebra, Estrela Atria, Ametista and ORS Vintecinco (with only 28,91 ppm of Iron).

Conclusions: After this results, BRS Parrudo showed the highest level of iron concentration in the grains and will be the basic material for continuing the breeding research for wheat biofortification in South Brazilian Region.

Keywords: Triticum, biofortification, cereal, breeding.

POTENTIAL OF THE POLYPHENOL, CYANIDIN 3-O-GLUCOSIDE, IN PREVENTING CARDIOVASCULAR DEFECTS IN AN ANIMAL MODEL OF HYPERTENSIVE HEART DISEASE

[1]Netticadan, Thomas; [2]Aloud, Basma; [3]Raj, Pema; [4]McCallum, Jason; [4]Kirby, Christopher; [5]Louis, Xavier; [6]Duhamel, Todd; [6]Wigle, Jeffrey; [1]Blewett, Heather; [4]Netticadan, Thomas.

[1]PhD. Research Scientist. Agriculture and Agri-Food Canada.; [2]MSc. PhD Student. MSc. PhD student. University of Manitoba.; [3]MSc. PhD Student. University of Manitoba. Agriculture and Agri-Food Canada; [4]PhD. Research Scientist. Agriculture and Agri-Food Canada; [5]PhD. Post Doctoral Fellow. University of Manitoba.; [6]PhD. Associate Professor. University of Manitoba.

Background and objectives: Polyphenols are a class of plant compounds which have gained interest in recent times due to reported health benefits. Cyanidin 3-O-glucoside (C3G) is a polyphenol found in abundance in certain dark fruits such as blackberries and black elderberries. Recent animal studies have reported that CG can prevent obesity and diabetes; however, its potential in preventing hypertension and heart disease, has not been studied. The in vitro cardiac effects of CG was studied using a cell culture model - cardiomyocytes exposed to endothelin 1 (ET1), a peptide which contributes to development of hypertension. The in vivo cardiovascular effects of C3G was examined using an animal model - the spontaneously hypertensive rat (SHR); the effects of CG was studied alone or in combination with a conventional blood pressure medication, hydrochlorothiazide (HCT).

Methods: For the in vitro studies, ET1 exposed cardiomyocytes and control cardiomyocytes were treated with and without CG, and cardiomyocyte hypertrophy and cell death were assessed. For the in vivo studies, five-week-old SHR and 5-week old normotensive controls [the Wistar-Kyoto rats (WKY)] were treated with and without C3G (10 mg/kg/day), HCT (10 mg/kg/day), and a combination of C3G+HCT for 15 weeks. Cardiovascular assessments included measurement of blood pressure by tail-cuff plethismography, and heart structure and function using echocardiography.

Results: Our in vitro studies showed that C3G prevented ET1-induced cardiomyocyte hypertrophy and cell death. Our in vivo studies showed that at 8-weeks blood pressure was lowered in SHRs treated with C3G, HCT, and C3G+HCT in comparison to SHRs. At 15 weeks SHRs treated with HCT and C3G+HCT showed lower blood pressure in comparison to SHRs, however, blood pressure was not lowered in SHRs treated with C3G alone. At 15 weeks, SHRs treated with C3G, HCT, and C3G+HCT showed a reduction in cardiac hypertrophy and improved diastolic heart function in comparison to SHRs.

Conclusions: The results of our study show that while CG was cardioprotective, the blood pressure lowering effect of CG was not sustained with increased severity of the disease. The results also suggest that consumption of CG rich dark berries may render cardiovascular benefits.

Keywords: Heart disease, polyphenol, cyanidin 3-O-glucoside, hydrochlorothiazide.

IMPACT OF OMEGA-3 FATTY ACIDS IN QUANTITATIVE AND QUALITATIVE FEATURES OF LIPOPROTEIN OF BRAZILIAN SMOKERS AND NON-SMOKERS

[1]Damasceno, Nagila; [2]Damasceno, Nagila.

[1]Department of Nutrition. Faculty of Public Health. University of Sao Paulo; [2]MSc.PhD. Department of Nutrition. Faculty of Publica Health. University of Sao Paulo. Brazil.

Background and objectives: Cigarette smoking is an independent risk factor for cardiovascular diseases. In addition, smokers have lower plasma omega-3, which contribute to increase the cardiovascular risk in these subjects. Objectives: To evaluate the impact of omega-3 supplementation on traditional lipid profile of smokers and its relation with qualitative features of lipoproteins.

Methods: Based in a randomized and parallel clinical study smokers and non-smokers subjects were enrolled. Omega-3 was administrated in capsules (3.0 g/day) and all subjects were monitored during 8 weeks. After complete demographic (sex, age), clinic (medication, actual disease, familial history of disease), diet (R24h), anthropometric (weight, waist circumference) and habitual physical activity evaluation, blood samples were collected after 12h of fasting. Lipid profile (total cholesterol, LDL-c, HDL-c, triglycerides, Apo AI and Apo B), glucose, insulin, non-esterified fatty acids, oxidized LDL and subfractions of HDL and LDL were analyzed.

Results: Both, smoker (n=17) and non-smoker (n=44) groups showed similar age, ethnicity, diet, physical activity, current medication and Framingham risk score, however smokers group had more male (p=0.039). After 8 weeks of intervention, total cholesterol and LDL-c were reduced in smokers. Triglyceride levels decreased in both groups (smoker= -15%; non-smoker = -17%, p= 0.536) during follow-up time. There was not significant changes in LDL subfraction, however, non-smokers showed higher large HDL (smoker= +5%; non-smoker = +14%, p= 0.010) and lower small HDL (smoker= -3%; non-smoker = -16%, p= 0.024). The omega-3 was associated with non-esterified fatty acids (r=-0.512; p=0.042) and electronegative LDL (r=0.793; p<0.001) in smoker group. Smoker showed 4.85 odds (CI=1.08-21.6; p=0.039) to have the sum EPA+ DHA lower than 8% - a cut off point for high cardiovascular risk.

Conclusions: Omega-3 promoted positive changes in lipid profile of smokers, but only in non-smokers the qualitative features of HDL were improved.

Keywords: Omega-3, lipoproteins, smoking.

EFFECTS OF HONEY VARIETIES ON GLYCEMIC RESPONSES, SALIVARY GHRELIN, LEPTIN AND APPETITE RATINGS. A RANDOMIZED CLINICAL TRIAL IN HEALTHY HUMANS

[1]Emilia Aimilia Papakonstantinou; [2]Gourdomichali, Theodora; [2]Kardara, Ioanna.

[1]PhD. Lecturer in Nutrition and Metabolism. Department of Food Science and Human Nutrition. Agricultural University of Athens. Greece; [2]MS. Nutritionist. Department of Food Science and Human Nutrition. Agricultural University of Athens. Greece.

Background and objectives: Diets low in GI/GL have been associated with lower hunger, increased satiety and lower risk of chronic diseases. Glycemic index (GI) and glycemic load (GL) of honey varieties vary significantly worldwide; whereas GI/GL of Greek honey varieties is unknown. Therefore, the aims of two-studies were to: 1. determine the GI/GL of three honey varieties (fir, heather, pine) and 2. investigate their effects on salivary ghrelin, leptin, insulin and subjective appetite ratings.

Methods: Eleven healthy, normal-weight volunteers participated in GI investigation following International Standard Organization's protocol. Then, eleven healthy, normal-weight women consumed, cross-over, in random order, three-honey varieties, with 3-days wash-out period. Capillary blood glucose samples and salivary insulin were collected at baseline, 60 and 120min. Salivary ghrelin and leptin were collected at baseline and 120min. Subjective appetite (hunger, satiety, desire to eat) were rated on visual analogue scales (100mm, VAS) at baseline and 120min.

Results: Fir was medium GI (63 on glucose scale), low GL (8); heather was high GI (73), low GL (9); and pine high GI (100), medium GL (12). There was a significant main effect of time on blood glucose, salivary insulin, salivary ghrelin, subjective hunger and satiety (p for all<0.05). Peak rise in glucose was significantly higher after pine honey vs. fir and heather (p<0.001 for both). Salivary ghrelin concentrations decreased significantly after consumption of all honeys (p<0.001). Subjective hunger increased significantly after consuming fir (p=0.03) and pine (p=0.04), but not after heather (p=0.08); without significant differences between them. Subjective satiety decreased significantly after consuming fir (p=0.03) and pine (p=0.04), but not after heather; without significant differences between them. No differences were observed for fasting glucose, iAUC for blood glucose, fasting insulin, iAUC for insulin, fasting leptin, 120min-leptin and subjective desire to eat.

Conclusions: Honey varieties produced different GI/GL. All honeys, independently of their GI/GL, decreased salivary ghrelin concentrations, without affecting leptin or insulin, indicating decreased hunger. However, subjective hunger was increased and satiety decreased after consumption of all honey varieties. More studies are needed to investigate the effects of honey varieties on the complex issue of appetite.

Keywords: Honey, glycemic index, ghrelin, leptin.

EVALUATING THE EFFECT OF DOUBLE FORTIFIED SALT ON MULTIPLE MARKERS OF IRON STATUS IN CHILDREN AND ADULTS: A SYSTEMATIC REVIEW AND META-ANALYSIS

[1]Baxter, Jo-Anna; [2]Kamali, Mahdis; [3]Gaffey, Michelle; [4]Bhutta, Zulfiqar.

[1]PhD Candidate. Centre for Global Child Health and Department of Nutritional Sciences. Hospital for Sick Children and University of Toronto. Canada.; [2]Research Assistant. Centre for Global Child Health. Hospital for Sick Children. Canada; [3]Project Manager. Centre for Global Child Health. Hospital for Sick Children. Canada.; [4]Senior Scientist. Centre for Global Child Health and Centre for Excellence in Women and Child Health. Hospital for Sick Children and Aga Khan University. Canada.

Background and objectives: Salt is one of few universally consumed food vehicles, making it a good candidate for fortification. Iodized salt has been highly effective in reducing iodine deficiency, thus further fortifying salt with iron could improve iron status within populations with poor access to iron supplements and widespread iron deficiency anemia. Intended to provide approximately 30% of one's daily dietary iron requirement, double fortified salt (DFS) has been developed.

Methods: To understand the effect of DFS compared to iodized salt (IS) on several markers of iron status, we conducted a systematic review of published and grey literature with no age restrictions. A total of 14 articles and reports were identified to meet the inclusion criteria. Meta-analyses were performed, and results were presented as mean differences (MD), standard mean differences (SMD), or risk ratios (RR) with 95% confidence intervals (CI).

Results: DFS was found to increase hemoglobin concentration in most studies, and the total MD in hemoglobin concentration was 3.4 g/dL (95% CI: 2.4 to 4.4; 12 trials; 39,682 individuals; I2: 95%). Anemia also significantly decreased among those provided with DFS compared to IS (RR: 0.79; 95% CI: 0.69 to 0.89; 9 trials; 36662 individuals; I2: 98%). However, no significant difference was observed between groups for serum ferritin (SMD: -0.08 μg/L; 95% CI: -1.06 to 0.91; 5 trials; 1775 individuals; I2: 99%) or transferrin receptor concentration (MD: -4.70 μg/L; 95% CI: -11.67 to 2.27; 5 trials; 1,261 individuals; I2: 98%). Notably, for all comparisons high heterogeneity was observed.

Conclusions: DFS could offer a modest increase in hemoglobin concentration, although its ability to improve the iron status of those at the greatest risk of poor iron-related health outcomes could be limited (i.e., pregnant women and young children). Furthermore, effective delivery of DFS could be limited by supply chain requirements.

Keywords: Salt, iron, iodine, food fortification.

EFFECTS OF CONJUGATED A-LINOLENIC ACIDS (CLNAS) FROM POMEGRANATE AND BITTER GOURD SEED OILS ON INFLAMMATORY PARAMETERS IN RAW 264.7 CELL CULTURES

[1]Gasparotto Sattler, José Augusto; [2]Yoshime, Luciana; [2]Melo, Illana Louise; [3]Carvalho, Eliane; [4]Mancini-Filho, Jorge.

[1]PhD Candidate. Nutricionist. Faculty of Pharmaceutical Sciences. University of Sao Paulo. Brazil.; [2]PhD. Nutricionist. Faculty of Pharmaceutical Sciences. University of Sao Paulo. Brazil.; [3]PhD. Veterinarian. Faculty of Pharmaceutical Sciences. University of Sao Paulo. Brazil.; [4]PhD. Senior Professor. Faculty of Pharmaceutical Sciences. University of Sao Paulo. Brazil.

Background and objectives: Punicic acid (C18:3 – 9c11t13c) and α-eleostearic acid(C18:3 – 9c11t13t), two conjugated isomers of α-linolenic acid (C18:3 – 9c12c15c), are found at high concentrations in pomegranate seed oil (PSO) and bitter gourd seed oil (BSO), respectively. Both conjugated seed oils exert anti-inflammatory effects possibly through mechanisms involving alterations in eicosanoid synthesis, reduction in the levels of signaling proteins and NF-κB, activation of PPARɣ, and reduction in the levels of proinflammatory cytokines. This study aimed to investigate the anti-inflammatory effects of PSO and BSO, compared with those of linseed oil (LSO), on the activity of four cytokines, MCP-1, IL-6, IL-1β, and TNF-α, in RAW 264.7 cell cultures.

Methods: RAW 264.7 (monocyte/macrophage) cells were plated at a density of 5×10^5 cells/mL and treated with samples of PSO, BSO and LSO at 5, 25 and 50 μM for 24 hours before the assessment of activities of MCP-1, TNF-α, IL-6, and IL-1β.

Results: Treatment with PSO, BSO, and LSO resulted in lower activities of MCP-1 and IL-6 in cells compared with those in lipopolysaccharide-stimulated cells (LPS). The activity of IL-1β showed no significant difference among LPS-treated cells and non-treated cells. TNF-α activity dropped in cells treated with BSO, PSO, and LSO.

Conclusions: These results can help to better understand the physiological role of CLNAs in inflammatory processes and contribute to research into the development of nutraceuticals and functional foods rich in CLNAs.

Keywords: Conjugated fatty acids, punicic acid, alpha-eleostearic acid, inflammatory; seed oil.

DETERMINATION OF PARTIAL CONTENT OF PHENOLIC CONTENT AND ANTIOXIDANT ACTIVITY IN CHIA SEEDS (SALVIA HISPANICA L.)

[1]Gonzalez, Blanca Edelia; [2]López Hernández, Abad Arturo; [3]Ortega Villarreal, Ana Sofía; [4]González Trejo, Ariadna Berenice.

[1]Universidad Autónoma de Nuevo León. Facultad de Salud Pública y Nutrición; [2]Lic. Nut. Food Laboratory. Center of Research on Nutrition and Public Health. Faculty of Public Health and Nutrition. Autonomus University of Nuevo Leon. Mexico.; [3]MC. Food Laboratory. Center of Research on Nutrition and Public Health. Faculty of Public Health and Nutrition. Autonomus University of Nuevo Leon. Mexico.; [4]Biol. Food Laboratory. Center of Research on Nutrition and Public Health. Faculty of Public Health and Nutrition. Autonomus University of Nuevo Leon. Mexico.

Background and objectives: Due to the growing interest for the world's public health, functional foods and nutraceutical demand has increase. Chia seeds (Salvia hispanica L.) are a popular food of Mexico since pre-Hispanic, it's considered as a functional food due to its bioactive compounds believed to have health benefits. It possesses a high content of phenolic compounds, which are important for the protection of the lipid oxidation that impact as much as the health of the users as food quality.

Objectives: Determine the content of phenolic compounds and antioxidant activity in methanolic extract of chia seeds.

Methods: The chia seeds used in this project were cultivated in Mexico. Extracts were made with 50g of chia in 250ml of methanol-maceration concentrated by rotavaporation.

Antioxidant capacity was determined using DPPH {2,2-diphenyl-1-picrylhydrazyl} (Bondet, 1997), FRAP {ferric reducing antioxidant power} (Benzie y Strain, 1996) and ABTS {2,2'-azino-bis(3-ethylbenzothiazoline-6-sulphonic acid) } (van den Berg, 2000) methods, expressing results as mM of TEAC g-1 {mmol Trolox equivalent antioxidant capacity/g}. Previous to the quantification of phenolic compounds by HPLC {High Performance Liquid Chromatography} an hydrolytic split off of the glycosides of polyphenols was performance following the methodology proposed by Taga et al., (1984) and Hempel and Bohm (1996) for the chromatographic technique, with modifications by analyzing the extracts before and after hydrolysis. Total polyphenol content was determined as mg GAE/g {milligrams equivalent of gallic acid per gram of extract} by the Folin-Ciocalteu method proposed by Singleton and Rossi 1965.

Results: The antioxidant activity of the extracts was 2.49±0.15, 8.32±0.91 and 4.77±0.38 mM TEAC g-1 for DPPH, FRAP and ABTS respectively. Total polyphenol content was 1.08 ± 0.03 mg GAE/g. In the chromatographic analysis, caffeic acid was found mainly in the non-hydrolyzed extract (3.47±0.59 mg/g) followed by chlorogenic acid (0.51±0.16 mg /g). In non-hydrolyzed extracts, after hydrolysis was found: myricetin 1.21±0.89 mg/g, quercetin 2.70±1.14 mg /g and kaempferol 0.27±0.12 mg/g.

Conclusions: Regarding the above, chia seeds can be considered as a good component of human diet, due to its high phenol-

ic compounds content (caffeic acid, chlorogenic acid, myricetin, kaempferol and quercetin) with antioxidant activity, which can lead to health benefits.

Keywords: Chia seeds, antioxidant activity, phenolic compounds.

EFFECT OF THE STIMULATION WITH (-) EPICAT-ECHIN ON GENE EXPRESSION IN HUVEC CELLS

[1]Tejero, Maria Elizabeth; [2]Sulser-Ponce de León, Sandra; [3]Barrera-Reyes, Paloma; [4]Ruiz-Leyja, Estela D´Abril; [5]Vadillo-Ortega, Felipe.

[1]PhD. Researcher. Laboratorio de Nutrigenomica. Instituto Nacional de Medicina Genomica. Mexico.; [2]Nutrition Student. Universidad Iberoamericana. Mexico; [3]PhD student. Doctorado en Ciencias Biomédicas. UNAM. Mexico; [4]M Sc student. Maestria en Biologia Experimental. UAM-I. Mexico; [5]MD. PhD. Facultad de Medicina. UNAM. Mexico.

Background and objectives: Epicatechin (EC) is the most abundant polyphenol in cocoa. Consumption of cocoa polyphenols has been related with cardiovascular benefits such as decrease in blood pressure and improvement of markers of glucose and lipid metabolism in human. These polyphenols have been shown to modulate gene expression and exert an anti-inflammatory effect. The present study analyzed the dose-response effect of EC stimulation on the expression of genes related with inflammation (NFkB) and endothelial cell function (eNOS) in primary culture of human umbilical vein endothelial cells (HUVEC). The tested doses included concentrations that are achievable by intake of EC containing food.

Methods: HUVEC cells were isolated from the umbilical cord of women with a history of healthy pregnancy who signed the informed consent. Endothelial cells were isolated and cultured using standard methods. Cells were stimulated with three different doses of EC (1, 0.1, 0.01 uM and untreated control) during 4 h. All experiments were conducted in triplicates. RNA was isolated from cells and eNOS and NFkB (p50) mRNA was measured using real time, quantitative RT-PCR by absolute quantitation. HUVEC cells were identified by immunoflorescence staining. Comparison of the mRNA abundance across treatments was conducted by a one-way ANOVA. Statistical analysis was conducted in SPSS v.20 software. This project was approved by the Ethics committee at INMEGEN.

Results: The immunoflorescence staining was positive for endothelial cells. Significant differences in mRNA abundance were found for the analyzed genes. Stimulation with EC at 0.01 uM decreased the expression of eNOS mRNA as compared with control ($p < 0.001$). The expression of NF kB significantly increased after the stimulation with 0.1 and 0.01 uM of EC as compared with control. No effect of the highest dose was observed on the analyzed transcripts.

Conclusions: These results suggest that treatments induced moderate pro-inflammatory changes in the analyzed genes. Further investigation is required to determine the effect of EC at different times and changes in the protein products of the analyzed genes.

Keywords: Epicatechin, eNOS, NFkB, endothelial cells, cocoa.

EXPRESSION MODULATION OF AGTR1A AND BDKRB2 GENES IN HYPERTENSIVE RATS TREATED WITH EXTRACT OF CHIA SEEDS

[1]Gonzalez, Blanca Edelia; [2]Arredondo Mendoza, Gerardo Ismael; [3]Guzmán de la Garza, Francisco Javier; [4]Campos Góngora, Eduardo.

[1]Universidad Autónoma de Nuevo León. Facultad de Salud Pública y Nutrición; [2]Lic. Nut. Investigation Centre of Public Health and Nutrition. Autonomous University of Nuevo León. Mexico.; [3]Dr. en C. Investigation Centre of Public Health and Nutrition. Autonomous University of Nuevo León. Mexico; [4]Dr. en C. Investigation Centre of Public Health and Nutrition. Autonomous University of Nuevo León. Mexico.

Background and objectives: High Blood Pressure (HBP) is the principal risk factor for cardiovascular disease. HBP is regulated by the renin-angiotensin system, particularly the angiotensin-converting enzyme (ACE). ACE inhibitors are used as first-line therapy, however, these produce secondary reactions. Searching of natural source is an alternative for HBP treatment and salvia species have shown a hypotensive effect. We analyzed the effect of an ethanolic extract of chia (Salvia hispanica L.) seeds (EESH) on the expression of Agtr1a and Bdkrb2 genes, involved in HBP regulation.

Methods: A hypertension rat model was generated by administration of a nitric oxide synthesis inhibitor: NG-nitro-L-arginine methyl ester (L-NAME). Hypertensive rats (12) were allocated to three different treatments; the first group received captopril, the second group received EESH and the last group remained with administration of L-NAME. Control group (healthy group, 4 rats) was treated with distilled water during the whole study. In the second phase, gene expression analysis was realized by RT-PCR in cardiac tissue samples, using specific oligonucleotides designed for Agtr1a, Bdkrb2 and Gapdh genes. Comparisons of level expression between groups was performed using statistical analyses with ANOVA test.

Results: Rats treated with L-NAME increased its blood pressure: between 310 to 328 mmHg, while the control group showed values of 100 mmHg. After, the administration of the different treatments, rats that was receiving L-NAME showed an increment on blood pressure levels (31.2%), and the administration of captopril and EESH decreased 0.2% of blood pressure levels. Gene expression analysis showed that the administration of L-NAME incremented significantly the expression of Agtr1a gene, in comparison to basal levels (healthy rats). In the hypertensive rats treated with captopril there were no changes in the expression of Agtr1a. The administration of EESH produced a similar effect as captopril in Agtr1a expression levels. The Bdkrb2 gene expression did not show significative changes in the different treatment groups.

Conclusions: The EESH shown to have a similar effect to the captopril on the blood pressure of hypertensive rats. Besides, a regulatory effect of the expression of the genes involved on the modulation of blood pressure was observed.

Keywords: High Blood Pressure, Salvia hispanica L, expression genes.

PHYSICOCHEMICAL, FUNCTIONAL AND NUTRITIONAL CHARACTERIZATION OF RAW FLOUR OBTAINED FROM DIFFERENT SWEET POTATO (IPOMOEA BATATAS) AND ÑAMPI (DIOSCOREA TRIFIDA)

[1]Quintero Montenegro, Rosa Itzela; [2]Valenzuela, Ximena; [3]Sevillano, Alejandrino; [4]Rivera, Dayra.

[1]Dra. Ciencias y Tecnología de Alimento. Universidad Tecnológica de Panamá; [2]MSc Laboratorio de Envase de la Universidad de Santiago de Chile; [3]Licdo. Ciencias y Tecnología Innovadora de Alimentos. Universidad Tecnológica de Panamá; [4]Licda. Ciencias y Tecnología Innovadora de Alimentos. Universidad Tecnológica de Panamá.

Background and objectives: The main objective in food processing is the use of inexpensive raw materials, high durability and high amount of compounds with nutritional value, in order to reduce the potential costs and prevent deterioration, establishing as a priority the search for new alternatives to increase its conservation.

The use of technological purpose flour in bread and pastry requires knowledge of the characteristics regarding the ability to develop along with the other ingredients that make up the mass. These characteristics of the flour contemplated parameters humidity, water absorption, and enzyme activity bread making quality. This paper aims to characterize two types of flour from artisanal mining, in order to determine their physical, nutritional, functional characteristics and potential uses in baking and pastry

Methods: For this performance from the fruit from a craft collection process it was determined by a proximal composition and activity antioxidants was determine by method DPPH and polyphenols totals. Also, determining the thermal qualities thermal analysis (DSC) and thermo gravimeter (TGA) was performed

Results: Statistically significant differences were found between the samples flour studied humidity (1.88 – 3.57%), ashes (3.51 – 4.42%), protein (5.74 ± 1.36 %), crude fat (0.262 - 1.52%), total carbohydrate (4.48 – 9.02%) and polyphenols (200.8 ± 50.67 mg GAE/100 g dry mass)

The swelling and solubility of both flours showed similar changing patterns as the temperature increased.

Conclusions: The flour obtained show physicochemical characteristic and chemical composition desirable mainly by high protein contain, total carbohydrates. Also, presented high capacity water absorption and swelling power. On the other hand, the phenol content and antioxidant capacity were

All the flour has excellent potential as ingredients for new baking product development

Keywords: Flour, sweet potato, ñampi, tropical roots, functional properties.

CONSUMPTION OF MILK PRODUCTS WITH 100% B-CASEIN A2 IMPROVES OVERALL GASTROINTESTINAL TOLERANCE BUT HAD NO EFFECT ON BEHAVIOR OF MEXICAN CHILDREN WITH AUTISM SPECTRUM DISORDER

[1]Pedroza García, Karina Alejandra; [1]Ronquillo, Dolores; [2]Palacios Delgado, Jorge Raúl; [2]Anaya-Loyola, Miriam Aracely; [2]Rosado, Jorge L.

[1]MD. Facultad de Ciencias Naturales. Universidad Autónoma de Querétaro. México; [2]PhD. Facultad de Ciencias Naturales. Universidad Autónoma de Querétaro. México.

Background and objectives: Autism spectrum disorders (ASD) affect two areas of development, the first comprises restricted, repetitive and stereotyped behaviors, second refers to alterations in social communication. There is evidence of behavioral improvement of children with ASD following casein free diets because digestion of β-casein A1, but not β-casein A2, produce an opioid peptide called β-casomofphin 7 which has been associated with behavioral disturbances and gastrointestinal problems. The aim of the study was to compare the effect of milk and cheese ingestion with either a combination of A1/A2 or only A2 β-casein on ASD children's behavior, milk tolerance and intestinal permeability.

Methods: A double-blind, randomized 16-week crossover study was conducted. 22 ASD children and adolescents participated. Subjects underwent 2-week dairy washout followed by 6 weeks of dairy products with β-casein A2 or A1/A2 and a further 2-weeks dairy washout followed by final 6 weeks of dairy products with β-casein A2 or A1/A2. Child Behavior Checklist (CBCL) and Repetitive Behavior Scale-Revised (RBS-R) were applied to measure behavioral changes in internalized and externalized behaviors and repetitive behaviors. Intestinal permeability was evaluated by a lactulose/mannitol test in urine by HPLC. Gastrointestinal tolerance was measured by questionnaire in which the number of bowel movements, consistency, diarrhea, constipation, or loss of appetite were recorded.

Results: No changes were observed in the psychometric questionnaires RBS-R (0.6±8.7 vs. -5.6±9.3, p=0.06) and CBCL (12.8±2.7 vs.13.6±2.7, p=0.16) between treatments which could be a reflection of the integrity of the intestinal permeability, average L/M was 0.01 ± 0.02. Gastrointestinal tolerance was consisitently improved during the intake of products with β-casein A2 than β-casein A1/A2.

Conclusions: In this initial study we conclude that the intake of milk and milk products with 100% of β-casein A2 have benefits in gastrointestinal tolerance but not beneficial effects in overall behaviour of children with ASD. Since mucosal permeability was not affected in our children, we cannot rule out the possibility that milk with 100% of β-casein A2 has a positive effect on the behavior of children with ASD who have increased intestinal permeability or frequent gastrointestinal problems.

Keywords: Autism spectrum disorder, behavior, β-casein A2, intestinal permeability, milk tolerance.

TOTAL POLYPHENOL CONTENT AND ANTIOXIDANT CAPACITY IN JUICE AND PEEL OF BLUEBERRIES (VACCINIUM CORYMBOSUM) GROWN IN CAÑETE VALLEY, PERU

[1]Lon Kan Prado, Elena Elizabeth; [2]Macavilca Ticlayauri, Edwin Antonio; [3]Lon Kan Prado, Carlos Alberto; [4]Canchos Chipana, Carlos; [4]Reyes Veramendi, Jyothisa Eva-Gina.

[1]PhD. Professor Nutritionist. School of Nutrition. Universidad Le Cordon Bleu. Peru.; [2]Engineer. Professor. School of Food Engineering. Universidad José Faustino Sanchez Carrion. Peru.; [3]MSc. Professor. School of Nutrition. Universidad Le Cordon Bleu. Peru.; [4]BSc. Food Ingineering. School of Food Engineering. Universidad José Faustino Sanchez Carrion. Peru.

Background and objectives: Blueberries are considered as the king of antioxidant foods, due its high content that protects our bodies from damage by free radicals, unstable molecules that can damage cellular structures and contribute to aging and diseases like cancer. The aim of the present study was to determinate the total polyphenol content and antioxidant capacity of juice and peel from blueberries (Vaccinium corymbosum) grown in Cañete Valley, Peru.

Methods: Folin-Ciocalteu and DPPH methods were used to determinate the concentration of total polyphenol content and antioxidant activity, respectively. Extracts were obtained from juice and peel in four study parameters. At first, solvents with different polarities were tried (water, methanol, ethanol 80% and acetone-water 75%); second, ratio fruit/solvent; thirth, extraction-time and fourth, temperature.

Results: Results in juice: total polyphenol content 3,474 mg Gallic acid/ml juice and antioxidant capacity 12,131 Trolox mg/ml juice. Results in peel: showed solvent acetone/water 75% > ethanol/agua 80% > methanol > distilled water. The ratio 1/10 was greater ratio 1/12. 4 hours-time exhibed the higher values in total polyphenol content 16.40 mg Gallic acid/ml extract and antioxidant capacity 8,90 mg Trolox/g blueberries. The effect of temperatures were studied between 40 to 80 °C. At 60, 70 and 80 °C showed higher total polyphenol content values: 19,213; 26,522; 32,830 mg Gallic acid/ml extract, respectively; however the stability and antioxidant capacity were reduced when increased the temperature: 13,500; 13,675 and 12.525 mg Trolox/g peel, respectively; and at temperatures below about 40-50 °C the total polyphenol content and the antioxidant capacity showed higher stability. It is concluded that the peel has higher total polyphenol content and antioxidant capacity than the juice and fresh whole fruit.

Conclusions: The stability and antioxidant capacity were reduced when increased the temperature (13,500; 13,675 and 12.525 mg Trolox/g peel, respectively).

At temperatures below about 40-50 °C the total polyphenol content and the antioxidant capacity showed higher stability.

It is concluded that the peel has higher total polyphenol content and antioxidant capacity than the juice and fresh whole fruit.

Keywords: Blueberries, polyphenol content, antioxidants capacity.

EFFECT OF DEEP FRYING ON BIOACTIVE COMPONENTS OF WHEAT FLOUR PRODUCTS

[1]Prakash, Jamuna; [2]Oghbaei, Morteza.

[1]Professor (Retd.), Department of Food Science and Nutrition, University of Mysore, India.; [2]Research Scholar.

Background and objectives: Deep frying is one of the most common cooking methods used for many products, and in particular for cereal based snacks and dishes. Frying uses high temperature and could lead to partial destruction of bioactive components. Frying also changes the microstructure of foods altering the bioavailability of its constituents.

Objective; Hence the present investigation was undertaken to determine the effect of deep frying wheat flour based products on their bioactive components namely, total phenols and flavonoids.

Methods: The flours used were whole wheat (WWF) and refined flour (RWF) as these are commonly used for preparation of staple products. Mineral fortification of flour was one of the variation chosen as many times staple flours are fortified with minerals in developing countries. Whole and refined wheat flour fortified either with iron or zinc (each with 10 & 20mg) were used for preparing 'Chapathis' (Indian unleavened pan-roasted flat bread), and 'Poories' (deep fried flat bread) and analyzed for total and in vitro bioavailable total phenols and flavonoids.

Results: Results showed that the total phenol content in chapathi was higher in WWF products (83.25-93.74 mg/100g) and much lesser in RWF products (19.82-25.96 mg/100g). Similar trend was seen in bioavailability pattern (60-77% for WWF and 36-40% in RWF). Wheat had a small flavonoid content which was higher in WWF products than RWF products. However bioavailability was slimier in WWF and RWF. On deep frying, there was a visible decline in the bioactive constituents, both total phenols and flavonoids reduced in fried products. The bioavailability was also much lesser in comparison with pan-roasted products. In WWF poories, 43-58% of total phenols were bioavailable whereas similar range for RWF poories were 17-21%. Again the RWF products had much lesser availability than WWF products indicating that both refining and deep frying were detrimental to content and availability of bioactive components in wheat flour.

Conclusions: Hence, limiting the use of refined flour as well as deep frying is beneficial to retain maximum bioactive components.

Keywords: Total phenols, flavonoids, bioavailability, roasting, frying.

RECOMMENDATION VS. REALITY: A GLOBAL ASSESSMENT OF FRUIT AND VEGETABLE INTAKE AND VARIETY

[1]Randolph, Keith; [2]Murphy, Mary M; [3]Barraj, Leila; [3]Spungen, Judith; [4]Herman, Dena R; [5]Randolph, Keith.

[1]PhD. Technology Strategist. Nutrilite Health Institute. United States; [2]Exponent Inc. Washington DC. USA; [3]Exponent Inc. Washington. USA.; [4]Department of Family and Consumer Sciences. California State University. Northridge. USA.; [5]PhD. Nutrilite Health Institute. USA.

Background and objectives: In 2004 the World Health Organization (WHO) and Food and Agricultural Organization (FAO)

established minimum fruit and vegetable intake recommendations for adults at 400 g or 5 servings per day. The basis for this recommendation was epidemiological data that showed a strong inverse relative risk for chronic disease morbidity with fruit and vegetable intakes up to this level. Despite this recommendation, there has not subsequently been a global assessment of fruit and vegetable intake.

Methods: Utilizing WHO World Health Survey data (2002) and FAO food supply utilization data (2012), we evaluated fruit and vegetable intake, fruit and vegetable variety, and intakes of selected phytonutrients in different regions globally.

Results: The results show a striking shortfall globally in fruit and vegetable intake relative to the WHO minimum recommendation, and relatively narrow range of variety. According to this assessment, approximately 75% of individuals worldwide fail to meet WHO minimum intake levels.

Conclusions: These data strongly support the need to better educate consumers regarding the health promoting and risk reducing effects of fruit and vegetable dietary patterns.

Keywords: Fruit and vegetable intake, dietary pattern.

Laboratory of Translational Immunology, Department of Internal Medicine, University of Campinas, Campinas, São Paulo, Brazil; [3]M.S.c student of clinical medical.Laboratory of Translational Immunology, Department of Internal Medicine, University of Campinas, Campinas, São Paulo, Brazil; [4]PhD. Biologist. Laboratory of Translational Immunology, Department of Internal Medicine, University of Campinas, Campinas, São Paulo, Brazil; [5]PhD. Prof. Doctor Laboratory of Translational Immunology, Department of Internal Medicine, University of Campinas, Campinas, São Paulo, Brazil.

Background and objectives: Type 1 Diabetes mellitus can be associated with increase of oxidative stress and infiltration of cells of immune system, such as lymphocytes CD4+ and CD8+. The P.alata is considered by the Brazilian Pharmacopoeia as a medicinal plant that plays important role decreasing inflammation. The aim was to evaluate the effect of P.alata aqueous leaves extract and vitexin and isoorientin in cell inhibition and free radicals production.

Methods: NOD mice spleen lymphocytes were isolated through the wool column/2,5x105 and cultured with min6 cells/8x104.The co-cultures were treated with different concentrations of P.alata and vitexin and issorientin and analyzed in proliferation of CD4+ and CD8+ lymphocytes to evaluate the concentration of inhibition dose (ID50). The ID50 were used to analysis of Apoptosis, Mitochondria Depolarization, CellRox oxidative stress reagentes, MitoSOX red mitochondrial superoxide indicator and Glutathione ThiolTracker Violet. All analyses were done by flow cytometry. The supernatants were used to evaluate insulin production by ELISA in min6 cells.

Results: The concentration of inhibition proliferation of P.alata was 500μg/mL, Vitexin 200μM and Isoorientin 5μM. The apoptosis demonstrated most of cells in late apoptosis/necrosis and the mitochondrial depolarization was higher in P.alata and Vitexin when compared with Isoorientin. CellRox showed higher in all treatment and Glutathione decrease in all treatment, but in P.alata showed greater decrease of this antioxidant. The production of superoxide treated with Vitexin and P.alata was higher in CD4+. Insulin analysis showed high production of hormone in all treatment. The CD4+/CD8+ lymphocytes are the main type of cells involved in destruction of β cells during type 1 Diabetes Mellitus. The results showed that CD4+ and CD8+,when treated with P.alata or Vitexin and Isoorientin, can inhibits cell prolifera-

tion through mitochondrial depolarization increase the oxidative stress and consequently cell death. Besides that, the high production of insulin demonstrated that β cell in min6 continued to produce this hormone,maintaining viability cellular.

Conclusions: In conclusion, the treatment with P.alata or vitexin and Isoorientin leads to lymphocytes death triggered by increased oxidative stress without causing damage to β cells, therefore these treatments can aid in decreasing cell infiltration in β cells.

Keywords: Passiflora alata curtis, vitexin and isoorientin, antioxidant activity, decrease inflammation.

Biomedical. Laboratory of Translational Immunology. Department of Internal Medicine. Faculty of Medical Sciences. University of Campinas. Campinas. São Paulo. Brasil.; [3]MSc student. Biologist. Laboratory of Translational Immunology. Department of Internal Medicine. Faculty of Medical Sciences. University of Campinas. Campinas. São Paulo. Brasil.; [4]PhD student. Biomedical. Laboratory of Translational Immunology. Department of Internal Medicine. Faculty of Medical Sciences. University of Campinas. Campinas. São Paulo. Brasil.; [5]PhD. Biologist. Laboratory of Translational Immunology. Department of Internal Medicine. Faculty of Medical Sciences. University of Campinas. Campinas. São Paulo. Brasil.; [6]PhD. Laboratory of Translational Immunology. Department of Internal Medicine. Faculty of Medical Sciences. University of Campinas. Campinas. São Paulo. Brasil.

Background and objectives: Passiflora alata Curtis leaves (passion fruit) contains phenolic compounds in its composition with anti-inflammatory and antioxidant properties. This study aimed to investigate the effects of aqueous leaf extract of P. alata, catechin and rutin, compounds presents in the leaves, in lymphocytes submitted to co-culture with MIN6 cells.

Methods: Different concentrations of P. alata (50, 200 and 500μg/mL), catechin (25, 50 and 75μM) and rutin (50, 150 and 300μM) were added separately to cell culture containing lymphocytes (2.5×105) from diabetic NOD mice and MIN6 cells (8×104) and it was maintained in culture for 96 hours (CO2 5% at 37°C)

for analysis of proliferation, apoptosis, ERK phosphorylation cascade's and AKT signaling pathway in TCD4+ and TCD8+ populations. The presence of inflammatory cytokines and insulin in culture supernatant was also analyzed. All analyses were done by flow cytometer (Guava easycyte, Millipore®, Bellirica, USA).

Results: It was observed a decrease in the percentage of CD4+ and CD8+ T cells proliferation after each treatment. The concentrations of P. alata (500μg/mL), catechin (50μM) and rutin (300μM) to be used in apoptosis, ERK, AKT and supernatant analysis were determined calculating 50% of inhibition of lymphocytes proliferation (ID50). Increase in the percentage of lymphocytes in apoptosis and late apoptosis/necrosis was observed when submitted to P. alata. AKT analysis showed lower expression in lymphocytes submitted to P. alata and catechin while lymphocytes in the presence of P. alata and both compounds presented lower percentage of ERK phosphorylation. Decrease in TNFα and IFNλ cytokines was observed in supernatants of P. alata and rutin treatment while the expression of insulin was preserved after all treatments.

Conclusions: TCD4+ and TCD8+ cells develops an important role in triggering type 1 diabetes whereas these cell types attack the pancreatic islets destroying beta cells. In addition, inflammatory cytokines such as TNFα and IFNγ are important mediators of beta-cell death induced by CD4+ T cells. The decrease in the levels of these cytokines after treatment associated with preservation of insulin, inhibition of proliferative T cells, induction of apoptosis and decrease in the expression of AKT/ERK may provide useful information for the treatment of autoimmune diabetes with natural products.

Keywords: Passiflora alata, rutin, catechin, anti-inflammatory effect, NOD mice.

EFFECTS OF GENETIC AND ENVIRONMENTAL FACTORS ON PROANTHOCYANIDINS IN SEA BUCKTHORN (HIPPOPHAË RHAMNOIDES)

[1]Yang, Wei; [2]Laaksonen, Oskar; [3]Kallio, Heikki; [4]Yang, Baoru.

[1]Food Chemistry and Food Development. Department of Biochemistry. University of Turku. Finland; [2]PhD. Food Chemistry and Food Development. Department of Biochemistry. University of Turku. Finland; [3]PhD. Professor (emeritus). Food Chemistry and Food Development. Department of Biochemistry. University of Turku. Finland; [4]PhD. Professor. Food Chemistry and Food Development. Department of Biochemistry. University of Turku. Finland.

Background and objectives: Sea buckthorn (Hippophaë rhamnoides) berries are rich sources of flavonoids and other polyphenols. Proanthocyanidins (PAs) in sea buckthorn have biological activity and may be effective in maintaining health.

Methods: Sea buckthorn berries of three subspecies (H. rhamnoides ssp. rhamnoides, ssp. mongolica and ssp. sinensis) including nine varieties grown in Finland, Canada and China were

collected and the contents of PA oligomers and total PAs were detected using HILIC-ESI-MS-SIR method and BL-DMAC method, respectively.

Results: The three subspecies were separated by three validated factors in the partial least squares discriminant analysis model (PLS-DA). The content of total PAs in ssp. rhamnoides was significant higher than that in ssp. mongolica (p < 0.05). Five varieties 'Prevoshodnaya', 'Prozcharachnaya', 'Chuiskaya', 'Oranzhevaya' and 'Vitaminaya' of ssp. mongolica were separated in principal-component analysis (PCA) model. Sea buckthorn berries of ssp. rhamnoides ('Tytti', 'Terhi' and one of wild origin) harvested during 2007–2013 in Finland and of ssp. sinensis (wild) harvested in 2008 in China were investigated by the contents of PAs based on growth environments. In ssp. rhamnoides, the levels of total PAs in the northern samples were significantly higher than that in the southern samples (p < 0.05). The three varieties ('Tytti', 'Terhi' and one of wild origin) were all well discriminated by latitude in the PLS-DA model. Negative correlation was found between total PAs and most of the temperature and radiation-related variables (p < 0.01), and positive correlation with most of precipitation and humidity variables. In the northern ssp. rhamnoides samples, clearly decreasing trends were found in the contents of total PAs during the growth season until harvest when length of the growth season, temperature sum, and total radiation were increasing. No significant correlation was found in southern samples. Within ssp. sinensis, latitude correlated negatively to total PAs and positively to PA oligomers. In comparison to the latitude, altitude showed less impact on PAs.

Conclusions: Genetic backgrounds and growth environments showed significant influence on the content and composition of PAs in sea buckthorn.

Keywords: Sea buckthorn, proanthocyanidins,subspecies, latitude, weather conditions.

EVALUATION OF THE EFFECT OF PARTIAL SUBSTITUTION OF TREATED VETCH SEEDS FLOUR (VICIA SATIVA) BY WHEAT FLOUR (TRITICUM SPP) IN FUNCTIONAL AND SENSORY PROPERTIES OF BREAD

[1]Maldonado, Pedro; [2]Buitrón Sierra, Lucía.

[1]PhD. Engineer in foods. Department of Food Science and Biotechnology (DECAB). Escuela Politécnica Nacional (EPN). Ecuador; [2]Bsc. Agroalimentary. Department of Food Science and Biotechnology (DECAB). Escuela Politécnica Nacional (EPN). Ecuador.

Background and objectives: Common vetch (Vicia sativa), leguminous used for cattle feed and agricultural land repositioning, have high nutritional composition but contain cyanogenic compounds that not allow human consumption. Vetch could be used for human alimentation if cyanogenic compounds are reduced.

The aim of this work was to study the effect of partial substitution of treated vetch (Vicia sativa) seeds flour, by wheat flour (Triticum Spp) in functional and sensory properties of bread.

Methods: Soaking in water for 24 hours, followed by oven drying at 40 °C (6 or 12 hours) were used in vetch seeds to diminish the cyanogenic compounds, the same which were determined by Spectrophotometry Uv-vis after a Grignard's reaction between the samples and Sodium Picrate. A milling of treated and untreated seeds was carried out to obtain flours, a proximal characterization of those were performed. The levels of partial substitution evaluated in functional and sensorial properties were: 0, 5, 10, 15, 20 y 25%. Volume, weight, loaf volume and height of breads were determined. Brabender Faringraph and extensogramme parameters as well as the moisture absorption and the tolerance indices were evaluated. CO_2 production of the doughs were measured by a fermentogramme essay (60, 52.5, 42, 38 and 42 min). Sensory bread tests were performed to determine bakery aptitude and acceptability.

Results: The cyanogenic glycosides content of the untreated vetch was 0.44 µg/g. After the treatments, these decreased to 0.30 and 0.27 µg/g, respectively, resulting not dangerous for human consumption. In general, these treatments did no change proximal characterization of the untreated seeds flour. CO_2 production were between 820-1000 cc during fermentation. Extensibility (145 mm), tenacity to 5 cm (460 UB) and energy (103 cm2) of dough did not change between 0 and 5 % of substitution. Loaf volumes were from 3.30 to 1.80 cm3/g and correlated with bread heights (8.54-4.65 cm) and arrival time (1.5-4.2 min). Samples supplemented with vetch flour up to 15% and 10% of substitution had acceptability and baking aptitude, respectively.

Conclusions: Functional and sensory properties diminished from 10% of level substitution. Vetch substitution in dough contributes with proteins, fiber, fatty acids, turning bread into a functional food.

Keywords: Vetch, wheat, partial substitution, bread making, functional food.

LOCAL INSIGHTS INTO THE NUTRITION OF HILL TRIBE CHILDREN UNDER FIVE YEARS IN NORTHERN THAILAND: BEFORE AND AFTER AN AGRICULTURE INTERVENTION

(1)Roesler, Anna; (2)Smithers, Lisa; (2)Moore, Vivienne.

(1)Dietitian, PhD candidate, The University of Adelaide, Australia; (2)PhD. Public Health. The University of Adelaide. Australia.

Background and objectives: Approximately one third of Northern Thai hill tribe children under five years are stunted. Food insecurity and poor nutrition knowledge have been recognized as causes. A nutrition-sensitive agricultural intervention was implemented to address these causes. The aim of this research is to gain an in-depth understanding of local infant and young child feeding (IYCF) beliefs and practices before and after implementation of the intervention.

Methods: A two-day workshop and 30 in-depth interviews were undertaken in June 2014 with health officers, nurses, village health volunteers and carers of children under five years from four ethnic hill tribe villages. An agricultural intervention was implemented involving the provision of hens, vegetable seeds and nutrition education to families with children under age five years, followed by monthly check-ups for six months. One year after implementation, 20 in-depth interviews were conducted with intervention participants. All interviews and the workshop were transcribed and translated from Thai to English and thematically analyzed.

Results: Prior to the intervention, predominant breastfeeding occurred for one to three months and a variety of nutritious complementary foods were delayed in their introduction. Breastfeeding was impeded by the need for mothers to return to work. Infants were usually cared for by older family members and fed water and rice mixtures. Following the intervention some carers delayed the introduction of rice and introduced a variety of nutritious complementary foods, however, the majority of carers continued with previous practices.

Conclusions: The formal intervention trial showed it had benefits in the short term and this research shows that further work would be required for the benefits to be sustained, including cultural change broader structural support in addition to the nutrition sensitive agricultural intervention.

"DORM FOODS": A WEB-BASED NUTRITION INTERVENTION WITH BRAZILIAN COLLEGE STUDENTS

(1)Milhassi Vedovato, Gabriela; (2)Gabriel Sanchez Tavares da Silva, João; (3)Amorim Angotti, Alanis; (4)Cardozo Silva, Luana; (5)Gobetti Leonardi, Fabricio.

(1)MS, PhD. Nutritionist. Institute of Health and Society. Baixada Santista Campus. Federal University of Sao Paulo. Brazil.; (2)Master Student of Post Graduate Program in Interdisciplinary Health Sciences. Institute of Health and Society. Baixada Santista Campus, Federal University of Sao Paulo. Brazil.; (3)Undergraduate Student in Nutrition. Institute of Health and Society. Baixada Santista Campus. Federal University of Sao Paulo. Brazil.; (4)Undergraduate Student in Social Work. Institute of Health and Society. Baixada Santista Campus. Federal University of Sao Paulo. Brazil.; (5)Social Work. Institute of Health and Society. Baixada Santista Campus. Federal University of Sao Paulo. Brazil.

Background and objectives: Young adults, especially in college, may be more vulnerable to unhealthy eating. Our objective is to report the experience of a web-based nutrition education program for students focusing on social-environmental factors and food-related behaviors.

Methods: An online course was developed for dormitory-resident college students as part of a student affairs policy at the Federal University of Sao Paulo, Brazil. Two seasons of a 2-months intervention were conducted (100 vacancies/version), aimed to share food-related experiences, creating an atmosphere of consciousness about food production and society. It presented four topics: "Food: memory, affection, identity, citizenship, and nutrients?"; "Eating habits and university dorms"; "Capitalism and food policy: a critical view of the food on your plate"; "Gastro-anomy", and components included messages, videos, readings, discussion forums, and wikis. Initial and final questionnaires were applied to evaluate participant's characteristics, perceptions and behaviors.

Results: There were 167 registrations in overall, and 19% of applicants completed the entire course. Half of the students were from the health sciences campus, 43% referred living in dorms, and 81% reported the need to improve their food habits. Before the course, 51% of students classified their eating behavior as regular. At the end, 77% reported changes, and 72% classified their eating behavior as good or very good. The main positive behavior changes reported were: be more critical and concerned about food and sustainability, preparing own meals, eating out less often, decreasing in consumption of ultra-processed, increasing in consumption of fresh produce, and trying new foods. Participants mentioned some barriers, such as lack of information to make more ethical and sustainable food choices, time constraints, lack of money, organization or motivation. The course components were considered facilitators to behavior change, as well as social support and food accessibility. Although, 95% of participants reported being able to cook, the course did not show impact to develop new culinary skills.

Conclusions: This experience showed potential in increasing knowledge, modifying perceptions and food-related behaviors in academic contexts. Future studies should examine the role of university cafeterias and address online access difficulties to improve adherence to distance education.

Keywords: Food and nutrition education, web-based distance education course, university dorms foods, university.

THERAPEUTIC PATIENT EDUCATION IN TYPE 2 DIABETES: IMPACT ON HEALTHY NUTRITION HABITS, EMPOWERMENT AND GLYCEMIC CONTROL

[1]Ruiz Morosini, María Lidia; [2]Ruiz Morosini, María Lidia; [3]López González, Eva.

Affiliation: [1]MD School of Diabetes Certified Educators Argentine Society Diabetes; [2]MD Diabetes Certified Educators School Argentine Society of Diabetes Argentina; [3]Md Diabetes Certified Educators School Argentine Society of Diabetes Argentina.

Background and objectives: Background: The education of people with diabetes mellitus (DM) is an essential tool to empower on healthy nutrition habits and optimize treatment.

Objectives: to evaluate acquired healthy nutrition habits, empowerment and glycemic control after a therapeutic patient education intervention in people with DM2.

Methods: a cohort study in people with DM2, carried out by certified SAD/IDF educators who were trained to replicate a structured therapeutic education program focused on motivating on healthy nutrition habits, 5 interactive workshop sessions (groups up to 15 people) of 120 Min of duration, once per week in a row. We used the same educational material in all the Centers and we evaluated changes in habits, weight and knowledge (multiple-choice questions) and test DES-SF 8 before and at the end. Laboratory at de beggining and tree month later. Descriptive statistics and paired Wilcoxon test were performed. (84% who completed the program)

Results: 150 people were evaluated, Age: 57.1 ± 12.1 years, fem. 58.7%, age DM2: 7.7 ± 7.6 years, glycemia fasting 140.1 mg / dl, initial weight 84.3 ± 19.4 kg, treatment with oral drugs 84.7%, insulin 30%, BMI : 32.5 k / m2, smoking 12%, schooling less than 7 years 22.8% and ≥7 years 77.2%. Glycemic control: before A1C: 7.8 ± 2.1% tree month 7.1 ± 2.8%(p<0.002).

Changes in habits (previous and post): intake of 2 or more servings per day of vegetables before 54% and later 72.6% (p<0.0001), 2 or more portions per day of fruit previous 60.6% and later 71.3% (p<0.001), 4 or more intakes /day prior 74% and later 83.3% (p<0.001). Weight loss 1.9 ± 1.36 kg (p<0.04), previous physical activity 52.8% and later 60.5% (p<0.001)

Test of Knowledge: previous 63% and posterior 88% (p<0.0001). The greater knowledge correlated with higher level of education, with males and with greater weight loss.

Empowerment (DES-SF8) before 3.8 and later 4.2 points (p<0.007) The sub-item with the greatest change was goal setting.

Conclusions: Education program focused on motivating had an impact on changes habits and weight loss. We found a significant increase in knowledge, with impact on empowerment and glycemic control.

Keywords: Education, healthy habits, motivation, type 2 diabetes, glycemic control.

TRANSLATING FOCUSED ETHNOGRAPHIC STUDY FINDINGS INTO DESIGN AND IMPLEMENTATION OF BEHAVIOR CHANGE COMMUNICATION INTERVENTION IN KENYA

[1]Macharia-Mutie, Catherine; [2]Nyaga, Christine.

[1]PhD. Senior Monitoring and Evaluation Specialist. Global Alliance for Improved Nutrition. Nairobi.Kenya.; [2]MSc. Junior Associate. Global Alliance for Improved Nutrition. Nairobi. Kenya.

Background and objectives: The Focused Ethnographic Study (FES) methodology is used to answer a set of program relevant questions that are important for making decisions about future actions for a social, public health or nutrition intervention. We used FES to examine household perspectives on infant and young child feeding (IYCF) practices and beliefs in the Turkana, Marsabit, Isiolo, Wajir and Garissa counties of Kenya. The transitional period from exclusive breastfeeding to complementary feeding, is a period when infants are most vulnerable to the deleterious effects of inadequate nutrient intakes. Based on FES findings, Global Alliance for Improved Nutrition designed a social behavior change communication (SBCC) intervention targeting improved IYCF practices of children 6-23 months in the five Counties.

To design a package of interventions aimed at supporting individuals, households and groups to adopt and sustain high impact

nutrition behaviors specifically IYCF practices based on FES findings within a resilience program in the five counties.

Methods: Based on FES findings, we designed a SBCC intervention focusing on behavior change, social mobilization and advocacy around IYCF including inadequate micronutrient intake, cooking practices and food security. Target was self-help group members including fathers and grandmothers that were also receiving a package of other interventions from consortium partners. The community was reached through care groups and radio listener groups. Talking books were used in areas where there was no local radio frequency.

Results: The FES identified zinc and iron to be the most critical problem nutrients. We reached 5163 households with 6443 children 0-5 years of whom 46% were under 2 years through 230 care-groups and over 100,000 through mass communication on IYCF messages. 170 health workers and 86 CHVs trained on care-group model. Over 20 model vegetable gardens were established. The FES was adopted by MOH as a methodology for identifying IYCF interventions and BCC strategy adopted by Turkana County.

Conclusions: FES provides empirical support for evidence based programming of nutrition interventions in resource-constrained populations. Care-groups and radio listener groups were an innovative model through which community members can discuss nutrition related issues. Engagement with government provides for sustained efforts of promoting IYCF behavior change in the region.

Keywords: FES, Infant and Young Child Feeding, Behavior Change Communication.

TYPE OF NUTRITION FACTS PANEL (NFPS) ON PACKAGED FOOD PRODUCTS AND THEIR COMPREHENSIBILITY BY THE CONSUMERS

[1]Singh, Meenu; [2]Chandorkar, Suneeta.

[1]Post Doctoral Fellow. Division of Nutrition. St. John's Research Institute. St. John's National Academy of Health Sciences. Bangalore 560034. Karnataka. India.; [2]Assistant Professor. Department of Foods and Nutrition. Faculty of Family and Community Sciences. The Maharaja Sayajirao University of Baroda. Vadodara 390002. Gujarat. India.

Background and objectives: Nutrition information on the packaged foods aids healthy food choices. However, absence of a uniform style of Nutrition Facts Panel (NFP) on the packaged food leads to lack of comprehensibility of NFPs by the consumers. Therefore, the present study aimed at assessing the comprehensibility of commonly found NFPs on packaged foods.

Methods: The study was carried out on 807 consumers aged ≥15 years in Vadodara, Gujarat, India. Each consumer was shown four NFPs, varying in terms of the format and the amount of nutrition information, and their responses were recorded on a pre-tested semi-structured questionnaire. NFP-1 presented nutrients as "per 100g" of the product with fractions of total-fats and

total-carbohydrates. NFP-2 presented nutrients in two tabular formats. One table detailed micronutrients with their significance and second table listed four mandatory nutrients "per 100g" of the product. NFP-3 reported five mandatory nutrients as "per 100g" and "per serving". NFP-4 listed nutrients in two tables. One of the tables had nutrients as "per serving" and "%DV" with five mandatory plus other essential nutrients while the other table presented nutrients as "per 100g." All the NFPs were as per Food Safety Standards Act guidelines (2006).

Results: Comprehensibility of four different NFPs commonly found on packaged foods revealed that the best comprehended NFP was NFP-2(82%) followed by NFP-1(67%), NFP-4(55%) and NFP-3(52%). Percent scores on understanding of NFPs were higher among adolescent girls (53%) and adult females (53%) than their male counterparts, 50% and 45% respectively. Fat was considered by most of the consumers (27%) for evaluating NFPs, followed by energy (23%), protein (17%), vitamins (14%) and carbohydrates (13%). "Nutrients of concern" namely, cholesterol, sugar, TFA and sodium were considered by less than 10% of the consumers. Terminologies that were reported difficult to understand on NFPs were units for expression of nutrients, serving size, nutrients like MUFA (24%), TFA (18%) PUFA (24%),etc.

Conclusions: With the increase in complexity or the amount of information on NFPs, the difficulty in comprehension also increases. Therefore, there is a need to present NFPs in uniform and simplified format so as to make them easy to understand by the consumers.

Keywords: Nutrition facts panel, consumer awareness, packaged foods.

BREAKING FRESH GROUND ON ADOPTING SUSTAINABLE DIETS: ASSESSMENT OF USING CONSUMER PARTICIPATION TO DEVELOP TOOLS FOR BRIDGING THE INTENTION-BEHAVIOUR GAP

[1]Fink, Leonie; [2]Ploeger, Angelika; [3]Strassner, Carola.

[1]PhD Student. Nutritionist. Department of Department of Food · Nutrition · Facilities. University of Applied Sciences Münster. Germany.; [2]Prof. Dr. Section of Organic Food Quality and Food Culture. Faculty of Organic Agricultural Sciences. University of Kassel. Germany.; [3]Prof. Dr. Department of Food · Nutrition · Facilities. FH Münster University of Applied Sciences. Germany.

Background and objectives: When trying to adopt sustainable diets, people often deal with the gap between their good intentions and their actual behaviour. Tools are needed which support people´s needs during the process of diet adoption. To meet those needs, it might be useful to involve people in the developmental process. Therefore, we conducted six workshops in different cities in Germany from September to December 2016. Our workshop

design provided a combination of creativity supporting techniques. The purpose was to enable all participants to develop ideas contributing to the research question: How can we bridge the intention-behaviour gap regarding the adoption of sustainable diets? Besides the workshop results, it is important to explore the potential of our innovative approach by examining the participants' experience with it. The aim of the subsequent survey among the participants was to examine their assessment of the workshop design in combination with the research question, the applied methods and the suitability for active participation.

Methods: We collected the data using seven structured and closed ended questions with a verbalised response scale as one part of an anonymous feedback tool we distributed always after the end of the six workshops. Participants were men and women between the age of 16 and 70 years.

Results: The sampling comprised 82 participants of which 63 (76,8%) completed the feedback questionnaires and 19 (23,2%) didn't fill in the questionnaire. Evaluation shows that 61 participants (96,8%) agree that the research question is suitable for exploration within an idea generation workshop and 58 (92,1%) say that therefore a series of local workshops is sensible. Concerning the applied methods, 62 (98,4%) say that they were suitable for the workshop. Only 2 people (3,2%) claimed that the methods were not supporting the creativity for generating ideas. All participants (100%) grant that involving people in this research is reasonable and 58 (92,1%) say that the participation in the developmental process searching for tools can contribute to their successful application later on.

Conclusions: Our conclusion from the results is that our methodological approach corresponds to the concept of citizen science. Here we see potential for further contributions to this latest research development.

Keywords: Citizen science, consumer input, diet adoption, intention-behaviour gap, sustainable consumption.

ASSESSING THE VALUE OF EATING PATTERNS AS MARKERS OF DIET QUALITY IN A RESOURCE-CONSTRAINED SETTING

O'Hara, Corey.

MS. PhD Candidate. Friedman School of Nutrition Science and Policy. Tufts University. United States of America.

Background and objectives: Decades of research have shown that empirically derived eating patterns have substantial power to predict risk for health outcomes, including cardiovascular disease, diabetes, metabolic syndrome, cancers, and a range of plasma biomarkers (Hu 2002; Newby and Tucker 2004; Barbaresko et al. 2013). Rising rates of overweight and obesity in low-income countries have more recently led to use of eating pattern assessment in these contexts, but the approach has been virtually unused in relation to undernutrition. The purpose of this study is to determine the value of this methodology in predicting risk of child malnutrition associated with undernutrition.

Methods: Household eating patterns are identified using exploratory factor analysis with 24-hour, 12-food-group dietary recall data from a clustered survey of 740 households in the Far-West region of Nepal. Survey-adjusted OLS and logistic regression is used to assess the relationship of these patterns to anthropometry of an index child in these households, while controlling for food environment and household characteristics. Similar analysis is performed regressing anthropometric indicators on the household dietary diversity score (HDDS), which is associated with daily per capita caloric availability and is commonly used as a proxy for food security in monitoring impact of development programs.

Results: Three consistent patterns emerged: a "diverse," "energy-dense," and "typical." All else equal, the energy-dense pattern (dairy, sugar/sweets, and oils/fats) was positively associated with WAZ ($p<.01$), WHZ ($p<.001$), BMIZ ($p<.01$), and overweight ($p<.05$) and negatively associated with underweight ($p<.01$) and wasting ($p<.01$). The diverse pattern was positively associated with overweight ($p<.05$), and there was no significant association between anthropometry and the typical pattern. HDDS was moderately correlated with the diverse pattern ($r=.56$, $p<.001$) but not the energy-dense ($r=.14$, $p<.05$) and typical patterns ($r=.13$, $p<.05$). All else equal, HDDS was not significantly associated with any anthropometric measures.

Conclusions: Eating patterns derived from limited dietary data may be sufficient to predict child nutritional status, and eating patterns may offer value beyond simple dietary diversity scores—constructed using the same data—in helping to understand context-specific dietary factors influencing growth. In a resource-constrained setting, understanding the relationship between how people eat and nutritional status may be useful in determining areas for programmatic intervention.

Keywords: Nepal, diet quality, malnutrition, dietary diversity, eating patterns.

DOES PEER COUNSELING PROMOTE APPROPRIATE INFANT FEEDING AND BETTER GROWTH IN INFANTS IN URBAN SLUMS IN BANGLADESH?

[1]Ara, Gulshan; [2]Khanam, Mansura; [3]Papri, Nowshin; [4]Kabir, Iqbal; [5]Dibley, Michael.

[1]Public Health Nutritionist, Nutrition and Clinical Services Division, icddr,b; [2]MPH, Nutritionist, Nutrition and Clinical Sciences Division, icddr,b; [3]MPH, Medical Doctor, Nutrition and Clinical Services Division; [4]PhD, Scientist, Bangladesh breastfeeding oundation; [5]MD, Professor, Sydney School of Public Health.

Background and objectives: Adequate and age-appropriate nutrition during infancy and early childhood is fundamental for attaining and maintaining the growth and health of children. The objectives of this study is to investigate the association between infant feeding practices, and growth and compared data between control and intervention groups to measure the impact of peer counseling.

Methods: A community-based randomized controlled trial was conducted in selected slums of Dhaka, Bangladesh in which 350 mother-infant pairs were randomized to either receive infant feeding counseling (n = 175) or a control group (n = 175) between September 2014 and July 2016. The outcome data were collected at enrollment, following childbirth, and every two months interval up to 12 months. We have created scales to measure infant feeding practices (IFPs) and anthropometry from birth to 12 mo of age to assess the main outcomes of weight and length. Moreover, we created infant feeding scales based on infant feeding recommendations and run linear regression models to determine the effect of intervention.

Results: Higher proportion of intervention mothers (89%) reported first hour initiation of breast feeding than control mothers (78%). More than 95% of the neonates in both groups received colostrum. More mothers in the intervention group (n = 136, 73%) were exclusively breastfeeding at 5 months compared to mothers in the control group (n = 124, 27%). Better feeding scale scores were associated (p<0.001) with better weight and length gains during infancy. Infants who were in the 75th percentile of the infant feeding scales found to be significantly less stunted (P<0.05) compared with infants who were in the 25th percentile of these scales at intervention group as well as control group at different follow up period (1, 3, 5, 7, 9 and 12 months).

Conclusions: Our results provide the evidence for the effects of peer support on increasing rates and duration of exclusive breastfeeding. Similarly, this study also give a positive support of adhering to current infant feeding recommendations on better nutritional status of infants. Further studies are needed to follow the linear growth of these children during the second year of their life.

Keywords: Infant feeding scale, peer counseling, randomized control trial.

DEVELOPING A VOICE MESSAGING INTERVENTION TO IMPROVE NUTRITION IN A LARGE-SCALE HORTICULTURE INTENSIFICATION PROJECT IN SENEGAL

Downs, Shauna; Fanzo, Jessica.

PhD. Berman Institute of Bioethics. Johns Hopkins University. USA.

Background and objectives: Irrigated horticultural production at scale can be a powerful vehicle for income generation in Sub-Saharan Africa; however, there is a need for evidence about how best to integrate nutrition in a scaleable way. This project is unique for two key reasons: 1) it is injecting nutrition (via behavior change communication strategies) into an existing agriculture development project and 2) it is using voice messaging as a delivery mode for nutrition education.

Methods: We will leverage a large, funded, cluster-randomized controlled trial (RCT) that evaluates the impact of the PAPSEN-TIPA development project, which disseminates drip-irrigation and improved horticultural technologies to groups of smallholder farmers in Senegal. One hundred and twenty-four villages in three regions of Senegal are participating in the study (~1275 households). In order to develop the voice messaging intervention we first conducted formative research by conducting focus groups (n=6) with men and women to identify barriers and facilitators to improving infant and young child feeding practices. We combined these findings with baseline results from the larger RCT as well as market surveys.

Results: The focus groups found that men were making food purchasing decisions within households, horticulture crops produced were being sold rather than being consumed within the household and that there was an avoidance of feeding infants and young children "heavy" foods (e.g., animal sourced foods). These findings were complemented with the baseline survey data that indicated that 63% of children consumed a minimally diverse diet and consumption of nutrient-rich food groups was generally low. Moreover, 64% of children 6-59 months surveyed were anemic. These findings were subsequently combined to identify the key messages for the intervention, including: consumption of locally available and affordable animal sourced foods, dark leafy greens and vitamin A rich fruits and vegetables along with messaging around consumption of horticulture within the household. Voice messages will be sent to both mothers and fathers in the study in order to ensure buy-in for purchasing nutrient-rich foods.

Conclusions: This study has the potential to provide important insight into the effectiveness of using mobile technology to inject nutrition into large-scale agriculture development projects.

Keywords: Behavior change communication, infant and young child feeding, nutrition-sensitive interventions.

PROMOTING FOOD LABEL INFORMATION READING SKILLS AMONG URBAN ADOLESCENTS IN INDIA - 'READ-B4-U-EAT' STUDY

[1]*Saha, Snehasree;* [2]*Rao, V. Sudershan;* [3]*Rao, VishnuVardahana;* [4]*Gavaravarapu, M SubbaRao.*

[1]M.Sc. Assistant Professor, Udaynarayanpur Madhabilata Mahavidyalaya,University of Calcutta, Kolkata,India; [2]PhD. Scientist E. food & Drug toxicological research institute . National Institute of Nutrition(Indian Council of Medical Research),India; [3]PhD. Scientist F. Dept of Biostatistics. National Institute of Nutrition(Indian Council of Medical Research),India; [4]PhD. Scientist E. Extension & Training Division.National Institute of Nutrition(Indian Council of Medical Research),India.

Background and objectives: India is home to ~20% of world's adolescents but of whom ≈19.3% are overweight/obese. This in part is attributed to increasing trend of shift from at-home meals to away-from-home meals. Lack of skills to interpret food label information, which can serve as point-of-purchase guideline for healthy food choice can add to the woes. The present study describes an educational intervention that aimed at improving the food label information skills among urban adolescents (13-15y) in a south Indian City.

Methods: Firstly, a KAP questionnaire was developed & its content-validity was assessed by a panel of 3 experts. Test-retest reliability was assessed by administering it among 114 participants within a gap of 7-days. Spearman Correlation co-efficient, difficulty and discrimination indices were calculated to accept/reject questions. The questionnaire thus validated was administered among 170 participants to assess the determinants of food label usage by co-relating label use with demographic details, nutrition awareness and perceptions. 'Read-B4-U-Eat' a multi-component education module comprising 3 interactive sessions, animated film, booklet and 9 posters was developed and tested on 116 participants. The impact of educational intervention was assessed by administering KAP questionnaire pre- and post-intervention and observing food choices of 60 participants in a simulated shopping environment. Retention was assessed by interviewing participants' parents (n=30).

Results: For validating the questionnaire, Spearman-Correlation was calculated for internal consistency. Following this, patterns and words in the questionnaire were changed to finalize using Difficulty index (range: 0.2-8) and discrimination index (≥0.20). General nutrition awareness, specific health claims and perceived weight status were identified as major determinants of food label use. Read-B4-U-Eat module significantly (p<0.05) increased knowledge on manufacturing-date, ingredients, nutrient-panel and quality-symbols & checking of sodium declaration in snacks. After the intervention, use of label information to read fat-content (100%), ingredients, calorie, sugar and protein was increased. Reading date-of-manufacture and best-before-date, quality-symbols also improved notably. Parents (24 of 30) informed that their children's label reading skills retained after 3 months.

Conclusions:

This study was one of the first attempts to equip adolescents to use food label information in India. This can be scaled up for integration in school curricula.

Keywords: Food label, adolescents, educational intervention.

titude of non-Igbo bank workers to local dishes in Abia State and influencing factors.

Methods: Validated and pretested questionnaire was used to obtain data on the demographics, dietary adaptation and attitude to local dishes and influencing factors from 236 non-Igbo indigenes working in various banks and residing in two commercial cities in Abia State. Dietary adaptation was assessed using a Likert scale rating of 10 different local dishes ranging from "Being aware of the dishes" to "Ability to prepare, consume and enjoy the dishes frequently". Attitude was assessed using 12 questions on a 5 point scale rating ranging from "Strongly agree" to "Strongly disagree". Factors influencing dietary adaptation were assessed using 5 point scale rating of 11 questions ranging from "Affected much" to "Never affected". Pearson's correlation was used to determine the relationship between respondents' demographics, dietary adaptation and attitude to local dishes. IBM SPSS Statistics (version 20) was used to analyze the data and significance judged at P<0.05.

Results: Demographic result showed that 18% of the bankers have Igbo mothers, 52% have resided in the State for less than 2 years while 38% have lived in another Igbo speaking State but for less than 2 years (58%). Majority (79%) of the bankers moderately adapted to the local dishes while 35% showed positive attitude to local dishes. Dietary adaptation score positively correlated with having Igbo mother, duration of residence in Abia (P<0.01) and in another Igbo speaking State (P<0.05). Only duration of residence in the State positively (P<0.01) correlated with attitude. Dietary adaptation also positively (P<0.01) correlated with attitude to local dishes. Preconceived myths and fallacies were factors that most affected the level of dietary adaption.

Conclusions: Dietary adaptation and attitude towards local dishes among non-Igbo indigenes working and residing in Abia State improved with duration of residence in the State but were limited by preconceived myths and fallacies.

Keywords: Dietary adaptation, Attitude, Local dishes, Non-Igbo indigenes, Bank.

NUTRITION EDUCATION PRACTICES IN HEALTH TEACHERS FROM SHANGHAI K-12 SCHOOLS: THE CURRENT SITUATION, BARRIERS AND WILLINGNESS

[1]Chen, Bo; [2]Li, Fang; [1]Dong, Ruihua; [2]Chen, Jingsi; [2]Yuan, Yaqun; [1]Liu, Qipei; [1]He, Gengsheng.

[1]PhD. Department of Nutrition and Food Health. Fudan University. China; [2]MS. Department of Nutrition and Food Health. Fudan University. China.

Background and objectives: To investigate the current situation of health teachers performing nutrition education in Shanghai K-12 schools, and to determine the barriers and willingness of teaching nutrition in the classroom.

Methods: A total of 904 health teachers from Shanghai K-12 schools was invited to fill out a Wechat-based questionnaire by

---

investigating the current situation of teaching nutrition in the classroom, the barriers and resources of performing nutrition education, and the wiliness of performing future education on nutrition. The questionnaire were self-designed and validated. Logistic analysis was used to identify the factors influencing the education practices and willingness.

Results: There are 722 (84.29%) health teachers currently teaching nutrition in the classroom. Among them, 532 (73.68%) teachers spent less than 1 hour to teach the class. Among the 182 teachers who did not teaching nutrition, 57 (31.32%) reporting that nutrition was not a required course by the school, 69 (37.91) reporting of willing to teach but lack of knowledge, and 17 (9.34) reporting of willing to teach but lack of support. There are 735 teachers willing to develop a future nutrition course, and 762 teachers willing to teach nutrition in other ways. Using the logistic models to identify the factors influencing whether or not teachers were currently teaching nutrition in the classroom, gender, age, school type, level of concerning about nutrition, and the level of received background on nutrition background were identified as significant factors. Using the logistic models to identify the factors influencing whether or not teachers were willing the teach future lessons on nutrition, location, school type, level of concerning about nutrition, and currently teaching nutrition lessons were identified as significant factors.

Conclusions: Nutrition education in Shanghai K-12 schools is not sufficient.

Keywords: Nutrition education, K-12 schools, teachers, barriers, willingness.

NUTRITION STATUS AND FEEDING PRACTICES AMONG ORPHANED CHILDREN IN MEXICO

[1]Nieto, Claudia; [2]Maafs Rodríguez, Ana Gabriela.

[1]Nutritionist, MSc. Life Sciences Department. Instituto Tecnológico y de Estudios Superiores de Monterrey. Mexico.; [2]Nutritionist, M. Ed. Life Sciences Department. Instituto Tecnológico y de Estudios Superiores de Monterrey. Mexico.

Background and objectives: Children in abandonment have become an increasing problem in Mexico. According to the National Institute of Statistics and Geography (INEGI) there are 30 thousand children living in orphanages. Children and adolescents institutionalized in orphanages are exposed to greater risks of poor nutrition and health. The aim of this study was to explore the nutrition status and feeding practices among this vulnerable population.

Methods: Quantative: This is a mixed methods study. Quantitative data was taken from (n=24) institutionalized children (<9 years old). Trained personnel measured the children using standardized procedures. Nutrition status of children were categorized according to the World Health Organization criteria. Qualitative: Fieldworkers (n=20) who worked at the orphanage and collected the data, were interviewed to explore their perceived barriers to better food prac-

tices. The interviews were read line by line and then coded. Transcriptions were analyzed using the MAXQDA software.

Results: Quantative: Stunting was prevalent among children (n=11, 45.8%), whereas overweight and obesity had a lower prevalence (n= 2, 8.3%). Qualitative: Three main themes arose from the analysis: 1) Poor hygiene methods: participants reported lack of hygiene in the kitchen and food wasting. "It is quite hard to manage that amount of food with reduced space and hardly any kitchen staff to help out..." 2) Caregiver's attitude/situation: most of the caregivers felt observed; therefore, they might not have acted as usual. "We had everything, from very willing nurses to others very conservative with their methods" and 3) Perceived need for a multidisciplinary approach: Most of the participants reported that there was a generalized need for nutritionist and psychologist to be involved in the caring of the children. "Most of the children need psychological support due to their vulnerable situation".

Conclusions: Results showed that most of the institutionalized children are stunted (this situation might come from previous abandonment situation); furthermore, feeding practices and hygiene methods could be improved. Data showed that there is generalized call for a multidisciplinary approach. Government should be encouraged to improve the nutrition of orphan children around the country.

Keywords: Nutrition status, feeding practices, orphaned children.

STRESSORS AND COPING STRATEGIES OF INFANT AND YOUNG CHILD FEEDING PRACTICES IN RWANDA: PERCEPTIONS OF MOTHERS, FATHERS, GRANDMOTHERS AND COMMUNITY HEALTH WORKERS

[1]Ahishakiye, Jeanine; [2]Bouwman, Laura; [3]Brouwer, Ingeborg; [4]Matsiko, Eric; [5]Koelen, Maria.

[1]MSc. Human Nutrition and Dietetics Department.University of Rwanda. Rwanda; [2]PhD.Health and Society Chair Group. Wageningen University. The Netherlands.; [3]PhD. Nutrition and Health over the life course chair group. Wageningen University. The Netherlands.; [4]MSc.Human Nutrition and Dietetics Department.University of Rwanda. Rwanda.; [5]Professor, PhD. Health and Society Chair Group. Wageningen University. The Netherlands.

Background and objectives: Background: Chronic malnutrition is an unabated public health priority in Rwanda with an unacceptable high stunting prevalence of 38% among under-five year olds. Although exclusive breastfeeding is a social norm and widely practiced, only 18% of children aged 6-23 months are fed in accordance with the recommendation for infant and young children feeding practices, contributing to these high rates.

Aim: This study investigated the everyday challenges towards appropriate infant and young child feeding practices (IYCFP) experienced by community members in poor resource, rural setting of the Muhanga District in Rwanda and how they engage resourc-

es and strategies to deal with these challenges by use of a salutogenic, solution-oriented approach.

Methods: 16 Focus group discussions were held with mothers, fathers, grandmothers and community health workers (CHWs) in Muhanga district (144 participants in total). The discussions were recorded, transcribed verbatim and thematically analyzed using Atlas.ti software.

Results: Two main themes emerged from the data. Firstly, a discourse on optimal practices that reflects the knowledge about and efforts to align with recommendations on proper IYCFP. Second, a discourse on impeded mother-child interaction involved challenges hindering optimal practices and the applied resources and strategies. A number of challenges emerged as impeding appropriate IYCFP being mainly poverty, gender imbalance (laborious women's work and limited support from partner) and seasonal fluctuations. Required resources included time-availability, attentiveness, responsiveness and resources specific to optimal complementary feeding such as availability of proper foods, money, and home-grown food. Strategies to cope with the challenges involved family and social support from CHWs and health facility staff, financial support through casual labor, mothers saving and lending groups and kitchen gardens.

Conclusions: Conclusion: Determinants of IYCFP are beyond food practices and embedded in everyday-life situations (mother's workload, social support at family and community levels, financial resources available at family level, mothers' knowledge about appropriate IYCFP). Hence, strategies to improve child nutrition should also go beyond food related practices and consider the multidimensional nature of IYCF in the everyday reality of those living in impoverished situations.

Keywords: Infant and young child feeding practices, breastfeeding, stressors, salutogenesis, coping strategies

COMMUNITY VIDEO: AN ADAPTABLE AND EFFECTIVE TOOL FOR NUTRITION SOCIAL AND BEHAVIOR CHANGE

[1]*Cunningham, Sarah;* [2]*Granger, Kristina;* [3]*Koniz-Booher, Peggy;* [4]*Moses, Philip.*

[1]BS. SPRING Project. JSI Research and Training Institute, Inc. USA.; [2]MPH. SPRING Project. The Manoff Group. USA.; [3]MPS. SPRING Project. JSI Research & Training Institute, Inc. USA.; [4]MPH. SPRING Project. JSI Research and Training Institute, Inc. USA.

Background and objectives: Community video is an innovative social and behavior change communication (SBCC) tool that can be harnessed to promote maternal, infant, and young child nutrition (MIYCN), hygiene, and nutrition-sensitive agriculture practices. The USAID-funded Strengthening Partnerships, Results: **Methods:** Formative research is crucial for adapting this community-centered model, allowing implementers to better understand the nutrition context, as well as influencers and determinants of key behaviors, and to prioritize behaviors for video top-

ics. Local extension agents or community volunteers are trained on MIYCN, hygiene, and nutrition-sensitive agriculture (in some contexts) as well as on video production for select team members. SPRING works with local partners and teams to create videos addressing priority behaviors and determinants featuring "early adopters" of improved practices. After production teams pretest and finalize videos, they are shown in community peer groups using portable pico projectors, followed by facilitated discussions.

Results: A feasibility study conducted in India in 2013 found the approach to be promising, with good community engagement and interest as well as anecdotal evidence of behavior change. Evaluations in Niger and Burkina Faso found the approach to be an effective and cost-effective SBCC approach. An evaluation of the pilot program in Niger found that households that have handwashing stations with water and soap increased from 73.8% at baseline to 96.2% only 3-4 months after exposure to videos on handwashing. The program's cost per beneficiary reached was approximately US$16.19 per person, projected to be US$3.73 once the program is taken to scale. The approach has been successfully adapted for a number of contexts and local partnership models, and a focus on capacity-building for local production teams has strengthened the sustainability of the approach.

Conclusions: Community video is a promising SBCC approach for promoting nutrition-specific MIYCN and hygiene as well as nutrition-sensitive agriculture practices. The approach provides implementers and communities with a flexible tool to create participatory, context-specific, and sustainable nutrition-related SBCC programs.

Keywords: SBCC, nutrition, MIYCN, nutrition-sensitive agriculture, ICT.

ASSESSMENT OF A CASCADE TRAINING APPROACH FOR NUTRITION: LESSONS LEARNT FOR E-LEARNING IN GUATEMALA

[1]*Palmieri, Mireya;* [2]*Kavle, Justine;* [3]*Fischer, Maggie;* [4]*Gomez, Leonel.*

[1]Msc. Independent Consultant.; [2]PhD. Senior Nutrition Advisor. Maternal Newborn Child Health and Nutrition Division. Maternal and Child Survival Program (MCSP) / PATH. Washington DC. USA.; [3]MPH. Chief of Party. Maternal and Child Survival Program (MCSP)/ Save the Children. Guatemala City. Guatemala.; [4]MD. Technical Director. Maternal and Child Survival Program (MCSP)/ Jhpiego. Guatemala City. Guatemala.

Background and objectives: The Diplomado course, developed in 2014, focused on training on maternal infant and young

child nutrition for various cadres of health providers, including auxiliary nurses and nurses. In 2015, ~ 600 health providers were trained in eight modules related to Essential Nutrition Actions. Central and district levels viewed the course as a core training tool for nutrition. To date, no assessment of training methodologies for nutrition have been conducted in the country – which can inform on training strategies needed at the national and subnational levels. The key objectives of this assessment are to ascertain the strengths and areas of improvement of the Diplomado course, as well as examine the value added of the cascade training as a training methodology and the potential to adapt the course for e-learning to other health content, beyond nutrition.

Methods: This mixed methods assessment included 8 focus group discussions (FGDs) with health providers, 32 in-depth interviews (IDIs) with health providers and 8 FGDs with facilitators which were carried out in three areas of western Guatemala. In addition, 15 IDIs with key stakeholders involved in the design and/or implementation of the course were conducted. Following transcriptions of recordings for FGDs and IDIs, key emergent themes and sub-themes were coded. Quantitative post-tests were analyzed by topic. A review of key official documents and supporting materials was also carried out.

Results: The course demonstrated improved health providers' knowledge in key nutrition areas. Areas of improvement identified by health providers and facilitators included greater time allotment for content learning, and real-time learning at health facilities, in areas such as growth monitoring and interpretation. Implementing routine supportive supervision and mentoring were recognized needs for translation of skills to achieve improvements in quality of health services. Adaptation of the course through the development of additional health modules, on topics such as family planning and greater awareness of stunting at community level were cited as important.

Conclusions: The Diplomado course has potential for further expansion and adaptation to other areas, through an e-learning platform.

Keywords: Capacity building, nutrition, e-learning, health providers, health.

Conflict of Interest Disclosure: One of the authors, M. Fischer, aided in supporting the implementation of the DIplomado course. The author aided in providing input to the recommendations, though did not partake in collection of data, analyses or design of the assessment.

FEASIBILITY STUDY OF AN INTERVENTION OF GIFTING CHICKENS FOR YOUNG CHILDREN IN ETHIOPIA FOR PROVISION OF EGG AND EGG-SHELL

(1)Whiting, Susan; (2)Omer, Anteneh; (2)Mulualem, Demmelash; (3)Classen, Hank; (4)Vatanparast, Hassan.

(1)PhD. College of Pharmacy and Nutrition. University of Saskatchewan. Canada; (2)MSc. School of Nutrition, Food Science and Technology, Hawassa University. Ethiopia; (3)PhD. Animal and Poultry Sciences. University of Saskatchewan. Canada; (4)MD. PhD. College of Pharmacy and Nutrition. School of Public Health. University of Saskatchewan. Canada.

Background and objectives: Malnutrition in young children of Ethiopia is mainly related to poor quality and quantity of complementary foods, which are thin cereal gruels lacking in animal-sources. One egg a day is recommended but accessibility is low. By age of 12 months, need for calcium (Ca) goes up dramatically. An eggshell contains ~2 grams Ca. The objective was to evaluate effects of promoting egg and eggshell powder (ESP) consumption on nutritional status of children of 6-24 months.

Methods: A cluster, randomized,controlled trial was conducted in Halaba in 2016 for 6 months, following Intervention (127) and Control (128) children, 6-12 months old. Caregivers were counselled on feeding children with egg and ESP and on safe homestead poultry husbandry. Chicken gift ceremony was conducted in intervention kebeles. Children received two egg-laying local chickens; caretakers promised not to sell or share eggs nor chickens, and to maintain two or more chickens.

Results: Within one month, 83% of children had ≥3 hens; this increased to 93% by endline. Average egg consumption by children increased from ≤2 to 17 eggs/month; control children remained at 2 eggs/month. Eggshell use was accepted. Most children in the intervention group consumed ESP mixed in hardboiled egg. There were more underweight (-2SD WAZ) and stunted (-2SD HAZ) children in the Control group with 28% and 36% than in the intervention group with 20% and 25%, respectively. Underweight was reduced by 15% in the Intervention arm while a slightly increasing pattern was observed in the control group. Stunting increased in both groups with similar trend; however severe stunting rate (-3SD HAZ) was increased at a slower rate in the Intervention group. Hemoglobin <11.0 g/dl was more prevalent in the Control group (22%) than in the Intervention (16.5%) but decreased in both groups at the same rate.

Conclusions: The effect of increased egg and ESP consumption was seen as reduction of underweight but not stunting. Benefits of increased egg and eggshell consumption on intake, however, may have been offset by having free-range chickens corralled in homes each night, with potential to negatively affect children's health.

Keywords: Malnutrition, hemoglobin, stunting, poultry, calcium.

PROCESS EVALUATION OF THE CLUSTER RANDOMIZED CONTROLLED TRIAL ACTIVITAL- A SCHOOL-BASED HEALTH PROMOTION INTERVENTION

(1)Ochoa, Angelica; (1)Ochoa Avilés, Angelica; (2)Verstraeten, Roosmarijn; (3)Andrade Tenesaca, Dolores Susana; (4)Andrade Muñoz, Diana Jesús; (4)Ramírez Jimbo, Patricia Liliana; (5)Donoso Moscoso, Silvana Patricia; (6)Kolsteren, Patrick.

(1)MD. PhD. Department of Biosciences. Faculty of Chemistry Sciences. Cuenca University. Ecuador.; (2)MSc. PhD. Consultant. Ghent-Belgium; (3)MSc. PhD. Department of Biosciences. Faculty of Chemistry Sciences. Cuenca University. Ecuador.; (4)Eng. MSc. Department of Biosciences. Faculty of Chemistry Sciences. Cuenca University. Ecuador.; (5)Bioq. MSc. Department of Biosciences. Faculty of Chemistry Sciences. Cuenca University. Ecuador.; (6)MSc, PhD. Department of Food Safety and Food Quality. Ghent University-Belgium.

Background and objectives: Process evaluations (PE) of behavioral interventions can help to understand pathways of change and assess the opportunities to implement the intervention in real practice. In Ecuador, the school-based health intervention ACTIVITAL was effective in decreasing adolescents intake of added sugar and unhealthy competitive food items as well as in decreasing waist circumference. We report the PE of the ACTIVITAL.

Methods: The trial involved 10 intervention and 10 control schools and was conducted among 1430 adolescents (12-14 years old). Interventions strategies involved the implementation of interactive healthy eating classes with adolescents, healthy eating workshops with parents and canteen staff, and social events A full pre-specified PE was performed to document the implementation of the ACTIVITAL intervention. Reach, dose, fidelity and barriers of the intervention were evaluated. Data collection comprised observations, face-to-face interviews and questionnaires, applied to adolescents, parents, teachers and school staff.

Results: ACTIVITAL was implemented in all the schools, 46% of the school teachers delivered the classes themselves (the remaining classes were implemented by external teachers). Students received 94% of the planned classes, and, teachers were motivated in 89% of them. The teachers demonstrated sufficient knowledge in 88% of the classes and their students enjoyed 93% of the delivered classes. All the parental workshops were implemented and all but one school participated in the school canteens workshops. All the parental and canteen workshops were delivered by experienced staff and the attendants showed a positive attitude, but parental reach was low (15%). Most of the adolescents enjoyed the social events. The main barriers were the difficulty to include the program in the school curriculum, the voluntary participation of the school teachers, lack of time to perform the classes, poor parental reach, difficulties to change the food and portion sizes served by the canteens staff and persistence of an adverse nutritional environment outside the school.

Conclusions: In general, the ACTIVITAL intervention was well implemented and its content was well received by the included audiences. Future programs should: incorporate the activities in the school curriculum, deal with poor parental participation and promote changes in the canteens by means of new formative research.

ANTENATAL NUTRITION BEHAVIOUR CHANGE COMMUNICATION: CHANGE IN BIRTHWEIGHT IN RURAL BANGLADESH

(1)Chowdhury, Morseda; (2)Dibley, Michael J.; (3)Alam, Ashraful; (4)Raynes-Greenow, Camille.

(1)PhD candidate. School of Public Health. The University of Sydney. Australia.; (2)Professor. Global Public Health Nutrition. School of Public Health. The University of Sydney. Australia.; (3)Postdoctoral Research Associate. International Public Health. School of Public Health. The University of Sydney. Australia.; (4)NHMRC Career Development Fellow. Sydney Medical School. School of Public Health. The University of Sydney. Australia.

Background and objectives: Historically Bangladeshi diet lacks diversity, heavily dependent on carbohydrates, mostly rice, contributing up to 86% of the total energy intake. Bangladesh observed a sluggish improvement in the nutritional status of women over the last decade. Almost a quarter (24.75%) of pregnant women are moderately malnourished and more than half of them (59.50%) are anemic. Rural pregnant women consume 1464 ($\pm$416) kcal energy per day, which is far below the recommended daily allowance. As a result, mothers deliver babies whose birthweight falls below the normal cut off level.

Methods: We conducted a cluster randomised controlled trial in one rural district of Bangladesh, where treatment was randomly allocated among 900 pregnant women selected from 36 clusters in equal proportion. Community health workers visited all pregnant women in both groups once in every month from conception till delivery and provided 'balanced plate nutrition education' to intervention group only. The outcome was difference in mean birthweight & low birthweight (LBW) rate. Socio-demographic data was collected on enrolment and outcome was measured within 72 hours after birth.

Results: The mean birthweight in the intervention group was 124g greater than that in the comparison group (2.86kg vs 2.74kg; P<0.001). The prevalence of LBW babies was 9.4% in the intervention group and 22.1% in the comparison group (P<0.001). Multivariate analysis revealed that the risk of LBW was 2.78 times lower in the intervention group than in the comparison group (P< 0.001) when adjusted for other variables in the model taking cluster effect into account.

Conclusions: Balanced plate nutrition education targeted to bring about changes in dietary behaviour with focus to meal balanced in energy and quality can improve birthweight of infants in situation where LBW is a major problem.

Keywords: Birthweight, nutrition education, pregnant woman.

DESIGNING AN INTEGRATED AGRICULTURE AND NUTRITION INTERVENTION TO IMPROVE MATERNAL AND CHILD NUTRITION IN RURAL BANGLADESH: A FORMATIVE RESEARCH

[1]Alam, Ashraful; [2]Bokshi, Anowarul; [3]ARA, GULSHAN; [4]Li, Mu; [2]McConchie, Robyn; [5]Khanam, Mansura; [6]Dibley, Michael.

[1]PhD. Research Fellow. Sydney School of Public Health. University of Sydney. Sydney. Australia.; [2]PhD. Agriculturist. Sydney Institute of Agriculture. Univerity of Sydney. Australia.; [3]MSc. International Centre for Diarrhoeal Disease Research Bangladesh. Bangladesh.; [4]PhD. Sydney School of Publeac Health. Univeristy of Sydney. Australia.; [5]MSc. International Centre for Diarrhoeal Disease Research Bangladesh. Bangladesh.; [6]MBBS. MPH. Sydney School of Publeac Health. Univeristy of Sydney. Australia.

Background and objectives: Despite remarkable progress in agriculture over the past three decades in Bangladesh, food and nutrition insecurity among the poor is common. Several parallel interventions in agriculture and nutrition exist that lack integration. This paper presents the formative research findings of a study that assesses the feasibility of an intervention that integrates agriculture and nutrition behavior change with financial incentives, to improve maternal and child nutrition among disadvantaged families.

Methods: We conducted qualitative exploration and stakeholder consultation. i) In-depth interviews with mothers of <5 children in very poor households, and their husbands; ii) Key-informant interviews with agriculture extension workers, local shop keepers and mobile banking operators; 3) Focus Groups with opinion leaders and elderly women. We also organized stakeholder meetings that was attended by nutrition researchers, activists and program managers from the government and non-governmental organizations. We finalized the intervention design, including the sites, based on the feedback from the formative research findings and the stakeholders.

Results: The families widely practiced home gardening irrelevant of land ownership. Seasonal vegetables are the dominant foods produced in the homestead. Some families raised hens and ducks. The households produced these foods for their own consumption. Gardening and poultry raising were found to be solely women's activities. Respondents reported small size of the homestead and seasonal flooding for home gardening, and lack of medical care for poultry as the main barriers. Respondents knew about mobile banking ('BKash'), although none of them experienced using it. The women received gardening information from their neighbors and relatives. Seeds were provided by the neighbors, NGOs, and often purchased from local agro-dealers. The stakeholders suggested that the Agriculture Extension Workers might only be involved as trainers of counselors because their current job description does not include home visits. They identified voice message as more suitable than text message, and stressed on weekly reminders.

Conclusions: This formative research informed the design of a feasibility study that will guide the design of an integrated agriculture-nutrition intervention, which will be implemented and evaluated at a larger scale in the future.

DETERMINANTS OF ADHERENCE TO MICRONUTRIENT POWDERS AMONG CHILDREN 6-11 MONTHS OF AGE IN RURAL ETHIOPIA

[1]Samuel, Aregash; [2]Putri Pamungkas, Nindya; [3]Brouwer, Ingeborg; [4]Adish, Abdul Aziz; [5]Kebebe, Amha; [6]Osendarp, Saskia.

[1]Msc. Nutritionist. Division fo Human Nutrition. Wageningen University. The Netherlands. Ethiopian Public HEalth Institute. Addis Ababa. Ethiopia.; [2]BSc. Nutritionist. Division of Human Nutrition. Wageningen University. The Netherlands; [3]PhD. Nutritionist. Division of Human Nutrition. Wageningen University. The Netherlands.; [4]PhD. Deputy Regional Director. Micronutrient Initiative. Addis Ababa. Ethiopia; [5]PhD. Director General. Ethiopian Public Health Institute. Addis Ababa. Ethiopia; [6]PhD. Nutritionist. Division of Human Nutrition. Wageningen University. The Netherlands. Micronutrient Initiative. Canada.

Background and objectives: Micronutrient powders (MNPs) is a promising approach to improve micronutrients intakes of children in Ethiopia where malnutrition remains a public health concern. Adherence is a key element to reach successful implementation of delivering micronutrients to children. Identifying adherence and factors associated with adherence is essential to evaluate the effectiveness of MNPs and to provide necessary information for future MNP program implementation in Ethiopia.

Methods: A total of 1193 children aged 6-11 months were provided with MNPs during a seven-month intervention. Adherence and determinants of adherence were assessed monthly through the mothers. Adherence was measured by counting the number of MNPs sachets used, and determinants were assessed using a Knowledge, Attitude, and Practice (KAP) questionnaire. Adherence was defined in two ways: adherence based on distribution scheme and adherence based on instructions. Generalized Estimating Equation (GEE) analysis was performed to examine factors that determine adherence.

Results: Adherence fluctuated over time, with an average of 58% for adherence to distribution and 28% for adherence to instruction. On average, children consumed 95 out of total 120 sachets provided during the study. Each month, >80% of mothers reported that the child liked MNPs and > 90% responded that MNPs were easy to use. The factors of MNPs found easy to use, child liked MNPs, support from surrounding people and mother's age>25 years were positively associated with adherence of mothers to give MNPs to their children. Meanwhile, a far distance from home to the health post, knowledge of MNP correct use, perceiving negative effects and living in South Nation, Nationalities and People Region (SNNPR) had negative associations with adherence.

Conclusions: Despite an overall low adherence, the average 95 sachets of MNPs consumed over the study were reasonably good. MNPs were also well accepted by both mothers and children. It suggests that the MNP program has potential to be expanded, by taking into account the factors that positively and negatively determine adherence.

Keywords: Micronutrient powders, adherence, young children, Ethiopia.

Department of Nutrition Research. National Nutrition and Food Technology Research Institute and Faculty of Nutrition Sciences and Food Technology. Shahid Beheshti University of Medical Sciences.; (6)PhD. Sociology. Department of Community Nutrition. National Nutrition and Food Technology Research Institute. and Faculty of Nutrition Sciences and Food Technology, Shahid Beheshti University of Medical Sciences.

Background and objectives: Food and nutrition literacy may be the underlying factor that protects nutritional quality during transitions. This study evaluates the association between Food and Nutrition Literacy (FNLIT) and dietary habits of elementary school children in Tehran, Iran.

Methods: This cross-sectional study was undertaken on 803 students (419 boys and 384 girls) aged 10–12 years from 44 elementary schools in Tehran city. Demographic and socio-economic characteristics were collected through interviewing students and their mothers and/or caregivers. Food and nutrition literacy (FNLIT) was measured by a locally designed and validated self-administered questionnaire consisted of 46 items in 7 subscales. Dietary habits over the last 7 days were assessed by a questionnaire. The multinomial adjusted Odds ratios of food and nutrition literacy for dietary habits were analysed.

Results: High level of FNLIT cognitive domain were negatively associated with breakfast skipping (1-2 times a week; OR= 0.32, CI=0.17-0.60), eating lunch less than 7 days a week (nev-

er/1-2 times a week; OR= 0.40, CI=0.17-0.93, 3-6 times a week; OR= 0.45, CI=0.25-0.80) and eating dinner less than 7 days a week (never/1-2 times a week; OR= 0.32, CI=0.17-0.68). Also, negative relation between high FNLIT scores in skill domain and breakfast skipping was observed (3-6 times a week; OR= 0.33, CI=0.13-0.78). FNLIT skill domain had an evident positive relation with frequency of eating honey/jam (never eating; OR=0.44, CI=0.21-0.92; eating 1-2 times a week; OR=0.33, CI=0.14-0.76) and never eating sweet snacks (OR=2.84, CI=1.07-7.49). High FNLIT cognitive domain was contributed to never eating sausage/hamburger (OR=2.20, CI=1.01-4.83) and never eating salty snacks, (OR=2.82, CI=1.21-6.54).

Conclusions: Our findings highlighted the association between food and nutrition knowledge, skills and capacities and dietary behaviors. This evidence suggests that food and nutrition literacy can play an important role to facilitate healthy dietary behaviors of children. In addition, more emphasis in the development of skills in food and nutrition literacy is essential.

Keywords: Nutrition literacy, dietary habits, school age children, Iran.

Instituto PENSI/Hospital Infantil Sabará/ Fundação José Luiz Egydio Setúbal . Brazil.; (5)BSc. Speech Therapist. Centro de Dificuldades Alimentares. Instituto PENSI/Hospital Infantil Sabará/ Fundação José Luiz Egydio Setúbal . Brazil.; (6)MD. Pediatrician. Centro de Dificuldades Alimentares. Instituto PENSI/Hospital Infantil Sabará/ Fundação José Luiz Egydio Setúbal . Brazil.; (7)BSc. Nutricionist. Centro de Dificuldades Alimentares. Instituto PENSI/ Hospital Infantil Sabará/ Fundação José Luiz Egydio Setúbal . Brazil.; (8)PhD. Pediatrician. Centro de Dificuldades Alimentares. Instituto PENSI/Hospital Infantil Sabará/ Fundação José Luiz Egydio Setúbal . Brazil.

Background and objectives: Given the positive influence of responsive caregiving on dietary habits in childhood, to raise awareness of caregivers regarding their feeding behaviors is crucial in multiprofessional care on infant feeding. Objectives: Identification of most common responsive and nonresponsive feeding

practices in mothers of children with feeding complaints, as well as to seek associations between practices and caregivers' profile.

Methods: Cross-sectional study with 77 children under 18 years old, with complaints of feeding difficulties. Data were collected during interviews with mothers: children's age, gender, duration of exclusive breastfeeding, presence of organic disease, dynamics of bottle use (normal/prolonged bottle feeding), self-feeding practices and posture at meals (adequate / inadequate), use of appropriate feeding equipment; basic maternal demographic information (parity and level of education), feeding style (according to Hughes et al 2005), presence of coercive feeding, frequency and characteristics of family meals. ANOVA test, Chi-Squared test and binary logistic regression were used, with significance level at 5%.

Results: Results a: The nonresponsive profile predominated among mothers (76.2%, with the Authoritarian style being the most prevalent - 39.7%). The responsive profile ('authoritative' style) was characterized by absence of coercive feeding, stimulation of self-feeding practices, use of appropriate feeding equipment and meal environment, with interaction at meals. Nonresponsive profile ('authoritarian', 'indulgent' and 'negligent' styles combined) consisted of both inadequate environment and posture at meals, use of distraction and coercive feeding, lack of shared meals, and disregard for children's hunger signals. The habit of sharing meals with children was associated with mothers' profile, and considered a protection factor against nonresponsive care (OR 0.23; 95% CI 0.06-0.88). Both Authoritarian (p = 0.000) and indulgent mothers (p = 0.007) breastfed exclusively for longer periods of time when compared to negligent ones. There was a higher level of interaction with children in "responsive" parental style (OR 0.056; p = 0.01) compared to non-responsive styles combined.

Conclusions: Results highlight the need for educational interventions focused on caregivers' behaviors in families with feeding complaints.

Keywords: Responsive caregiving, motherhood, feeding practices, feeding difficulties, feeding complaints.

Department of Community Nutrition. National Nutrition and Food Technology Research Institute and Faculty of Nutrition Sciences and Food Technology. Shahid Beheshti University of Medical Sciences, Tehran. Iran.

Background and objectives: One of the most important personal skills to enable individuals to control the predictors of their health is food and nutrition literacy. Food and nutrition literacy like health literacy should be conceptualized as an asset and a protective factor. This study aimed to measure food and nutrition literacy and its predictive factors among urban 10-12 year-old children in Iran.

Methods: This cross-sectional study was undertaken on 803 students (419 boys and 384 girls) aged 10–12 years from 44 elementary schools in Tehran city, Iran. Food and nutrition literacy (FNLIT) was measured by a locally designed and validated questionnaire consisted of 46 items in 7 subscales. Adjusted binary regression logistic was used to assess the extent to which various independent covariates may predict low food and nutrition literacy as dichotomized outcome variables.

Results: Approximately 11.6% of students had low total food and nutrition literacy score. The majority (68.8%) of students had high scores in cognitive domain but was poor in skill domain (%2.6). The most important predictive factor of low total food and nutrition literacy was lower level of maternal education (OR=0.29, CI=0.09-0.87). The most important predictive factor of low nutritional health knowledge were father age in 30-40 year-

old compared with younger fathers (OR=0.12, CI=0.02-0.57) and Azeri ethnicity (OR=3.4, CI=1.35-8.71). Girls compared to boys (OR=0.30, CI=0.15-0.59) and students in 6th grade compared with those in 5th grade (OR=0.51, CI=0.28-0.93) had higher level of food choice literacy. Other predictive factors of low food choice literacy were lower mother education level (OR=0.16, CI=0.04-0.56) and younger age of mothers (OR=0.45, CI=0.21-0.96). Girls had lower level of critical food and nutrition literacy than boys (OR=1.57, CI=1.14-2.15). Probability of low critical literacy in later-birth children was higher than first-birth children (OR=1.50, CI=1.00-2.25). The students whose fathers' were older (≥ 46 years old) had better level of critical literacy (OR=0.56, CI=0.33-0.94).

Conclusions: Findings showed that despite desirable scores in cognitive domain, different aspects of food and nutrition literacy skills in primary school students are quite low. In planning future programs to promote food and nutrition literacy, more emphasis on skill development, considering socio-demographic predictors is recommended.

EASIER TO CHANGE ENVIRONMENTS THAN TO CHANGE BEHAVIOR? RETHINKING FOOD CHOICE DYNAMICS INCREASE SALES OF HEALTHY SNACKS AMONG YOUNG PEOPLE IN VOCATIONAL SCHOOL CANTEENS

[1]*Mikkelsen, Bent Egberg;* [2]*Romani, Annette Quinto.*

[1]PhD. Professor. Department of Clinical Medicine. Captive Foodscape Studies. Aalborg University. Copenhagen. Denmark.; [2]PhD. Department of Sociology, Aalborg University.

Background and objectives: Improving the dietary patterns of young people in a healthier direction is of considerable societal concern. Traditional approaches rest on the assumption that information an education can facilitate such change. However, studies have shown that such approaches tends to benefit those already complying with official nutritional advice whereas the socially less advantaged tends to benefit less. As a result, there is an increasing interest in interventions targeting the environment. According to dual process behavioral psychology changes in the environmental design – often referred to as nudgings - holds the potential to influence the consumer to make healthier decisions. The aim of this study was to examine if influencing food choice dynamics by slightly altering the choice architecture by relocating and re-exposing the healthy option could increase sales of healthy snacks among young people in vocational school canteens.

Methods: A healthy eating intervention was developed for young people in canteens of 13 vocational schools. The subjects attending is mainly young men between 16 and 19 years of age. A healthy snack pack not previously offered was developed. The intervention targeted the access to healthy snacks using 2 environmental change strategies. Salience of the healthy snack pack was

increased and customers were re-exposed to the healthy option more places. Sales data were collected pre/post test by canteen staff according to a protocol agreed with management canteens.

Results: The results showed that significantly more students chose the healthy snacks when measured follow up after the intervention compared to baseline before. Sales of the unhealthy snacks did not change significantly.

Conclusions: If students at vocational schools are to opt out unhealthy snacks and replace them with healthy alternatives, consideration should be given both to increase the exposure of healthy snacks and simultaneously undertake similar actions in the unhealthy snacks, for example by removing them or placing them less visibly in the canteen. Rethinking choice dynamics in self service food lay-outs through easy to implement minor changes seems to be able to change uptake of healthy options. More research is needed to explore effects and potentials of changing food choice architectures.

Keywords: Nudging, healthy eating, choice architecture, food environment, self service catering.

ILLEGAL COMMERCIAL SALES OF INFANT FORMULA AND INFANT PRODUCTS IN RIO DE JANEIRO CITY, BRAZIL

[1]*Boccolini, Cristiano Siqueira Boccolini;* [2]*Couto de Oliveira, Maria Inês;* [3]*Afonso Bertoldo, Lucilene;* [4]*Borges da Silva, Karine;* [5]*Priscila Nunes Rodrigues, Gloria.*

[1]PhD, Institute of Scientific and Technological Communication and Information for Health. Fiocruz. Brazil; [2]PhD. MEB. Universidade Federal Fluminense. Brazil; [3]PhD candidate. PPGICS. ICICT. Fiocruz. Brazil; [4]MsC. PPGSC. MEB. UFF. Brazil; [5]PPGSC. MEB. UFF. Brazil.

Background and objectives: The International Code of Marketing of Breast-milk Substitutes was decreed in 1981 by WHO in response to general breastfeeding decline observed trough the World. The aim of this document was to incentivize countries to introduce advertisement codes and legislation in order to protecting breastfeeding against predatory industry marketing strategies. In Brazil, the "International Code" was implemented as national regulation in 1988 and became a national law in 2006, named "Norma Brasileira de Comercialização de Alimentos para Lactentes e Crianças de Primeira Infância, Bicos, Chupetas e Mamadeiras" (NBCAL), in which, among other measures, infant formula, baby bottles and pacifiers cannot have special sales when commercialized. However, a NGO named International Baby Food Action Network has been reporting several marketing violations all over Brazil. The aim of this study was to evaluate commercial sale of infant formula and products related to baby feeding.

Methods: Cross-sectional study representative of Rio de Janeiro city's South-Zone, Brazil, a region with population from all

---

social classes, where a sample of 60% of stores that commercialize products in the scope of NBCAL were evaluated between March and April, 2017 (n=195). All commercialized products not allowed to have special sales were considered: Infant Formulas (IFO), Infant Formulas for Special Needs (IFO_SN) and baby bottles, pacifiers and nipple protection shells (BBPN).

Results: Among 195 stores evaluated, 68.4% were pharmacies, 23.7% supermarkets and 7.9% department stores. Among those, 83.6% commercialized IFO, 63.6% IFO_SN and 74.3% BBPN, and 22.3% had illegal commercial sales. Considering stores that commercialized IFO's (n=163), 14.7% had illegal sales; among those commercializing IFO_SN's (n=124), 11.3% violated the NBCAL law; and considering BBPN's commercialization (n=145), 11.7% stores had illegal sales.

Conclusions: The high prevalence of illegal commercial sales of infant formulas, baby bottles, pacifiers and nipple protection shells, with violations ranging from special exposition to individual discounts, suggests the need of reinforced vigilance by the governmental agencies. The disrespect of stores and infant food companies with the NBCAL law may be jeopardizing the family ability to choose the best way to feed their babies.

Keywords: Marketing. Breastfeeding. Infant Formula. Pacifier

FREE TIME, RECREATION AND ITS RELATIONSHIP WITH THE NUTRITIONAL STATE BY BODY MASS INDEX, IN UNIVERSITY POPULATION

[1]Hernández Juan, Patricia; [2]Hernández Juan, Patricia; [3]Bezares, Vidalma del Rosario Sarmiento; [3]Solís López, Magnolia; [4]León Gonzaléz, Juan Marcos; [5]Bezares Parada, Alma Cristina; [6]Pascacio González, María del Rocío.

[1]PhD. Instituto de Estudios Universitarios; [2]PhD. Full Time Research Professor (PITC) IEU; [3]PhD. Full Time Research Professor (PITC) UNICACH; [4]Nutritionist, Full Time Research Professor (PITC) UNICACH; [5]Nutritionist UNICACH; [6]Nutritionist, Professor (PITC) UNICACH.

Background and objectives: Free time is not currently used for activities that fully benefit the health of the individual. Health involves working productively and actively in social life. The objective of the research was to determine the habitual activities in leisure time and recreation, relating it to the nutritional state of the UNICACH University population.

Methods: The main activities performed in the free time were classified, and a diagnosis was made regarding gender, age, occupation, and body mass index (BMI), applied through a sample of 20% (905 individuals), random sampling Stratified: CU-UNICACH teachers, administrators and students, men and women 18 years and older, with letter of informed consent. Application of questionnaire "Use of free time" (reliability of 0.84 Cronbach Alpha). Equipment: mechanical scale model 761, (150 kg), portable stadiometer (120 cm), brand SECA. BMI assessed with Quetelet cohort points, expressed as percentage and ANOVA.

Results: The university community devotes its free time: to use electrical appliances (internet of 1 to 3 hours / day), to social networks, to eat and to sleep (5 to 8 hours); Teachers and students report that they generally nap, do not attend cultural events organized by the university and do not use sports facilities; 27.2% were overweight, 7% some degree of obesity, with a higher prevalence in the age group of 20-29 years; In the category student predominated male sex and 1.8% underweight in the female

Conclusions: The University population does not have a healthy lifestyle, not making good use of their free time, with important percentage of high weight.

Keywords: Free time, university, usual activities.

PROMOTION OF LOCAL AGROBIODIVERSITY IMPROVES DIETS OF WOMEN AND CHILDREN IN NORTH WEST VIETNAM: A CLUSTER RCT

[1]Raneri, Jessica E; [2]Hoang, Ky; [3]Berti, Peter; [4]Kennedy, Gina; [5]Lachat, Carl.

[1]MSc. Healthy Diets from Sustainable Food Systems Initiative. Bioversity International. Italy. MSc. Department of Food Safety and Food Quality. Faculty of Bioscience Engineering. Gent University. Belgium.; [2]MPh. Health Nutrition and Food Security Program. HealthBridge Foundation Canada. Vietnam.; [3]PhD. HealthBridge Foundation. Canada.; [4]PhD. Healthy Diets from Sustainable Food Systems Initiative. Bioversity International. Italy.; [5]PhD. Department of Food Safety and Food Quality. Faculty of Bioscience Engineering. Gent University. Belgium.

Background and objectives: Local agrobiodiversity has the potential to improve diet quality. Ethnic minority groups in NorthWest Vietnam have poor nutrition despite the region being an agrobiodiversity hotspot. A cluster randomized control trial was conducted in NorthWest Vietnam.

Methods: Four communes were randomly selected and allocated to control and intervention groups. From each, 85 women with at least one child aged 12-24 months were randomly selected. The one-year intervention was community-based farmer field school-like model (clubs). These promoted increased diversity of target food groups (FGs) produced and consumed based on identified low consumption in the baseline: pulses and vitamin A-rich vegetables and fruits. From these, neglected crops (produced by <40% of households) were selected by communities as 'target crops'. Clubs delivered training on two components: 1) Nutrition education and cooking demonstrations and 2) Agricultural capacity building in home gardens. Dietary intake was assessed using an administered quantitative 24-hour recall.

Results: After controlling for pre-intervention values, child sex and age, mother age and education and household income, 37% more women and 18% more children met Minimum Dietary Diversity Score (MDDS) compared to the control group. MDDS

increased significantly in the intervention group by 0.4 (p<0.01) and 1.4 (p<0.08) in children and women respectively. The number of species consumed increased more in the intervention than control, by 1 species in women and 4 in children (P<0.001 for both). The mean quantity of target FGs consumed per day also increased more in the intervention group. For women, pulses increased by an average of 47g/day (p<0.05); vitamin A-rich vegetables by 47g (p<0.001) and for vitamin A-rich fruits by 11g (p<0.001). For children, consumption of pulses, vitamin A-rich vegetables and vitamin-A rich fruits increased by 40, 26 and 3 grams, respectively (p<0.05, p<0.001, and p<0.01 respectively). Mean micronutrient intakes also increased more in the intervention group, especially for Vitamin A (RE), Vitamin C, B2, Folate, Calcium, Iron and Zinc.

Conclusions: Diet diversity and quality increased significantly after the intervention. This is consistent with previous global research demonstrating links between agrobiodiversity and food and nutrition security. We recommend replication of the study in different farming and agroecological systems.

Keywords: Diet diversity, Home gardening, Vietnam, Agrobiodiversity, Nutrition Education.

FOOD SUPPLY AT CHILDREN SCHOOL CENTERS, AND PRESCHOOLARS' NUTRITIONAL STATE BEFORE AND AFTER FOOD NUTRITION ORIENTATION

[1]Bezares Sarmiento, Vidalma del Rosario; [2]Ballinas Aquino, José Manuel Ballinas Aquino; [3]León González, Juan Marcos; [4]Toalá Bezares, Karina Jeanette; [2]Cruz Serrano, Nely Isabel; [3]Coello Trujillo, Verónica Guadalupe.

[1]Phd. Facultad de Ciencias de la Nutrición y Alimentos. Universidad de Ciencias y Artes de Chiapas; [2]PhD. Doctor. Facultad de Ciencias de la Nutrición y Alimentos. Universidad de Ciencias y Artes de Chiapas. México; [3]Msc. Nutritionist. Facultad de Ciencias de la Nutrición y Alimentos. Universidad de Ciencias y Artes de Chiapas. México; [4]Msc.Communicator. Facultad de Ciencias de la Nutrición y Alimentos. Universidad de Ciencias y Artes de Chiapas. México.

Background and objectives: The 21% of the caloric intake in kids comes from sugary drinks. In Mexico, over-weight and obesity has increased by a 26%, mainly due to preschoolers' sedentary lifestyle; The objective of this research was to gather data regarding the food offer at children school centers in Tuxtla Gutiérrez, Chiapas, México, and to offer food orientation in order to see changes in preschoolers' nutritional state

Methods: Investigation at the convenience of the researcher, with the authorization of parents and managers of the institution through personalized service, applied in 62 preschoolers, aged between 3 to 6 years, applied to children's school. The study variables were: weight / age (P / E), weight / height (P / T), height /

age (T / E). The equipment used was: mechanical scale model 761, (150 kg), portable meter (120 cm), brand SECA. The observation of foods available in and out of school was done through a tracking log. In educational guidance, didactic games and images were used, aimed at mothers and children, with two times of anthropometric assessments for preschoolers

Results: Food availability was 59% high energy density, low in fiber, with higher consumption of fried preparations, sweetened waters and sweet. Size for age improved 7.7%, from Normal: 58.1% to 65.8%; On the other hand the low cut went from 25.8% to 20.9%. In the case of weight for height improved 3.2%, from the Normal status figure: 56.4% to 59.6%, as well as the Low weight step from 30.8% to 12.9%; Although in a negative way, the results show a weight increase of 2.9 to 27.5%, predominantly in children. With regard to weight for age improved 19.3%, from Normal: 42% to 61.3%; In the case of the deficit, malnutrition increased from 46.9 to 16.1%, but, with an increase in overweight or obesity of 11.4% (11.2 to 22.6%, higher in children

Conclusions: Obesogenic atmosphere at children school centers. The orientation towards mothers and children turned out beneficial to increase normality rates in nutritional state. A considerable number of mothers over-concerned about increasing their children's weight; by not improving the food offer availability this phenomena will grow

Keywords: Food, preschool, orientation.

PROCEDURAL ASSESSMENT IN FOOD AND NUTRITION EDUCATION GROUPS FOCUSING ON AUTONOMY FOR FOOD CHOICES

[1]Vieira, Viviane Laudelino; [2]Zillesg Borges dos Santos, Bruna; [1]Caesar de Andrade, Samantha.

[1]PhD in Science. Food and Nutrition Reference Center (CRNutri). School Health Center Geraldo de Paula Souza. School of Public Health - University of São Paulo. Brazil.; [2]Undergraduate in Nutrition. Department of Nutrition. School of Public Health. University of São Paulo. Brazil.

Background and objectives: The assessment of food and nutrition education (FNE) actions can be considered a big challenge to the nutritionist, with the tendency to reduce it to quantitative indicators. Given that, this article describes the use of field diary as a procedural evaluation technique for FNE groups with focus on the autonomy for food choices.

Methods: Twelve reports from field diaries produced by two facilitators of the FNE groups (G1 and G2) and also, following the operating group benchmarks, were used. The groups presented 6 weekly meetings (1h30). In total, participated 10 people from G1 and 15 from G2, in addition to the facilitator and one observer. After each meeting, these steps were followed: (1) preliminary discussion immediately after the meeting, (2) field diary writing and (3) evaluation of the previous meeting and planning of the next one. There were successive diaries readings and plannings,

---

allowing the identification of evaluation vectors proposed by Pichon-Rivière: communication, belonging, learning, tele, cooperation and relevance.

Results: Initially, it was delegated to the facilitator the leadership on knowledge proposition, however, it was provided a collective construction of different aspects related to health and nutrition, resulting in learning with greater significance among participants. The communication process has been developed during the weeks, both related to the facilitator, as well as among participants. In the G2, it was noted an initial difficulty in people's interaction, which was eventually overcome as participants began to feel as a part of the group (belonging). Cooperation was explicit in G1, noted by how participants felt responsible for each other. As the meetings were occuring, more intense affinities (G1) and rejections (G2) could also be observed (tele). The tasks proposed in the meetings were eventually questioned both by G1 as G2, in addition, in face of participants' demands, adjustments were made for greater relevance.

Conclusions: Field diary consisted in an accessible and distinguished technique not only to guide the assessment of the meeting but also the planning for the next one, enabling a better understanding of each participant profile, mainly of the group's movements as a whole, contributing to the improvement of the facilitator 's performance.

MEXICAN FOOD BANKS: FROM ALLEVIATING FOOD INSECURITY TO PROMOTING HEALTHY EATING HABITS

[1]Cepeda Lopez, Ana Carla; [2]Quiroga Garza, Angélica; [3]Delgado González, Erika; [4]Vera Sayago, Ana Maria; [5]Plascencia Mendoza, Eduardo; [6]Leyva Ramos, Ana Cristina; [7]Banda Cambron, Sergio Antonio; [8]Ortiz-Tirado Aguilar, Almendra.

[1]PhD. MSc. MD. Ciencias de la Salud. Universidad de Monterrey. México.; [2]PhD. Psychologist. Departamento Académico de Psicología. Universidad de Monterrey. México.; [3]MSc student. MD. División de Ciencias de la Salud. Universidad de Monterrey. México.; [4]MD. División de Ciencias de la Salud. Universidad de Monterrey. México.; [5]Certified Chef. Centro de Investigación Innovación Gastronómica. México.; [6]Nutritionist. Banco de Alimentos de México. México.; [7]BS nutrition student. Banco de Alimentos de México. México.; [8]Sociologist. Banco de Alimentos de México. México.

Background and objectives: Mexico, as many other countries, is currently facing both sides of malnutrition. This problem goes beyond food availability and involves food quality. We are facing a diet transition that includes more processed food and inadequate vegetable intake. Food banks alleviate immediate food insecurity, and recently their ability to promote healthy nutrition has been recognised to play a central role.

In a descriptive study, previous to an educational program that aims to educate, train, and empower food bank recipients with the information and skills they need to improve eating patterns and preserve their health and the family's well-being: "Comer en Familia", a situational study was conducted.

Methods: 755 women/caregivers recipients of a food bank in San Cristobal de las Casas, Chiapas were surveyed about cooking knowledge, attitudes and behaviors.

Results: When asked about cooking tools and appliances 91% refer to own a blender, 61% a refrigerator, 34% a stove and 20% a microwave. Only 25% own a traditional "molcajete" (wrinding stone), 31% a Corn mill and 7% a metate (traditional flat stone used for grinding corn). Most of them own a pewter (62%) or aluminum (44%) pot, while 12% own a clay pot. Most participants (92%) cook at home and enjoy cooking for their family. 70% spend around 30 minutes to 1 hour cooking per day. Also, most of them eat at home (90%) together with their families (76%). However, 61% find it difficult to have access to fruits and vegetables at their communities, and 56% considered that eating healthy is expensive.

Conclusions: Food banks are potential sites for effective nutrition promotion programs by improving access to healthy and affordable food together with nutrition education such as cooking from scratch and getting the most from their food. Preliminary findings also suggest that women play an important role in the family's health. They are the caretakers of household food and nutrition security. Therefore, educating, training, and empowering women with the information and resources they need to improve eating patterns and preserve their health and the family's well-being is key to achieving food security in Mexico and deserves further study.

INFLUENCE OF MEAL CULTURES ON FOOD AND NUTRITION SECURITY: A CASE OF AFRICAN INDIGENOUS VEGETABLES IN KENYA

[1]Musotsi, Anne; [2]Abukutsa, Mary.

[1]Nutritionist. Department of Nutritional Sciences. Masinde Muliro University of Science and Technology. Kenya; [2]PhD. Horticulture. Department of Horticulture. Jomo Kenyatta University of Agriculture and Technology.Kenya.

Background and objectives: As Kenya focuses on achieving the sustainable development goals (SDGs), persistent food insecu-

rity and high level of poverty in over 50% of the population are still prevalent in some parts of the country. Contrastingly, the prevalence of metabolic syndrome (MS) associated with excess intake of calories is 34.6%. Various micronutrient deficiencies are also prevalent. Intervention measures, therefore, have to address both excessive and inadequate intake of nutrients. The use of African Indigenous Vegetables (AIVs) to alleviate hunger and malnutrition in Africa is under study. African Indigenous Vegetables are nutritionally superior to their exotic counterparts in some respects, have several agronomic advantages and some are also reported to have medicinal value. This notwithstanding, consumption of AIVs has been decreasing in some parts of Kenya. This trend is accompanied by loss of diversity and indigenous knowledge on preparation and cooking of AIVs. The objective of this research was to establish the preparation and cooking methods and consumption of AIVs in Kenya. The research questions were: which factors determine AIV consumption and how do meal cultures affect consumption patterns of AIVs?

Methods: The research design was a qualitative approach involving focus group discussions, cooking-along interviews and participatory observation as well as expert interviews. Research areas were Nairobi (urban), Nakuru (peri-urban), Kakamega (rural). The sample size was 50 (expert interviews, FGD, cooking along interviews), which were conducted between March 2015 and October 2016. Findings showed that eight varieties of AIVs were commonly consumed in various parts of Kenya.

Results: Findings showed that eight varieties of AIVs were commonly consumed in various parts of Kenya. More varieties were consumed in rural than urban areas. Indigenous knowledge, time for preparation and cooking, gender relations, price and perception were among factors that influenced consumption of AIVs. Further, consumption largely depended on ethnicity and the cultural practices influencing choice of food in various ethnic groups.

Conclusions: The study concluded that for optimal utilization of AIVs for food and nutrition security, there is need for interventions to promote acceptability of foods across different ethnic groups in Kenya and to overcome obstacles to preparation, cooking and consumption of AIVs.

Keywords: African Indigenous Vegetables, meal cultures, food and nutrition security.

Conflict of Interest Disclosure: This is part of my PhD work registered at Jomo Kenyatta University of Agriculture and Technology, Kenya

WHAT IS THE QUALITY OF SCHOOL MEALS IN BRAZIL?

(1)Camargo, Rafaella; (2)Domene, Semiramis.

(1)MSc. Dietitian. Federal University of São Paulo, Baixada Santista Campus. Institute of Health and Society, Graduate Program in Food, Nutrition and Health. Santos. São Paulo. Brazil.; (2)PhD. Dietitian. Federal University of São Paulo, Baixada Santista Campus. Institute of Health and Society. Department of Public Policies and Collective Health. Santos. São Paulo. Brazil.

Background and objectives: Brazilian is recognized internationally through the National School Meal Program (PNAE). PNAE, created in 1954, is reference for other countries in view of their universal coverage, perenniality, specific regulatory legislation, articulation with other policies and advances in relation to family agriculture.

Despite the importance of monitoring the policy for Food and Nutrition Security, there is still a lack of information about the quality of Brazilian school menus. Objective this study is to assess the quality of Brazilian school meals.

Methods: This cross-sectional study analyzed 2500 menus from 500 Brazilian municipalities. Menus were assessed by the Quality Index for School Meal Menus. This method proposes the evaluation of the weekly menu according to the following criteria: a) daily supply of cereals and tubers, legumes, vegetables, fruits, meat and eggs, dairy products, sweets as substitutes for meal, cured meats and sausages; B) weekly frequency of the sweets as dessert and ultra-processed foods; C) eventual offer of a second meal and meal timing adequacy. Data were analyzed by descriptive statistical analysis.

Results: A total of 29.4%, 50.6%, and 20% of the study menus presented high, intermediate, and low quality, respectively. Grains and tubers (86%) and meats and eggs (67%) groups presented the highest frequencies in the menus, followed by legumes (42.16%), vegetables (40%), fruits (35.56%), and dairy products (18.6%). Cured meats and sausages (8.68%) and sweets in place of meals (3.64%) were less frequent. Of the other components, 84.6% of the menus did not include sweets for dessert or included them only once a week. Ultra-processed foods appear in 65.6% of the menus at least once a week. Meal time was compatible with meal type in 22% of the sample.

Conclusions: Important foods for healthy and adequate diet, such as dairy products, vegetables, and fruits, are not provided regularly by Brazilian school meals. Despite the advances in policy management, the use of ultra-processed foods is still frequent in the menus.

Keywords: School feeding, menu planning, quality index.

ASSESSMENT OF NUTRITIONAL QUALITY AND SAFETY OF WINGED TERMITES (MACROTERMES BELLICOSUS) ENRICHED LOCALLY FORMULATED COMPLEMENTARY FOODS FROM SOUTH-WEST, NIGERIA

[1]Kayode, Ajayi; [2]Oladejo Thomas, Adepoju.

[1]BSc. MSc. Department of Human Nutrition and Dietetics. College of Medicine and Health Sciences. Afe Babalola University. Ado-Ekiti. Ekiti State. Nigeria; [2]BSc. MSc. PhD. Department of Human Nutrition. Faculty of Public Health. College of Medicine. University of Ibadan. Ibadan. Oyo State. Nigeria.

Background and objectives: Adequate nutrition during first 1000 days of life is crucial to child's healthy growth. Blending of local staple foods with edible insects which are nutrient dense can improve nutrient intake and prevent early childhood malnutrition. Nutritional quality and safety of Macrotermes bellicosus enriched locally formulated complementary foods (CFs) was assessed using rats

Methods: Macrotermes bellicosus (MB) were collected during their swarming, roasted for 10 minutes, and refrigerated at -4oC. Ground MB was added to boiled rice (BR) and boiled yam (BY) in ratio 10.0%, 15.0% and 20.0% (w/w) levels to give BR1 and BY1; BR2 and BY2, and BR3 and BY3 respectively. Nutrient and anti-nutrient composition of MB, BY, BR and the MB-enriched CFs were determined using standard AOAC methods. Nutritional quality of two best MB-enriched CFs were assessed using Wistar strain rats (six per group) fed adlibitum for 28 days. Serum trace minerals in MB-enriched CFs, control and basal diets were assessed using standard methods, and histopathological effects of CFs on rats' kidney, liver and spleen were determined. Data were analysed using descriptive statistics and ANOVA at α 0.05.

Results: Roasted MB contained 31.8g protein, 16.4g fat, 3.8g ash, 227.5mg calcium, 2.1mg iron, 15.0mg zinc, 330.4µg retinol equivalent (RE), 6.7µg vitamin D, 0.1mg trypsin-inhibitor, and yielded 529.0kcal energy/100g sample; while 100g of BR and BY contained between 3.7-5.9g protein, 2.4-2.7g fat, 2.6-2.7g ash, 70.0-120mg calcium, 4.2-5.6mg iron, 1.2-1.5mg zinc and yielded 380-386kcal energy. Enriched CFs contained 7.9-15.3g protein, 2.9-4.1g fat, 4.1-4.5g ash, 242.2-264mg calcium, 2.4-4.4mg iron, 15.1-19.8mg zinc and yielded 357-372kcal energy/100g sample. Enriched CFs showed significant increase in nutrient content compared with BR and BY ($p<0.05$). Serum trace minerals in rats fed with two best MB-enriched diets ranged between 3.4-4.3mg zinc, 23.4-27.9mg calcium, 30.6-37.0mg iron and 52.5-56.9µg RE, which were significantly higher than control (3.2, 22.2, 34.1, 48.2) and basal (2.2, 21.1, 24.0 mg, 32.3 µg) diets respectively. No pathological lesions were observed in the internal organs of rats fed CFs diets.

Conclusions: Adding Macrotermes bellicosus to local complementary foods improved their nutrient and gross energy content, hence its use should be encouraged among mothers

Keywords: Macrotermes bellicosus, complementary foods, nutritional quality, trace elements, minerals.

GREATER IMPROVEMENTS IN CHILD GROWTH AND DIET QUALITY AFTER A HOLISTIC COMMUNITY DEVELOPMENT INTERVENTION THAN AFTER NUTRITION TRAINING ALONE

[1]Miller, Laurie; [2]Joshi, Neena; [3]Lohani, Mahendra; [4]Rogers, Beatrice; [5]Mahato, Shubh; [6]Neupane, Sumanta; [7]Ghosh, Shibani; [8]Neupane, Shailes; [9]Webb, Patrick.

[1]M.D. Professor of Pediatrics. Tufts University School of Medicine. Boston MA. USA.; [2]Director of Programs. Heifer Nepal. Kathmandu Nepal.; [3]Senior Vice President. Heifer International. Little Rock AR. USA.; [4]Professor of Food Policy and Applied Nutrition. Friedman School of Nutrition Science and Policy. Tufts University. Boston MA. USA.; [5]Country Director. Heifer Nepal. Kathmandu Nepal.; [6]Analyst. Nutrition Innovation Lab. Kathmandu Nepal.; [7]Adjunct Assistant Professor. Friedman School of Nutrition Science and Policy. Tufts University. Boston MA. USA.; [8]Valley Research. Kathmandu Nepal.; [9]Alexander McFarlane Professor of Nutrition. Friedman School of Nutrition Science and Policy. Tufts University. Boston MA. USA.

Background and objectives: Linkages between nutrition-sensitive agriculture interventions and direct improvements in child nutritional status have been difficult to demonstrate. Likewise, household-level nutrition training has had variable results. Few organizations provide such training in the context of multi-sectoral community-based activities emphasizing livestock management practices and social capital development. The importance of this holistic approach to child outcomes has not been systematically studied. Therefore, we investigated the impact of a comprehensive community development intervention on child growth and diet, compared to training alone.

Methods: 3 matched communities (Banke, Nepal, 974 households) were randomly assigned to receive either Intervention ("full package" community development provided by Heifer Nepal, including social capital promotion, livestock/ nutrition training), Partial Intervention (livestock/ nutrition training alone), or Control (no interventions). Child growth monitoring plus comprehensive household surveys were completed at 5 household visits over 33 months.

Results: Wealth, hygiene practices, dietary diversity, and food security increased more in Intervention households ($p<.0001$, $p<.001$, $p<.0001$, $p<.0001$) than Partial or Control households. In addition, child diet diversity and WAZ, WHZ, HCZ, and MUACZ scores all improved significantly more in Intervention households than the other two groups ($p<.0001$, $p=.006$, $p<.0001$, $p<.0001$, $p<.0001$). In regression analysis, group assignment predicted child anthropometry (HAZ, WAZ, WHZ) and diet quality (diversity and animal source food consumption), after adjusting for child age/ gender as well as multiple household factors (caste, animals, wealth, women's empowerment and education).

Conclusions: In this longitudinal study, a comprehensive multi-sectoral intervention encompassing social and economic capital development and active nutrition messages more successfully improved key nutrition indicators and diet quality in young children. Livestock and nutrition training activities alone had little effect on

these outcomes. Household SES and hygiene practices also improved more in "full package" communities, even though these were not directly addressed by the intervention. Though more time-consuming and costly to administer, holistic community development was associated with better child growth and nutrition outcomes than isolated training programs alone. Organizations seeking measurable and sustainable improvements in these important child outcomes over time must consider the benefits of this more intensive strategy.

Keywords: Child nutrition, child growth, diet quality, community development, livestock.

PRESENCE OF PHYTOSTEROLS IN BEE POLLEN FROM EUCALYPTUS SP.: IDENTIFICATION AND EVALUATION OF THE IMPACT OF THE COLLECTION PERIOD AND GEOLOCATION

[1]Gasparotto Sattler, José Augusto; [2]Pereira de Melo, Illana Louise; [3]Cavanha Corsi, Giovanna; [4]Tedesco Yoshime, Luciana; [4]Mancini-Filho, Jorge; [4]Bicudo de Almeida-Muradian, Ligia.

[1]MsC. Nutritionist. PhD candidate at University of São Paulo. Pharmaceutical Sciences School. Department of Food and Experimental Nutrition .; [2]PhD. Nutritionist. University of São Paulo, Department of Food and Experimental Nutrition, Pharmaceutical Science School. Brazil.; [3]Nutrition Student. University of São Paulo, Department of Food and Experimental Nutrition, Pharmaceutical Science School. Brazil.; [4]Professor. University of São Paulo, Department of Food and Experimental Nutrition, Pharmaceutical Science School. Brazil.

Background and objectives: Bee pollen is one of the products of the beehive that has been studied regarding the benefits associated with its consumption, which are due to the presence of bioactive compounds like vitamins, phenolics, flavonoids and phytosterols. Phytosterols are associated with the prevention and treatment of cardiovascular diseases when they are included in the diet. However, there are few studies regarding the presence and quantification of PS in bee pollen. The objective of this study was to evaluate the presence of phytosterols, and the influence of the period of collection and geolocation, on the profile of bee pollen samples from Eucalyptus sp., which were collected in the Brazilian state of Rio Grande do Sul.

Methods: 24 samples were collected from six apiaries in a micro region of Southern Brazil at five different periods. The extractions were performed in two steps: firstly hot saponification, and then extraction of the unsaponifiable matter. The conditions used were 30% KOH in a water bath at 80 °C under stirring for thirty minutes. A gas chromatograph system was used for the phytosterol profile. The analytical standards 5-alfa-colestane, sitosterol, campesterol and stigmasterol were used to compare the analyzed samples.

Results: The results showed that bee pollen from Eucalyptus sp. presented a large amount of total phytosterols, ranging from 0.89 ± 0.2 to 5.56 ± 0.85 milligrams per gram of sample (mean =

2.26 mg/g). Most of the samples contained beta-sitosterol as the main component, with a mean of 40.33 % of the total phytosterols. Both the collection period and geolocation significantly influenced the phytosterol content of the samples.

Conclusions: The results suggest that bee pollen can be used as an important dietary source of beta-sitosterol, adding value to products by increasing potential health benefits. The differences in results may indicate that the contents of these molecules are mainly determined by the plant genotype of Eucalyptus sp. In addition, environmental conditions may influence this composition.

Keywords: Bee products. Phytosterols, Bioactive compounds, Gas chromatography, Bee pollen.

Nutrition & Health Sciences. Emory University. USA.; [4]MSc. Policies Institutions and Livelihoods Programme. International Livestock Research Institute. Kenya.; [5]MSc. Department of Behavioral Sciences and Health Education, Rollins School of Public Health, Emory University. USA.; [6]PhD. Policies Institutions and Livelihoods Programme. International Livestock Research Institute. Kenya.; [7]PhD. Hubert Department of Global Health and Department of Sociology. Emory University. USA.; [8]PhD. Policies Institutions and Livelihoods Programme. International Livestock Research Institute. Kenya.

Background and objectives: Studies have found that when women earn an income, child and household nutrition are more likely to improve compared to when men earn it. Sedentarization in East African pastoral communities might affect gendered control of food, milk and incomes. This paper investigates the relationship between women's empowerment (WE), household food insecurity and maternal and child diets in rapidly transforming pastoral communities in rural Tanzania.

Methods: From July to September 2015, we conducted a cross-sectional survey in two regions, among 373 livestock-owner households participating in a dairy-for-development project implemented by the International Livestock Research Institute. Eligible households had a child 6-24 months and/or a woman of reproductive age. Diet diversity scores (DDS) and diet diversity adequacy (DDA) were calculated for women (n=300) and children (n=95) according to Food and Agriculture Organization and World Health Organization guidelines. FANTA household food insecurity access scale (n=372) measured household food insecurity. The Women's Empowerment in Livestock Index (WELI) questionnaire

measures WE domains: time use, livestock/livestock-product-related decision-making, nutrition decision-making, and access to and control over assets, opportunities, and own-income.

Results: Women's mean WELI was 0.4±0.2 and DDS was 4.1±1.5; children's mean DDA was 2.8±1.2; 47.4% of households were food insecure, of which 20.4% were severely food insecure. One percentage point higher WELI score was associated with higher diversity of women (2.02 ± 0.36, P<0.001) and children (2.23±0.74, P<0.003). WELI scores were inversely associated with milk intake in the prior 24 hours in women (-7.31±1.15mL, P <0.01) and children (-1.23±0.38mL, P< 0.01) and the number of days milk was consumed in the previous 7 days (women: -0.07±0.02 days, P <0.01; children: -0.04± 0.01 days, P<0.01). WELI was not associated with household food insecurity.

Conclusions: Int these pastoral communities, WE was associated with more varied diets but not with household food security. With greater control over assets and products, more empowered women might procure a wider range of quality foods for themselves and their children. Further research is needed to understand the inverse association of WE on milk consumption and the lack of association with household food security, although this has also been found in other studies.

SENSORY ACCEPTABILITY OF IRON BIOFORTIFIED BEANS AND ORANGE FLESHED SWEET POTATO IN MALAWI

[1]Hummel, Marijke; [2]Talsma, Elise Francina; [3]Van der Honing, Ati; [4]Zulu, Rodah Morezio; [5]Gama, Arthur Chibwana; [5]Van Vugt, Daniel; [6]Spillane, Charles.

[1]MSc. Plant and Agrobiosciences Research Centre (PABC). National University of Ireland Galway (NUIG). Ireland.; [2]PhD. Harvest Plus. International Center for Tropical Agriculture (CIAT). Colombia.; [3]MSc. Division of Human Nutrition. Wageningen University . Netherlands.; [4]PhD. International Center for Tropical Agriculture (CIAT). Malawi.; [5]MSc. International Potato Centre (CIP). Malawi; [6]PhD. Plant and AgriBiosciences Research Centre (PABC). National University of Ireland Galway. Ireland.

Background and objectives: Over one-third of women and children under 5 in Malawi are suffering from micronutrient deficiencies. Research has shown the efficacy of biofortified crops, such as beta-carotene rich orange-fleshed sweet potato (OFSP) and iron rich beans, to improve nutritional status of target populations. The extent of consumption of biofortified crops will depend on the acceptability by consumers. Such acceptability has not been extensively investigated in Malawi. Therefore, we investigated the sensory acceptability of OFSP and iron beans in households in rural Malawi.

Methods: Sensory acceptability of OFSP (n=270 subjects) and iron beans (n=320) was investigated in adults using a discrimination test (blinded), preference test, and an acceptance test for 7 attributes. Also 57 children (beans) and 60 children (OFSP) aged

4-5 years took part in the preference test. Three OFSP varieties and one biofortified iron bean variety were tested against a local control variety. A 5-point facial Likert scale was used and participants were randomly assigned to taste either sweet potato or beans.

Results: Participants were able to discriminate between the taste of OFSP and local sweet potato variety, whereas they could not discriminate between non-biofortified beans and biofortified beans (p<0.05). Adults preferred the local sweet potato variety (76%) over OFSP. Although more children did prefer the orange variety (58%) this was not significant. Iron beans were more (p<0.05) liked than the non-biofortified beans by both adults (82%) and children (67%). In the acceptance test, the control sweet potato variety scored highest (4.4), whereas the three OFSP varieties scored significantly lower (range scores 3.4-4.0, p<0.05). Important factors for acceptance are starchiness and sweetness of the different sweetpotato varieties. The iron beans were significantly preferred over the non-biofortified variety (overall liking 4.3 vs. 3.8). For beans, the largest differences in liking were found for the attributes texture and hardness of the skin.

Conclusions: Overall, from a sensory perspective, biofortified OFSP and beans are well accepted in Malawi. However, although both were liked, there is still a preference for the local variety of OFSP and more research is needed to determine the reasons for this, to be able to develop varieties that are more preferred.

Keywords: Biofortification, sensory acceptability, beans, OFSP, Malawi.

RURAL-URBAN DYNAMICS IN NUTRIENT CONSUMPTION: EVIDENCES FROM INDIA

[1]Ramadas, Sendhil; [2]Palanisamy, Ramasundaram; [3]Kharkwal, Sheela.

[1]PhD. Scientist. ICAR-Indian Institute of Wheat and Barley Research. Karnal-132001. Haryana. India.; [2]PhD. National Coordinator. National Agricultural Higher Education Project. ICAR. New Delhi-110012. India.; [3]MSc. Research Scholar. ICAR-National Dairy Research Institute. Karnal-132001. Haryana. India.

Background and objectives: Economic development is associated with nutrition improvement. National food security notwithstanding, household nutritional security remains a problem, this paper explores into.

Methods: National Sample Survey data on consumption, expenditure and nutrition intake were analysed for instability (CV, Cuddy-Della Valle Index) and inequality (Gini, Lorenz Curve and Biplot).

Results: Monthly per capita expenditure on food declined from 72.90% in 1972-73 to 52.90% in 2011-12 in rural and from 64.50% to 42.60% in urban. The per capita monthly consumption of cereals declined from 15.26kg to 11.86kg in rural and from 11.24kg to 9.28kg in urban. The rural-urban differential has reduced despite a discernible shift in the consumption pattern noticed between them. The monthly per capita consumption of rice was 7kg in rural against 5kg in urban. Surplus production and availability of wheat increased its consumption from 25.43% (42.88%) to 39% (46.12%) in rural (urban). The rural coarse cereals consumption declined from

4.79 to 0.66kg due to its substitution by fine cereals, milk, fruits and vegetables with changing income, customs, habits and taste. High consumption of cereals in rural is due to the high energy required for physical work and payment of kind wages. The share of non-cereals increased in rural but declined in urban. However, the share of non-food items witnessed an increase across the country.

The per capita calorie intake declined by 1.46% in rural owing to reduced cereals consumption but increased by 4.70% in urban. Consumption of fat increased in both rural (92.08%) and urban (61.11%). Inequality in consumption of calories, protein and fat declined in rural, increased in urban but declined among expenditure classes. Instability in nutrient uptake was high and more pronounced in rural. State-wise correlation between calorie intake and per capita cereal production was positive and significant indicating that local production determined cereal consumption. Low prices enabled the poor consume enough calories in surplus states.

Conclusions: The rural per capita cereal consumption is a concern. Raising income increased the non-cereal and non-food consumption. Policy should focus on accelerating the supply of non-cereals and providing the poor access to right food-basket to reduce the gap and inequality in nutrition intake.

Friedman School of Nutrition Science and Policy. Tufts University. Boston. USA.

Background and objectives: Household production diversity is a common strategy promoted to improve dietary diversity of vulnerable populations in developing countries. The objective of this analysis is to examine the association between crop and livestock production diversity in rural Ugandan households and women's and child's dietary diversity.

Methods: Data used are from two survey rounds (2012, 2014) on the same households from 3 North and 3 South West Ugandan districts (random self weighting sample, n=6377 households, 6369 women, 2463 children 6 to 59 months). Pooled mixed effects repeated measures linear regressions tested the association between crop or livestock production diversity, women's dietary diversity score (WDDS) or child's dietary diversity score (CDDS). WDDS and CDDS are a count of all food groups consumed in the past 24 hours, crop production and livestock production diversity scores (CPDS and LPDS respectively) a count of all crops and livestock respectively. Co-variates include year of survey, geographical location, woman's age (WDDS model), household head gender, household wealth index, child's age and gender (CDDS models).

Results: Mean WDDS was 4.27 ± 1.48 and Mean CDDS was 2.48 ± 1.57. Mean CPDS was 4.09 ± 1.23 and mean LPDS was 1.12 ± 1.11. WDDS was negatively associated with age ($\beta=-0.010,p<0.001$), while CDDS is positively associated with age ($\beta=0.067,p<0.001$). We find a significant positive association between WDDS and CPDS ($\beta=0.22,p<0.001$) and LPDS ($\beta=0.23,p<0.001$). Controlling for age, geographical location, year, household head, wealth index and correcting for sample dependency did not alter the association (CPDS $\beta=0.23,p<0.001$, LPDS, $\beta=0.13,p<0.001$). CDDS was significantly and positive associated with both crop production ($\beta=0.15,p<0.001$) and livestock production diversity ($\beta=0.13,p<0.001$). Controlling for child's age, gender, geographical location, survey year, household head gender, wealth index and correcting for sample dependency did not alter the association (CPDS $\beta=0.14,p<0.001$, LPDS $\beta=0.07,p=0.016$)

Conclusions: Dietary diversity in rural Ugandan women and children 6-59 months of age is significantly associated with crop and livestock production diversity. The strength of association is consistent for crop production on adjusting for co-variates decreasing for livestock production diversity. Further analysis to understand the role of market access is required.

Keywords: Production diversity, dietary diversity, women, children, rural Uganda.

USE OF A SYSTEMS-BASED APPROACH TO IMPROVE DIETS AND SUSTAINABILITY OF FOOD PRODUCTION

[1]Kennedy, Gina; [2]Raneri, Jessica E; [3]Termote, Celine; [4]Nowak, Verena; [5]Remans, Roseline; [6]Groot, Jeroen; [7]Thilsted, Shakuntala.

[1]PhD. Senior Scientist. Bioversity International.; [2]MSc. Nutrition Research Specialist. Bioversity International. Rome. Italy; [3]PhD. Associate Scientist. Bioversity International. Nairobi. Kenya.; [4]PhD. Nutrition consultant. Bioversity International. Lusaka. Zambia.; [5]PhD. Consultant. Bioversity International. Rome. Italy.; [6]PhD. Associate Professo. Farming Systems Ecology Group. Wageningen University. Netherlands.; [7]PhD. Research Program Leader. Value chains and nutrition. WorldFish. Phnom Penh. Cambodia.

Background and objectives: Our current food system is damaging to both human health and nutrition and the environment. Poor diet quality is now the leading cause of morbidity and mortality worldwide while the way in which food is produced, distributed and consumed is causing extensive environmental damage. Using a systems-based approach we studied food production systems and dietary intakes in Kenya, Vietnam and Zambia to identify entry points for improving dietary diversity and improve sustainability of the food system through the inclusion of locally available nutrient-dense food by season.

Methods: Qualitative participatory methods were used to assess seasonal food availability and species diversity in Zambia. Quantitative household surveys of dietary intake and household level production were repeated across seasons in all sites. Kenya included two rounds of data collection and a total sample of 647 households, Vietnam included two rounds of data collection and a total sample of 416 households and Zambia included three rounds of data collection and a total sample of 1089 adults.

Results: Abundant food biodiversity was recorded for Kenya and Vietnam. In Kenya 67 edible plant species were recorded on-farm and households reported collection of 38 different wild edible plants. In Vietnam, 398 different species (292 species of plants and 106 animal/fish/insect species) were produced in the landscape. Dietary diversity scores for women in the lean season were 4.1(1.3), 4.8 (1.1) and 3.5 (1.0) and in the more abundant season for food availability 4.4 (1.3), 4.8 (1.1) and 2.9 (0.9) in Kenya, Vietnam and Zambia respectively. Food groups consumed by fewer than 50% of respondents in all sites and across all seasons include beans and peas, nuts and seeds, eggs and other fruits. Based on this assessment communities participated in different agriculture and nutrition interventions aimed to diversify both production as well as dietary intake.

Conclusions: This approach enabled communities to identify locally available foods to improve diet and production diversity. The identification of local solutions can also add environmental benefit such as adding diversity to the landscape that can improve soil fertility, pollinator density and also reduce distance food travels between producer and consumer.

A HYBRID APPROACH: MERGING AGRICULTURE AND HEALTH-BASED FORMATIVE RESEARCH TOOLS TO INFORM NUTRITION BEHAVIOR CHANGE INTERVENTIONS AMONG MOTHERS AND YOUNG CHILDREN IN SIERRA LEONE

[1]Moses, Philip; [1]Moses, Philip; [2]Pinga, Victor; [2]Granger, Kristina; [2]Koniz-Booher, Peggy; [2]Pietropaoli, Jenny; [2]Forrester, Heather; [2]Cunningham, Andrew.

[1]MPH. SPRING Project. JSI Research and Training Institute, Inc. USA.; [2]Strengthening Partnerships.

Background and objectives: The 2014 Ebola outbreak in Sierra Leone left rural districts with reduced food production and deteriorating household nutrition practices. This adversely effected nutrition status of pregnant and lactating women (PLW) and children under two years old. The USAID-funded Strengthening Partnerships, Results, and Innovation Globally (SPRING) project developed a hybrid formative research approach combing traditional agriculture Extension Advisory Services (EAS) and nutrition-based social and behavior change (SBC) tools to inform a more comprehensive response to this nutrition crisis.

Methods: SPRING adjusted traditional formative research tools common to both agriculture and health. EAS often use an agricultural value chain assessment to identify constraints to increasing income and yields. SPRING adjusted the value chain assessment tool to also identify constraints and opportunities to improving supply and quality of vitamin A-rich and animal-source foods (deficient in the diet of the target population), and to adopting agriculture practices that reduce impacts on time, energy, and income control of PLW. Health programs commonly use formative research tools such as barrier analysis and trials of improved practices to identify barriers and enablers to the adoption of improved household-level nutrition practices. SPRING adapted these tools to include nutrition-sensitive agriculture and hygiene practices (such as such as clean play spaces and handwashing) to identify factors related to the accessibility of targeted foods and to reducing environmental enteropathy. SPRING used the revised tools to assess 506 agriculture actors and PLW in Tonkolili District, Sierra Leone from March-June 2016.

Results: The merged tools provided unique information on the intersection of both the agriculture system and household-level nutrition behaviors that would not have been found using the traditional agriculture and health tools separately.

Conclusions: These new tools allowed SPRING to develop a tailored set of SBC communication materials for Sierra Leone that complement each other to affect change at both the market/value chain level (to improve the supply of highly nutritious foods) as well as the household level to enhance demand and consumption of nutritious foods and improve hygiene. Merging tools and approaches across sectors can greatly facilitate the development of more effective SBCC tools.

Niigata University. Japan.; [8]PhD. Professor. Research Institute for Sustainable Humanosphere. Kyoto University. Japan

Background and objectives: Cellulose is a major component comprising dietary fiber in many food products. Many studies indicated that dietary fiber exhibits various physiological functions not only for leading a decrease in the incidence of colon cancer but for promoting our health, exemplified by the control of mobility of the intestines and population of gut microflora. Recently nano-fibrillation techniques have been developed to apply cellulose as new and effective food materials acting as thickeners and/or stabilizer of emulsion, focusing on some attractive characteristics of cellulose nanofiber (CNF) including a high viscosity and water-holding activity. However, it remains largely unknown how CNF affects the physiological functions in the intestines, therefore, we aimed to reveal the compatibility of CNF to the physiological functions in the gastrointestinal tract in this study.

Methods: The nano-fibrillation for cellulose samples was treated using a grinder after wood tips were subjected to softening and delignification processes. Carboxymethylated cellulose nanofiber (CMC-NF) was produced by a surface modification of cellulose and nano-fibrillation. Mice were fed with the diet containing 3% cellulose, CNF or CMC-NF.

Results: There were no significant differences in body weight and dietary intake among the three groups of mice fed with cellulose during 8 weeks. After 8 weeks feeding, the plasma level of TNF-α and the concentration of lipocalin in feces were evaluated as inflammatory parameters. Myeloperoxidase (MPO) activity was measured as an indicator of neutrophils' infiltration into colon tissue. However, any significant difference was not observed in plasma TNF-α level, lipocalin concentration, and MPO activity among the three groups. Histological observation showed no reduction in the length of the large intestine and no incidence of colitis as seen in mice that had been administered dextran sodium sulfate. No symptom of inflammation was also supported by the data showing no significant difference in liver weight and some blood parameters. Moreover, analysis of T cell population in mesenteric lymph node using flow cytometer showed no significant fluctuation in the frequency of regulatory T cells and Th17 cells.

Conclusions: It thus follows that CNF can be used as a new promising food material so that nutritional, physiological, and immunological homeostasis are maintained.

Keywords: Compatibility. gastrointestinal tract. nano-fibrillated cellulose. physiological homeostasis. Safety.

LIVESTOCK REARING AND DEPRESSION IN ADOLESCENTS ARE ASSOCIATED WITH THEIR MENTAL DEVELOPMENT IN THE KASSENA-NANKANA DISTRICT OF GHANA

[1]Mohammed, Husein; [2]Aboud, Frances; [3]Otoo, Gloria; [4]Marquis, Grace.

[1]PhD. Nutrition. IMMANA postdoctoral fellow. Friedman School of Nutrition Science and Policy, Tufts University, Boston, USA.; [2]PhD. Psychology. Department of psychology. McGill University. Montreal. Canada.; [3]PhD. Nutrition. Nutrition and food Sciences department. University of Ghana. Legon. Ghana.; [4]PhD. Nutrition. School of dietetics and human nutrition. McGill University. Montreal. Canada.

Background and objectives: Animal source food and mental well-being have long been thought to be essential for child mental development. This results are part of a larger study to adapt and use a mental development tool in Ghana and evaluate the long-term effect of the Enhancing Child Nutrition through Animal Source Foods (ENAM) project in Ghana.

Methods: This study evaluated the effect of the ENAM project on the 2-5 y old children who were enrolled in the study in 2005. The vocabulary and similarity subtests of Wechsler Abbreviated Scale of Intelligence II were translated and back translated and then the vocabulary subtest was adapted to the local context to be used in rural and peri-urban communities in Ghana. The block design, matrix reasoning and similarity subtests did not need much translation. The adapted tool was then tested and re-tested in a selected school within the Kassena-Nankana district of Ghana. Information on adolescent's academic performance, nutritional status, assets, livestock rearing, and depression symptoms using a self-reporting questionnaire was taken. Data were analyzed using SAS 9.4 version.

Results: A total of 30 children (56.7% girls) with an average age of 11 y (range= 8 - 14 y) participated in the first part of this pretest. They had high assets (8 out of 10), raised livestock (67.9% had >1) and had a depression symptom score of 6 out of 20. The

average school attendance of 62 out of 70 d and academic score of 69.7%. Livestock rearing was negatively associated with depression (r=-0.5; p=0.02), while child academic score was associated with similarity subtest (r=0.43; p=0.03). In boys, the block design was associated with livestock rearing (r=-0.7, 0.04) and similarity was associated with school attendance (r=0.7, p=0.04) and depression (r=-0.7, p=0.03). However, in girls vocabulary, matrix reasoning and school attendance were associated academic score (r=0.5, p=0.04), (r=0.5, 0.04) and (r=-0.6, p=0.03) respectively.

Conclusions: The modified WASI appears to be valid in relation to academic performance, and in boys is positively related to livestock rearing and negatively to depression.

Keywords: Livestock, child development, depression, academic.

ADVANTAGES OF SUGAR REDUCTION WITH BLENDS VERSUS INDIVIDUAL STEVIOL GLYCO-SIDES

[1]Petit, Marcia Petit; [2]Samuel, Priscilla.

[1]M.S. Innovation. PureCircle Ltd. Oak Brook. IL. USA; [2]PhD. Global Stevia Institute. Oak Brook. IL. USA.

Background and objectives: Healthier lifestyles, clean label and natural-origin are of rising interest among consumers around the world which gives stevia leaf extract, a zero-calorie sweetener a unique opportunity. Stevia leaves contain over 40 steviol glycosides (SGs) that provide different sweetness and organoleptic properties. Rebaudioside A (Reb A) is one of the most abundant and the primary focus of stevia usage to date, but not without some taste challenges. This has led to an exploration of the characteristics of other SGs, both, individually and in combinations.

Methods: We hypothesized that blends of SGs may provide improved taste profiles versus Reb A. To test this hypothesis, two separate studies were conducted. Trained sensory panelists assessed the performance of Reb A versus a custom blend, versus an 8% sugar control, in acidified water at 3.2pH sugar reduction in study-1 and, in a 20% orange juice-drink with a 50% sugar reduction in study-2. Study-1 assessed the temporal profiling of the three products while study-2 was a descriptive analysis.

Results: The results study-1 showed that the duration of sweet aftertaste lasted longer for Reb A versus the custom blend and full sugar control (55.55 vs. 44.03 vs. 40.43 secs, P≤0.20). Other study parameters were not significantly different. Study 2 showed that the bitterness of the custom blend was significantly lower than the full sugar control (0.89 vs 1.34, P≤0.10) and, the Reb A and sugar control were not significantly different. In addition, metallic flavor (0.11 vs 0.55, P≤0.20) and licorice-root notes (0.15 vs. 0.67, P≤0.20) were lower with the custom blend versus Reb A, respectively. Reb A had a significantly higher "artificial-taste" character versus the control sugar and the custom blend (1.05 vs 0.28 vs. 0.25, P≤0.10), respectively.

Conclusions: These data suggest that the taste profile of the custom SG blends in these studies were closer to that of sugar, the preferred taste profile and, an improvement over Reb A. Future success will lie in the science of combining the right SGs for acceptable better tasting products that can positively impact reduced-sugar intake and health.

Keywords: Stevia, sugar reduction, sensory, taste, Reb A.

EXPOSURE BIOMARKERS OF ACRYLAMIDE AND GLYCIDAMIDE HEMOGLOBIN ADDUCTS AND ALL-CAUSE AND CARDIOVASCULAR MORTALITY IN NHANES 2003-2006

[1]Zhang, Yu; [2]Wang, Jun; [3]Jiao, Jingjing; [2]Huang, Mengmeng.

[1]Yu Zhang. PhD. Nutritionist. Department of Food Science and Nutrition, College of Biosystems Engineering and Food Science. Zhejiang University. China.; [2]BSc. Department of Food Science and Nutrition. College of Biosystems Engineering and Food Science. Zhejiang University. China.; [3]PhD. Nutritionist. Department of Nutrition. School of Public Health. Zhejiang University School of Medicine. China.

Background and objectives: Acrylamide has been acknowledged for its neurotoxicity, genotoxicity and reproductive toxicity, and classified as a Group 2A carcinogen. However, the relationship between the internal exposure to acrylamide and its metabolite glycidamide and mortality remains unclear. The aim of this study is to examine the association of hemoglobin adducts of acrylamide (AA-Hb) and glycidamide (GA-Hb) with all-cause and cardiovascular mortality in NHANES 2003-2006.

Methods: We followed 5504 participants who were ≥ 25 years of age. The exposure biomarkers and related variables were measured, including AA-Hb, GA-Hb, their sum (GA-Hb + AA-Hb) and their ratio (GA-Hb/AA-Hb). Hazard ratios (HRs) and 95% confidence intervals (Cls) were determined for all-cause mortality and cardiovascular mortality through the end of 2011. HRs and 95% Cls were estimated using Cox proportional hazards regression models using age as the underlying time metric and adjusted for sex, race/ethnicity, education level, physical activity, alcohol intake and other suspected risk factors.

Results: A total of 314 deaths were documented during 9 years of follow-up. After adjustment for known and suspected risk factors, GA-Hb/AA-Hb was inversely associated with all-cause mortality (hazard ratio [HR] comparing extreme quarters 0.606; 95% Cl, 0.372-0.987; P < 0.05 for trend) and cardiovascular mortality (hazard ratio [HR] comparing extreme quarters 0.368; 95% Cl, 0.169-0.802; P < 0.01 for trend). We did not observe any evidence to support the hypothesis that levels of biomarkers of acrylamide and glycidamide exposure measured as hemoglobin adducts (AA-

Hb and GA-Hb) were associated with the risk of all-cause and cardiovascular mortality. However, we found strongly suggestive evidence that GA-Hb/AA-Hb is inversely associated with all-cause and cardiovascular mortality in US adults. The ratio of hemoglobin adducts of glycidamide to acrylamide means the extent of acrylamide metabolism and can be used as an indicator of formation of the genotoxic metabolite glycidamide in the body and its detoxification. Moreover, the ratio GA-Hb/AA-Hb can be used as a useful marker of the mortality.

Conclusions: The ratio of GA-Hb to AA-Hb was inversely associated with all-cause and cardiovascular mortality. Efforts on further up-regulate GA-Hb/AA-Hb in the population can contribute to a substantial decrease in cardiovascular disease burden.

Keywords: Acrylamide; Glycidamide; Cardiovascular disease; Mortality; NHANES.

DOES LOCAL FOOD AVAILABILITY SUPPORT IMPLEMENTATION OF FOOD-BASED DIETARY RECOMMENDATIONS IN NORTHERN GHANA?

[1]de Jager, Ilse; [2]Giller, Ken; [3]Brouwer, Ingeborg.

[1]Msc. Nutritionist. Division fo Human Nutrition. Wageningen University. The Netherlands; [2]PhD. Agronomist. Production Systems Group. Wageningen University. The Netherlands; [3]PhD. Nutritionist. Division of Human NUtrition. Wageningen University. The Netherlands.

Background and objectives: Local feasible food-based dietary guidelines (FBDGs) help provide guidance to policy makers and consumers to redesign food systems and to improve diets of vulnerable populations. As FBDGs are based on the actual dietary patterns and their costs, it is assumed that they are available, affordable and acceptable for the population under study. However, often extremes of the distribution of foods consumed are used and therefore it remains unclear whether FBDGs are supported by the local availability of food.

Methods: Using quantitative dietary intake data of young children in rural Northern Ghana, we developed local FBDGs and studied whether these are supported by the diversity and quantity of household's foods production and the associations between household's production diversity, household's food and nutrient coverage and the child's diet.

Results: We found very low coverage of household's food needs (according to the developed FBDGs) and nutrient needs by their food production. None of the households cover their vegetables needs and more than 50% of household do not cover their calcium, vitamin A, vitamin B12 and vitamin C needs. Household's food production diversity is positively related with household's food and nutrient coverage. Household's production diversity, food and nutrient coverage are not related with the child's diet.

Conclusions: This study shows that although local FBDGs are based on actual dietary patterns and costs, the availability of food can be a limiting factor in the ability of populations to implement the FBDGs. Therefore the promotion of food-based recommendations through nutrition education or behavior change communications activities alone is not enough to lead to improvements in diets. Additional strategies are required such as agricultural- and market-based strategies in combination with nutrition specific interventions including food fortification, and home fortification options. These may offer opportunities to further facilitate adoption of recommendations and provide additional support to improve diets of vulnerable populations. The relation between household food availability and children's diet need to be further investigated for better understanding and identifying opportunities for strategies to improve children's diet.

Keywords: Food-based dietary guidelines; food coverage; nutrient coverage; crop diversity; dietary diversity

EFFECT OF POLISHING ON CONTENT AND BIO-ACCESSIBILITY OF SELECTED MINERALS FROM FIVE RICE VARIETIES

[1]Prakash, Jamuna; [2]Kamaraddi, Vijayalaxmi.

[1]Professor (Retd.), Department of Food Science and Nutrition, University of Mysore, India.; [2]Assistant Professor.

Background and objectives: Rice is a staple food for more than half of worlds' population. There are many varieties of rice grown with inherent compositional differences. Rice also undergoes excessive polishing to remove the bran layer and the consumer acceptability of white rice is much higher on account of better organoleptic characteristics. However, polishing also reduces the nutritional content of rice as most of the protective nutrients are concentrated in the brown aleurone layer.

Objective: The objective of the study was to estimate the mineral content and analyze bioaccessibility of calcium, iron and zinc in selected rice varieties with different degrees of polishing.

Methods: Rice samples selected were IEI-13901, KHP-2, KHP-5, KHO-10 and Rajamudi. These were subjected to different levels of polishing (0, 15, 30, 45, and 60 seconds) and analyzed for calcium, iron, zinc and phosphorus content following standard techniques. The bioaccessibility of calcium, iron and zinc was studied with dialysis technique.

Results: Results indicated that the calcium content of rice varieties ranged from 14.52 to 24.53 mg/100g in rice with no polish and reduced to 5.19-11.43 mg/100g in highly polished rice. Among the varieties, KHP-10 had a higher calcium content. Similar variations were also found in bioaccessible calcium which was in the range of 12.58-30.54%. Rice is fair source of iron with contents ranging from 0.83-3.03 mg/100g and highest bioaccessibility was seen in rice with first degree of polish (3.68-4.20%). Excessive polishing reduced iron availability considerably in all samples. Polishing also reduced zinc content, though the effect was lesser in both in content and availability which ranged from 11.27-17.51% in four varieties with one being much higher at 201-23.3% (Rajamudi). Phosphorus content also showed a decline with polishing.

Conclusions: In conclusion polishing of rice reduced the mineral content of all varieties, though the bioaccessibility were influenced to varying extent. Varietal differences were also observed in mineral content and bioaccessibility.

Keywords: Rice polish, brown rice, calcium, iron, zinc.

REORIENTING FOOD SYSTEMS TOWARDS IMPROVING NUTRITION OUTCOMES: MEASURING NUTRITIONAL QUALITY OF AGRICULTURAL PRODUCTION

Bogard, Jessica.

BSc. PhD candidate. School of Public Health. The University of Queensland. Brisbane. Australia.

Background and objectives: Food production systems are traditionally designed to maximising yields or income for producers. Shifting the goal of food systems away from 'feeding people to nourishing people' requires valuing and measuring the nutritional quality of production systems. The objective of this study was to identify indicators which capture the ability of a production system to nourish the most people, which could potentially be useful for prioritising and decision-making in agricultural production systems.

Methods: Two comprehensive agriculture and nutrition indicator guides were reviewed to identify indicators that capture an aspect of food or nutrient availability, access, consumption or utilisation. Relevant indicators were then mapped to the applicable stage of the food and nutrition system (production, distribution, consumption, nutrition). Those pertaining to agricultural production were applied to selected aquaculture production systems to yield insights into the strengths and limitations of different indicators that capture an element of nutritional quality of production output.

Results: The majority of existing indicators are relevant at the consumption or nutrition stages (n=33) of the food and nutrition system, rather than production (n=7). Application to aquaculture production systems demonstrates that different indicators capture different aspects of nutritional quality. Indicators that reflect nutrient composition of foods produced, diversity in nutrients produced, and the abundance or quantity of those nutrients, which are simple to calculate and interpret by decision makers are of most relevance here.

Conclusions: In capturing the ability of a production system to nourish the most people, the indicators 'nutritional yield, 'potential nutrient adequacy' and 'Rao's quadratic entropy' are likely to be of significant value.

Keywords: Food system, nutritional quality, production, aquaculture, diversity.

COMPARATIVE STUDY OF THE CHEMICAL COMPOSITION OF PINE NUTS GROWN IN SIX COUNTRIES

[1]*Lutz, Mariane;* [2]*Loewe, Veronica;* [3]*Zuleta, Ángela.*

[1]PharmD. MSc. CIDAF. Faculty of Pharmacy. Universidad de Valparaiso. Chile; [2]PhD. INFOR. Ministry of Agriculture. Chile.; [3]MSc. Faculty of Pharmacy and Biochemistry. Universidad de Buenos Aires. Argentina.

Background and objectives: Pinus pinea L. produces highly valued commercial pine tree nuts. It is endemic to the Mediterranean Basin, where pine nuts are part of the Mediterranean diet. The aim of the study was to compare the chemical composition of pine nuts harvested from six countries. In this comparative study, geographic zones and agro-climatic conditions that may affect the chemical composition of pine nut seeds were considered.

Methods: The chemical composition of pine nuts harvested from 15 growing areas, distributed in Chile (3), Argentina (2), Italy (3), Spain (1), Turkey (3), and Israel (3) was determined. All proximate analyses were performed using AOAC methodologies (2012). The relative contribution of climatic variables to chemical components was estimated using CART algorithms. As confirmatory analysis, the groups suggested by the identified climatic variables thresholds were compared by ANOVA. A principal component analysis was applied, generating a biplot for chemical composition of pine nuts and climate variables of different countries. Analyses were achieved using the software Infostat® and its interface with the software R®.

Results: The main component was fat (3.47 to 4.53 g kg-1), followed by protein (3.21 to 3.66 g kg-1). Dietary fiber averaged 1.23 g kg-1, while ashes averaged 0.44 g kg-1. Pine nuts from Chile and Argentina were similar, both countries exhibiting the highest thermal oscillation and rainfall. Italian nuts had the highest fiber content, while Spanish nuts had the highest fat content. Israel exhibited the highest number of dry months, and pine nuts contained more protein and minerals, while nuts from Turkey showed an intermediate position. The climatic variables affecting the chemical composition were: minimum and maximum average temperatures, amount of dry months, and thermal oscillation.

Conclusions: The differences observed in the chemical composition of pine nuts grown in different regions may be explained, at least in part, by the environment and soil type variability between regions. However, all pine nuts exhibited high nutritional quality, independently of the zone where they were grown.

Keywords: Pinus pinea L.; pine nuts; chemical composition; growing zone; agro-climatic conditions.

ASSESSING HOUSEHOLD FOOD SAFETY WITH A VALIDATED INDEX: CRITICAL ISSUES IN FOOD SAFETY AMONG HOUSEHOLDS WITH AND WITHOUT CHILDREN BELOW 5 YEARS

[1]Reddi, S G D Nagalakshmi; [2]Gavaravarapu, M SubbaRao; [3]Mendu, Vishnu vardhana rao; [4]R, Naveen kumar; [5]Vemula, Sudershan Rao.

[1]PhD Scholar. National Institute of Nutrition (ICMR Institute). Osmania University. Hyderabad. India; [2]MSc. PhD. Scientist E. Extension and training division. National Institute of Nutrition (ICMR Institute). Hyderabad. India; [3]MTech. PhD. Scientist F. Bio statistic division. National Institute of Nutrition (ICMR Institute). Hyderabad. India; [4]MSc. Technical officer. Food and drug toxicology research centre. National Institute of Nutrition (ICMR Institute). Hyderabad. India; [5]MSc. PhD. Scientist E. Food and drug toxicology research centre. National Institute of Nutrition (ICMR Institute). Hyderabad. India.

Background and objectives: Home is one of the primary locations of foodborne illnesses risks. Chances of food handling errors can pose high risk to susceptible people at home, especially under-five children (U5C). About 40% of global foodborne disease burden is contributed by this susceptible group, more so in countries like India where 15% of foodborne diseases are reported at household (HH) level. Food safety risks could be different among households with/without this vulnerable population. Given this background, we aimed to assess household food safety using a validated food safety index and identify critical issues in HHs with/without U5C.

Methods: A cross-sectional study was conducted among primary food preparers at home (N=400) with and without U5C (@200 in each category) drawn from rural and urban areas of Telangana State in south India. An 11-item validated food safety index (Maximum score-17) was administered. Data on incidence of food/waterborne illnesses in the fortnight preceding the survey was also collected. In addition, leftover cooked-foods (100g), drinking water (250ml) at point-of-use (PoU) and hand-rinses were collected for microbiological analysis (USFDA-BAM).

Results: About 23% of the respondents reported at least one foodborne illness in the previous 15 days of the survey. Of those who suffered, as many as 53% were children. About 50% of HHs were at food safety risk (Index cut-off score ≤9) and among these, a higher number had U5C. Such HHs have also shown significantly higher levels of food contamination than their counterparts with no U5C. Improper food storage, lack of pure water at PoU and fewer enabling assets (like separate kitchen; piped-water facility) were found to be critical issues affecting food safety among HHs with/without U5C. Along with these, practices like not re-heating the leftovers and presence of pest/pet near the kitchen area

OPERATIONALIZING MULTI-SECTORAL COORDINATION AND COLLABORATION STRATEGIES FOR IMPROVED NUTRITION

[1]Danton, Heather; [2]Clark, Samantha; [2]Klein, Alyssa; [3]Du, Lidan; [4]Titus, Sarah.

[1]MSc. Food Security and Nutrition Director. Strengthening Partnerships, Results, and Innovations in Nutrition Globally (SPRING) Project. JSI Research and Training Institute, Inc.; [2]MSc. Food Security and Nutrition Specialist, Strengthening Partnerships, Results, and Innovations in Nutrition Globally (SPRING) Project. JSI Research & Training Institute, Inc.; [3]PhD. Research Advisor. Strengthening Partnerships, Results, and Innovations in Nutrition Globally (SPRING) Project. Helen Keller International; [4]MSc. Food Security and Nutrition Manager. Strengthening Partnerships, Results, and Innovations in Nutrition Globally (SPRING) Project. Save the Children, Inc.

Background and objectives: The 2013 Lancet nutrition series argues that in order to achieve global targets for reducing undernutrition, there needs to be a multi-sectoral approach including scaled-up, proven nutrition-specific interventions and nutrition-sensitive agriculture and other sector interventions. While a multi-sectoral approach is arguably the most effective way to improve nutrition, little evidence exists about how to implement it,. To understand the role multi-sectoral collaboration may play in improving nutrition, the SPRING Project asked: how can we make multi-sectoral collaboration operationally feasible?

Methods: To answer this, SPRING conducted a literature review and analysis of attempts to coordinate nutrition across USAID portfolios in Bangladesh, Guatemala, and Rwanda. SPRING collected data through over 50 key informant interviews in those countries, and extensive review of project documents and existing literature. The Garrett conceptual model for working multi-sectorally was used to formulate interview questionnaires and analyze responses. 3

Results: The countries used different approaches and were at various stages in the cross-sector collaboration process, but shared similar obstacles in implementing structures, processes, and practices that affected their ability to initiate and sustain their efforts, including difficulties developing strategies that defined shared roles and responsibilities and systems for communications, monitoring and feedback. Lack of shared mandates and metrics created disincentives to investing time and resources toward collaboration. From findings, SPRING developed a set of key considerations along the program cycle that may contribute to making multi-sectoral collaboration more feasible and effective.

Conclusions: While collaboration strategies, goals, and models vary, they often follow a similar life cycle that can be systematically designed, implemented, and monitored. Understanding the context and opportunities in each phase can help standardize certain key approaches and inform future strategies. Incorporating the recommendations highlighted by this assessment may lead to more successful and sustained collaboration for nutrition.

Keywords: Nutrition-sensitive agriculture. Multi-sectoral collaboration. Program cycle.

---

were also affected food safety in HHs with U5C. However, poor hand-hygiene was critical among HHs without U5C. Rural HHs with U5C reported significantly (p<0.05) higher food safety risk than urban HHs.

Conclusions: This study highlighted critical issues affecting food safety among HHs with/without U5C. These would be useful to design targeted food safety education programmes and thus improve child health.

Keywords: Household, Food safety, Index, Under-five children.

PROMOTION OF BIOFORTIFED CROPS TO IMPROVE MICRONUTRIENT INTAKE AMONG CHILDREN UNDER FIVE AND WOMEN IN CHILD BEARIGN AGE IN TANZANIA, PAKISTAN AND BANGLADESH

[1]Tolossa, Asrat; [2]Thomas, Abena.

[1]MD, MPH Chief of Party- ENRICH MNCH Program; [2]Grant Manager/DME advisor ENRICH program.

Background and objectives: ENRICH is a Maternal Newborn and Child Health and Nutrition program funded by the Government of Canada and implemented in Bangladesh, Pakistan, Myanmar, Kenya and Tanzania. ENRICH will use nutrition pathway to reduce U5M by strengthening health systems and improving basic nutrition and nutrition sensitive services and addressing nutrition-related causes such as: poor breastfeeding, stunting, wasting, and vitamin A and zinc deficiencies (Lancet, 2013).

One of the strategies is promotion of production and consumption of biofortified micronutrient-rich crops which help to reduce vitamin A deficiency and improved iron status among CU5

Methods: ENRCH program trained and supported Lead Farmers, para-professional farmers and agricultural extension agents to become Trainers of Trainers (ToTs) within their communities and train select growers to become bio-fortified crops producers and seed multipliers in all 3 countries. ENRICH staff oversaw and directed the training of farmers on the production, harvest and post-harvest handling of bio-fortified crops. The program sensitized communities on bio-fortification to build consumer demand. Beneficiary farmers were encouraged to pass on the information to other farmers and scale up crop production.

Results: In Pakistan a total of 600 farmers were trained and 600 bags (each package weighing 25 kg) of Zincol-2016 seed was distributed among 600 farming households (438 male, and 162 female) for cultivation of half an acre of land. In Bangladesh, 17 trainers were trained on zinc rice production technology. The program selected 1560 rice farmers and 4.68 tons of zinc rice variety, BRRI dhan74, seeds were purchased and distributed. In Tanzania a total of 72 lead farmers were trained and received training manuals and vines for OFSP production. Twenty seven (27) OFSP production demonstration farm sites were also established. In all countries, the program negotiated an agreement with local stakeholders for the delivery of biofortified planting materials.

Conclusions: Local stakeholders involvement and participation is key to promotion of production and consumption of biofortifed crops. Lead farmers approach and passing on information to other farmers in the villages is a feasible delivery model for introduction and scale up biofortification. Integrating biofortification to public programs is key to sustainability.

PERFORMANCE AND CARCASS CHARACTERISTICS OF BROILER CHICKENS FED DRIED CASHEW APPLE PULP IN REPLACEMENT FOR MAIZE

[1]Yisa, Iyabode Kehinde; [2]Longe, Oyebiodun Grace; [3]Awojulugbe, Oluseyi; [4]Oshibanjo, Olusegun.

[1]M.Sc. Animal Nutritionist. Department of Animal Science. University of Ibadan. Nigeria.; [2]PhD. Professor. Animal Biochemistry and Nutrition. Department of Animal Science. University of Ibadan. Nigeria; [3]B.Sc. Animal Scienist. Department of Animal Science. University of Ibadan. Nigeria; [4]PhD. Animal procducts and Meat Scienist. Department of Animal Science. University of Ibadan. Nigeria.

Background and objectives: Alternative ingredients have become a major focus of the broiler industry given the dire competition between man, industry and livestock for conventional ingredients such as maize. Dried cashew apple pulp (DCAP) has been used to replace maize broiler diets in Brazil and Asian countries. This study was to evaluate the effect of replacing maize with dried cashew apple pulp (DCAP) in broilers chicken diets on performance and carcass characteristics in Nigeria.

Methods: A total of 250 four weeks old Arbor Acre plus commercial broiler chickens were randomly selected and assigned to 5 dietary groups of 0%, 5%, 10%, 15% and 20% DCAP replacement for maize in a twenty- eight day trial . Each group comprised 5 replicates of 10 birds each. Growth performance characteristics was recorded, birds were slaughtered at the end of the experiment and carcass characteristics were measured.

Results: It was observed that 10% replacement level had the highest final weight, weight gain and least feed conversion ratio (FCR) while 20% replacement level had the least final weight, weight gain, feed intake and highest FCR. There were no significant differences (P>0.05) in head, neck, drumstick, breast, back, wings, gizzard, empty gizzard, heart, liver and gastrointestinal tract weight except thigh weight, abdominal fat and spleen which are higher at 10% replacement level.

Conclusions: Dried cashew apple pulp compared favourably with maize at the given level, it therefore can be used successfully in its replacement without deleterious effect to growth and carcass characteristics.

Keywords: Alternative ingredient, dried cashew apple pulp, maize, broiler chicken.

RESIDUAL B-CAROTENE AND CYANIDE LEVELS IN GARI PRODUCED FROM UNFERMENTED YELLOW CASSSAVA (MANIHOT ESCULENTA CRANTZ) USING LOCAL PROCESSING METHOD

[1]Onimawo, Ignatius; [1]Onimawo, Victor; [1]Alamu, Osas.

[1]University; [1]Nigeria University

Background and objectives: In order to find ways of improving the consumption of vitamin A rich foods in Nigeria, yellow fleshed cassava was introduced to farmers. This study was carried out to determine the level of the retained β-carotene in processing yellow cassava (variety IITA TMS 01/1371 or UMUCASS 38) into gari using local processing method, and also to determine the residual cyanide after processing (fermented and unfermented) of the yellow-fleshed cassava.

Methods: Harvested samples of the yellow fleshed cassava were fermented in the traditional way (natural fermentation for 48hr) while some samples were unfermented. The fermented cassava were processed into cassava grit- gari which is a staple food commonly consumed in Nigeria. High performance liquid Chromatography (HPLC) was used to determine the level of β-carotene in gari produced from fermented and unfermented yellow cassava while the cyanide level was determined by an automated enzymic method.

Results: Results showed that the gari produced from fermented yellow cassava had a higher level of β-carotene depending on the number of days of fermentation compared with the gari from unfermented yellow cassava. The gari produced from unfermented cassava had the least content of β-carotene (8.076±0.311ug/g) during the first week of storage compared with those produced from fermented cassava (10.600±0.470- 20.610±0.098ug/g). There was a reduction in the β-carotene contents in all groups during the 5week storage period. The rate of loss of β-carotene over a five week period showed that the gari from unfermented cassava had the least rate of loss (0.885ug/week) compared with the gari from fermented cassava over the same period (0.955-2.447ug/week). However the level of Hydrogen cyanide (HCN) retained was more in the gari from unfermented yellow cassava (3.160±0.006mg/100g) compared with the gari from fermented cassava (0.470±0.046-1.423±0.006 mg/100g).

Conclusions: On the basis of the result, it is suggested that yellow cassava should be fermented before being roasted into gari and adequate method of storage be adopted to reduce loss of the β-carotene while in storage.

Keywords: β-Carotene, Cyanide, Unfermented, Gari, Yellow Cassava

INFLAMMATORY AND IRON STATUSES AND THEIR RELATIONSHIP WITH BODY FAT MASS IN LEAN AND OBESE INDIGENOUS GUATEMALAN WOMEN

[1]Orozco, Monica; [2]Arriaga, Claudia Lorena; [3]Zamora, Alejandra; [4]Solomons, Noel W.; [5]Schümann, Klaus.

[1]PhD. Senior Program Leader for Iron Safety Studies. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala; [2]BSc. Research Chemist. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala; [3]BSc. Research Nutritionist. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala; [4]Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala City. Guatemala.; [5]MD. PhD. Director. Hildegard Grunow Foundation. Munich. Germany.

Background and objectives: Obesity is usually accompanied by chronic, low-grade, systemic inflammation and up-regulated hepcidin gene expression, often reflected by higher circulating C-reactive protein (CRP) and 25-hepcidin levels. These events lead to lower intestinal uptake and increased tissue sequestration of iron. The high prevalence of overweight/obesity and poor living conditions observed amongst indigenous Mayan populations may both predispose to inflammation and disturbances in iron metabolism. Here, we sought to explore the differences in biomarkers of iron and inflammation status, and their relationship with body fat mass, in lean and obese indigenous Guatemalan women.

Methods: Twenty-two non-pregnant, non-anemic, pre-menopausal women, aged 30-45 years, from Sololá, Guatemala were recruited, evaluated and classified into two groups of lean (n=11) and obese (n=11) women, using combined body mass index (BMI) and % body weight as fat mass (%FM) criteria. Serum 25-hepcidin and ferritin concentrations for both groups were assessed and compared using one-tailed Student T-tests, whereas CRP values were analyzed with a Wilcoxon test (one-tailed).

Results: The mean age for lean (34.8±5.0 years) and obese (36.2±3.3 years) did not differ (p=0.23). Mean BMI and %FM for the lean and obese groups were: 21.2±1.5 kg/m2, 27.1±4.5% and 32.0±2.6 kg/m2, 45.4±4.0%, respectively. The average concentrations of serum 25-hepcidin were: (means) 3.1±1.2 and 3.9±2.3 ng/ml (p=0.12); ferritin: 41.3±24.1 and 72.9±47.6 ng/ml (p=0.03); and

(median) CRP: 1.3 (95% CI -0.2,6.0) mg/L and 3.9 (95% CI 2.2,8.0) mg/L (p<0.005) for the lean and obese women groups, respectively.

Conclusions: The biomarkers of inflammation observed in this group of women perform as expected, confirming the paradigm of the effect of obesity on inflammation and iron status, when women were carefully selected and polarized using the dual criteria for both relative body mass (BMI) and adiposity (%FM).

Background and objectives: Hyperuricemia is casually linked with pathogenesis of gout and cardio-metabolic diseases with prevalence of 8-22% worldwide. Profiling metabolites by metabolomic approach will facilitate discovering metabolic pathway(s) and novel markers involving pathophysiology of hyperuricemia. Previously, certain amino acids and acylcarnitines were reported to be cross-sectionally associated with serum uric acid, but longitudinal associations remain to be established. Therefore, we aimed to investigate the associations between amino acid and acylcarnitine profiles with incident hyperuricemia in a prospective Chinese cohort.

Methods: A total of 1,616 Chinese aged 50–70 years participating in a 6-year cohort with a baseline free of hyperuricemia

were included. Baseline plasma amino acids and aclycarnitines were profiled by targeted gas or liquid chromatography coupled to mass spectrometry metabolomics. Hyperuricemia was defined as serum uric acid ≥416.0 μmol/L (7.0 mg/dL) in men and ≥357.0 μmol/L (6.0 mg/dL) in women. Multivariable log-Poisson models were used to examine the associations between metabolites and incident hyperuricemia. Statistical significance was defined as P <0.0009 (0.05/56) with Bonferroni correction.

Results: The 6-year incidence of hyperuricemia was 24.6%. Among all quantified metabolites (22 amino acids and 34 acylcarnitines), only cysteine and long-chain acylcarnitines C20:4 were positively associated with incident hyperuricemia. The relative risks (95% confidence intervals [CI]) per standard deviation increment) were 1.24 (1.14-1.36; P = 8.4E-07) for cysteine and 1.16 (1.07-1.25; P = 0.0004) for C20:4, respectively, after multivariable adjustment including lifestyle, body mass index, fasting glucose, lipids, creatinine and uric acid. The underlying mechanism(s), which although remains unclear, might involve oxidative stress or mitochondrial dysfunction accompanied by elevated cysteine and long-chain acylcarnitines.

Conclusions: This study is the first one showing the longitudinal associations of cysteine and long-chain acylcarnitines C20:4 with future incident hyperuricemia, independent of established risk factors. More studies are needed to confirm our findings in different ethnical populations and also potential utilization for early prediction and prevention.

IRON CONTAMINATION IN PARENTERAL NUTRITION MIXTURES

[1]Menéndez, Ana María; [2]Farias, Silvia; [2]Servant, Roberto; [3]Cortez, Iris; [4]Montemerlo, Hugo José; [5]Weisstaub, Adriana Ruth; [6]Russi, Fernando; [5]Pita Martín de Portela, Maria Luz.

[1]PhD. Pharmacyst. Universidad de Belgrano. Buenos Aires. Argentina.; [2]Analytical Chemistry. Atomic Energy National Agency. San Martín. Buenos Aires. Argentina; [3]Analytical Chemistry Laboratory. Benito Roggio Ambiental. Belgrano University; [4]Universidad del Salvador. Buenos Aires. Argentina; [5]School of Pharmacy and Biochemistry. Buenos Aires University. Buenos Aires. Argentina; [6]Centro de mezclas intravenosas SA. Hospital Militar Cosme Argerich. Buenos Aires. Argentina.

Background and objectives: Iron is an essential trace element, but it is not recommended to add excessive amount of it to total parenteral nutrition (TPN) because it affects the mixtures stability. Nevertheless, the variable iron contamination has been documented in the components used to prepare TPN. This contamination must be taken into account by the compatibility limitations regarding lipids destabilization.

Objectives: 1) to determine iron contamination levels in commercial individual components available in Argentina to prepare TPN mixtures. 2) to calculate the iron contamination amount present in a neonate, an infant and an adult. typical TPN prepared with individual components.3) To calculate the contamination amount regarding the iron requirements.

Methods: Iron was determined in 40 individual solutions, from different labs and lots, belonging to 11 commercial products available in Argentina. Three replicates of each sample were analyzed by Argon Inductively Coupled-Plasma- Optical Emission Spectrometry (ICP/ OES). Perkin Elmer 5100 DV. Samples containing organic substances were digested in a laboratory microwave oven, using concentrated nitric acid. Analysis were carried out according to the guidelines provided by ISO/ IEC 17025: 05.

Results: Iron levels for each individual solution were (μg/mL): mean value±SD: Dextrose 50%: 1.12±0.03; Dextrose 70%: 1.32±0.52; Amino acids 10%: 0.25±0,11; Lipids 20%: 4.58±0.80; Potassium chloride: 0.11±0.03; Sodium chloride 20%: 0.11±0,03; Magnesium sulfate: 0.11±0,00; Sodium glicerophosphate: 2.76±0.48; Sodium phosphate: 4.51±0.13; Calcium gluconate: 2,01±0,27; Zinc sulfate: 0.12±0,04; Sterile water: non detectable.

According to the obtained values, the calculated iron total amount (mg) provided by the individual components contamination would be for a typical TPN mixture: adult 2.352; neonatology: 0.073; pediatric: 0.524.

Conclusions: iron found as contaminant in the studied components was not declared in the label. The Fe contamination levels in both pediatric mixtures were around 0.5 mg/L, but levels in adult TPN were 1.2 mg/L, which would affect the TPN stability. Regarding the iron daily requirements, Fe contamination in TPN mixtures for adults would be very high, but near 70% in infant and very low in neonate TPN. Therefore, It would be advisable that manufacturers declare the Fe contaminant content in the label products to avoid iron excess which would compromise the evolution of critical patients.

Keywords: Parenteral nutrition, Iron contamination, adults, pediatric

MEASURING BRAZILIAN BREAKFAST QUALITY: THE DEVELOPMENT OF AN INDEX TO BE USED IN DIFFERENT POPULATIONS

[1]Santos, Roberta; [2]Gorgulho, Bartira; [2]Marchioni, Dirce; [3]Baltar, Valéria T.

[1]PhD student. Nutritionist. Department of Nutrition. School of Public Health. University of São Paulo. Brazil.; [2]PhD. Nutritionist. Department of Nutrition. School of Public Health. University of São Paulo. Brazil.; [3]PhD. Statistic. Department of Epidemiology and Biostatistics. Institute of Collective Health. Fluminense Federal University. Brazil.

Background and objectives: Breakfast is considered an important eating event. A single index to assess and compare the quality of this meal across different populations is needed. We are proposing an index to evaluate the nutritional quality of the breakfast, that can be applied across populations with different cultural backgrounds.

Methods: We used a representative sample of the Brazilian population aged 19 years or older with data of individual food consumption from the National Dietary Survey conducted in 2008-2009. We considered as breakfast the episode of consumption with the highest energy intake contribution in the time range 6AM to 10AM. The final study sample included 31.735 adolescents and adults of both genders. The Breakfast Meal Index (BMQI) was based on Main Meal Quality Index and nutritional guidelines and recommendations as World Health Organization and the World Cancer Research Fund nutritional recommendations and was composed by nine components: fruits, calcium, fiber, carbohydrate, total fat, saturated fat, processed meat, added sugar and energy density. Each component can score between zero and 10 points and the final score range is 0-100 points.

Results: The BMQI was positively (p<0.001) associated with intake of carbohydrate, protein, fiber, vitamins E, C and B6, thiamine, niacin, riboflavin, folate, iron, phosphorus, magnesium, zinc, selenium, calcium and potassium. Total fat, saturated fat, cholesterol, sodium and added sugar were negatively associated with indicator. The Cronbach's coefficient alpha for reliability was 0.66, and the BMQI score was positively associated with age (p<0.001) and income (p=0.045), and negatively associated with male (p<0.001) and residents of urban area.

Conclusions: The proposed BMQI seems to be an useful instrument for evaluating, monitoring and comparing the breakfast quality in populations studies.

Keywords: Meal quality. Breakfast. Meal index. Dietary quality. Nutritional guidelines.

TENOMODULIN GENE IS POTENTIALLY INVOLVED ON METABOLISM AND ADIPOGENESIS IN HUMAN DIFFERENTIATED ADIPOCYTES

[1]Ruiz Ojeda, Francisco Javier; [2]Gomez-Llorente, Carolina; [2]Rupérez-Cano, Azahara Iris; [2]Gil, Ángel; [2]Aguilera, Concepción María.

[1]PhD. Nutritionist. Department of Biochemistry and Molecular Biology II. School of Pharmacy. Institute of Nutrition and Food Technology; [2]PhD. Department of Biochemistry and Molecular Biology II. School of Pharmacy. Institute of Nutrition and Food Technology "José Mataix". Biomedical Research Centre. University of Granada. Granada. Spain.

Background and objectives: Tenomodulin (TNMD) is a transmembrane protein inhibiting angiogenesis and it is highly expressed during the adipogenic differentiation. In this sense, it has been reported an up-regulation of mRNA levels in adipose tissue from adults with obesity; and a down-regulation during diet-induced weight loss. Our group has observed that TNMD gene was up-regulated in omental adipose tissue from obese pre-pubertal children compared with their normal-weight peers by genome analysis and qRT-PCR. The aim of the present work was to study the putative metabolic function of TNMD and its association with adipogenesis and metabolism in human adipocytes.

Methods: Human adipose-derived stem cells (hADSC) were differentiated into adipocytes for 14 days. TNMD gene expression and protein levels were analyzed at different times from day 0 to day 14 (d0, d7, d10 and d14) by qRT-PCR and Western blotting. Subsequently, the mature adipocytes at d14 were incubated with an adenovirus-5 (Ad-5) vectors containing a shRNA-TNMD or shRNA-scrambled as a control for 48 hours. Different genes related to glucose and lipid metabolism and adipogenesis were analyzed by qRT-PCR such as CCAAT/enhancer-binding protein alpha (C/EBP-α), peroxisome proliferator-activated receptor-gamma (PPAR-γ), glucose transporter 4 (GLUT4), adiponectin (ADI-POQ), hormone-sensitive lipase (HSL), adipose triglyceride lipase (ATGL) and perilipin (PLIN).

Results: TNMD expression and protein levels were significantly up-regulated during the adipogenic differentiation (P<0.05). TNMD inhibition, both mRNA as protein levels, was approximately 90 % in the Ad-5-shRNA-TNMD-treated adipocytes compared with the Ad-5-shRNA-control. C/EBP-α, PPAR-γ, GLUT4, ADIPOQ, HSL, ATGL and PLIN gene expressions were significantly down-regulated in the Ad-5-shRNA-TNMD-treated cells (P<0.05).

Conclusions: TNMD is highly expressed in human differentiated adipocytes from hADSC. TNMD inhibition provokes a generalized alteration on glucose and lipid metabolism and adipogenesis in human adipocytes.

Keywords: Obesity, adipogenesis, metabolism.

Background and objectives: Changes in the nutritional condition of the elderly may be related to the aging process and / or pathological processes. With regard to the psychological aspect of this elderly person, the manifestation of neuropsychiatric disorders may also impair good nutrition. The fact that some also present underlying diseases reinforces the need for supply and nutrient balance, which can be found in foods of native cooking. Objective: to investigate the action of the Amazon diet during the period of home care for the elderly using psychotropic drugs.

Methods: It is an observational study in loco, to determine the effect of the food intake of the Amazonian diet on the improvement of signs and symptoms of adverse reactions to the use of psychotropics, by the elderly, with moderate and high risk for fragility.

Results: Some of the foods in the Amazon diet have natural compounds that may have activity in the fight against cardiometabolic diseases, chronic non-transmissible diseases, due to its antioxidant, anti-inflammatory, cholesterol-lowering, polyphenol-rich properties. The elderly, accompanied by the Pilot Health at Home Project and who presented neuropsychiatric disorders, were cared for by a multiprofessional team and oriented to the Amazonian diet, according to the categorization of Ribeiro and Cruz (2012) in fruits, flours and fish, and Its effects on health, quality of life, optimal amount of nutrient intake. It was verified that the elderly who started to insert in their daily food the native cuisine, have reported improvement of the symptoms related to the adverse effects of the administered psychotropics. The nutritional evaluation by the health professionals of the team also showed improvement of nutritional standards, lipid profile, glucose, blood pressure, and self-esteem improvement.

Conclusions: Nutrition for the elderly population needs to be carefully discussed by the health team, especially when these elderly people use psychotropic drugs that are almost always associated with other medications. In view of the diversity and peculiarity of food in the Amazon region, the study also reveals the importance of the health team in the region to be bringing this information to the population and carrying out actions aimed at native nutritional education.

Keywords: Amazon diet; psychotropic drugs; elderly

Nutritionist. Department of Nutrition Exercise and Sports. University of Copenhagen. Copenhagen. Denmark; [9]PhD. Nutritionist. Nutrition Section. International Atomic Energy Agency. Vienna. Austria.

Background and objectives: It is important to understand the linkage between nutritional status, growth, breastfeeding and body composition in order to design interventions to prevent growth faltering, but few data from low- and middle-income countries are available.

The objective was to assess the role of nutritional status and other correlates of body composition in Kenyan children aged 6 and 15 months.

Methods: Four hundred and forty nine (449) infants were enrolled in an observational study embedded in a nutrition intervention trial conducted in rural Kenya. Infants were enrolled at 6 months of age. Anthropometric measurements were conducted, and fat-free mass (FFM) and fat mass (FM) were measured with the deuterium dilution technique when the children were 6 and 15 months of age, respectively. Linear regression was used to assess the association of sex, breastfeeding, stunting and wasting as correlates of fat-free mass index (FFMI), fat mass index (FMI) and body mass index (BMI).

Results: At the age of 6 months, boys had a 0.45 (95% CI 0.10-0.80) kg/m2 higher FFMI compared to girls. There was no difference in FMI.A similar pattern was seen when the children reached the age of 15 months. Those who stopped breastfeeding before the age of 15 months (11%) had a 0.10 (95% CI -0.60; 0.40) kg/m2 lower FMI when they reached 15 months. At 6 months, stunted infants had a 0.28(95%CI -0.85; 0.29) kg/m2 lower BMI than infants with LAZ above 0, due to 0.66(95% CI -1.08;-0.23) kg/m2 lower FMI, but not FFMI. Stunting was not associated with body composition at 15 months of age. Wasted children had both lower FFMI and FMI at 6 and 15 months of age.

Conclusions: Further research is needed to establish the relation between these early changes in body composition and later body functions and the risk of infectious and chronic diseases.

Background and objectives: Background: Aging is associated with profound changes in body composition that occur in late life. With age, adiposity increases and skeletal muscle mass is re-duced. This loss with age leads to sarcopenia, which is a multifactorial process that includes physical inactivity in its development. Sarcopenia establishes its symptoms in inactive individuals, but is also observed in some who remain active throughout their lives. Training with physical exercise is favorable to delay sarcopenia, like adequate food and nutrition, among other factors that improve the quality of life in old age.

Objectives: To analyze body composition and hand grip strength in elderly, institutionalized and active TAI CHI practitioners.

Methods: An anthropometric study was performed in old people attending day care for the elderly institutions and assiduous practitioners Tai Chi Chuan in the National School of Wushu. Fat mass (FM), fat free mass (FFM) and total body water (TBW) were calculated by electrical bioimpedance with an Impedimed DF50 analyzer. From the resistance, skeletal muscle mass (SMM) was obtained by equations. Muscle strength was obtained with a JAMAR dynamometer. Statistical analysis used the general linear model, principal component analysis, and polynomial logistic regression.

Results: The women had higher FM, lower FFM, TBW, SMM and muscular strength than men, verified with a General Linear Model. There is a significant effect of age on weight increase, decrease in height, SMM and muscular strength. The FFM and the subcomponents TWB and SMM corresponded to strength force and were more diminished in the institutionalized elderly. Logistic regression showed that decreased muscle strength was more representative in the institutionalized elderly. In them, sarcopenic obesity is also more frequent. Tai Chi Chuan practitioners have significantly more lean body mass development and physical performance than older adults who stay in day care institutions, that have a more sedentary behavior, corresponding to the sarcopenia.

Conclusions: The physical activity of TAI CHI CHIAN offers better predictions for body composition to reduce sarcopenia in the elderly.

GESTATIONAL PROTEIN RESTRICTION PLUS RICH-SUCROSE DIET IN ADULTHOOD PROMOTES AFFECTATIONS IN LIVER OF RATS

[1]*Rodríguez-Antolín, Jorge;* [2]*Cervantes-Rodríguez, Margarita;* [3]*Cuevas, Estela;* [3]*Nicolás-Toledo, Leticia.*

[1]Centro Tlaxcala de Biología de la Conducta. Universidad Autónoma de Tlaxcala. Mexico; [2]PhD. Licenciatura en Nutrición. Facultad de Ciencias de la Salud. Universidad Autónoma de Tlaxcala. Mexico.; [3]PhD. Centro Tlaxcala de Biología de la Conducta. Universidad Autónoma de Tlaxcala. Mexico.

Background and objectives: Background. Gestational protein restriction increases metabolic diseases. The consumption of a high-sucrose diet has been associated with non-alcoholic fatty liver

disease in both infant and adult populations. The combination of gestational protein restriction and the intake of a carbohydrate-rich diet during adulthood on the development of non-alcoholic fatty liver disease is yet unknown. Objective. To analyze that sugared water consumption promotes cell damage and liver fat accumulation in adult offspring exposed to gestational protein restriction.

Methods: Four groups of rats Wistar (22 weeks age): 1) The offspring from mothers feed with a control diet, 2) the offspring from mothers feed with protein-restricted diet 3) the offspring from mothers feed with a control diet but with access to water with sucrose 5 % plus in adulthood, and 4) the offspring from restricted mother and with access to water with sucrose 5 % plus in adulthood. Growth and consumption of food and water were monitored throughout the study. We evaluated with histological analysis of the liver and anti 3-Nitrotyrosine with inmunohistochemistry technique.

Results: No differences were found in body weight throughout of 22 weeks. Food and water consumption were affected for sucrose diet. In female and male offspring from restricted mothers, the sweetened water consumption in adulthood promoted an increase in the liver weight and fat accumulation. In male offspring, only the sweetened water consumption induced fat accumulation and an intense cytoplasmic staining of anti 3-Nitrotyrosine in the liver.

Conclusions: Thus, female offspring from malnutrition mothers are more susceptible than male one to be affected by a sucrose-diet in adulthood.

Keywords: Malnutrition, sucrose diet, fatty liver disease, 3-Nitrotyrosine.

THE EFFECTS OF VERY-LOW CARBOHYDRATE DIETS ON WEIGHT LOSS AND HEPATIC LIPIDS AND GENE EXPRESSIONS IN DIET-INDUCED OBESE MICE

Yamazaki, Tomomi; Ikaga, Reina.

PhD. Department of Nutritional Science. National Institute of Health and Nutrition. National Institutes of Biomedical Innovation. Health and Nutrition. Japan.

Background and objectives: Obesity is caused by excessive fat or carbohydrate intake. The improvement of obesity is an important issue, especially in Western societies. Low-carbohydrate diet is used to achieve weight loss in humans. To clarify the effect on weight loss, we investigated the serum chemicals and the gene expression in liver of a very-low carbohydrate diet (VLCD)-fed diet-induced obese (DIO) mice.

Methods: DIO male ddY mice were divided into high-fat diet (HFD) and VLCD groups. The body, liver and white adipose tissue (WAT) were weighed and the serum chemicals and hepatic lipids and the mRNA expression were analyzed after feeding for 3, 12 and 24 weeks.

Results: The mice fed VLCD decreased their body weights for the first three weeks. After 24w, the body weights of HFD and VLCD groups were similar, namely the mice in VLCD group gained more weight than the other for 21w. There were no significant differences in the weights of liver and WAT between HFD and VLCD groups. The concentration of insulin of VLCD-fed mice was significantly decreased compared with HFD-fed mice throughout the whole period. On the contrary, serum FGF21 concentration was significantly increased in the VLCD -fed mice. After feeding for 24w, the VLCD-fed mice showed heavier liver TG contents than HFD-fed mice. In the liver, the mRNA expressions of CD36 and FGF21 were increased in VLCD-fed mice.

Conclusions: VLCD-fed mice increased their body weights and the liver TG contents after feeding for 24w, in spite of the decrease in serum insulin concentration. Since hepatic expression of CD36 was increased, the increase in hepatic lipid might be caused by the activation of peroxisome proliferator-activated receptor γ. VLCD seems to be beneficial for the loss of weight for a short time.

Keywords: very-low carbohydrate diet, weight loss, hepatic lipids

Background and objectives: Adolescence is a period in which micronutrients status might be compromise due to frequent consumption of food with low nutritional value and due to increased requirements for growth and development. Among those, B-vitamins, as key-role micronutrients, might be affected. For this reason, the aim of this study is to determine the dietary patterns (DPs) explaining the highest variance of vitamin B6, folate, and B12 intake and related concentrations among European adolescents.

Methods: 2,173 adolescents participating in the HELENA (Healthy Lifestyle in Europe by Nutrition in Adolescence) study met the eligibility criteria for B-vitamins intake analysis (46 % males) and 586 did it for biomarkers analysis (47 % males). Two non-consecutive 24-h dietary recalls were used to assess mean intakes. Concentrations were measured by chromatography and immunoassay. Reduced rank regression was applied to elucidate the combined effect of food intakes in B-vitamins intakes and concentrations.

Results: Identified dietary patterns (one per each B-vitamin intake and biomarker and by sex) explained a variability between 34.2 % and 23.7% of the B-vitamin intakes and between 17.2 % and 7% of the biomarkers. Fish, eggs, cheese, and white and buttermilk intakes, loaded positively for B-vitamins intake in both sexes; in contrast, soft drinks and chocolate, loaded negatively. For biomarkers, there was a higher heterogeneity in terms of foods loads in the identified patterns, like in the case of cheese, that loaded negatively for the identified pattern in males and females for plasma vitamin B12, and positively in the pattern of males and females for RBC-folate, and also positively for PLP in females. Besides, some food items loaded differently between intakes and biomarkers, like fish products which, in females, loaded positively for intakes, but negatively for plasma folate.

Conclusions: The identified dietary patterns explained more variance of the B-vitamins intake than for their related biomarkers both in males and females. The dietary patterns were different for the same B-vitamin between males and females, and between intake and status of the same B-vitamin. Further studies are needed to elucidate the factors determining such differences.

Keywords: Dietary patterns, Reduced Rank Regression, B-vitamins, Europe, adolescents

RELATIONSHIP BETWEEN NON NUTRITIVE SWEETENERS INTAKE AND NUTRITIONAL STATUS

Garcia, Maria Isabel; Tello, Sofia; Poch, Clarisa; Rellecati, Candela; Muguerza, María de los Ángeles; Capaldi, Luciana; Ruiz, Laura Matilde.

LDN. Nutritionist. Department of food and nutrition. Centro Gallego de Buenos Aires. Argentina.

Background and objectives: Obesity and associated metabolic diseases are going through a constant worldwide increase. At the need to prevent and/or maintain a good health condition an interest for non-nutritive sweeteners (NNS) rise. Although their impact on intake and body weight is unclear, its consumption is high for being widely distributed in foods. Epidemiologic studies associate NNS consumption with excessive food intake and body weight gain.

The objectives are to estimate NNS consumption's prevalence in diet products on an adult population, evaluate association between nutritional status and NNS consumption and estimate NNS intake and compare it with the Acceptable Daily Intake (ADI).

Methods: Transversal, observational and analytic study, carried out from August 2015 to February 2016. Age, gender, current weight and height (Body Mass Index -BMI- calculation), diet food with NNS intake frequency (images) and information about consumption time periods, reasons, and others, were registered via survey.

Results: The sample was formed by 336 people. 95.5% of them consumed NNS. Only the saccharin intake was associated positively and statistically significant to BMI (p<0.05). Aspartame was the most consumed NNS. Consumption of cyclamate and saccharin was greater than the ADI. NNS consumption was higher in females (p<0.05).

Conclusions: There was no conclusive data on the effects of NNS on energetic intake, appetite or its relation with sweet flavor. Almost the entire sample has consumed NNS and most of them presented high BMIs. Only the saccharin intake was associated positively to BMI. NNS consumption was widely spread amongst the surveyed, regardless of BMI.

Keywords: non nutritive sweeters, overweigth, obesity, appetite.

FERMENTATION OF ¹³C-INULIN IS NOT AFFECTED BY A SINGLE ADMINISTRATION OF DIFFERENT WHEAT BRAN FRACTIONS IN HEALTHY SUBJECTS

[1]Deroover, Lise; [2]Verspreet, Joran; [3]Luypaerts, Anja; [4]Vandermeulen, Greet; [2]Courtin, Christophe; [5]Verbeke, Kristin.

[1]MSc. Department of Clinical and Experimental Medicine. KU Leuven. Belgium.; [2]PhD. Department of Microbial and Molecular Systems. KU Leuven. Belgium.; [3]Industrial Engineer. Department of Clinical and Experimental Medicine. KU Leuven. Belgium.; [4]Lab technician. Department of Clinical and Experimental Medicine. KU Leuven. Belgium.; [5]PhD. Department of Clinical and Experimental Medicine. KU Leuven. Belgium.

Background and objectives: Wheat bran (WB) is a constituent of whole-grain products, which may be colonized by specific bacteria in the human colon and hereby stimulate cross feeding, leading to a more efficient carbohydrate fermentation and an increased butyrate production.

We investigated to what extent WB fractions with different fermentation characteristics affect the fermentation of other carbohydrates (13C-inulin) in the colon.

Methods: Ten healthy subjects performed four test days on which they consumed a standard breakfast, labelled with inulin-14C-carboxylic acid, an oro-caecal transit time marker and supplemented with 10 g 13C-inulin and 20 g of a WB fraction (unmodified WB, WB with reduced particle size or destarched pericarp-enriched WB). On the control test day, no WB was consumed. Breath and blood samples were collected on regular time points for 14h to measure the start of fermentation and plasma 13C-labelled short chain fatty acid (SCFA; acetate, propionate, butyrate) concentrations, respectively. The relative proportions of acetate:propionate:butyrate were calculated to examine cross-feeding.

Results: The amount of 13CO2 in the breath samples started to increase before the breakfast reached the colon (14CO2 increase in breath) (208.5 ± 29 min and 219 ± 24.2 min after the breakfast, respectively), indicating that the fermentation of 13C-inulin already started in the terminal ileum. In addition, fermentation of inulin resulted in higher plasma 13C-SCFA concentrations for approximately 8h, with maximal concentrations reached 6h after the breakfast, but compared to the control, SCFA levels were not further increased by WB (Wilcoxon signed ranks test; All p>0.1). Relative proportions of acetate:propionate:butyrate in plasma amounted 89:4:7, 89:4:7, 90:4:6 and 83:5:12 with unmodified WB, WB RPS, PE WB and the control, respectively, but were not changed by any WB fraction compared to the control, indicating that WB did not stimulate cross-feeding (Wilcoxon signed rank test; All p>0.1).

Conclusions: Fermentation of 13C-inulin resulted in increased plasma SCFA for about 8h, suggesting that a sustained increase in plasma SCFA can be achieved by administering a moderate dose of carbohydrates three times per day. However, addition of a single dose of a WB fraction did not further increase the 13C-SCFA concentrations in plasma, nor stimulated cross-feeding between the gut bacteria.

Keywords: colonic fermentation; carbohydrates; inulin; wheat bran; short-chain fatty acids

HEME IRON ABSORPTION AND GENE EXPRESSION OF PROTEINS RELATED TO HEME IRON ABSORPTION IN RAT SMALL INTESTINE

[1]Shinoda, Shoko; [2]Azuma, Yuki.

[1]PhD. Graduate School of Human Health Sciences. Tokyo Metropolitan University. Japan.; [2]MSc. Graduate School of Human Health Sciences. Tokyo Metropolitan University. Japan.

Background and objectives: It is widely known that the absorption of heme iron is higher than nonheme iron, but mechanism of heme iron absorption has not been clarified. HCP1 (heme carrier protein-1) has been identified as a heme iron transporter expressed in the small intestinal mucosa. However, HCP1 is considered to be a folate transporter, and its function as a heme iron transporter is not clear. In order to clarify the heme iron absorption site in the small intestine, we investigated the gene expression of proteins related to heme iron absorption, and the absorption of hemin and water-soluble heme iron in the duodenum, jejunum and ileum.

Methods: To investigate the response of gene expression to iron deficiency, small intestine of normal and iron deficient rat were used. The small intestine was divided into five sections, and Hcp1, Flvcr (feline leukemia virus subgroups C receptor), HO-1 (heme oxygenase 1), and Fpn1 (ferroportin 1) mRNA were de-

termined by real-time PCR. Also, duodenum and jejunum was ligated and water-soluble heme or hemin iron was administered to measure the uptake of iron into mucosal cells and portal vein blood.

Results: Levels of expression of HO-1 and Fpn1 mRNA were high in the duodenum, and these were upregulated in iron-deficient rats. In the duodenum, iron uptake was about 30% after loading with water-soluble heme iron, but hemin was not absorbed. Levels of expression of Hcp1 and Flvcr1 mRNAs were high in the jejunum, and iron uptake was also high after loading with hemin in this section. Hcp1 and Flvcr1 mRNAs were not upregulated by iron deficiency.

Conclusions: In the duodenum and jejunum of the small intestine, different iron absorption mechanisms for water-soluble heme iron and hemin are considered to exist.

Keywords: heme iron absorption, HCP1, Flvcr, iron deficiency, hemin

PLASMA FREE FATTY ACID CONCENTRATIONS IN SCHOOLCHILDREN WITH AND WITHOUT ABDOMINAL OBESITY

[1]Aristizabal, Juan; [1]González-Zapata, Laura Inés; [2]Estrada-Restrepo, Alejandro; [3]Monsalve, Julia; [4]Restrepo-Mesa, Sandra; [5]Gaitan-Charry, Diego.

[1]PhD. Nutritionist. School of Nutrition and Dietetics, University of Antioquia, Medellín. Colombia.; [2]MSc. Epidemiology. Grupo de Investigación en Demografía y Salud. Universidad de Antioquia. Colombia; [3]MSc. Nutritionist. Escuela de Nutrición y Dietética. Universidad de Antioquia. Colombia; [4]Professor. Colombia.; [5]PhD. Doctor. Grupo de Investigación Alimentación y Nutrición Humana. Universidad de Antioquia. Colombia.

Background and objectives: In adults with abdominal obesity (AO), increased concentration of free fatty acids (FFAs) is associated with cardiometabolic risk factors. However, this association remains controversial in children. This study aimed to compare plasma FFAs concentration in children with and without AO, and to examine FFAs associations with cardiometabolic risk factors.

Methods: Twenty-nine children with AO were matched, one by one, according to sex and age, with 29 non-obese peers. Abdominal obesity was classified using the ninety percentile from the IDEFICS-Study (Identification and prevention of Dietary- and lifestyle-induced health EFfects In Children and infantS). Fasting plasma glucose, insulin, and lipids were determined by colorimetric and enzymatic methods. Plasma FFAs were analyzed by gas chromatography.

Results: Seventeen boys and twelve girls with similar average age (7.1 ± 2.6 vs 7.2 ± 2.7 y; p>0.05) were included in each group. Children with AO showed higher body mass index (BMI) (19.7 vs 15.4 kg/m2; p<0.001), waist circumference (64.9 vs 53.7 cm; p<0.001), systolic blood pressure (98.6 vs 93.5 mmHg; p<0.01)

and fasting insulin (70.2 vs 42.4 pmol·L; p<0.05). There were not significant differences in plasma total FFAs concentration between groups. However, children with AO had higher palmitoleic acid (0.94 vs 0.70 wt%; p<0.05) and dihomo-gamma linoleic acid (2.76 vs 2.07 wt%; p<0.05). Palmitoleic and dihomo-gamma linoleic acids correlated (p<0.05) with BMI (r=0,397; r=0,296, respectively) and waist circumference (r=0,380; r=0,276, respectively). Myristic and palmitoleic acids correlated (p<0.05) with high-density lipoprotein cholesterol (r=-0.408; r=-0.572, respectively).

Conclusions: These findings suggest that abdominal obese children have different plasma FFAs concentrations than non-obese peers, and the associations of FFAs with cardiometabolic risk factors are present in childhood.

Keywords: Students, body mass index, cardiometabolic risk factors, palmitoleic acid, dihomo-gamma linoleic acid.

THE EFFECT OF EXERCISE-TO-REST PERIOD RATIO ON THE RECUPERATION OF STORED FUEL FROM EXERCISE IN EXERCISE TRAINED RATS

[1]Cho, Younok; [2]An, Jeehyun.

[1]PhD. Professor. Department of Food and Nutrition. Duksung women's university. Republic of Korea; [2]Department of Food and Nutrition. Duksung Women's University. Republic of Korea.

Background and objectives: Replenishment of body's fuel store after exercise is a key process for the next bout of exercise. This study was conducted to examine the effect of exercise-to-rest period ratio and physical training on the recuperation of stored fuel.

Methods: Forty rats weighing 95-105 g were randomly assigned to either non-exercise training (NT) or regular exercise training (T) groups for 5 weeks and were subdivided into two groups: non-exercise(NE), exercise and recuperation group(ER). NE group were sacrificed without exercise and ER group were sacrificed after 1 hour rest from exercising for 0.5(ER2:1), 1(ER1;1), 2(ER1:2) hours.

Results: Liver glycogen level was increased in ER group and was reached to the highest level at ER1:1 ratio while it was not different between NE group and ER group in NT animal. Muscle glycogen level was increased at ER2:1 ratio and returned to the level of NE in NT animal while it was reached to the highest level at ER2:1 ratio and decreased but still higher than those of the level of NE in T animal. Free fatty acid level was reached highest level at ER2:1 ratio and decreased and was lower than those of NE at ER1:1 and ER1:2 ratio in NT animal while it was reached to the highest level at ER2:1 ratio and decreased but was not lower than those of NE at ER1:2 ratio in T animal. Muscle triglyceride level of of ER group was lower than that of NE group regardless of the different exercise-to-rest period ratio in NT animal while it was decreased and lower than that of NE group at ER2:1 and ER1:1 ratio but returned to that of NE in T animal. Muscle protein level was decreased at ER2:1 and started to be increased but was not reached to the level of NE group in NT animal while it was de-

creased at ER2:1 and ER1:1 but was returned to the level of NE group in T animal.

Conclusions: Animal would have to rest for periods in the 1:2 ratio in non trained group and 1:1 ratio in trained group to replenish the body's fuel store after exercise.

Keywords: exercise, rest, recuperation, training, fuel

EFFECT OF EXERCISE-TO-REST PERIOD RATIO AND PHYSICAL TRAINING ON THE RECUPERATION OF ANTIOXIDATIVE DEFENSE SYSTEM IN RATS

[1]Cho, Younok; [2]Kang, Keumjee.

[1]PhD. Professor. Department of Food and Nutrition, Duksung women's university. Republic of Korea; [2]PhD. Professor. Department of Food and Nutrition. Duksung Women's University. Republic of Korea.

Background and objectives: Successful recuperation after exercise is a key process to prepare the athlete for the next bout of exercise and the major components of recuperation may be the recuperation of antioxidative defense system of the body. This study was conducted to examine the effect of exercise-to-rest period ratio and physical training on the recuperation of antioxidative defense system of tissue from exercise in animal.

Methods: Forty 4-week old male Sprague-Dawley rats weighing 95-105 g were randomly assigned to one of two groups: non-exercise training (NT) or regular exercise training (T). At the end of week 5, the rats were subdivided into two groups: non-exercise(NE), exercise and recuperation group(ER). NE group were sacrificed without having performed exercise at the end of week 5. ER group were sacrificed after 1 hour rest from exercising on a treadmill (15° incline, 0.5-0.8 km/hr) for 0.5(ER2:1), 1(ER1;1), 2(ER1:2) hours respectively. Catalase activity was determined in plasma. The activity of superoxide dismutase (SOD), ratio of reduced glutathione to oxidized glutathione (GSH/GSSG), and levels of malondialdehyde (MDA) were determined in liver cytosol.

Results: SOD activities of NT animal were decreased at ER1:2, ER1:1, ER2:1 ratio and was not recovered to that activity of NE group while that of T animal were decreased at ER2:1, ER1:1 ratio and was recovered to that activity of NE group at ER1:2 ratio. Catalase activities of both NT and T animals were not different at ER2:1, ER1:1, ER2:1 ratio from that of NE group. MDA levels of both NT and T animals were increased at ER2:1, ER1:1 ratio but decreased at ER1:2 ratio and were not recovered to level of NE group. The results of this study suggest that training may improve exercise performance by enhancing the antioxidative defense system.

Conclusions: Animal would have to rest for periods in the 1:2 in non trained group and 1:1 in trained group to recuperate an antioxidative defense system and this system is effective in exercise trained animals.

Keywords: exercise, rest, recuperation, training, antioxidative system

VALIDITY OF NUTRIENT INTAKES DERIVED FROM WEBSITE DISH-BASED DIETARY ASSESSMENT

[1]Matsuzaki, Eri; [2]Michie, Mikiko; [3]Kawabata, Terue.

[1]Master of Nutrition. Kagawa Nutrition University. Japan.; [2]Nutritionist. Greenhouse Co., Ltd. Japan.; [3]Dr. Nutrition. Kagawa Nutrition University. Japan.

Background and objectives: We compared the relative validity of nutrient intakes derived from Internet website dish-based dietary records (WDDR) and weighed dietary records (DR).

Methods: The study participants were 218 registered users of a dietary management website and all were female. After excluding participants with missing data, 137 participants were included in the final analyses. The participants recorded their daily meals on both the DR and WDDR. The DR calculated energy and nutrient intakes using Standard Tables of Food Composition in Japan. For the WDDR, energy and nutrient intakes were automatically calculated by the website. We compared differences in the DR and WDDR with respect to intakes of energy and 13 nutrients.

Results: The median values for the intake of protein and seven nutrients showed no significant difference between the DR and the WDDR, and the estimated values were generally similar. The interquartile range of nutrients with a significant difference did not show a large deviation with the exception of vitamin A. Correlation coefficients showed a strong correlation of 0.7 with the exception of sodium and vitamin E. The kappa coefficients for energy, calcium, iron, vitamin C, and dietary fiber were good to fair and all others were moderate. Using Bland-Altman plots, we found proportional errors in intake values for vitamins and minerals. We could not confirm obvious systematic errors for energy, protein, fat, and carbohydrate intake.

Conclusions: Overall, the WDDR is considered to be a valid method of estimating energy and nutrient intake.

Keywords: web, dish-based, dietary records, Internet

FERROPENIC ANEMIA: OXIDATIVE STRESS AND CYTOMOLECULAR DAMAGE ASSOCIATED WITH FERROUS SULFATE PREVENTIVE ADMINISTRATION

[1]Gambaro, Rocio Celeste; [2]Seoane, Analía; [3]Padula, Gisel.

[1]BSc. Anthropologist. Instituto de Genética Veterinaria "Ing. Fernando N. Dulout". Universidad Nacional de La Plata. Consejo Nacional de Investigaciones Científicas y técnicas. Argentina.; [2]PhD. Biologist. Instituto de Genética Veterinaria "Ing. Fernando N. Dulout". Universidad Nacional de La Plata. Consejo Nacional de Investigaciones Científicas y Técnicas. La Plata. Argentina.; [3]PhD. Anthropologist. Instituto de Genética Veterinaria "Ing. Fernando N. Dulout". Universidad Nacional de La Plata. Consejo Nacional de Investigaciones Científicas y Técnicas. Facultad de Ciencias Naturales y Museo UNLP. La Plata. Argentina.

Background and objectives: Iron deficiency anemia (IDF) is a pathological condition characterized by insufficient iron to synthesize iron-containing proteins and enzymes. Iron is an essential trace mineral for a number of biological functions. Although iron deficiency may be prevented by adequate dietary intakes, it is internationally agreed that iron supplementation to lactating mothers and infants is a priority. The Argentine Pediatric Society recommends daily ferrous sulfate supplementation as a preventive strategy. Since the 90´s, a single weekly dose of ferrous sulfate has been an alternative treatment. On the other hand, ferrous sulfate is known for its pro-oxidant properties, leading to increased oxidative stress that may seriously damage membranes, proteins and DNA. The aim of this study was to determine the possible cytomolecular damage and oxidative stress caused by daily and weekly administration of ferrous sulfate for IDF prevention, in in vitro cultured human lymphocytes.

Methods: We performed two controls (negative and positive) and two ferrous sulfate treatments (weekly and daily). Cytomolecular damage was assessed by the comet assay and oxidative stress using T-BARS.

Results: Weekly ferrous sulfate treatment elicited a decreasing trend in the production of oxygen free radicals and, consequently, of oxidative stress and cytomolecular damage.

Conclusions: Since weekly ferrous sulfate supplementation causes less side effects, it would allow higher treatment compliance, thus decreasing IDF prevalence. Future in vivo studies and the development of further techniques would enable us to obtain more conclusive results.

IN VITRO AND IN VIVO EVALUATION OF THE FERMENTABILITY OF TWO DIFFERENT WHEAT-DERIVED FIBRE FRACTIONS

[1]Deroover, Lise; [2]Boets, Eef; [3]Gomand, Sara; [4]Preston, Thomas; [5]Vermeulen, Karen; [2]De Preter, Vicky; [3]Courtin, Christophe; [3]Delcour, Jan; [2]Verbeke, Kristin.

[1]MSc. Department of Clinical and Experimental Medicine. KU Leuven. Belgium.; [2]PhD. Department of Clinical and Experimental Medicine. KU Leuven. Belgium.; [3]PhD. Department of Microbial and Molecular Systems. KU Leuven. Belgium.; [4]PhD. Scottish Universities Environmental Research Centre. University of Glasgow. UK.; [5]MSc. Department of Pathology, Bacteriology and Avian Diseases. Ghent University. Belgium.

Background and objectives: Dietary fibre (DF) is neither digested nor absorbed in the small intestine but is fermented in the large intestine by the resident microbiota with production of short-chain fatty acids (SCFA). The extent of DF fermentation depends on structural and physicochemical characteristics of the fibre.

In this study, the SCFA production from two structurally different wheat-derived fibre fractions was quantified using in vitro fermentation experiments and a dietary intervention study in healthy humans.

Methods: Readily fermentable arabinoxylan oligosaccharides (AXOS) and water-insoluble dietary fibre-enriched bran (DF-B) were produced from both unlabelled and 13C-enriched wheat bran (WB). Both (unlabelled) fractions were incubated in vitro with faecal slurries obtained from healthy subjects at 37°C for 24h. Remaining arabinoxylan (AX) was quantified using GC-FID and metabolite profiles, including SCFA, were analysed using GC-MS. In the human intervention study, ten healthy subjects consumed 13C-labelled AXOS and 13C-labelled DF-B at breakfast on two separate days followed by collection of breath and blood samples on regular time points for 14h. Breath samples were analysed for 13CO2 and H2 and blood samples were analysed for 13C-SCFA levels. A faecal sample was analysed for butyrate-producing capacity.

Results: After in vitro incubation of faecal slurries with AXOS for 24h, only 5% of residual AX was retrieved whereas almost 90% of the AX remained after DF-B incubation. Fermentation of AXOS resulted in a faster and higher increase in SCFA compared to DF-B. Metabolite profiles showed that AXOS fermentation was associated with SCFA, some alcohols and aldehydes, whereas DF-B fermentation was associated with branched-chain and median-chain fatty acids. In humans, excretion in breath of the fermentation gases, 13CO2 and H2 increased after 13C-AXOS but not after 13C-DF-B. Cumulative total 13C-SCFA levels in blood were significantly higher after 13C AXOS compared to 13C-DF-B (89 [74-103] mmol vs. 9.3 [5.4-15.5] mmol; p=0.005). Total butyrate recovery was not correlated to the butyrate-producing capacity in the faecal samples.

Conclusions: In conclusion, the molecular structure and physicochemical characteristics of AX in WB, clearly determine the extent of fermentation. Furthermore, the use of stable isotope labelled substrates provides an efficient manner to establish differences in in vivo fermentation.

FROM STARCH STRUCTURE TO ITS IN VIVO METABOLIC FATE: ADVANCED IMAGERY TECHNIQUES TO EXPLAIN THE CHANGES IN STARCH STRUCTURE DURING DIFFERENT BISCUIT-MAKING PROCESSES

[1]Cesbron Lavau, Gautier; [2]Goux, Aurélie; [2]Meynier, Alexandra; [2]Vinoy, Sophie.

[1]Msc. Nutrition Scientist. Mondelez International; [2]PhD. Mondelēz International R&D. Nutrition Research Department. France.

Background and objectives: Based on WHO recommendations, starch represents the largest component of our daily energy intake (40% to 50%). During food manufacturing, heat, moisture and pressure alter dramatically the digestibility of starch in processed foods (Bornet et al. 1993; Vinoy et al. 2016). The control of these major process parameters can lead to large differences of starch digestibility (Englyst et al. 2003).

The originality of this work was to combine complementary measures to characterize the extent of starch gelatinization, its structure through sophisticated imagery as well as its rate of digestion measured in vitro (Englyst method) and in vivo (Glycaemic Index (GI) determination).

Methods: Four different technologies were chosen for their different process parameters: rotary biscuits, extruded cereals, soft cakes and rusks. The first three were made in two versions, wholegrain by addition of wheat bran and plain using regular wheat flour. Samples were sent for starch digestion analysis in vitro and a GI test using all 9 products was launched. Conjunctively, the internal structure and aspect of the starch were determined by using x-ray diffraction (XRD), x-ray micro-tomography and field emission gun scanning electron microscopy (FEG-SEM).

Results: The study highlighted several differences between technologies. Only the rotary products, with and without bran maintained a high slowly digestible starch (SDS) level (24g/100g, and 28 g/100g respectively) and a low GI (47 ± 5, and 43 ± 3 respectively). Soft cakes with and without bran showed low SDS values (2g/100g for both product) and medium GI values (63 ± 6, and 66 ± 5 respectively). Rusk products displayed low SDS values (1g/100g) and a medium GI (61 ± 4). The extruded cereals, with and without bran had the lowest SDS values (0.1g/100g for both products) and higher GI values (66 ± 4 and 77 ± 4 respectively). The imaging technologies unveiled significant changes in starch structure and showed a higher level of preservation for the rotaries which corresponded to the in vitro and in vivo digestion results.

Conclusions: By controlling food process, slow digestibility of starch can be maintained because of its starch structure preservation.

THE PROTECTIVE ROLE OF MITOCHONDRIAL SERINE HYDROXYMETHYLTRANSFERASE AGAINST OXIDATIVE STRESS-INDUCED MITOCHONDRIA DYSFUNCTION AND DNA DAMAGE

[1]Yeh, I-Ling; [2]Shane, Barry; [3]Huang, Rwei-Fen S.

[1]Dietitian. Department of Dietetics. National Taiwan University Hospital. Taiwan; [2]Professor. Nutritional Sciences & Toxicology. Department of Nutritional Sciences & Toxicology. University of California, Berkeley. USA.; [3]Professor. Department of Nutritional Science. Fu Jen Catholic University. Taiwan.

Background and objectives: Two different isoform enzymes serine hydroxymethyltransferase (SHMT) involved in folate metabolism occurs mainly in the cytosol and mitochondria (mt). Numerous studies suggested that polymorphisms of cytosol SHMT (cSHMT) were associated with related to plasma homocysteine levels and increased risks of cancer development. The functional role of mitochondrial SHMT (mSHMT) remains obscure. By use of the Chinese hamster ovary (CHO) mutant cells, glyA, with defective mSHMT, we have previously shown that treatment of glyA with tert-Butylhydroperoxide (tBH), an exogenous oxidative stress, resulted in elevated superoxide levels and depleted mt folate levels. Aims of the study were to determine the role of mSHMT and its interaction with folate insufficiency in mt function upon oxidative stress.

Methods: Treated with 50μM tBH for 72hrs and pre-incubation with folate supplements in glyA.

Results: Treated with 50μM tBH for 72hrs in glyA was showed that mt biogenesis increased including mtDNA content and mt mass. Additional, mtDNA-encoded genes also increased including cytochrome c oxidase subunit (COX) II, III and ATP synthase Fo subunit 6. However, it also increases 8-hydroxy-20-deoxyguanosine (8-OHdG), a DNA damage indication in glyA treatment via tBH. Intriguingly, pre-incubation with folate supplements increase both cytosolic and mt folate and reduced the t-BH-induced ROS. The folate supplementation was attenuated confusing mt biogenesis and 8-OHdG by t-BH treated glyA.

Conclusions: Taken together, the data suggest that functional defects of mSHMT in the mt, as observed in glyA, has handicapped the biosynthesis of folate, and folate in the mt plays a critical role in the protective action of exogenous oxidative stress.

BIOMARKER OF LONG-CHAIN N-3 PUFA AND RISK OF BREAST CANCER: ACCUMULATIVE EVIDENCE FROM AN UPDATED META-ANALYSIS OF EPIDEMIOLOGICAL STUDIES

(1)Yang, Bo; (2)Ma, Ai Guo; (2)Li, Duo.

(1)PhD. Nutritionist. Research Institue of Nutrition and Health. Qingdao University; (2)PhD. Nutritionist. Research Institute of Nutrition and Health. Qingdao University. China.

Background and objectives: Long-chain (LC) n-3 polyunsaturated fatty acid (PUFA) in different biospecimens (serum/plasma/erythrocyte/adipose tissue) as biomarkers of fatty acid intake can provide objective measures that reflect both dietary consumption and relevant biological processes. Nevertheless, results of epidemiological studies on biomarker of LC n-3 PUFA in relation to risk of breast cancer (BC) are inconsistent. We therefore conducted a meta-analysis to assess the up-to-date pooling effects based on prospective cohort and case-control studies.

Methods: The compositions of LC n-3 PUFA in erythrocyte membrane (EM) and adipose tissue (AT) were compared between BC cases and noncases as a standardized mean difference (SMD). Risk ratios (RRs) or odds ratios (ORs) with 95% confidence interval (CI) from prospective and case-control studies were pooled using a random-effects model in the highest vs. lowest categorical analysis, respectively.

Results: A database was derived from 19 eligible studies (10 cohorts with circulating LC n-3 PUFA as biomarker, 6 case-control with AT and 3 with EM), comprising 133,943 individuals (4,386 cases and 129,557 noncases). BC cases have significantly lower LC n-3 PUFA compositions in EM than noncases (SMD = -0.27; 95% CI: -0.41, -0.13; I2 = 28.10%), whereas no significant difference was found in AT (SMD = -0.15; 95% CI: -0.06, 0.36; I2 = 81.50%). In pooled analysis of cohort studies (n=10), circulating LC n-3 PUFA was significantly associated with reduced risk of BC (RR = 0.88; 95% CI: 0.78-0.99; I2 = 0.00%), and the summary RR was 0.85 (95% CI: 0.72-1.00; I2 = 0.00%) for 20:5n-3, 0.98 (95% CI: 0.81-1.19; I2 = 0.00%) for 22:5n-3, and 0.86 (95% CI: 0.76-1.02; I2 = 10.00%) for 22: 6n-3, respectively. In pooled analysis of case-control studies (n=9), LC n-3 PUFA composition in EM was inversely associated with risk of BC (OR = 0.36; 95% CI: 0.18-0.70; I2 = 86.40%), whereas no significant association was observed for AT (OR = 0.91; 95% CI: 0.64-1.28; I2 = 29.90%).

Conclusions: Circulating LC n-3 PUFA was inversely associated with risk of BC, especially 20:5n-3 and 22:6n-3. Such findings support that LC n-3 compositions in circulating blood may be an independent predictive factor for BC.

TRANSCULTURAL ADAPTATION OF THE EATING MOTIVATION SURVEY (TEMS) TO BRAZILIAN PORTUGUESE

(1)Moraes, Jéssica; (2)Koritar, Priscila; (3)Alvarenga, Marle.

(1)BSc. Nutricionista Departamento de Nutrição. Faculdade de Saúde Pública. Universidade de São Paulo. Brazil.; (2)MSc. Departamento de Nutrição. Faculdade de Saúde Pública da Universidade de São Paulo. Brazil.; (3)PhD. Departamento de Nutrição. Faculdade de Saúde Pública da Universidade de São Paulo. Brazil.

Background and objectives: When we think about food that are many reasons why the people eat what they eat. People can eat motivated by factors like hunger, the appearance of the food, desire, taste, price, to control weigh or maybe handle some emotions, because it is fashionable or because of the nutritional content - and still by cultural or family traditional reasons. Understanding these motivations is crucial to development of nutritional recommendations able to modify inappropriate and dysfunctional eating patterns. This understanding can be evaluated by instruments – among the existing ones, The Eating Motivation Survey (TEMS) allows the identification of the motivations to eat and food choices. Therefore, the aim of this study is to present the TEMS transcultural adaptation process for applicability in Brazilian population studies.

Methods: The process involved the conceptual and item equivalence; semantic equivalence by 2 translators, 1 linguist, 22 experts (response frequency) and 23 bilinguals (comparing the results by paired t test, Pearson Correlation and Intraclass Correlation Coefficient); and the operational equivalence carried out with 32 adult individuals.

Results: All these equivalences showed satisfactory results to use the scale in Brazil, which allows the TEMS application to evaluate the food choices motivations in our context.

Conclusions: All these equivalences showed satisfactory results to use the scale in Brazil, which allows the TEMS application to evaluate the food choices motivations in our context.

Keywords: Eating behaviour, motivation, cross-cultural comparison, questionnaires

MULTIVARIATE NUTRITIONAL ASSESSMENT THROUGHOUT SEXUAL MATURATION

[1]Cumpian-Silva, Jéssica; [2]Rinaldi, Ana Elisa Madalena; [3]Mazzeti, Camila; [4]Sá, Beatriz Medeiros; [4]Santos, Aline Micaele Reis; [4]Cruz, Danielle Rocha; [5]Conde, Wolney Lisboa.

[1]MD. Nutricionista. Laboratório de Avaliação Nutricional de Populações. Faculdade de Saúde Pública (FSP). Universidade de São Paulo (USP). Brasil; [2]PHD. Professor Doutor. Nutricionista. Faculdade de Medicina. Universidade Federal de Uberlândia. Brasil; [3]MD. Nutricionista. Departamento de Nutrição. Universidade de São Paulo. Brasil; [4]Estudante Graduação. Universidade de São Paulo. Brasil; [5]PHD. Professor Doutor. Nutricionista. Departamento de Nutrição. Universidade de São Paulo. Brasil.

Background and objectives: The form of analysis can lead to confusion in the influence of sexual maturation in the assessment of nutritional status.

Methods: Data came from 680 adolescents surveyed in city of Piracicaba (SP, Brazil), 1134 adolescents surveyed in city of Sao Paulo (SP, Brazil) and 3321 adolescents American research National Health and Nutrition Examination Survey (NHANES III). Multivariate patterns of nutritional status were estimated using Principal Components Analysis. We set eigenvalues to 0.7 and loadings to 0.2. Sexual maturation was self-evaluated according to five Tanner stages.

Results: The first 4 components are responsible for 63.5% of the variability of Piracicaba, 71.13% NHANES and the first three components in Sao Paulo account for 81.45%. The first component of Piracicaba and NHANES was characterized by anthropometric variables especially skinfolds (triceps, subscapularis, suprailiac and thigh) and waist circumference. The data of Sao Paulo held the second component was characterized by the same anthropometric variables. The second component was characterized by sexual maturation in Piracicaba and NHANES (pubic hair, breast and external genitalia) beyond the age, height, weight and phase angle. In São Paulo, the component that marks the sexual maturation was retained in the first, and presented the same characteristics of other banks with the same markings variables. The third was characterized by cholesterol, triglycerides and glucose in Piracicaba and NHANES. The third and final component in Sao Paulo was characterized by body composition variable (phase angle). The fourth component mixed load presented for biochemical variables. The adequacy of the sample in relation to the degree of partial correlation between variables was estimated by the Kaiser-Meyer-Olkin (KMO), which was 0.8031 Piracicaba, 0.8712 NHANES and 0.7713 Sao Paulo.

Conclusions: Multivariate analyses of nutritional status reveals many possible profiles whose cannot be properly described using usually a single univariate indicator, such as body mass index. We have no conflict of interest to declare.

VEGETARIAN DIET, NUTRITIONAL STATUS AND CIRCULATING BRAIN DERIVED NEUROTROPHIC FACTOR LEVELS IN ADULTS

[1]Pimentel, Carolina; [2]Philippi, Sonia; [3]Simomura, Viviane; [4]Teodorov, Elisabeth.

[1]Nutricionist. PhD. Professor of Health Science Institute Paulista University. UNIP. São Paulo. Brazil.; [2]Nutricionist. PhD. Professor of Department of Nutrition. Public Health School. University of Sao Paulo. São Paulo. Brazil.; [3]Nutricionist. MSc. Paulista University. UNIP. São Paulo. Brazil.; [4]Biologist. Professor of Mathematics, Computing and Cognition Center. Federal University of ABC. Santo André. Brazil.

Background and objectives: Introduction: Recent studies have demonstrated that the Brain Derived Neurotrophic Factor (BDNF) is related to a possible endocrine role and also to nutritional factors, since they are involved in the regulation of energy metabolism and a positive correlation with the Body Mass Index (BMI). Objective: To evaluate nutritional status (waist circumference [WC] and BMI) and circulating BDNF levels in adult vegetarian individuals compared to omnivores.

Methods: A cross-sectional study was carried out with 96 subjects (56 vegetarians and 40 omnivores) adults. BMI was obtained by dividing body weight (kg) by squared height (m2). To obtain weight, we used an electronic scale (Welmy®, model R-110) and the stature was measured using a portable anthropometer (Estad® - Alturexata, 0,35m to 2,13m). The waist circumference (WC) was used to evaluate the body composition with the umbilical scar measurement using an inextensible metric tape with a Sanny® brand lock. The classification of the nutritional status according to BMI followed the cut-off points recommended by the WHO (1995) and classified as normal (18,5 kg/m2 to 24,9 kg/m2) and altered (> 24,9 kg/m2). The WC was classified according to the risk of metabolic complications associated with obesity, according to gender, considered normal for women, when <80 cm and altered or at risk if > 80 cm, for men normal WC was considered < 94 cm and altered or at risk >94 cm (WHO, 1998). BDNF levels were evaluated with the BDNF Emax ImmunoAssay System (Promega, Madison, WI, USA) according to the manufacturer's specifications and was classified according to the median (626.0 pg/mL).

Results: In relation to nutritional status, the VEGs are leaner (63,9 ± 10,4 kg vs 69,4 ± 14,6 kg, p=0,032), they have a lower BMI (22,5 ± 2,6 kg/m2 vs 25,0 ± 3,9 kg/m2, p< 0,001) and lower values of WC (81,8 ± 8,2cm vs 87,8 ± 10,9cm, p=0,003). Regarding the BDNF variable, there was no difference between vegetarians and omnivores (662,8 ± 276,5pg/ml vs 698,1 ± 314,9 pg/ml, p=0,563).

Conclusions: The results suggest that the vegetarian diet has a beneficial role in relation to the nutritional status of these individuals.

Brasil; [5]PHD. Professor Doutor. Nutricionista. Departamento de Nutrição. Universidade de São Paulo. Brasil.

Background and objectives: The index used in analysis can lead to confusion about influence of sexual maturation in the assessment of nutritional status. We will estimate multivariate indices from a pool of body measures to describe nutritional status.

Methods: Data came from 833 adolescents surveyed in Piracicaba(Brazil) and 3321 in United States(NHANESIII). Principal Components Analysis was applied to define multivariate patterns of nutritional status from anthropometric measurements (weight, height, skinfolds, and waist circumference), body composition (phase angle) and biochemical exams (glucose, cholesterol, triglycerides and hemoglobin). To define multivariate patterns of nutritional status we set eigenvalues to 0.7 and eigenvectors to ±0.2. Each pattern was set as outcome in a mixed multilevel regression with two levels. In the individual level we included sex and in the second we included Tanner stages, age, sex and socioeconomic score.

Results: The first four components are responsible for 63.5% of the variability in Piracicaba and 71.1% in NHANESIII. All patterns were the same for both surveys. The first component was characterized by anthropometric variables; especially skin folds (triceps, subscapular, suprailiac and thigh) and waist circumference a pattern of adiposity. The second was characterized by sexual maturation (pubic hair, breast and gonad),age, height, weight and phase angle a pattern of linear growth process. The third was characterized by cholesterol, triglycerides and glucose a pattern of metabolic markers linked to adiposity. The forth component was characterized by phase angle and hemoglobin(positive eigenvector) and glucose(negative eigenvector) patterns of metabolic markers linked to lean mass. The adequacy of the sample in relation to the degree of partial correlation between variables was estimated by Kaiser-Meyer-Olkin(KMO), which was 0,80Piracicaba and 0,87NHANESIII. In mixed effects regression models, variance attributable to sexual maturation at level 2 was low; the individual fixed effects explained changes in body composition mostly. The two surveys Tanner's stages explained less than 20% of patterns that are unrelated to sexual maturation and explained more than 80% pattern two that is related to linear growth and sexual maturation.

Conclusions: The nutritional status in adolescents does not require adjustment by sexual maturation. Adolescent weight gain may be the source of confusion at the time of diagnosis.

GLYCEMIC PROFILE AND CIRCULATING BRAIN DERIVED NEUROTROPHIC FACTOR LEVELS IN ADULT VEGETARIANS

[1]Pimentel, Carolina; [2]Philippi, Sonia; [3]Simomura, Viviane; [4]Teodorov, Elisabeth.

[1]Nutricionist. PhD. Professor of Health Science Institute Paulista University. UNIP. São Paulo. Brazil.; [2]Nutricionist. PhD. Professor of Department of Nutrition. Public Health School. University of Sao Paulo. São Paulo. Brazil.; [3]Nutricionist. MSc. Paulista University. UNIP. São Paulo. Brazil.; [4]Biologist. Professor of Mathematics, Computing and Cognition Center. Federal University of ABC. Santo André. Brazil.

Background and objectives: Introduction: Data from the literature have repeatedly demonstrated the beneficial role of the vegetarian diet in reducing risk factors for cardiovascular diseases, mainly because they positively modulate biochemical parameters, particularly those related to glycemic control and lipemia. Recently, animal studies have demonstrated the relationship of the Brain Derived Neurotrophic Factor (BDNF) and its relationship with increased insulin sensitivity and consequent lowering of blood glucose levels. Objective: To evaluate the glycemic profile (fasting glycemia) and circulating levels of BDNF in adult vegetarian individuals compared to omnivores.

Methods: A cross-sectional study was carried out with 96 subjects (56 vegetarians and 40 omnivores) adults. The biochemical parameters were obtained by means of blood collection, glycemia by the Automated Enzymatic Colorimetric method and the BDNF levels by BDNF Emax® ImmunoAssay System (Promega®, Madison, WI, USA), according to the manufacturer's specifications . For analysis, biochemical variables were classified as normal and altered using the following reference ranges for altered fasting glycemia (> 110mg/dL) and for BDNF (median [626.0 pg/mL]). The analyzes were performed in Statistical Package for Social Sciences (SPSS) version 20.0 and for all a level of significance of 5% was considered.

Results: Vegetarians had lower fasting blood glucose levels when compared to omnivores (82,13 ± 9,11 mg/dL vs 85,8 ± 10,87 mg/dL, p=0,004). Regarding the BDNF variable, there was no difference between vegetarians and omnivores (662,8 ± 276,5pg/ml vs 698,1 ± 314,9 pg/ml, p=0,563).

Conclusions: The results indicate that the vegetarian diet has a beneficial role in relation to the glycemic control of these individuals, research with a greater number of subjects is necessary to understand its relationship with BDNF levels.

METIGENTITY, A NUTRIGENETIC APPROACH GUIDING INDIVIDUAL NEEDS AND PREFERENCES TOWARDS OPTIMAL AND PERSONALIZED NUTRITION

(1)Palou, Andreu; (2)Mercader, Josep; (3)Gil, Raul; (4)Serra, Francisca; (5)Sabater Bibiloni, Agustín.

(1)MBA. Executive Director. Alimentómica S.L. Spin off of the University of the Balearic Islands. Spain; (2)PhD. R+D Department. Alimentómica S.L. Spin off of the University of the Balearic Islands. Spain; (3)MsC. Consultant. Alimentómica S.L. Spin off of the University of the Balearic Islands. Spain; (4)Prof. PhD. Laboratory of Molecular Biology Nutrition and Biotechnology. Nutrigenomics. University of the Balearic Islands. Spain. CIBER Physiopathology of Obesity and Nutrition CIBEROBN. Spain; (5)University of the Balearic Islands. Spain.

Background and objectives: Nutritional assessment is based on reliable information that combines nutrient exposure, its bioavailability and metabolic function. However, individual's response to dietary assessment can be highly variable, which has been associated with small genetic differences found throughout people's DNA, being SNP (single nucleotide polymorphisms) the most common. Therefore, implementation of personalized nutritional guidance requires the development of evidence-based biomarkers able to dissect the interaction between gene variants, nutrients and life-style aspects.

The objective has been the design and implementation of a nutrigenetic approach characterizing a set of gene variants focused on genetic susceptibility to obesity (Metigentity) and extended to analysis of sports performance (MetigentitySport).

Methods: A panel of genes were selected from studies showing association with obesity, sports performance or related issues (diabetes, hypertension, sliming pattern, endurance, motivation, etc). In addition, a selection of genetic variants playing a role in individual responses to nutrients or ergogenic aids was also included.

Results: Around 50 gene variants have been priorized and incorporated at Metigentity. Identification of the number of alleles associated with the risk-benefit variants allowed the setting of specific genetic scores (GS) and assessment of people's genotype. Metigentity estimates GS for (1) risk to develop metabolic alterations associated with obesity (type 2 diabetes, hypertension, hypertriglyceridemia,…); (2) macronutrient metabolism performance; (3) eating behaviour; (4) gustative perception and nutrient/food preferences; (5) the impact of dietary components on biomarkers related to metabolic diseases; and (6) the ability to lose weight and to experience the rebound effect in response to dietary interventions. MetigentitySport analyzes around 30 gene variants and estimates (1) genetic capacity to practice aerobic endurance sports and power, sprint and speed sports; (2) psychological aptitude towards sports; (3) genetic susceptibility to suffer from sport injuries; (4) response to nutrients and supplements related to performance; and (5) the response to particular exercises in terms of performance and health. Holistic integration of all GS is elaborated and guidelines best suited to the individual's genotype is supplied.

Conclusions: The nutrigenetic approach Metigentity (http://www.metigentity.com/), and its extension MetigentitySport, constitute evidence-based biomarkers and are valuable tools for nutritionists guiding individual needs and preferences towards optimal and personalized nutrition.

Keywords: nutrigenetics, SNP, obesity, sports performance, personalized nutrition

THE INFLUENCE OF THE PEAKING TRAINING ON SALIVARY IGA SECRETION IN COLLEGE TRIATHLETE

(1)Matsumoto, Megumi; (2)Satoh, Kentaro; (3)Kushi, Hidehiko; (4)Hamuro, Koji; (4)Sakurai, Masao; (4)Saito, Hiroshi; (4)Tanaka, Ryohei; (4)Saito, Takao; (4)Kohda, Noriyuki; (4)Hamada, Koichiro.

(1)PhD. Nutritionist.; (2)MSc; (3)PhD., MD; (4)PhD.

Background and objectives: Some triathletes often feel sick in conditioning period (peaking period) toward the race. The aim of this study is to consider the method of conditioning athletes by investigating the changes of the immunity through examining the variation of salivary IgA secretion.

Methods: For the college students' triathletes of 33 males and 7 females who participate the race, the amount of salivary IgA about one month before the race were continuously measured. In addition, meal content and the amount of water intake and physical activity in the training were recorded and the relationship with salivary IgA secretion was evaluated.

Results: No significant change in nutrition intake during the test period was observed. Significant high level of water intake was shown only on the race day. The average amount of physical activity a week of two to three weeks before the race was the highest as 744.7 ± 51.5 kcal/day, and that of one to two weeks before the race was 513.2 ± 28.5 kcal/day. That of last week before the race was 305.5 ± 29.9 kcal/day, and this value was significantly lower than the initial value (P <0.05). In the subjects whose average amount of physical activity of the three days in one to two weeks before the race (pre-race 12 to 14 days) was more than 1000 kcal/day, the amount of salivary IgA secretion significantly reduced at one week before the race (P <0.05), and at the day before the race further reduction was observed (P <0.1). When the daily high-intensity exercises above a certain level two weeks before the race were performed, the salivary IgA secretion from the week to the day before the race reduced. Therefore, peaking method performed during a certain period before the race which contains high-intensity exercise weakens the mucosal immune function and induces the state which is easy to break a condition.

Conclusions: In the college students' triathletes, the amount of the salivary IgA secretion was decreased by the peaking carried

---

out toward the race. This was considered to be one of the causes breaking the condition just before the race.

Keywords: IgA, triathlete, peaking training, conditioning

EFFECT OF JAPANESE SOUP STOCK "DASHI" IN AUTONOMIC NERVOUS SYSTEM ACTIVITY AND MENTAL FATIGUE

[1]Yamazaki, Hanae; [2]Moritaki, Nozomi; [3]Inoue, Kazuo.

[1]Ph.D. Associate professor. Department of Food Science and Human Nutrition. Faculty of Agriculture. Ryukoku University Associate professor. Department of Food Science and Human Nutrition, Faculty of Agriculture. Ryukoku University. Japan; [2]Grad Student. Laboratory of Nutrition Chemistry. Division of Food Science and Biotechnology. Graduate School of Agriculture. Kyoto University. Japan.; [3]Ph.D. Associate professor. Laboratory of Nutrition Chemistry. Division of Food Science and Biotechnology. Graduate School of Agriculture. Kyoto University. Japan.

Background and objectives: The Japanese soup stock, called "Dashi", is used in many traditional Japanese cuisine and it's taste and flavor assume a fundamental part in most of the dishes. Recently, some studies have indicated that a long-period intake of dashi brings beneficial influence on health. In this study, we focused on the instant effect of dashi intake on the autonomic nervous system activity and emotion related to a feeling of fatigue.

Methods: Healthy and non-smoking volunteers aged 20-25 were participated in this study. The subjects consumed assigned breakfast at 9:00, and the experiments were conducted between 10:30 and 11:30. Heart rate variability (HRV) was employed to assess the autonomic nervous system (ANS) activity. To measure degree of mental fatigue condition, the flicker test was used with 30 minutes simple calculation tasks "Uchida Kraepelin Test". The subjective assessment for emotional states were also determined by a Visual Analog Scale (VAS) method.

Results: We observed that the increase of parasympathetic nerve activity at 15 minutes time point after intake of dashi, which means that the emotional condition supposed to shift to the phase of relaxing. Interestingly, only the inhalation of dashi odor also induced similar effect on ANS. The results of flicker test and VAS showed that dashi intake decreased an accumulation of a feeling of fatigue.

Conclusions: These results suggested that dashi has acute effects on improving the emotional states, and the distinctive odor of dashi plays an important role in these effects.

Keywords: dashi, autonomic nervous system activity, flicker test, visual analog scale, anti-fatigue

AN INCREASE IN 4E-BP1 LEVEL MEDIATES TO ENHANCE TRIGLYCERIDE ACCUMULATION IN RAT LIVER UNDER PROTEIN MALNUTRITION

[1]Toyoshima, Yuka; [2]Tokita, Reiko; [1]Taguchi, Yusuke; [3]Yoshizawa, Fumiaki; [4]Takahashi, Shin-Ichiro; [5]Kato, Hisanori; [1]Minami, Shiro.

[1]PhD. Department of Bioregulation. Nippon Medical School. Japan.; [2]Bachelor. Department of Bioregulation. Nippon Medical School. Japan.; [3]PhD. Department of Agrobiology and Bioresources. Faculty of Agriculture. Utsunomiya University. Japan.; [4]PhD. Department of Animal Sciences. Graduate School of Agriculture and Life Science. The University of Tokyo. Japan.; [5]PhD. Corporate Sponsored Research Program "Food for Life". Organization for Interdisciplinary Research Projects. The University of Tokyo. Japan.

Background and objectives: We have shown that feeding of a low-protein diet increases the amount of eukaryotic translation initiation factor (eIF) 4E-binding protein 1 (4E-BP1), a substrate of mammalian target of rapamycin complex 1 (mTORC1) in rat liver. There are increasing evidences that mTORC1 pathway controls lipid metabolism. However, the role of 4E-BP1 in the regulation of lipid metabolism is not clear. The present study was undertaken to examine whether 4E-BP1 is involved in the enhancement of hepatic triglyceride (TG) accumulation in rats fed a low-protein diet.

Methods: Experiment 1. In order to increase 4E-BP1 in the liver artificially, five-week-old rats were injected via their tail vein with adenovirus (Ad) expressing rat 4e-bp1 or LacZ and fed a standard chow. Seven days after Ad injection, their livers were collected.

Experiment 2. In order to knockdown hepatic 4E-BP1 under protein malnutrition, five-week-old rats were injected via their tail vein with Ad expressing rat 4e-bp1 short-hairpin RNA (sh4E-BP1) or non-specific short-hairpin RNA. Eight days after Ad injection, each Ad-injected group was divided into two groups. One was fed a 15% casein diet as a control diet and the other was fed a 5% casein diet (5C) as a low-protein diet for 4 days. On the 5th day, their livers were collected.

Results: Experiment 1. The 4E-BP1 overexpression did not change hepatic TG levels.

Experiment 2. The 5C-feeding increased 4E-BP1 levels in the liver of both Ad-injected rats, but 4E-BP1 knockdown by sh4E-BP1 Ad injection suppressed 5C-feeding-induced increases in hepatic 4E-BP1 levels. The 4E-BP1 knockdown also suppressed 5C-feeding-induced increases in the protein levels of eIF4G, a translation initiation scaffolding protein, in the liver. Hepatic TG levels were significantly increased by 5C-feeding in the liver of both Ad-injected rats. However, 4E-BP1 knockdown attenuated 5C-feeding-induced hepatic TG accumulation.

Conclusions: These data indicate that TG accumulation is not enhanced just by increasing 4E-BP1 in the liver, although the increase in 4E-BP1 levels is necessary to enhance TG accumulation in the liver under protein malnutrition. In addition, it is suggested that 4E-BP1 might control TG levels in concert with eIF4G in rat liver under protein malnutrition.

Keywords: protein malnutrition, liver, 4E-BP1, triglyceride, rat

Biochemistry & Biotechnology Department. Rovira i Virgili University and Sant Joan de Reus Hospital. IISPV. Reus. CIBEROBN. ISCIII. Spain.

Background and objectives: Several cases of eating disorders (EDs) were reported in patients with celiac disease (CD), suggesting that ED could be a comorbidity associated with CD. However, few epidemiological studies have assessed this potential association. We aimed to evaluate the risk of EDs in individuals diagnosed with CD in comparison to healthy controls.

Methods: A total of 98 cases and 98 controls matched by gender, age and body mass index between 10 and 23 years-old were studied. A questionnaire was completed on medical history, and sociodemographic and anthropometric characteristics. Various ED screening self-reported tests were administered.

Results: A total of 61.2% of the study population were girls with a mean age of 15.3±3.7 years-old. Patients with CD scored non-significantly higher on all the ED screening tests than control participants. No differences were observed between study groups in terms of the frequency of individuals who exceeded the clinical cutoff identifying those at risk of ED. Being a patient with CD above 13 years-old was associated with a 2.15 point increase in the Eating Attitude Test (EAT) score compared to being a control [βcoefficient=2.15 SE 1.04; P=0.04] after adjusting for various confounders.

Conclusions: Although being a patient with CD was associated with a significantly higher EAT score in individuals above 13 years old, no clear differences were observed between individuals with CD and controls in terms of risk of ED when other screening tests were used. More studies with larger samples and prospective designs are warranted to confirm these findings.

Keywords: Celiac disease, eating disorders, Eating Attitude Test.

A RANDOMIZED TRIAL OF IRON-BIOFORTIFIED BEANS IN SCHOOL CHILDREN IN MEXICO

[1]Finkelstein, Julia; [2]Mehta, Saur; [3]Luna, Sarah V.; [3]Rahn, Maike; [4]Villalpando, Salvador; [5]Mundo Rosas, Veronica; [6]Shamah-Levy, Teresa; [7]Beebe, Stephen E.; [8]Haas, Jere D.

[1]ScD. Assistant Professor. Division of Nutritional Sciences. Cornell University. USA; [2]ScD. Associate Professor. Division of Nutritional Sciences. Cornell University. USA; [3]PhD. Division of Nutritional Sciences. Cornell University. USA; [4]MD PhD. Instituto Nacional de Salud Publica, Cuernavaca. Mexico.; [5]MSc. Instituto Nacional de Salud Publica, Cuernavaca. Mexico.; [6]PhD. Instituto Nacional de Salud Publica, Cuernavaca. Mexico.; [7]PhD. Centro Internacional de Agricultura Tropical. Cali. Colombia.; [8]PhD. Professor. Division of Nutritional Sciences. Cornell University. USA.

Background and objectives: The objective of this randomized efficacy trial was to determine the effects of iron-biofortified beans (Fe-Beans) on iron status in children, compared to control beans (Control-Beans).

Methods: A randomized trial of biofortified beans (Phaseolus vulgaris L), bred to enhance iron content, was conducted for six months in Oaxaca, Mexico. Participants were school-aged children (5-12 y) attending 20 rural, public, boarding schools from the Mexican state of Oaxaca. Iron status [hemoglobin, serum ferritin (SF), soluble transferrin receptor (sTfR), and total body iron (TBI)], inflammatory biomarkers (C-reactive protein (CRP) and -1 acid glycoprotein (AGP)), and anthropometric indices were evaluated at enrollment and at the end of the trial. The primary outcomes evaluated included: hemoglobin, serum ferritin, and sTfR concentrations; anemia (Hb <12.0 g/dL) and iron deficiency (serum ferritin <15.0 µg/L); and total body iron. Hemoglobin concentrations were adjusted for altitude, and serum ferritin levels were adjusted for inflammation (CRP, AGP) using Thurnham and BRINDA methods. Total body iron was calculated using Cook's equation. Mixed models were used to examine the effects of Fe-Beans on hematological outcomes, compared to Control-Beans, adjusting for baseline indicator, with school as a random effect.

Results: At baseline, 17.8% of children were anemic (Hb <12.0 g/dL) and 15.9% were iron deficient (serum ferritin <15.0 mg/L). A total of 14.5% of children had elevated CRP (>5.0 mg/L) or AGP (>1.0 g/L) concentrations at baseline. During the randomized efficacy trial, indicators of iron status, including hemoglobin, serum ferritin, sTfR, and TBI concentrations improved from baseline to endline (6 months) in both intervention and control groups. However, Fe-Beans did not significantly improve iron status indicators, including hemoglobin, serum ferritin, sTfR, or total body iron, compared to Control-Beans. Similarly, there were no significant effects of the iron-biofortified beans intervention on anemia or iron deficiency, compared to the control beans.

Conclusions: In this 6-month randomized efficacy trial of iron-biofortified beans in school children in Mexico, indicators of iron status improved in both intervention and control groups. However, there were no significant differences in the effects of Fe-Beans on iron status, compared to Control-Beans.

Keywords: Iron, biofortification, anemia, iron deficiency, Mexico

MUSCLE STRENGTH, METABOLIC PROFILE, SARCOPENIA AND SARCOPENIC OBESITY IN OLDER CUBAN PEOPLE. PRELIMINARY RESULTS

[1]Ruiz-Alvarez, Vladimir; [2]Díaz-Sánchez, María Elena; [3]Hernández-Triana, Manuel; [4]Llera-Abreu, Elisa; [5]Díaz-Fuentes, Yoandry; [4]Roque Treville, Celia María; [5]Lanyau Domínguez, Yeneisy; [5]Campos-Hernández, Derbis; [4]Díaz-Domínguez, Maybe; [5]Hernández-Hernández, Hector.

[1]Msc. Researcher; [2]PhD. Nutrition Center. National Institute of Hygiene, Epidemiology and Microbiology. Cuba.; [3]PhD. International Institute for Healthcare Professionals. USA.; [4]BSc. Nutrition Center. National Institute of Hygiene, Epidemiology and Microbiology. Cuba.; [5]MSc. Nutrition Center. National Institute of Hygiene, Epidemiology and Microbiology. Cuba.

Background and objectives: Background: Sarcopenia is the age-associated loss of skeletal muscle mass and function; and the sarcopenic obesity may be defined by a high fat to fat-free mass ratio. These conditions can be accompanied by reduced muscle strength and metabolic disorders due to a decline of both number and fibre size of the muscle. Objectives: To evaluate variations on the muscle strength and metabolic profile associated to sarcopenia and sarcopenic obesity in elderly people.

Methods: A sample of adults older than 60 years, not institutionalized or attending day care institutions for the elderly, was evaluated to get information on body composition, blood glucose and lipids, and muscle strength. Muscle strength was measured by dynamometry; body fat, by electrical bioimpedance; and skeletal muscle mass (SMM) and skeletal muscle index (SMI), by Baumgartner equations. Univariate and multivariate statistical analysis were used.

Results: The frequency of sarcopenia was similar between men and women. Older individuals were more likely to have this condition. Body Mass Index (BMI), SMM and SMI were lower in sarcopenic subjects. Grip strength was markedly decreased in sarcopenic men, while no significant difference was found within women. Body fat was higher in sarcopenic men and not in sarcopenic women. Therefore, Sarcopenic obesity was more frequent within men. Subjects with this condition in both sexes were older, had higher BMI and body fat; and lower SMM, SMI and grip strength. The metabolic profile showed no differences between subjects with or without sarcopenia and was not associated with sarcopenic obesity either.

Conclusions: Reduced muscle strength is evident in both sarcopenia and sarcopenic obesity, and was more marked as the age increases. The lack of association between sarcopenia, sarcopenic obesity and metabolic disruptions must be further analysed using multivariate analysis and include treatment for metabolic diseases, physical activity and diet.

Keywords: elderly, sarcopenia, sarcopenic obesity, metabolism, strength.

FOOD OR WATER FOR SANITATION: EXPLAINING REGIONAL DIFFERENCES IN CHILD MALNUTRITION RATES IN UGANDA

[1]Kabunga, Nassul; [2]Ghosh, Shibani; [3]Duggan, Christopher; [4]Bashaasha, Bernard; [5]Griffiths, Jeffrey; [2]Webb, Patrick.

[1]PhD. Research Fellow. International Food Policy Research Institute. Kampala Office. Uganda.; [2]Feed the Future Innovation Lab for Nutrition. Friedman School of Nutrition Science and Policy. Tufts University. Boston. USA.; [3]Department of Global Health and Population. Harvard T.H. Chan School of Public Health. Harvard University. USA.; [4]College of Agriculture and Environmental Sciences. Makerere University. Kampala. Uganda.; [5]Department of Public Health and Community Medicine. School of Medicine. Tufts University. Boston. USA.

Background and objectives: Child undernutrition rates remain high across Uganda. However, there are important regional differences in malnutrition rates, with the southwestern region—described as the country's food basket— persistently recording disproportionately higher levels of child undernutrition compared to, for example, the northern region which has higher poverty and food insecurity linked to many years of civil war. It is important for policymakers to understand context-specific determinants of poor nutrition and not assume that higher agricultural productivity alone can solve such problems.

This study analyzes factors explaining differential child stunting rates between Southwestern and Northern Uganda.

Methods: Using panel data collected from two rounds of household surveys in rural Uganda in 2012 and 2014, the analysis includes >3,300 households (in each round), containing >5,400 children below 5 years of age. In addition to child anthropometry, the data contains variables on agriculture, socioeconomics, as well as on water, sanitation and health practices. Oaxaca decomposition methods, controlling for time and locational fixed effects, were used to examine factors that drive mean differences in height-for-age z-scores (HAZ) between regions.

Results: Mean HAZ scores were -0.95 ± 0.03 and -1.77 ± 0.06 for northern and southwestern Uganda, respectively. This represents a significant mean difference of 0.82 ± 0.07 ($p < 0.001$). Decomposition analysis reveals major differences in water access/volumes and important divergence in levels of food output. Households in Northern Uganda on average use 8 more liters ($p < 0.001$) of water per capita per day for domestic purposes than households in the southwest. This difference alone accounts for 0.40 ± 0.07 ($p < 0.001$) in variability in HAZ scores observed. Interacting domestic water use with sanitation patterns showed that northern households are likely using domestic water for sanitation related habits, such as washing hands after toilet use.

Conclusions: Contrary to conventional wisdom, this study showed that differentials in undernutrition across regions of Uganda are not necessarily due to differences in food production or diet diversity, but are heavily driven by differences in domestic water use. This does not negate the need to address serious problems of food insecurity across the country, but the findings suggest

a need for greater attention to WASH in development programming alongside agricultural productivity enhancement.

Keywords: Child malnutrition, height-for-age (HAZ), domestic water use, sanitation, Uganda.

A NEW ALLOMETRIC BODY MASS INDEX FOR CHILDREN AND ADOLESCENTS AND THE CORRELATION WITH HEIGHT AND ADIPOSITY

[1]Mazzeti, Camila; [1]Cumpian-Silva, Jéssica; [2]Rinaldi, Ana Elisa Madalena; [3]G Carvalho, Julia; [4]Lisboa Conde, Wolney.

[1]MD. Nutricionist. School of Public Health. University of Sao Paulo. Brazil.; [2]PhD. Nutricionist. Federal University of Uberlândia.; [3]Student of Nutrition. School of Public Health. University of Sao Paulo. Brazil.; [4]PhD. Nutricionist. School of Public Health. University of Sao Paulo. Brazil.

Background and objectives: Allometry presents an alternative for to discuss and analyze the weight and height gains during the growth, monitoring the peculiarities of physical growth and changes in the body for a good nutritional assessment. To propose a new allometric nutritional index based on the weight-height relation and to evaluate its performance according to Benn's premises.

Methods: Individuals under 19 years old from Brazil, USA, South Korea, Mexico and England. The cleaning excluded values under or above 2SD of the residues of the regressions weight-Age, height-Age and weight-height by country, gender and age. The coefficient b0 of the log-linear weight-height regressions were used as exponent at each age for the calculation of the new international allometric body mass index (IMCA). The exponent was modeled between the ages by spline. Associations between traditional BMI (IMCT) or IMCA with height and adiposity were estimated by the Pearson coefficient.

Results: Cleaning excluded 8.5% individuals from the data pool. The value of b0 is 2 at birth in both genders and evolves to values of 3 at the beginning of puberty (in different moments for boys and grils), gradually regressing to the value 2 at the end of growth. The association between IMCA and height was zero and higher than 0.8 with total adiposity in all age groups. In the same comparison, the associations with IMCT were near to 0,4 in some genders and ages, and above 0.8 for association with adiposity.

Conclusions: The exclusion of extreme values of the sample provided b0 exponents more consistent than in other published works. The IMCA showed a superior performance to that recorded for the IMCT in the two premises of Benn and revealed an index not influenced by height, which makes it more suitable to analyze the nutritional status of children and adolescents under 19 years. The new IMCA requires additional studies to determine new cutoff points.

Keywords: Allometry; BMI; Growth; Nutritional Evaluation; Adiposity

INTERDISCIPLINARITY ON COMMUNICATION OF NUTRITIONAL INFORMATION BY SOCIAL MEDIA - FACEBOOK

[1]Pinto-e-Silva, Maria Elisabeth Machado; [2]Santos, Fernanda Ferreira; [3]Simoni, Natalia Koren; [4]Gines Geraldo, Ana Paula.

[1]Assoc. Professor. School of Public Health. University of São Paulo. São Paulo. Brazil; [2]BSc. Nutr Depart. School of Public Health. University of São Paulo. Brazil.; [3]MSc. Nutr.Depart. School of Public Health. University of São Paulo. Brazil.; [4]PhD. Nutr. Depart. Federal University of Santa Catarina. Brazil.

Background and objectives: BACKGROUND: Social medias has increasingly been used by individuals from Brazil's different regions and social strata, what turn them relevant to communicate nutritional knowledge in a planned and referenced way. Its use can be optimized by nutrition and marketing knowledge interdisciplinarity.

OBJECTIVES: It aims to observe the effects of nutrition and marketing knowledge interdisciplinarity during planning and execution of publications related to nutrition, available on Facebook's DIETÉCNICA page; and its metrics variations in two distinct moments.

Methods: Metrics provided by Facebook's DIETÉCNICA page were compared between 2013 and 2015, in which publications development and execution were not planned, and between 2015 and 2017, applying "Digital Marketing Decalogue". This tool consists of ten steps that are used in accordance with the time in which the media has been. In this project was used "social networks", "search", "planning", "blogs", "final touch" and "results" for contents planning and execution, decision of publication frequency and collection of its metrics. Metrics are composed by number of people who view the publication; likes, clicks, comments and shares.

Results: As a result of the use of "Digital Marketing Decalogue" there was a greater increase on DIETÉCNICA's metrics. Without the use of the marketing tool, number of views on publications (range) was around 300, after the its implementation it achieved about 3000, demonstrating the relevance of planning publications. It was observed that nutrition and marketing knowledge interdisciplinarity during publications planning and execution contributed positively to average increase on Facebook metrics, when compared with the moment when there was no interdisciplinarity.

Conclusions: With this project is possible to observe that knowledge interdisciplinarity is essential for planning interventions of nutritional information communication on social media, such as Facebook, because it enables directing efforts to achieve a common goal; in this project it was a greater communication of nutritional knowledge for media users, which was achieved.

GENETIC POLYMORPHISMS IN THE AHR AND ADORA2A GENES ARE ASSOCIATED WITH COFFEE CONSUMPTION

[1]Miranda, Andreia; [2]Steluti, Josiane; [2]Carvalho, Aline M.; [2]Fisberg, Regina; [2]Marchioni, Dirce.

[1]PhD student. Nutritionist. Department of Nutrition. School of Public Health. University of São Paulo. SP. Brazil.; [2]PhD. Nutritionist. Department of Nutrition. School of Public Health. University of São Paulo. Brazil.

Background and objectives: Coffee is among the most widely consumed beverages in the world and has received considerable attention regarding health risks and benefits. Recent epidemiological studies identified single nucleotide polymorphisms (SNPs) in aryl-hydrocarbon receptor (AHR) and adenosine A2A receptor (ADORA2A) genes that are associated with caffeine and coffee consumption. The aim of this study was to examine whether the genetic polymorphisms from the AHR and ADORA2A gene regions were associated with usual coffee consumption in the Brazilian population.

Methods: Data came from the 'Health Survey of Sao Paulo' (ISA-Capital 2008). The study sample included 540 participants aged 20 years or older, in Sao Paulo City, Brazil. Diet was assessed by two 24-hour dietary recalls (24HR) and usual intakes were calculated using the Multiple Source Method. Coffee consumption was categorized into <1, 1-3, and ≥3 cups/day. DNA extraction occurred by salt method, with the support of a mass spectrometry-based detection for quantification. Three SNPs (rs2298383, rs4410790, rs6968865) using the CRP-based assays were genotyped. Multiple logistic regression models were performed to estimate the association between SNPs and categories of coffee consumption, adjusting for potential confounders i.e. age, sex, race, body mass index, smoking status, physical activity level, alcohol consumption, and total energy intake.

Results: The final study population showed a mean age of 44.9 (SE 1.1) years, mostly women (54.3%), self-declared white (60.1%), never or former smokers (76.8%), insufficiently active (77.4%), and with overweight/obesity (55.5%). The mean of coffee consumption was 141.1 mL/day. After multivariate adjustment, significant and positive associations were observed between coffee consumption (≥ 3 cups/day) and ADORA SNP (rs2298383) and AHR SNPs (rs4410790, rs6968865). Compared with subjects who consumed ≤1 cup coffee/day, subjects who consumed ≥3 cups/day were more likely to be carriers of mutant allele. The corresponding odds ratio (OR) and 95% confidence interval (CI) were 1.68 (1.01, 2.82), P-trend=0.047; 1.84 (1.07, 3.17), P-trend=0.025; and 1.71 (1.03, 2.84), P-trend=0.037 for rs2298383, rs4410790, and rs6968865, respectively.

Conclusions: Our findings show that genetic variations in the ADORA2A and AHR receptor gene polymorphisms were associated with coffee consumption (≥ 3 cups/day).

Keywords: coffee consumption; ADORA2A, adenosine A2A receptor gene; AHR, aryl-hydrocarbon receptor gene; polymorphisms; genotype.

DIFFERENT ISOMERS OF TOCOPHEROL EVOKE DISSIMILAR CYTOSOLIC CALCIUM INCREASES AND ANTIOXIDANT IMPACT IN LIVING CACO-2 CELLS

[1]Hidalgo, Miltha; [2]Rodríguez, Vania; [3]Porras, Omar.

[1]Nutricionist. Instituto de Nutrición y Tecnología de los Alimentos. Universidad de Chile. Chile; [2]Physician. Instituto de Nutrición y Tecnología de los Alimentos de la Universidad de Chile. Chile; [3]PhD. Instituto de Nutrición y Tecnología de los Alimentos de la Universidad de Chile. Chile.

Background and objectives: Tocopherols are hydrophobic bioactive compounds, which isomers together are considered as vitamin E. Particularly abundant in seeds and nuts, each isomer is present at different proportion, being the α-tocopherol the most abundant. However, comparisons of biological impact of each individual isomer are scarce; therefore we have evaluated the acute impact of α, γ and δ-isomers on intestinal epithelial cell line, Caco-2.

Methods: Cell line Caco-2 was used in the passages 40-60. Living cell imaging was accomplished by epifluorescent microscopy technique in an open chamber modality. Cytosolic calcium recordings were possible by loading the cells with fura-2, a fluorescent calcium indicator. Antioxidant cellular capacity was achieved by transducing HyPer biosensor, a fluorescent protein able to sense intracellular H_2O_2. This study also determined fluctuations in intracellular sodium and pH by SBFI and BCECF, respectively.

Results: Acute exposure with tocopherol isomers evoked a rapid and consistent increase in cytosolic calcium by Caco-2 cells at concentration as low as 5 μM, with slight differences between them. Removal of extracellular Ca2+ was only effective to reduce the number of responsive cells by α-tocopherol but did not affect the calcium response evoked by γ and δ isomers. On the other hand, redox impact of tocopherol isomers was evaluated in Caco-2 cells expressing the HyPer biosensor, α- and δ- were the isomers that evoked bigger changes in the biosensor signal than γ-tocopherol. By mimicking a rapid cytosolic increase with ionomycin and monensin, both ionophores with different intrinsic mechanisms, we also could observe a deflection in HyPer signal, suggesting a role for cytosolic calcium in activate redox cellular machinery.

Conclusions: The different isomers of tocopherol elicited an acute redox response in Caco-2 cells, along with this cellular response we also detected a fast increase in cytosolic Ca2+, which had an extracellular origin only for α-tocopherol, whereas that calcium responses evoked by γ and δ isomers were not affected by extracellular Ca2+ removal. By inducing a massive entry of Ca2+ we were also able to record a redox response, suggesting that fluctuations in cytosolic Ca2+ are enough to mediate a redox response in living cells.

Keywords: tocopherol, Caco-2, Calcium imaging, HyPer, antioxidant capacity

ASSOCIATIONS BETWEEN FOOD INTAKE, PERCEIVED EXERTION, SUM OF 6 SKINFOLDS AND LEG CROSS-SECTIONAL AREAS IN PROFESSIONAL ARGENTINEAN CYCLISTS ASSESSED BETWEEN MARCH-AUGUST 2016

Leonardi, Antonella.

PhD. Nutritionist. Department Nutrition Sciences. Maimónides University. Argentina.

Background and objectives: Road Cycling is known to be one of the most physically demanding sports, where athletes aim to achieve optimum muscle and fat parameters through a meticulous training and nutrition, which are crucial when seeking high performance. The aims of this study were to explore and relate Professional Cyclist's diet in terms of Carbohydrates, Proteins and fats, their perceived exertion during competition and their fat and muscle parameters.

Methods: Argentinean professional road cyclists were studied. 104 active elite road cyclists were assessed in terms of Age, Weight and Height, sum of 6 Skinfolds and leg cross-sectional areas, in order to quantify adipose and muscular tissues and compare with optimum standards. Perceived Exertion was inquired regarding a competition. Food Intake was evaluated through a 3-day register. Data was assembled in SARA System to assess nutrition in terms of calories, carbohydrates, proteins and fats. The rest of the variables were processed in order to create a full-descriptive statistical analysis and seek possible association between them through the x2 test.

Results: 40% of the cyclists reported a high sum of 6 skinfolds (55,2mm ±14,6mm). Diet was deficient in terms of energy and carbohydrates, and excessive in proteins. Significative association was found between an elevated sum of 6 skinfolds and a high perceived exertion (p<0,0001). An adequate consumption of energy (p=0,002) and carbohydrates (p=0,00001) were associated to a lower range of perceived exertion. An optimum sum of 6 skinfolds was associated to an adequate energy intake.

Conclusions: Nutrition assessment is needed to promote proper eating habits according to the demands of Argentinean proffesional cyclists, in order to reach optimum fat and muscle ratios and to a maximum performance. It is important that Argentinean cyclists begin to cover their high carbohydrate needs rather than exceeding their protein daily intake.

Keywords: Sport Nutrition, Cycling, Anthropometry, Perceived Exertion.

Conflict of Interest Disclosure: Identifying the feeding practices of Argentinean cyclists and their anthropometric profile, as well as the way these affect effort perception, could be useful not only approach a diagnosis, but also to estimate possible improvements in performance by developing more accurate diet patterns, looking for a morphological profile that adjusts better to proffesional road cycling.

INTERMITTENT FASTING IN DIFFERENT PERIODS OF PREGNANCY: MATERNAL EFFECT AND METABOLIC PROGRAMMING OF THE INSULINIC HYPOTHALAMIC VIA AND OBESITY IN THE MALE PROLE

[1]*Geminiani A. Baptista, Julia;* [2]*Rosas Fernández, Mariana Alejandra;* [3]*Oliveira Batista, Leandro;* [3]*Tibau Albuquerque, Kelse.*

[1]Nutritionist. Postgraduate Student. Rio de Janeiro Federal University. Macaé. Brazil.; [2]MSc. Nutritionist. Postgraduate Student. Rio de Janeiro Federal University. Macaé. Brazil.; [3]PhD. Nutritionist. Researcher in Experimental Nutrition Laboratories. Rio de janeiro Federal University. Macaé. Brazil.

Background and objectives: Chronic dietary restriction during gestation may promote changes in fetal metabolism and impair the hypothalamic signaling of insulin in the offspring. Nonetheless, nausea and vomiting are common during gestation and induce intermittent feeding. However, it is not clear whether this intermittent involuntary fasting causes harm to offspring in adult life. We evaluated whether intermittence between feed restriction and ad libitum (IFR) in pregnant Wistar rats is capable of inducing obesogenic changes in male offspring.

Methods: Pregnant rats were kept with free access to chow (the control group, C) or with 60 % restriction of C on alternate days during the first half (fasting 1 group, F1) or in the second half (fasting 2 group, F2) or in whole pregnancy (total fasting group, TF). In lactation, the diet was ad libitum. After the period of lactation, the progenitors were euthanized for visceral fat collection, while the male offspring were maintained until adulthood (100 days) with ration ad libitum. Part of the adult offspring received intrahypothalamic cannula for administration of insulin (20 mU) or vehicle (0.9 % saline) and evaluated visceral adiposity.

Results: The offspring C responded to intracerebroventricular infusion of insulin, but F1, F2 and TR did not reduce food intake after 12 h and 24 h of insulin injection versus vehicle infusion. The maternal weight gain during pregnancy did not differ, but the cumulative consumption of group C was higher versus the other groups. Binge eating was observed in the ad libitum period of F1 and TF parents versus C and F2. There was no difference in the adiposity in the offspring.

Conclusions: Pregnant rats subjected to intermittent fasting were able to adjust energy homeostasis while maintaining adequate gestational weight gain, still the restriction induced metabolic programming and ruptured the hypothalamic anorectic response of adult offspring, increasing the risk of obesity at this stage.

Keywords: intermittent feeding, metabolic programming, female rat pregnancy, male rat offspring

THE RELATIONSHIP OF NUTRITIONAL STATUS WITH INTELLECTUAL COEFFICIENT AND ACADEMIC ACHIEVEMENT IN MEXICAN CHILDREN FROM URBAN PRIMARY SCHOOLS

[1]Galván, Marcos; [2]Guerrero-Barreto, Esmeralda; [1]López-Rodríguez, Guadalupe; [1]Guzmán-Saldaña, Rebeca; [3]Suárez-Dieguez, Teodoro.

[1]Phd. Professor. U Autonoma de Hidalgo; [2]MsC. Nutritionist. U Autonoma de Hidalgo.; [3]MsC. Professor. U Autonoma de Hidalgo.

Background and objectives: The objective was to determine the magnitude of association of the nutritional status with the IQ and academic performance in children from urban primary schools in Hidalgo, Mexico.

Methods: An analytical observational study was carried out on 459 schoolchildren aged 6 to 10 years old from a public and a private school located in Tula, Hidalgo, during the 2013-2014 school cycle. The students were given weight and height measurements with calibrated instruments and standardized personnel, Koppitz test was applied to assess IQ and emotional indicators (EI), the grade point average was recorded as an indicator of academic achievement (AA), and socioeconomic status (SE) was assessed with household assets and father's level of schooling. Body mass index (BMIZ) and height-for-age (HAZ) Z scores were calculated using WHO 2007 references. Differences, correlations and interactions were assessed, and the magnitude of association of predictor variables (BMIZ and HAZ) and response (IQ and AA) with adjusted linear regression models (LRM).

Results: In school children of middle SE, obesity was 10 percent higher compared to high and low SE (p <0.01). The grade point average was higher in school children of high SE (8.9) compared to low SE (8.1) (p <0.01), and IQ average was higher in high SE school children (4.7) compared to low SE (4.2) (p <0.01). HAZ correlated positively with AA and IQ in low SE school children (r = 0.30 and r = 0.27, respectively); and the BMIZ correlated negatively with AA in school children of high SE (r = -0.41). The LRM for AA of school children of low SE, the HAZ, adjusted for EI, age and gender; explained the 33% of academic performance. The LRM for IQ of school children of low SE, the BMIZ, adjusted for EI, age and gender; explained the 44% of the IQ.

Conclusions: The anthropometric variables of HAZ and BMIZ explained the third part of academic and cognitive performance in low SE school children; indicating the strong influence that nutrition still has on the poorest children in countries in economic transition.

HEPATIC STEATOSIS INDUCED BY AMINO ACID DEFICIENCY OR BY MANIPULATION OF THE DIETARY AMINO ACID COMPOSITION

[1]Nishi, Hiroki; [2]Yamanaka, Daisuke; [3]Kamei, Hiroyasu; [1]Goda, Yuki; [4]Kumano, Mikako; [5]Toyoshima, Yuka; [6]Takenaka, Asako; [7]Chida, Kazuhiro; [7]Hakuno, Fumihiko; [7]Takahashi, Shin-Ichiro.

[1]MSc. Graduate School of Agricultural and Life Sciences. The University of Tokyo. Japan.; [2]PhD. Graduate School of Agricultural and Life Sciences. The University of Tokyo. Japan.; [3]PhD. Institute of Science and Engineering. Kanazawa University. Japan.; [4]BSc. Graduate School of Agricultural and Life Sciences. The University of Tokyo. Japan.; [5]PhD. Department of Bioregulation. Nippon Medical School. Japan.; [6]PhD. Department of Agricultural Chemistry. Meiji University. Japan.; [7]PhD. Graduate School of Agricultural and Life Sciences. The University of Tokyo. Japan.

Background and objectives: A low-protein diet causes young rats to decrease serum insulin and IGF-I levels, leading to mild growth retardation. In addition, such animals show increased insulin sensitivity and marked lipid accumulation in peripheral metabolic organs. In the present study, we unveiled this process to induce lipid accumulation in response to amino acid deficiency, especially focusing on hepatic steatosis development.

Methods: For animal experiments, we prepared a control diet containing 15% (w/w) amino acids equivalent to 15% casein and a low-amino acid diet containing 5% (w/w) amino acids or diets deficient in a single amino acid, and fed these diets to 6-week-old male Wistar rats for 7 days. Additionally, we applied a cell-culture model in which rat primary hepatocytes, and H4IIE and HuH7 cells, rat and human hepatoma cell lines respectively, were cultured in serum-free media containing complete amino acids (Full) or no amino acids (Zero).

Results: While a low-amino acid diet could induce triglyceride (TG) accumulation in the rat liver, simply a low-threonine or low-arginine diet could also develop the hepatic steatosis, accompanying an unexpected change in serum amino acid profiles, which implies that particular amino acid-specific signals were involved in hepatic lipid metabolic regulation. Since respiratory exchange ratios were not significantly different between control group and low-amino acid diet group, their lipid consumption rate might be comparable. On the other hand, when hepatocytes were cultured in Zero medium, their intracellular TG levels were increased, compared to Full medium, indicating that amino acid deficiency can induce hepatocytes to accumulate TG in a cell-autonomous manner. In addition, lipid synthesis activity of H4IIE and HuH7 cells using glucose as a substrate was enhanced in Zero medium. Similar to the rat model, when H4IIE cells were cultured in media deficient in a single amino acid, TG accumulation levels varied according to the amino acid composition of the media.

Conclusions: We conclude that a manipulation of dietary amino acid composition causes a dynamic change in blood amino acid profiles, which is sensed by hepatocytes and accelerates their lipid synthesis in a cell-autonomous manner, leading to hepatic steatosis.

LYSINE DEFICIENCY SIGNAL SELECTIVELY IN-DUCES LIPID ACCUMULATION IN MUSCLE AND ADIPOSE TISSUES OF RATS

[1]Hakuno, Fumihiko; [2]Goda, Yuki; [2]Nishi, Hiroki; [2]Kumano, Mikako; [3]Yamanaka, Daisuke; [4]Yamanouchi, Keitaro; [4]Katsumata, Masaya; [5]Kato, Hisanori; [4]Nishihara, Masugi; [3]Takahashi, Shin-Ichiro.

[1]PhD. Molecular Biologist. Graduate School of Agriculture and Lie Sciences. The University of Tokyo.; [2]Graduate Student. Nutritionist. Graduate School of Agricultural and Life Sciences. The University of Tokyo. Japan; [3]PhD. Endocrinologist. Graduate School of Agricultural and Life Sciences. The University of Tokyo. Japan; [4]PhD. Veterinary. Graduate School of Agricultural and Life Sciences. The University of Tokyo. Japan; [5]PhD. Nutritionist. Graduate School of Agricultural and Life Sciences. The University of Tokyo. Japan.

Background and objectives: We have previously reported that dietary amino acid restriction reduces serum levels of IGF-I and insulin, resulting in growth retardation, and additionally accumulation of triglycerides (TG) in liver, skeletal muscle and adipose tissues. The present study was undertaken to elucidate the effects of dietary amino-acid deprivation on lipid accumulation in muscle and adipose tissues.

Methods: We fed growing rats with the control diet containing sufficient (15%, w/w) amino acids (CN), or deficient (5%, w/w) amino acids (5AA) or diets deficient in each single amino acid in which only a single amino acid was reduced to the same amount as a 5AA diet and the others were the same as a CN diet (low AA) for a week. TG content was measured in muscle and liver tissue. And adipose tissues were imaged by computerized tomography (CT) scans.

Results: Lipid accumulated in adipose and skeletal muscle tissues in rats fed the 5AA diet and low-Lys diet compared with rats fed CN diets. Then rats were fed the 5AA diet or low-Lys diet for 8 weeks and we investigated lipid accumulation in each tissue. Adipose tissues in abdomen were imaged by CT scans and we calculated the volume of adipose tissues in each rat. The volume of adipose tissues was increased in rats fed the 5AA diet and low-Lys diets. The cell size of adipocytes of epididymis fat tissue was enlarged in the rats fed the 5AA and low-Lys diets. TG accumulation in skeletal muscle was also increased at 2-weeks feeding with 5AA and low-Lys diets.

Conclusions: These data suggest that depletion of lysine from the diets resulted in the accumulation of lipids in muscle and adipose tissue. Taken together with the data that lipid accumulated in liver in rats fed with low-Arg diets, selective amino acid deprivation from the diet could become a distinct signal to exert insulin-like activities for lipid metabolism, leading to induction of lipid accumulation in liver, skeletal muscle or adipose tissue selectively.

Keywords: amino acid, muscle, adipose tissue, lipid accumulation

EFFECTS OF DIETARY B VITAMINS INTAKE AND FOLATE METABOLISM IN THE DEVELOPMENT OF MILD COGNITIVE IMPAIRMENT AND THE POTENTIAL UNDERLYING MECHANISM

[1]An, Yu; [1]Zhang, Xiaona; [1]Lu, Yanhui; [1]Rong, Hongguo; [1]Tao, Lingwei; [2]Yu, Huanling; [2]Yuan, linhong; [2]Xiao, Rong.

[1]PhD. School of Public Health. Capital Medical University. China.; [2]PhD. Professor. School of Public Health. Capital Medical University. China.

Background and objectives: There is emerging evidence that blood levels of several B vitamins and cognitive function may be affected by dietary intake of these vitamins but the underlying mechanism is still controversial. DNA methylation together with oxidative stress are key to understanding the pathogenesis of mild cognitive impairment (MCI). The present study aimed to examine the relationship between B vitamins intake and MCI among the middle-older aged and elderly in China and shed light on the potential mechanism.

Methods: A cross-sectional study was carried out in 1487 Chinese adults aged 50 and above. A selection of comprehensive cognitive tests was administered to evaluate their cognitive performance. MCI patients were screened by using Mini-mental state examination (MMSE) Montreal Cognitive Assessment (MoCA) test and then diagnosed by neurologists. A semi-quantified Food frequency questionnaire (FFQ) method was used for dietary intake of B vitamins (mainly folic acid, vitamin B6, and vitamin B12) survey. Serum folate metabolism and oxidative stress markers were measured with ELISA. Global DNA methylation was determined by Illumina Methylation 450K chips.

Results: Subjects with higher intake of folate, vitamin B6 and vitamin B12 performed better in memory and processing speed. MCI patients had significantly higher concentrations of homocysteine (P<0.001) and oxidative stress markers(P<0.001) and lower folate (P<0.001) than non-MCI subjects. Serum levels of homocysteine was negatively correlated with folate and positively correlated with oxidative stress markers. Besides, 2277 different methylation gene loci were screened between MCI patients and non-MCI subjects, suggesting several gene function and metabolic pathways associated with MCI development.

Conclusions: Inadequate dietary intake of B vitamins, disturbances in folate and homocysteine metabolism and oxidative stress, with different DNA methylation as essential cofactors, are integral to MCI development.

Keywords: B vitamins, DNA methylation, folate metabolism, oxidative stress, mild cognitive impairment

MECHANISM FOR THE DECREASE IN PLASMA ALPHA-TOCOPHEROL UNDER PROTEIN DEFICIENCY

[1]Takenaka, Asako; [2]Sato, Ryota; [3]Osada, Kyoichi; [4]Kawabata, Hiroaki.

[1]PhD. School of Agriculture. Meiji University. Japan; [2]Graduate School of Agriculture. Meiji University. Japan.; [3]School of Agriculture. Meiji University. Japan.; [4]School of Agriculture. Meiji University. Japan.

Background and objectives: Alpha-tocopherol is a major form of vitamin E and one of the most important antioxidants in mammals. It has been reported that plasma alpha-tocopherol concentration was reduced in rats fed protein deficient diet, which means that oxidative stress is increased under the condition of protein deficiency. In the present study, we investigated the mechanism for the decrease in plasma alpha-tocopherol concentration under protein deficiency in rats.

Methods: Five-week-old male Wistar rats were fed a control diet containing 20% casein (20C) or a low protein diet containing 5% casein (5C) for 7 days. Alpha-tocopherol concentrations in plasma, liver, peripheral tissues, feces and bile were measured. In order to investigate the effect of protein deficiency on alpha-tocopherol absorption in the intestine and transport from the liver into the circulation, mRNA and protein levels of intestinal transporters (NPC1L1 and SR-BI) and hepatic transporter (alpha-TTP) were measured. In addition, we fed rats with 20C or 5C with/without 0.08% ezetimibe, an inhibitor of NPC1L1, and measured plasma, liver, and fecal alpha-tocopherol concentrations to estimate the contribution of NPC1L1 on alpha-tocopherol absorption.

Results: Plasma and tissue alpha-tocopherol concentrations were lower in protein deficient rats while protein deficiency did not affected hepatic alpha-TTP mRNA and protein levels. These results demonstrate that reduced plasma and tissue alpha-tocopherol concentration is not caused by the decreased alpha-tocopherol transport activity from the liver into the circulation. On the other hand, fecal excretion of alpha-tocopherol was increased in protein deficient rats, demonstrating that reduced alpha-tocopherol absorption in the small intestine is a possible cause for the decrease in plasma and tissue alpha-tocopherol concentration in protein deficient rats. Ezetimibe did not affect fecal excretion of alpha-tocopherol and intestinal NPC1L1 level was not affected by protein deficiency, which demonstrated that reduced absorption of alpha-tocopherol was not caused by NPC1L1. On the other hand, intestinal SR-BI level was decreased in protein deficient rats that may reduce alpha-tocopherol absorption.

Conclusions: Protein deficiency reduces intestinal SR-BI and increases fecal excretion of alpha-tocopherol, which results in the reduction of plasma and tissue alpha-tocopherol concentrations in rats.

Keywords: alpha-tocopherol, protein deficiency, vitamin E

MYOKINE RESPONSES TO RESISTANCE EXERCISE WITH DIFFERENT NUTRIENT AVAILABILITY ON A CONCURRENT EXERCISE DAY IN YOUNG, HEALTHY, PHYSICAL ACTIVE MALES

[1]Mensink, Marco; [2]Knuiman, Pim; [3]Hopman, Maria; [2]Hangelbroek, Roland.

[1]PhD. MD. Assistant Professor. Division of Human Nutrition. Wageningen University. The Netherlands; [2]MSc. PhD-student. Division of Human Nutrition. Wageningen University. Wageningen. The Netherlands; [3]PhD. Professor. Department of Physiology. Radboud University Medical Centre. Nijmegen. The Netherlands.

Background and objectives: Myokines are proteins produced and released by skeletal muscle in response to exercise, and suggested to play a role in exercise-induced adaptations of muscle tissue. Nutrient availability, in particular carbohydrate (CHO), is proposed as a potential regulator of myokine responses. We evaluated the effects of a pre-exercise carbohydrate-rich meal versus a low carbohydrate -high fat- meal on plasma myokine responses to resistance exercise after a glycogen-depleting endurance exercise earlier that day.

Methods: Fifteen males performed two experimental days with a 90 min bout of endurance exercise at 70% VO2max in the morning (8.30-10 am) and resistance exercise in the afternoon (2-2.30 pm):5 x 8 80% 1-RM repetitions of bilateral leg press and extension. Either a high CHO/low fat meal (110g CHO, 52g protein, 9g fat; ~750 kcal) or a iso-caloric low-CHO /high fat meal (20 gr CHO, 52g protein, 51g fat) was provided 2h before resistance exercise (noon). Blood was drawn after an overnight fast and at regular time intervals up to 3 hours after resistance exercise to measure plasma myokine/cytokine levels.

Results: Postprandial plasma glucose and insulin levels were higher, and FFA lower, on the high-CHO condition compared to the low-CHO. IL-6 increased post-exercise, and was significantly higher after the low-CHO meal in the post-resistance exercise period compared to the high-CHO meal. IL-8 and IL-10 were only increased after the endurance exercise. IL-15 increased postprandial on the high-CHO condition only, and was increased in the early post-resistance exercise period, with a slightly higher level on the high-CHO condition. TNFα and Decorin did not show a clear response, while ANGPTL4 was slightly elevated post-exercise, and strongly increased in the postprandial period, with no differences between meals. MCP-1 tended, on both occasions, to increase after the endurance exercise with subsequent a reduction below baseline.

Conclusions: The composition of the pre-exercise meal did in general not influence myokine responses in the post-resistance exercise period, although plasma IL-6 levels were higher in the low-CHO condition compared with high-CHO. Our findings support the view that pre-resistance exercise carbohydrate availability does not have a major impact on acute responses of myokines.

EFFECT OF EXERCISE STIMULUS-INDUCED ANDROGEN STEROIDOGENESIS ON LCFA TRANSPORT PROTEINS IN SKELETAL MUSCLE

[1]Kim, Jisu; [2]Park, Jonghoon; [3]Nahyun, Kim; [4]Kim, Eunseok; [4]Park, Yeram; [5]Lim, Kiwon.

[1]Physical activity & Performance Institute. Konkuk University. Korea; [2]Ph.D. professor. Department of Physical Education. Korea University. Seoul. Korea; [3]Department of Physical Education. Korea University. Seoul. Korea; [4]Department of Physical Education. Konkuk University. Seoul. Korea; [5]Ph.D. professor. Department of Physical Education. Konkuk University. Seoul. Korea.

Background and objectives: The aim of this study was to determine whether an acute of aerobic exercise would increase androgen hormone concentration in skeletal muscle and LCFA transport proteins.

Methods: 20 Male ICR mice, 9 weeks old, were randomized into three groups: Control (n=7, CON), Exercise (n=7, EX), and Exercise + SRD5A1A2 Inhibitor (n=7, EX-IN, SRD5A1A2 is an enzyme to be needed when free testosterone (FT) is metabolized to dihydrotestosterone (DHT)). Inhibitor was administered to the EX-IN intraperitoneally while the CON and EX were treated with vehicle only. After 1-hour administration in mice, exercise was performed at 60-70%VO2max for 30min. Respiratory Exchange Ratio (RER) during exercise were measured in calorimeter. The levels of FT and DHT in Skeletal muscle tissue were determined using an ELISA kit, and FAT/CD36 and CPT1 were examined by western blot.

Results: We found that FT and DHT concentration in skeletal muscle were no significantly difference among the groups. However, EX group had significantly lower integrated area under the curve in RER at last 10-min during an exercise than EX-IN. The EX and EX-IN groups had greater FAT/CD36 expression in skeletal muscle than CON group. Similarly, EX groups had significantly higher CPT1 expression than in CON group, whereas EX-IN group had significantly lower than in EX group.

Conclusions: Our results provide a novel finding that aerobic exercise did not change FT and DHT levels in skeletal muscle. However, androgen metabolism on skeletal muscle in association with the increase of CPT1 gene activation.

CARBON STABLE ISOTOPE RATIOS HAVE POTENTIAL AS A BIOMARKER FOR THE ASSESSMENT OF SUGARS INTAKE IN NEW ZEALAND POPULATIONS

[1]Kruimer, Devonia; [2]Te Morenga, Lisa; [3]Mann, Jim; [4]Merriman, Tony.

[1]MSc. PhD Candidate. Department of Human Nutrition and Riddet Institute. University of Otago. New Zealand; [2]PhD. Senior Research Fellow. Department of Human Nutrition. Edgar Diabetes and Obesity Centre and Riddet Institute. University of Otago. New Zealand; [3]PhD. Professor. Departments of Human Nutrition and Medicine. Edgar Diabetes and Obesity Centre and Riddet Institute. University of Otago. New Zealand; [4]PhD. Professor. Department of Biochemistry and Edgar Diabetes and Obesity Centre. University of Otago. New Zealand.

Background and objectives: Carbon stable isotope ratios (13C/12C; expressed as δ13C) in various tissues have recently been shown to predict intakes of free sugars derived from cane and corn in U.S. populations. Whereas corn, cane and sugar-beet derived sugars are commonly used in the U.S., cane sugar predominates in New Zealand (NZ). Our objective was to investigate whether δ13C is associated with sugars intakes in two small cohort studies conducted in NZ.

Methods: The first cohort included young people who identified with at least one Pacific Island group aged 15-20y (n = 80). The second involved Māori (indigenous) adults living in a semi-rural community on the East Coast of NZ (n= 37). Sugars intakes were assessed using culturally tailored and validated food frequency questionnaires. Isotopic compositions for carbon (δ13C) and nitrogen (δ15N) in red blood cells were determined by combustion in an Elemental Analyser and measurement of the resulting N2 and CO2 gases by Isotopic Ratio Mass Spectrometry (EA-IRMS). Compound-specific analysis of the stable isotope ratios in the alanine fraction (δ13Calanine) of red blood cells was determined by Gas Chromatography with combustion and Ipe Ratio Mass Spectrometry (CG-IRMS).

Results: In the Pacific cohort a dual isotope model including δ13C and δ15N correlated with self-reported free sugars intakes; r=0.48 for total free-sugars and r=0.61 for sugar-sweetened beverage intakes in normal-weight subjects (body mass index (BMI): 19-25 kg/m2), but not in overweight and obese participants. Conversely, δ13Calanine was not correlated with free sugars intakes. In the Māori cohort δ13Calanine was correlated with total sugar intake (r= 0.49, p=0.002), sucrose intake (r=0.45, p=0.004), and added sugars intake (r=0.49, p=0.002). Linear regression analysis adjusted for sex, age, BMI and HbA1c showed that δ13Calanine was strongly associated with total sugars intake (r2= 0.49, p = 0.002). The dual isotope model including δ13C and δ15N was not associated with self-reported sugar intakes.

Conclusions: Carbon stable isotope ratios in red blood cells have potential as objective biomarkers of sugar intakes in New Zealand population studies. A larger validation study involving optimal dietary assessment method is now warranted to confirm these preliminary findings.

Background and objectives: Circulating branched chain amino acids (BCAAs) have been related to insulin resistance and type 2 diabetes (T2D) risk. We tested whether the BCAAs-increasing rs1440581 PPM1K T-allele affected changes in glucose metabolism traits depending on dietary fat intake during a weight loss dietary intervention.

Methods: The rs1440581 PPM1K variant was genotyped in 757 non-diabetic individuals (NUGENOB study). Participants were randomly assigned to one of the two energy restricted diets (low-fat diet: 20-25% fat, 15% protein, 60-65% carbohydrate; high-fat diet: 40-45% fat, 15% protein and 40-45% carbohydrate). The changes in fasting glucose, insulin, insulin resistance (HOMA-IR) and cell function (HOMA-B) were measured after 10 weeks of intervention.

Results: Significant interactions were found between the PPM1K genotype and low-/high-fat diet on changes in insulin, HOMA-IR and HOMA-B (p interaction 0.01, 0.02 and 0.003, respectively). In the low-fat dietary group the T allele was marginally associated with smaller decreases in insulin and HOMA-IR (0.69 U/mL per risk allele, p=0.07; and 0.21 per risk allele, p=0.04; respectively). On the other hand, in the high-fat diet group, the T allele was associated with decrease in HOMA-B (-12.5 per risk allele p=0.006).

Conclusions: Our findings indicate that the rs1440581 polymorphism may differently influence changes in glucose metabolism during weight loss depending on dietary fat intake.

Department of Nutrition, Food Sciences and Physiology. Centre for Nutrition Research. University of Navarra. Spain/ CIBERobn. ISCIII. Spain/ Navarra Institute for Health Research (IdiSNA). Spain.

Background and objectives: Epigenetic marks, including DNA methylation, might be reversible and modulated by environmental factors such as dietary exposures. Some dietary components have demonstrated to mediate metabolic effects through methylation processes. Therefore, some of the beneficial effects of the Mediterranean diet (MedDiet) could involve methylation changes. The objective of this study was to analyse whether an intervention with a MedDiet supplemented with extra virgin olive oil (MedDiet+EVOO) or nuts (MedDiet+nuts) was able to influence the methylation levels in peripheral blood cells.

Methods: A subset of 36 individuals was selected within the PREvención con DIeta MEDiterránea (PREDIMED)-NAVARRA study, a randomised, controlled, parallel trial with three groups of intervention in high cardiovascular risk volunteers: MedDiet+EVOO, MedDiet+nuts and a low-fat control group. Methylation levels were measured at 5 years of intervention and at baseline. CpG sites (CpGs) with high changes in methylation and homogenous dispersion with putative biological implications were chosen by statistically restricted selections.

Results: Five CpGs related to intermediate metabolism, diabetes, obesity, inflammation and signal transduction were finally selected; one with methylation differences in the MedDiet+nuts group (cg01081346–CPT1B) and four in the MedDiet+EVOO group (cg00173776–PUM1, cg12147622–DDIT4, cg21870545–EPB41, cg24045357–LINC01117).

Conclusions: Specific components of MedDiet, particularly nuts and EVOO, were able to induce changes in methylation levels

in several genes from peripheral blood cells. These methylation changes may be related to some of the potential benefits in health and may contribute to explain the role of MedDiet on health outcomes.

LOW FOLIC ACID INTAKE IS ASSOCIATED WITH SIK1 HYPOMETHYLATION AND INSULIN RESISTANCE IN OBESE SUBJECTS

[1]Ramos-Lopez, Omar; [2]Samblas, Mirian; [3]Milagro, Fermin I.; [1]Mansego, María L.; [4]Zulet, Maria Angeles; [5]Riezu Boj, José Ignacio; [6]Martínez, J. Alfredo.

[1]PhD. Department of Nutrition, Food Sciences and Physiology. Centre for Nutrition Research. University of Navarra. Spain; [2]MSc. Department of Nutrition, Food Sciences and Physiology. Centre for Nutrition Research. University of Navarra. Spain; [3]PhD. Department of Nutrition, Food Sciences and Physiology. Centre for Nutrition Research. University of Navarra. Spain / CIBERobn. ISCIII. Spain; [4]PhD. Department of Nutrition, Food Sciences and Physiology. Centre for Nutrition Research. University of Navarra. Spain / CIBERobn. ISCIII. Spain / Navarra Institute for Health Research (IdiSNA). Spain; [5]PhD. Department of Nutrition, Food Sciences and Physiology and Centre for Nutrition Research. University of Navarra. Spain / CIBERobn. ISCIII. Spain / Navarra Institute for Health Research (IdiSNA). Spain.

Background and objectives: Folic acid is involved in the regulation of many biological processes including DNA methylation via the one-carbon metabolism pathway. Furthermore, folic acid deficiency has been putatively implicated in the onset of diverse metabolic diseases, including insulin resistance, by altering DNA methylation patterns on key regulatory genes. The aim of this study was to investigate the association between folic acid intake and metabolic features, with emphasis on gene-specific DNA methylation patterns.

Methods: A cross-sectional ancillary study was conducted in obese subjects (n=47) from the RESMENA study (Spain). Fat mass was measured by dual-energy X-ray absorptiometry (DXA). Dietary intake and the metabolic profile were assessed by standardized methods. DNA methylation in peripheral white blood cells was analyzed by microarray (Infinium Human Methylation 450K BeadChips).

Results: Subjects with a folic acid intake lower than 300 µg/day showed more fat mass (especially trunk fat), as well as higher levels of glucose, insulin, HOMA-IR index, cortisol and PAI-1 than those consuming at least or more than 300 µg/day. Noteworthy,

low folic acid was related to salt inducible kinase 1 (SIK1) gene hypomethylation. Moreover, methylation levels of SIK1, a direct CREB target gene involved in glucose metabolism, negatively correlated with HOMA-IR index.

Conclusions: These results suggest that SIK1 hypomethylation could be an epigenetic mechanism underlying low folic acid-induced insulin resistance in obese subjects.

Keywords: Folic acid, epigenetics, DNA methylation, obesity, insulin resistance

CIBERobn / Division of Endocrinology, Department of Medicine, Complejo Hospitalario Universitario de Santiago (CHUS/SERGAS), Instituto de Investigación Sanitaria de Santiago (IDIS), Santiago de Compostela, Spain; [5]MD, PhD. Department of Nutrition, Food Sciences and Physiology. Centre for Nutrition Research. University of Navarra. Spain/ CIBERobn. ISCIII. Spain/ Navarra Institute for Health Research (IdiSNA). Spain; [6]PhD. Department of Nutrition, Food Sciences and Physiology. Centre for Nutrition Research. University of Navarra. Spain/ CIBERobn. ISCIII. Spain/ Navarra Institute for Health Research (IdiSNA). Spain.

Background and objectives: Fibroblast growth factor 21 (FGF-21), a potent activator of glucose uptake, has been proposed to be related to insulin resistance, metabolic syndrome (MetS), nonalcoholic fatty liver disease (NAFLD), and weight status. The objective was to evaluate the relationship between FGF21 and criteria of MetS in obese subjects after 6 months under energy restricted diet.

Methods: Sixty-six adults (55.5% men; 49 ± 9 years; BMI: 35.7 ± 4 kg/m2) of RESMENA study were evaluated at baseline and after 6 months. Blood pressure, anthropometric, body composition (DXA), glycemic and lipid profile (Pentra C-200) as well as FGF21 (ELISA assay) were determined.

Results: The participants showed a significant reduction in weight (6.9 ± 2.9 kg), and waist circumference, body fat, visceral adipose tissue, blood pressure, total cholesterol, LDL-c, TG, glucose and HOMA-IR. Interestingly, FGF21 significantly decreased after weight loss intervention (p<0.001), whose change positively

---

and significantly correlated with variation in HOMA-index (r= 0.312; p= 0.015). Thus, a linear regression model was set up to assess the influence of FGF21 on HOMA-index (β= 23.6; R2= 0.112; p= 0.040) revealing that the association depend on weight loss.

Conclusions: Our data show a positive relationship between FGF21 and insulin resistance suggesting the potential mediating role of FGF21 on glucose homeostasis in weight loss.

Keywords: FGF21, obesity, weight loss, insulin resistance.

ELEVATED THYROGLOBULIN CONCENTRATIONS, BUT NO INCREASED PREVALENCE OF THYROID FUNCTION DISORDERS IN AREAS WITH CHRONIC EXCESSIVE IODINE INTAKE

[1]*Farebrother, Jessica;* [2]*Untoro, Juliawati;* [3]*Assey, Vincent;* [4]*Makokha, Anselimo;* [5]*Andersson, Maria;* [6]*Zimmermann, Michael Bruce.*

[1]MPharm MPH. Human Nutrition Laboratory. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland.; [2]PhD. East and Southern Africa Regional Office (ESARO). UNICEF. Kenya; [3]PhD. Nutrition Services. Ministry of Health and Social Welfare. Tanzania.; [4]PhD. Department of Food Science and Technology. Jomo Kenyatta University of Agriculture and Technology. Kenya.; [5]PhD. Human Nutrition Laboratory. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland.; [6]MD. Human Nutrition Laboratory. Institute of Food, Nutrition and Health. ETH Zurich. Switzerland.

Background and objectives: Excessive iodine intake may have adverse effects on thyroid function, including hyperthyroidism, hypothyroidism and thyroid autoimmunity, but the relative effects across the life cycle are unclear. Large regional variations in iodine intake have been reported in Eastern Africa, from deficient to well above recommended levels, questioning the adherence to existing universal salt iodization (USI) programmes. We sought to evaluate the effects of prolonged excessive iodine intake on thyroid function.

Methods: In this cross-sectional study, we evaluated the iodine status (UIC) and thyroid function (tT4, TSH, Tg on dried blood spots) of approximately 3600 participants from 6 population groups (pregnant, lactating and women of reproductive age, schoolchildren, breastfeeding and weaning infants), at two purposefully chosen sites in Kenya (K) and Tanzania (TZ) with previously documented excessive iodine intakes in schoolchildren. We analysed household salt iodine content and groundwater concentrations, and a questionnaire assessed the intake of iodised salt and consumption of foods rich in iodine.

Results: Iodine intake greatly exceeded minimum requirements in all groups: median UIC in schoolchildren was above the 300 g/L WHO cut-off indicating excessive intake, however below that of 500 g/L proposed during pregnancy. At 43.5 mg/kg (IQR 33.5, 54.0), salt iodine concentrations complied with national leg-

islation at both sites. Drinking water iodine concentrations ranged from 0 to 2943 g/L. The prevalence of thyroid disorders was low in all population groups (<0.5% overt, <2.8% subclinical disease), however a high prevalence of elevated thyroglobulin was observed in schoolchildren (K: 46.2%, TZ: 31.1%) and pregnant women (K: 20.1%; TZ: 16.7%).

Conclusions: In these populations, exposed to a prolonged iodine intake exceeding the dietary requirements, the prevalence of thyroid disorders was similar to iodine-sufficient populations suggesting that the thyroid gland may adapt to high intakes. The well-functioning USI programmes should be maintained, but monitoring and surveillance must be strengthened. Groundwater likely contributes to the high iodine intakes in the present study populations. In areas of known iodine excess, monitoring of groundwater sources should be encouraged.

Keywords: Iodine excess, thyroid function, thyroglobulin, USI, groundwater

FEASIBILITY OF COLLECTING NUTRITION INFORMATION USING COMPUTER ASSISTED TELEPHONE INTERVIEWING

[1]*Hachhethu, Kusum;* [2]*Chesterman, Sabrina;* [3]*Mwongela, Beatrice;* [4]*Ng'endo, Mary;* [5]*Bauer, Jean-Martin.*

[1]MSc. Nutritionist.United Nations World Food Programme. Vulnerability Analyis and Mapping. Rome. Italy; [2]MSc. World Agroforestry Centre (ICRAF). Nairobi. Kenya; [3]Msc. United Nations World Food Programme. Nairobi. Kenya; [4]PhD. World Agroforestry Centre (ICRAF). Nairobi. Kenya; [5]MPP. United Nations World Food Programme. Rome. Italy.

Background and objectives: Regular information on nutrition status within target populations is needed to monitor changes over time, provide early warning, and guide policies and programmes linked to nutrition in vulnerable counties. With rapid growth in mobile phone access and ownership in sub-Saharan Africa, data collection using mobile methodologies such as Computer-Assisted Telephone Interviewing (CATI) could enable quick, affordable and high frequency data collection at scale.

The objective of the study was to understand mobile phone access, ownership, and usage patterns by rural women in Kenya, in particular the opportunities and constraints for monitoring nutrition via mobile phone interviews with women of reproductive age and caregivers of young children.

Methods: We conducted 17 focus group discussions and 16 in-depth interviews with women, as well as 22 key informant interviews with mobile phone vendors, local nutritionists and local government representatives. The study was conducted in two counties in Kenya (Kitui and Baringo) representing different socioeconomic and agroecological conditions. Qualitative data were coded and analysed using NVivo 10 based on defined codes; additional codes and sub-nodes were added based on emerging themes from the data.

Results: Our results show that the majority of women in both counties had access to phones through inter- and intra-household sharing, even if they didn't own one themselves. Similarly, a majority of participants showed high willingness to participate in mobile phone surveys related to diet. However, potential barriers for women to participate in mobile phone surveys included poor network coverage, trust issues, and gender norms.

Conclusions: Innovative data collection methodologies such as CATI can be used to collect nutrition information from rural women. Potential barriers related to trust issues and gender norms can be addressed through prior community sensitization, particularly with local leaders and male household heads. Mobile phone surveys are most feasible in areas where network coverage is good, however pre-scheduling of phone calls can minimize non-response in areas of poor network.

Keywords: Nutrition, Mobile survey, CATI, Data Innovation, Rural Kenya

Conflict of Interest Disclosure: United Nation World Food Programme's mobile Vulnerability Analysis and Mapping (mVAM) project uses various mobile methodologies to collect food security data.

CHANGES IN OBESITY METABOLOMIC PROFILE ASSOCIATED WITH MANGANESE INTAKE IN A POPULATION BASED STUDY

[1]Macedo Silva, Alexsandro; [2]Mendes Gorgulho, Bartira; [3]Carioca, Antonio Augusto; [4]Fisberg, Regina; [5]Marchioni, Dirce.

[1]PhD Student. Department of Nutrition of University of Sao Paulo; [2]PhD. Nutricionist. Department of Nutrition. University of Sao Paulo. Brazil; [3]PhD Student. Department of Nutrition. University of Sao Paulo; [4]Professor. Nutritionist. Department of Nutrition. University of Sao Paulo. Brazil.; [5]Professor. Nutricionist. Department of Nutrition. University of Sao Paulo.

Background and objectives: The amino acids (AA) profile has been reported to be related to metabolism alteration, impairing the mitochondrial activity, in obese individuals. Manganese dietary intake inadequacy could collaborate in abnormal accumulation of body and tissue fat, such as impairers lipid metabolism, and glucose tolerance. The relationship between manganese intake, and AA profile could indicate mitochondrial metabolism alteration, and future diseases. The aim of this study was evaluate the association between dietary manganese intake and AA profile.

Methods: The dietary intake data were obtained from the "Health Survey of São Paulo" (ISA-Capital 2008), a population based cross-sectional survey in São Paulo, Brazil. The blood sample was obtained from 168 adults ($\geq$20 years) and 21 amino acids in plasma were analyzed, using Affinity/HPLC with electrochemical detection method. AA profile was performed using factor analysis with extraction of principal components by varimax rotation. The factor loading considered the eigenvalue more than 0.4. Finally, linear regression was used to verify the relationship between manganese intake and AA profile, adjusting by age, sex, and energy intake.

Results: The factor analysis retained five factors with cumulative variance of 0.662, and Kaiser-Meyer-Olkin of sampling adequacy equal to 0.824: F1 (Isoleucine, Leucine, Lysine, Methionine, Phenylalanine, Tryptophan, Tyrosine, Valine); F2 (Asparagine, Glycine, Serine, Threonine); F3 (Arginine, Glutamate, Histidine); F4 (Citrulline, Glutamine, Ornithine); F5 (Alanine, Aspartate, Proline). F1 (β= -0.2616; p=0.009) and F3 (β= 0.2047908, p=0.047) revealed significant association with the manganese intake. The F1, that represented the AA profile related to β-oxidation, was negatively correlated with manganese intake; while F3, that represent the citric acid cycle, was positively correlated with manganese intake.

Conclusions: The manganese intake was associate negatively to the AA profile related to the β-oxidation, composed mainly by the branch chain amino acids and aromatic amino acids, which ones have been associated to obesity, and metabolism alterations, causing future diseases. However, the manganese consumption revealed positively association with citric acid cycle AA profile, whereas the manganese might be related to the enzymes responsible for aerobic metabolism.

Keywords: Manganese Intake. Metabolomics. Obesity. Metabolism.

OSU Co., Ltd.. Japan; [6]PhD. Physical Education. Graduate School of Changwon University. Republic of Korea.; [7]PhD. Physical Education. Graduate School of Konkuk University. Republic of Korea.

Background and objectives: L-lactate is known as the end-product of glycolysis. Therefore it is considered as a fatigue product. However, since last decades there has been demonstrated positive effect of L-lactate. Nevertheless it is not known whether the L-lactate changes on energy metabolism and energy substrates utilization.

Methods: Study1. We investigated the effects of L-lactate treatment by using an open calorimetric chamber on resting rats for 6 hours. We randomized 32, 7-week-old male SD rats into 4 groups: the control (Con: DW), caffeine (Caf: 1mg/100g), L-lactate (Lac:400mg/100g), and caffeine and L-lactate mixed compound

---

(Caf+Lac: 1mg, 400mg/100g). We treated different substances to each groups by using sonde for oral administration. We examined 6 hours on energy metabolism in resting conditions by using respiratory metabolic chambers.

Study 2. We did Additional experiment to see gene movements within 2 hours with Caf+Lac group, because they were the highest group in fat oxidation. We treated same dose of Caf+Lac and sacrificed 30minutes, 60 minutes and 2 hours after the treatment. We sacrificed zero-point without any treatment and analyzed all the groups by RT PCR.

Results: Study1. There was no significant difference in oxygen uptake and carbon dioxide production between groups. However with fat oxidation, Lac and Caf+Lac were significantly higher than Con in first 2 hours after administration in fat oxidation.

Study2. MCT1 decreased after 2hours compared to zero and FAT/CD36 showed up and down tendency with significant difference within 2 hours. Finally PDK4 increased at 2hours compared to zero.

Also when we examined blood sample we could see there is a significant increase in glycerol level after 2hours.

Furthermore when we analyzed glycogen level in liver, we could find significant increase within 2 hours.

Conclusions: The rejection of glycolysis which might be understood as increase in glycogen synthesis, has possibility of shown to as increase in fat oxidation. For this reason, L-lactate administration could be an effective supplement for aerobic athletes' glycogen loading and therefore it needs to be studied more with metabolism clarification and dose response.

Keywords: L-lactate, Fat oxidation, Glycogen, Resting metabolic rate

ANTHROPOMETRIC MEASUREMENTS ASSOCIATED TO METABOLIC SYNDROME AND INSULIN RESISTANCE IN CHILEAN SCHOOL AGE CHILDREN

[1]Fernandez, Ximena; [2]Arnaiz, Pilar; [3]Barja, Salesa; [4]Villarroel, Luis; [5]Mardones, Francisco.

[1]BSc. MSc. Department of Public Health. Pontificia Universidad Católica de Chile. Chile.; [2]MD. Department of Pediatrics. Pontificia Universidad Católica de Chile. Chile.; [3]MD. MSc. Department of Pediatrics. Pontificia Universidad Católica de Chile. Chile.; [4]PhD. Department of Public Health. Pontificia Universidad Católica de Chile. Chile.; [5]MD. MSc. Department of Public Health. Pontificia Universidad Católica de Chile. Chile.

Background and objectives: The World Health Organization has recommended determining - sex and population – specific relationships between measures of fatness and morbidity. Obesity anthropometric indicators were associated in this study of Chilean children with the metabolic syndrome (MS) and with insulin resistance (IR).

Methods: A cross-sectional study enrolled 3325 subjects attending 5th and 6th grade of primary education during 2009-2011. The relationship of MS and IR with anthropometric indicators was

assessed. Receiver operator characteristic (ROC) curves were used to compare discrimination and estimate optimal cutoffs of body mass index (BMI), fat mass (FM), waist circumference (WC) and waist-to-height ratio (WHtR). Sensitivity, specificity and net classification improvement (NRI) for these cut cutoffs were compared with values obtained applying international recommendations.

Results: Children were 52.2% females and mean age was 11.4±1 years. All anthropometric indicators had similar ROC areas for MS and RI, both in girls and boys. Optimal cutoffs slightly improved NR when compared with international recommendations.

Conclusions: The similarities observed permitted to propose two simpler anthropometric measures for clinical practice. They are BMI and WHtR; the latter has also the advantage of not needing tables to assess the specific diagnosis.

Keywords: children, insulin resistance, metabolic syndrome, fat mass, body mass index

EFFECT OF LEAA SUPPLEMENTATION ON MUSCULAR FATIGUE AND INFLAMMATORY CYTOKINES IN WHEELCHAIR BASKETBALL PLAYERS

[1]An, Young Hwan; [2]Kim, Hee-Jae; [3]Jung, Yong Jin; [4]Fujimura, Naoko; [4]Toyoda, Takuya; [5]Yamada, Toshiyuki; [5]Uchida, Hirohisa; [1]Lim, Kiwon.

[1]Department of Physical Education. Konkuk University. Seoul. Korea; [2]Physical Activity and Performance Institute (PAPI). Konkuk University. Seoul. Korea; [3]Department of Internal Medicine. Seoul National University. College of Medicine. SMG-SNU Boramae Medical Center. Seoul. Korea; [4]Institute of Food Science & Technologies. Ajinomoto Co., Inc.. Kanagawa. Japan; [5]Sports Nutrition Department. Ajinomoto Co., Inc.. Tokyo. Japan.

Background and objectives: Several studies found that an effect of amino acid supplement on reducing muscle damage and attenuated development of delayed onset muscle soreness (DOMS) induced by exercise. This study has a purpose of investigating the effect of LEAA (Leucine-enriched essential amino acids mixture) intake on muscle recovery and muscle fatigue of disabled athletes through examining the wheelchair basketball players.

Methods: Ten of wheelchair basketball players with spinal cord injury and amputated participated were recruited. All subjects were exposed to a LEAA (12.0 g/day) or placebo treatment in a double-blind, randomized, and cross-over experiment. We measured the variables related to muscular fatigue or inflammatory response before the intense exercise and followed 4 day of recovery.

Results: In our results, there was significant decrease of circulating IL-6 level in LEAA treated group compared to placebo

group. However, there was not alternation of TNF-alpha and CK levels. There was no significant difference in relative values of muscle soreness with ANOVA analysis. However, significant improvement in relative values of whole body & back soreness with Effect size analysis with Cohen's d.

Conclusions: Based on our results and previous reports, supplementation of LEAA before and after the intense exercise-induced muscular fatigue could be helpful to reduced muscular soreness and inflammatory response in wheelchair basketball players.

Keywords: Wheelchair basketball, Muscular fatigue, Inflammatory, LEAA (Leucine-enriched essential amino acids mixture)

SIBLINGS 6-59 MONTHS AND CHILD STUNTING IN 'MULTI -MULTI' NUTRITION PROGRAMME

Mahamadou, Tanimoune.

World Food Programme. (WFP). Rwanda

Background and objectives: In Rwanda, Nyamagabe and Rutsiro districts have stunting prevalence rates above the WHO critical threshold of 40%. The one UN Nutrition projects 'multi-multi' was implemented between August 2014 and December 2016, to effectively reduce the stunting levels in the two districts. Impact of siblings on child stunting in targeted households was studied.

Methods: A cross-sectional survey sampled 3700 children aged 6-59 months in the two districts. Data were collected between August and September 2016, and were stratified by number of siblings in household. Stunting in children was determined using the World Health Organization (WHO) growth standard 2006 index (HAZ). Data quality was assessed using ENA plausibility check and statistical analysis was performed with SPSS version 24.

Results: Stunting was lower in children enrolled in the project 50.9% vs. 54.9%, P> 0.05. Trend is much significant 46.4% vs. 54.1%, p<0.05 in children enrolled in the project with no sibling under five years in the household. Stunting level was reversed among households having targeted children with older siblings not enrolled in the programme (57.4% vs.56.3%). Stratification by age in household with older siblings, indicates that the older the child is (12-24 months) the more affected he or she is.

Conclusions: Household size especially , presence of one or more siblings under five years is a social determinant of child stunting. Additional research is required on quantifying the impact of siblings on child undernutrition for future programme targeting.

Keywords: Siblings, Stunting, 'multi-multi'

RESEARCH METHODS USED TO DETERMINE COST-EFFECTIVENESS OF A SUPPLEMENTARY FEEDING TRIAL TO PREVENT CHILD UNDERNUTRITION IN BURKINA FASO

[1]*Shen, Ye;* [2]*Cliffer, Ilana;* [3]*Suri, Devika;* [4]*Vosti, Stephen;* [5]*Webb, Patrick;* [5]*Rogers, Beatrice.*

[1]MSPH. Friedman School of Nutrition Science and Policy. Tufts University. USA.; [2]MPH. Friedman School of Nutrition Science and Policy. Tufts University. USA.; [3]MS. MPH. Friedman School of Nutrition Science and Policy. Tufts University. USA.; [4]PhD. University of California-Davis. USA.; [5]PhD. Friedman School of Nutrition Science and Policy. Tufts University. USA.

Background and objectives: Policy-makers increasingly call for evidence of cost-effectiveness in international aid and nutrition programming. Guidance on tailoring methods to policy relevant questions is limited, making it challenging to determine cost-effectiveness in programmatic settings. As part of the Food Aid Quality Review (FAQR) funded by USAID/Food For Peace Office (FFP), we describe cost-effectiveness research methods applied to a preventive supplementary feeding trial comparing four specialized nutritious food aid products.

Methods: A cluster-randomized trial enrolled 6,092 children at six months old. Each enrollee received one of four isocaloric foods (three Fortified Blended Foods and one Ready-to-Use-Supplementary Food) with monthly anthropometric measurements for 18 months. Outcomes relevant to cost-effectiveness analysis include number of child-months and number of children ever diagnosed as wasted (Weight-for-Height Z score<-2) or stunted (Height-for-Age Z score<-2). Using an Activity-Based-Costing-Ingredients (ABC-I) approach, we collected costs associated with program fixed investments, food commodities, transportation, storage, distribution, repackaging, programmatic activities, and beneficiary and volunteer opportunity costs. The Incremental Cost-Effectiveness Ratio(ICER) for each cost-effectiveness measure was calculated across the four arms. Cost-effectiveness measures and their formulas were determined based on the nature of the program and outcomes of interest.

Results: Because a child could fall into wasting or stunting more than once over 18 months, we assess the programmatic "cost per child never wasted" and "cost per child never stunted". The ICER formula used to compare across arms is "Difference in total program cost per child / Difference in (number of children ever diagnosed with wasting or stunting / number of children)". Because the length of time during which a child was malnourished is important to long-term growth and development, we will determine "cost per child-month of stunting averted" and "cost per child-month of wasting averted". The ICER formula is "Difference in total program cost per child / Difference in (number of total child-months with stunting or wasting/number of children)".

Conclusions: These methods offer rigor to cost-effectiveness research design, including cost data collection and creation of appropriate cost-effectiveness measures. Meaningful cost-effectiveness estimates produced by the research community will in turn

lead to real impact on better-designed-and-managed nutrition programs and policies in international development.

Keywords: cost-effectiveness, supplementary feeding, stunting, wasting, food aid

PLASMA ALANINE AMINOTRANSFERASE (ALT) ACTIVITY IS A RELIABLE BIOMARKER FOR THE RISK OF INSULIN RESISTANCE AND DIABETES PREDISPOSITION

[1]Goda, Toshinao; [2]Honma, Kazue; [3]Tohyama, Kazushige; [4]Mochizuki, Kazuki.

[1]PhD. Professor. School of Food and Nutritional Sciences. University of Shizuoka. Japan; [2]PhD. Research Assistant Professor. School of Food and Nutritional Sciences. University of Shizuoka. Japan; [3]SBS Shizuoka Health Promotion Center. Japan; [4]PhD. Professor. Department of Local Produce and Food Sciences. University of Yamanashi. Japan.

Background and objectives: The onset of diabetes is reportedly related with insulin resistance and uncontrolled gluconeogenesis in the liver. In this study, we examined whether elevated plasma concentration of alanine aminotransferase (ALT), a hepatic key enzyme for gluconeogenesis, is associated with the increases in blood HbA1c levels during the 5-year follow-up period after health checkups in middle-aged apparently healthy Japanese men.

Methods: Associations between the baseline clinical parameters or lifestyle factors (categorized in Q1-Q4) and the increase in blood HbA1c levels were determined in 1,729 men aged 35–54 years by logistic regression analyses. We also conducted In vitro analysis where human liver-derived HepG2 cells were cultured with 0.5-100 nmol /L insulin for 8h, and the mRNA levels of ALT gene and the extent of histone acetylation around the gene were measured.

Results: Multivariate logistic regression analyses showed that among the clinical parameters and lifestyle factors, the baseline plasma ALT activity was most explicitly associated with the increase in blood HbA1c levels, and the odds ratios for the increment of HbA1c of 0.5% or more in 5 years were 1.71 and 2.64, in the quartile groups Q3 (p = 0.018) and Q4 (p < 0.001) for ALT, respectively, as compared with Q1. In vitro analysis of human liver-derived HepG2 cells showed that the mRNA levels of ALT2, but not ALT1, were reduced by insulin in a dose dependent manner, and that the insulin-induced suppression of ALT2 mRNA levels was in association with decreases in histone H3 and H4 acetylation surrounding the ALT2 gene.

Conclusions: These results suggest that plasma ALT activity is a reliable biomarker for the risk of insulin resistance and diabetes predisposition in middle-aged apparently healthy Japanese men.

BENEFICIAL EFFECT OF PERSONALISED LIFESTYLE ADVICE AS COMPARED TO GENERIC ADVICE ON WELLBEING AMONG ACTIVE DUTCH SENIORS – A PILOT STUDY

[1]de Hoogh, Iris; [2]Doets, Esmée; [3]Holthuysen, Nancy; [4]Wopereis, Suzan; [5]Verain, Muriel; [4]Boorsma, André; [6]Bouwman, Emily; [7]Pasman, Wilrike; [4]van Erk, Marjan; [8]Reinders, Machiel.

[1]MSc. Nutrition Scientist. Microbiology & Systems Biology. TNO. The Netherlands.; [2]PhD. Wageningen Food & Biobased Research. Wageningen University & Research. The Netherlands.; [3]BSc. Wageningen Food & Biobased Research. Wageningen University & Research. The Netherlands.; [4]PhD. Microbiology & Systems Biology. TNO. The Netherlands.; [5]Wageningen Economic Research. Wageningen University & Research. The Netherlands.; [6]MSc. Wageningen Economic Research. Wageningen University & Research. The Netherlands.; [7]PhD. Microbiology & Systems Biology. TNO. the Netherlands; [8]PhD. Wageningen Economic Research. Wageningen University & Research. The Netherlands.

Background and objectives: Ageing is associated with a gradual loss of skeletal muscle mass and function. It is estimated that sarcopenia affects 30% of seniors over 60 years. Also, 60% of Dutch seniors suffer from overweight or obesity. Both obesity and sarcopenia can be treated with a healthy diet and regular physical exercise.

Previous studies have shown that personalised advice is more effective than general information for improving healthy behavior. Personalisation of lifestyle advice can be done by using individual's health status and behavior (biological factors), and by using personal characteristics (socio-psychological factors). The primary focus of this study was to demonstrate whether personalisation of lifestyle advice as compared to generic advice improves measures of wellbeing in a population of active seniors.

Methods: At total of 59 seniors aged 60 years or older and with a self-reported BMI of 20-30 kg/m2 were recruited. The study was designed as a 9-week single-blind randomised controlled trial. At baseline and end, biological, genetic and socio-psychological measurements were performed. Food intake and compliance were measured three times during the study. The intervention group (n=30) received Personalised dietary and lifestyle Advice (PA), based on their dietary intake, phenotype and genotype. The control group (n=29) received Generic Advice (GA) for improving their muscle health.

Results: Scores on the Short Physical Performance Battery (SPPB) increased significantly in both the PA and GA group. Decrease in body fat percentage and hip circumference was significanlty greater in the PA group. Waist circumference decreased significantly in the PA group, but the difference between the PA and GA group was not significant. There were no differences in changes of self-perceived health between groups. However, in the PA group, scores for motivation and resilience increased significantly.

Conclusions: This study showed that both the PA and GA group improved their muscle health as shown by improved scores

---

on SPPB. However, the PA group showed a stronger beneficial decline in body fat percentage and hip circumference as compared to the GA group. This indicates that personalised lifestyle advice results in additional health benefits in a population of active seniors as compared to general advice.

Keywords: personalized advice, elderly, lifestyle, nutrition, muscle health

NUTRIENTS AND DNA METHYLATION ACROSS THE LIFE COURSE: A SYSTEMATIC REVIEW OF STUDIES IN HUMANS

[1]*Braun, Kim;* [2]*Mandaviya, Pooja;* [3]*Nano, Jana;* [4]*Thomas, Carolin;* [5]*Troup, Jenna;* [6]*Muka, Taulant;* [7]*Bramer, Wichor;* [8]*Heil, Sandra;* [6]*Franco, Oscar;* [9]*Voortman, Trudy.*

[1]RD. MSc. Department of Nutrition. Harvard T.H. Chan School of Public Health. USA.; [2]MSc. Department of Clinical Chemistry. Erasmus University Medical Center. The Netherlands.; [3]MD, MSc. Department of Epidemiology. Erasmus University Medical Center. The Netherlands.; [4]MSc. Department of Epidemiology. Erasmus University Medical Center. The Netherlands.; [5]MSc. Research and Development. Metagenics Inc. USA; [6]MD, PhD. Department of Epidemiology. Erasmus University Medical Center. The Netherlands.; [7]Medical Library. Erasmus University Medical Center. The Netherlands.; [8]PhD. Department of Clinical Chemistry. Erasmus University Medical Center. The Netherlands.; [9]PhD. Department of Epidemiology. Erasmus University Medical Center. The Netherlands.

Background and objectives: DNA methylation can be modified by environmental factors, including nutrition. The susceptibility to change of DNA methylation in response to nutrition is particularly high during early life. Nevertheless, nutrition has also been reported to be associated with DNA methylation in other stages of the life course, for instance, during adolescence and adulthood. In order to gain more insight in effects of several nutrients on DNA methylation across the life course, a comprehensive overview of the current knowledge is of importance. Therefore, we conducted a systematic review on the relationship between nutrients and DNA methylation in humans across the life course.

Methods: The literature search was designed by an experienced biomedical information specialist. Six bibliographic databases (Embase.com, Medline (Ovid), Web-of-Science, PubMed, Cochrane Central and Google Scholar) were searched. We selected studies that examined the association between nutrients (blood levels; dietary intake; or dietary supplements) and DNA methylation (global, site specific or genome-wide) in humans of all ages. We did not apply any restrictions on year of publication or language. All abstracts, full text selection and data extraction was performed by two independent reviewers, with a third reviewer available for disagreements.

Results: Of the 3774 references identified, 109 studies met our inclusion criteria. Of the included studies, 31 studies investigated the association between maternal nutrition and offspring DNA methylation, nine studies were carried out in subjects during infancy, childhood, or adolescence, and 69 studies were performed in adults. Several candidate gene and epigenome-wide association studies identified effects of nutrients, including folate, fatty acids, and vitamin D, on DNA methylation of CpG sites known to be involved in several health aspects, such as embryonic development and cancer.

Conclusions: To date, promising results have been reported in the field of nutrition and DNA methylation in humans at different stages across the life-course. Especially for nutrients known to be involved in one-carbon metabolism, such as folate, but also others, such as fatty acids and vitamin D. However, further large-scale studies of high quality are needed to expand our understanding on the role of nutrition in DNA methylation and its effects on health and disease.

Keywords: DNA methylation, systematic review, epidemiology, life-course, epigenetics.

Conflict of Interest Disclosure: The authors Kim V.E. Braun, Trudy Voortman, Jenna Troup, Taulant Muka, and Oscar H. Franco work in ErasmusAGE, a center for ageing research across the life course funded by Nestlé Nutrition (Nestec Ltd.), Metagenics Inc. and AXA. The authors report no conflict of interest related to this work.

THINK FLEXIBLE TO ADDRESS NUTRITION RESEARCH CHALLENGES

[1]*Tanguy, Jérôme;* [2]*Crabbé, Rafael;* [3]*Chow, Shein-Chung.*

[1]MSc. Biostatistician. Nestle Research Center. Clinical Development Unit. Lausanne. Switzerland; [2]MD. Head of Clinical Development Unit. Nestle Research Center. Clinical Development Unit. Lausanne. Switzerland; [3]PhD. Professor of Biostatistics and Bioinformatics. Department of Biostatistics and Bioinformatics. Duke University School of Medicine. Durham. North Carolina. USA.

Background and objectives: Human studies are essential to obtain evidence of beneficial effects of nutritional interventions on health. Nutrition clinical trials have specific challenges to overcome such as population selection, lack of learning phases, small beneficial effects, high heterogeneity of the response and difficulties in finding appropriate endpoints. We believe that this challenging framework favors the need of exploratory but optimized clinical trials: It creates significant opportunities, but also barriers, for the application of adaptive design methods.

Methods: This work highlights specificities and challenges in nutritional clinical trials. The application of adaptive design methods is then evaluated in terms of benefits, challenges and obstacles during implementation. Practical recommendations for implementation are also presented.

Results: In practice, adaptive design provides the opportunity to modify certain aspects of the trial design whilst the study is ongoing, without violating the quality and the integrity of the data. It allows the investigator to correct wrong assumptions made at the beginning of the trial such as power calculation for sample size; it helps to select the most promising option early with limited number of subjects available at interim; and it provides the opportunity to react earlier to surprise either positive (e.g., strong benefits) or negative (e.g., safety concern or futility).

Compared to traditional designs implementation, adaptive designs require additional efforts at each stage of the trial. It requires careful planning. Simulation-based evaluation of the trial and formal assessment of trial options with quantitative comparison of design choices are recommended. It requires a precise operational execution, with appropriate technology. A close collaboration and coordination is needed among different functional and operational teams during the course of the study. Underlying theoretical complexity of adaptive design implies a solid statistical ground and a careful interpretation of the results. Major adaptations or modifications to a trial could prevent from answering to the scientific questions that the original trial intended to answer.

Conclusions: Authors hope this work will allow a better understanding and adoption of the adaptive design methodology by the nutrition scientific community, and will contribute to the design of more efficient and ethical optimized clinical trials.

THE NEEP APPROACH: CLOSING RESEARCH GAPS AND BUILDING CSO CAPACITY THROUGH EVALUATION

[1]*Kothari, Monica;* [2]*Mackison, Dionne;* [3]*Houston, April;* [4]*Fimbi, Sandrine;* [5]*Perry, Abigail;* [6]*Musselman, Brianna;* [7]*Lionetti, Denise.*

[1]MS/MPH, Senior Monitoring and Evaluation Advise, PATH, Washington, DC, USA; [2]PhD. Nutrition Adviser. Nutrition Team. DFID. London. United Kingdom; [3]MS. Communications Consultant, PATH, Washington DC.USA; [4]Finance and Operations Team Lead, PATH, Washington DC.USA; [5]MSc. Senior Nutrition Adviser. Nutrition Team. DFID. London. United Kingdom; [6]MA, Senior Program Assistant, PATH, Washington. DC. USA; [7]MPH, Project Director, PATH, Washington. DC. USA.

Background and objectives: The Nutrition Embedding Evaluation Program (NEEP) was a four-year program that began in October 2013, funded by the UK Department for International Development and managed by US-based international health organization PATH. The objectives of NEEP were to: 1) build capacity to identify and measure results of nutrition-related interventions, 2) address knowledge gaps on effectiveness and cost-effectiveness of nutrition interventions, and how they can be delivered at scale, 3) support civil society organizations (CSOs) to strengthen their ability to carry out effective evaluations of their nutrition-related interventions, and 4) disseminate evidence of best practice for impact. After conducting a gap analysis to determine NEEP priorities, PATH (following consultation with DFID) allocated grants and provided technical assistance to local CSOs, tracking performance and compliance throughout the program. Altogether, NEEP supported robust evaluation of 18 nutrition-related interventions in 12 different low- and middle-income countries.

Methods: Near the halfway point of the program and approximately one month before CSO contracts were scheduled to end, PATH surveyed grantees to identify any common challenges they faced during the evaluation process and how those challenges were overcome. The authors of this paper reviewed qualitative data from these surveys, monthly and quarterly NEEP grantee reports, and other internal documents and compiled a list of key implementation challenges and recommendations for future nutrition evaluation funding projects.

Results: Grantees reported challenges related to tracking and accessing intervention participants for evaluation, obtaining an adequate intervention sample size to achieve statistically significant results, experiencing delays with local internal ethical review board approval, political unrest creating unsafe conditions for evaluators, and transporting anthropometric measurements/equipment. PATH recognized that the timeline for these evaluations could be made more flexible to allow for thorough data collection and publication, and accommodate for environmental challenges beyond the evaluators' control.

Conclusions: The NEEP administration and implementation process was challenging, but provided valuable lessons that are transferrable to other nutrition program evaluators and funders. NEEP presented a successful model for an "ongoing external presence" for CSO grantees, ensuring quality and consistency in monitoring and evaluation from the initial planning stages to project completion.

Keywords: Evaluations, nutrition-sensitive, CSOs, PATH

Background and objectives: Intake of high-fat (HF) diets has been associated with steatosis, hepatic lipid alterations and insulin resistance in humans and in experimental animal models. Since rumenic acid (RA) and vaccenic acid (VA), naturally present on dairy products, showed to induce health benefits on lipid and carbohydrate metabolism, some efforts have been made to increase their levels in the milk fat (MF) and obtain a functional milk fat (FMF). The aim of the present study is to investigate parameters related to glucose and triacylglycerol (TAG) metabolism in rats fed high-fat diets containing a FMF obtained by PUFA supplementation to dairy cow diets.

Methods: Male Wistar rats were fed (60-d) with S7 (soybean oil, 7%), S30 (soybean oil, 30%), MF30 (soybean oil, 3% + MF, 27%) or FMF30 (soybean oil, 3% + FMF, 27%) diets. Biochemical parameters on serum; TAG levels in liver and skeletal muscle; lipogenic and β-oxidative enzymes activities and expressions in liver; and hepatic TAG secretion rate in vivo were determined. In addition, an oral glucose tolerance test, the metabolites from glycolysis and some key enzyme activities in skeletal muscle were assessed. Statistical differences ($p<0.05$) were tested by ANOVA.

Results: Compared to S7, S30 diet induce TAG accretion in liver (+36%) and skeletal muscle (+61%), decreased muscle glucose utilization by a lower flux through hexokinase (-53%) and 6-phosphofructokinase (-49%), glucose intolerance and hyperinsulinemia (+48%). The FMF30 group showed lower levels of TAG in liver (-26%) associated with an enhanced β-oxidation (CPT-I gene expression +122%) and a higher TAG secretion rate (+31%), compared to S30. In muscle, FMF30 also reduced the TAG levels (-49%) and increased the flux through the 6-phosphofructokinase (+116%) improving the glucose utilization.

Conclusions: In conclusion, the FMF prevented the TAG accretion induced by high fat diet consumption and improve the glucose utilization in skeletal muscle.

Food Science and Nutrition. Department of Biological Sciences. School of Biochemistry and Biological Sciences. National University of Litoral. Argentina.

Background and objectives: Conjugated linoleic acid (CLA) might regulate the lipid liver and adipose tissue accretion. Since there is an association between maternal nutrition, fat depots and risk of offspring chronic disease, the aim was investigate the effect of maternal CLA consumption on triacylglycerol (TAG) regulation and some inflammatory parameters in adult male rat offspring receiving or not CLA.

Methods: Female Wistar rats were fed control (C) or CLA-supplemented (1%,w/w) diets during 4 weeks before and throughout pregnancy and lactation. After weaning, male offspring of CLA rats were fed C or CLA diets (CLA/C and CLA/CLA groups, respectively), while C male offspring rats were fed C diet (C/C group) for 9 weeks. Serum TAG concentration, liver TAG content, lipogenic and oxidative enzyme activities, gene expressions, transcriptional factors (SREBP1c, PPARα and PPARγ) and inflamatory cytokines mRNA levels; and epididymal white adipose tissue (EWAT) LPL activity were measured.

Results: Serum TAG levels were increased in CLA/CLA (+65%) and CLA/C (+92%) groups, associated with a reduction of EWAT LPL activity (-41%) and (-67%), respectively. Liver TAG levels were decreased in CLA/CLA (-22%) group related to a significant reduction of FAS (-37%) and ACC (-27%) enzyme activities, as well as of FAS (-44%), ACC (-48%), SCD1 (-54%) and SREBP1c (-25%) mRNA levels, without changes in β-oxidation parameters. Even though in CLA/C rats a normal liver TAG levels were founded, FAS (-38%) and ACC (-31%) activities, as well as ACC (-62%) expression were significantly diminished, associated with a lower expression of the key enzyme of β-oxidation (CPT-Ia) (-23%), PPAR-α (-22%) and PPAR-γ (-45%). Liver IL-1β gene expression showed a significant decrease in both, CLA/CLA and CLA/C groups. No changes were observed in IL-6 mRNA levels.

Conclusions: These results demonstrate that maternal CLA supplementation programs male rat offspring liver lipid metabolism leading to a prevention of the TAG accretion in adipose tissue and liver. The present findings could be important to develop some dietary strategies to reduce the incidence of obesity and fatty acid liver disease in humans.

SYSTEMATIC REVIEW ON THE MARKERS OF GLYCAEMIC EXPOSURE IN THE NON-DIABETIC POPULATION

[1]Feskens, Edith; [2]Brennan, Lorraine; [3]Dussort, Pierre; [4]Mela, David J.; [5]Rabbani, Naila; [6]Rathmann, Wolfgang; [7]Respondek, Frédérique; [8]Theis, Stephan; [5]Thornalley, Paul; [9]Vinoy, Sophie.

Germany.; [7]PhD. Scientist. Tereos. Thumeries. France; [8]PhD. Scientist. Südzucker Group. Mannheim. Germany.; [9]PhD. Scientist. Mondelēz International. Saclay. France.

Background and objectives: Reducing dietary glycaemic exposures in the general population is increasingly supported as a preventive approach to address the growing global burden of Type 2 diabetes. To study the impact of dietary modifications affecting glycaemic exposures, the availability of established biomarkers suitable for use in non-diabetic populations is essential. Therefore, our objective was to review and characterize alternative markers of sustained glycaemic exposures that could be used to evaluate and compare the glycaemic impact of dietary interventions among non-diabetic populations.

Methods: The protocol has been described in the PROSPERO database of systematic reviews, register number CRD42017037408. The following markers/measurements were pre-selected: continuous glucose monitoring, di-carbonyl stress, 1,5-anhydroglucitol, fructosamine, glycated albumin/proteins, advanced glycated end products (AGEs), HbA1c, and metabolomics. Systematic searches were done for publications of human studies in MEDLINE and EMBASE published until July 2016, to identify research where these markers had been measured in relation to diet as part of intervention or observational studies. Results were interpreted with respect to sensitivity, time-responsiveness, conditions and range of response.

Results: The systematic search generated 6547 unique records. After the screening process, 111 papers were included, ranging from only 4 for 1,5-anhydrioglucitol to 30 for AGEs. The selected papers highlighted the paucity of available data for these markers as tools to assess the glycaemic exposure in non-diabetic populations.

Conclusions: Considerable additional work is needed to validate the use of any of these as biomarkers for assessment of glycaemic exposure in non-diabetic populations. Such work includes demonstration of dose response, sensitivity and specificity, development of quantitative measurement assays and measurement in larger cohorts.

Keywords: biomarkers, glycemic exposure, type 2 diabetes, prevention, carbohydrates

Background and objectives: Hormonal regulation of appetite could be affected by the bacterium Helicobacter pylori. The objective of this study was to evaluate the association of H. pylori genotype and the type of gastric pathology, with serum ghrelin and leptin concentrations and Body Mass Index (BMI).

Methods: Fasted dyspeptic adults referred for an upper gastrointestinal endoscopy were enrolled. Height, weight and nutrient intake were assessed. Serum total ghrelin and leptin levels were analyzed by enzyme-linked immunosorbent assay. 13C-Urea Breath Test was performed and four gastric biopsies were obtained during endoscopy for histopathology and H. pylori DNA amplification and genotyping. Data analysis was performed using the $\chi 2$, Mann–Whitney U, and Kruskal-Wallis tests, Spearman's correlation and linear regression.

Results: 163 patients ($40.8 \pm 14.0y$), 98/65 females/males, were included. H. pylori prevalence was 53.4% (CI95%; 45.7 - 65.8%). Neither nutrient intake nor BMI differed significantly between groups. Serum ghrelin concentrations were significantly lower in H. pylori+ patients [median 311.0 pg/mL (IQR; 230.0 – 385.5)], independently of their cagA genotype, than in H. pylori- [median 355.0 pg/mL (IQR; 253.8 - 547.8)] (P = 0.025), even after adjusting for BMI and gender (P = 0.03). Leptin levels did not differ significantly between infected and uninfected patients [median 1.84 (0.80 – 4.85) vs 1.84 (0.50 – 5.09), (P = 0.87)]. The type and severity of gastric pathology in the corpus was associated with lower ghrelin serum levels (P = 0.04); whereas, gastric pathology of the antrum was not associated to ghrelin levels (P = 0.08).

Conclusions: H. pylori infection, independently of its cagA genotype, and the severity of gastric pathology of the corpus, are associated with lower ghrelin serum concentrations in dyspeptic patients, emphasizing its role on appetite regulation.

Keywords: H. pylori, cagA genotype, ghrelin, leptin, gastric pathology

EXPLORING VARIATIONS IN HEMOGLOBIN CONCENTRATION AND MEASUREMENT – THE HEMOGLOBIN MEASUREMENT (HEME) WORKING GROUP

[1]Moorthy, Denish; [2]Namaste, Sorrel; [3]Rappaport, Aviva.

[1]Technical Advisor. Micronutrients. Spring Project. USA.; [2]Team Lead. Technical Advisor. Anemia. Spring Project. USA.; [3]Consultant. Spring Project. University Of British Columbia. Canada.

Background and objectives: Measurement of hemoglobin concentration is common practice for monitoring and evaluating anemia reduction programs. Accuracy of hemoglobin measurement may vary widely. In order to improve the accuracy and quality of hemoglobin measurement across contexts, the USAID-funded Strengthening Partnerships, Results: **Methods:** Data were identified from cross-sectional studies among different population groups (children 6 -59 months, and pregnant and non-pregnant women 18-45 years) to assess precision, agreement, and measures of clinical validity to diagnose anemia.

Results: We identified data from nine studies conducted in Asia (Lao PDR, Cambodia, and India), Africa (Ghana, Rwanda, and Republic of The Gambia), and the Americas (Mexico, Guatemala, and USA) that compared hemoglobin measurements done using multiple devices (hematology autoanalyzers, and HemoCue devices) in different settings (laboratory and field). Priority research topics generated include: (1) factors influencing hemoglobin concentration, specifically capillary versus venous blood samples, type of analyzer, different models of the Hemocue devices, collection methods, and effect of sex, age, and climate.

Conclusions: This multi-investigator, multi-country research collaboration is the first of its kind to study variations in hemoglobin measurement. The findings from the study will contribute to the World Health Organization (WHO)'s review of its global guidelines for hemoglobin thresholds used to define anaemia at the individual and population level.

HARMONIZATION OF DATA COLLECTION ACROSS 4 COUNTRIES – THE ENRICH EXPERIENCE

[1]Owais, Aatekah; [2]Begum, Khadija; [3]Kekre, Priya; [4]Sellen, Daniel.

[1]MPH PhD. Project Statistician. Department of Anthropology. University of Toronto. Canada; [2]MBBS MPH PhD. Research Coordinator. Department of Anthropology. University of Toronto. Canada; [3]MPH. Project Technical Assistant. Department of Anthropology. University of Toronto. Canada; [4]PhD. Director. Centre for Child Nutrition and Health. University of Toronto. Canada.

Background and objectives: Undernutrition remains a major contributor to maternal and childhood morbidity and mortality. Enhancing Nutrition Services to Improve Maternal and Child Health in Africa and Asia (ENRICH) is a multi-country, broad-spectrum and integrated intervention program designed to help member countries achieve their global nutrition targets.

Methods: As part of ENRICH impact evaluation, a baseline assessment was conducted via household surveys (HHS) using a quasi-experimental design. In three of the four countries (Bangladesh, Kenya, Tanzania), a comparison area likely to have baseline characteristics similar to the intervention area was selected. In Pakistan, no comparison area was planned due to contextual reasons.

Results: The survey questionnaires were developed by University of Toronto (UofT) in coordination with World Vision Canada (WVC), ensuring consistency in tools, variables and response sets across settings. In-country research partners (CRPs) in each of the four countries carried out local contextualization and translation of the questionnaires. Data collection at all sites was conducted via Open Data Kit (ODK) platform on android tablets. English and predominant local language ODK templates for field-based entry of HHS were designed in Excel, converted into XML format, and uploaded to country-specific secure ODK Aggregate servers. Blank ODK forms were then accessed by field teams on their android tablets to be filled in during data collection in each country. Completed forms were saved on the tablets until uploaded to the ODK Aggregate server at the end of each working day. Multiple challenges were encountered and met across settings.

Conclusions: ODK is an effective and efficient platform for collecting large amounts of data across different geographical sites in a relatively short period of time under a range of field challenges. Data thus collected were of high quality, with minimal effort required for data cleaning and management. Using ODK also allowed for rapid, real-time updates to data collection tools based on feedback from enumerator training and first few days of data collection in each country. Strong training, supervision and real-time international coordination was key to maximizing the potential and flexibility of ODK platforms for complex and large scale evaluations in low-income settings.

Keywords: harmonization of data collection, maternal and child nutrition, nutrition intervention program, ODK, multi-country

PARATHYROID HORMONE AND FETAL LENGTH IN A PREGNANCY COHORT IN DHAKA, BANGLADESH

[1]Qamar, Huma; [2]Perumal, Nandita; [3]Papp, Eszter; [4]Gernand, Alison D; [5]Mahmud, Abdullah Al; [6]Roth, Daniel.

[1]BSc. Graduate Student. Department of Nutritional Sciences. University of Toronto. Canada.; [2]MPH. Graduate Student. Dalla Lana School of Public Health. University of Toronto. Canada.; [3]PhD. Research Manager. Centre for Global Child Health. Hospital for Sick Children. Canada.; [4]PhD, MPH. Nutritional Scientist. Department of Nutritional Sciences. Pennsylvania State University. USA.; [5]MSc. Scientist. Centre for Nutrition and Clinical Services Division. International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b). Bangladesh.; [6]MD, PhD. Clinician Scientist. Centre for Global Child Health. Hospital for Sick Children. Canada.

Background and objectives: The prevalence of fetal growth restriction remains high throughout South Asia, but the causes remain unclear. An important measure of fetal skeletal growth is birth length, which has been associated with psycho-motor development and postnatal length gain. Maternal parathyroid hormone (PTH) is a potential modifiable factor that may be a marker of fetal skeletal growth. PTH is a peptide hormone important in regulating calcium homeostasis, mineral metabolism, and bone turnover. In the present study, we aimed to investigate the association of maternal parathyroid hormone (PTH) with infant length at birth in a pregnancy cohort in Dhaka, Bangladesh.

Methods: This was a cross-sectional study using mother-infant data and biospecimens obtained at birth from a subset of participants (n=519) enrolled in the Maternal Vitamin D for Infant Growth (MDIG) trial, a dose-ranging prenatal vitamin D supplementation trial in Dhaka, Bangladesh. Infant anthropometry was collected within 48 hours of birth. Laboratory analyses were performed to estimate concentrations of maternal serum 25-hydroxyvitamin D and maternal plasma PTH, magnesium, FGF23, and CRP at delivery. We derived relative maternal calcium intake using a limited food frequency questionnaire. The primary outcome was newborn length-for-gestational-age z-scores (LAZ). Secondary outcomes included other newborn anthropometric indices. Statistical analyses were performed using multivariable linear regression models.

Results: At delivery, median maternal perinatal PTH concentration was 3.20 pmol/L (IQR: 1.94-4.80). Mean infant LAZ

at birth was -0.89 (SD=0.99). The associations between maternal PTH concentrations at delivery and infant LAZ as well as other anthropometric indices will be presented.

Conclusions: The association of perinatal PTH concentrations and infant anthropometric indices at birth will be summarized. The significance of the findings, including the potential role of PTH as a marker of fetal growth restriction and maternal nutrition status will be discussed.

Keywords: Parathyroid hormone, pregnancy, fetal growth restriction, skeletal growth

METHODS FOR RIGOROUS IN-HOME OBSERVATION CONDUCTED DURING A FOOD AID COST-EFFECTIVENESS TRIAL IN BURKINA FASO

[1]Cliffer, Ilana; [2]Nikiema, Laetitia; [3]Garanet, Franck; [4]Suri, Devika; [1]Langlois, Breanne; [5]Shen, Ye; [6]Walton, Shelley; [7]Webb, Patrick; [7]Rogers, Beatrice.

[1]MPH. Friedman School of Nutrition Science and Policy. Tufts University. USA.; [2]MD. Nutrition Department. Institut de Recherche en Science de la Sante. Burkina Faso.; [3]MD.Nutrition Department. Institut de Recherche en Science de la Sante. Burkina Faso.; [4]MS. MPH. Friedman School of Nutrition Science and Policy. Tufts University. USA.; [5]MSPH. Friedman School of Nutrition Science and Policy. Tufts University. USA.; [6]MPH. RD. Friedman School of Nutrition Science and Policy. Tufts University. USA.; [7]PhD. Friedman School of Nutrition Science and Policy. Tufts University. USA.

Background and objectives: To satisfy the need for direct assessments of feeding behaviors, in-home observation methods are gaining in use in global health and nutrition research. Bolstering existing methodological literature, we describe an approach to in-home observation aimed at understanding food preparation and feeding practices during a study comparing the cost-effectiveness of food aid in Burkina Faso.

Methods: From November 2014 to October 2016, we conducted four consecutive days of non-participant observations in randomly selected households of project beneficiary children receiving one of four foods in a supplementary feeding programme. Female observers surveyed beneficiary children aged 6-23 months, using a pre-coded grid in 30-minute time increments from 06:00 to 18:00 to record feeding and hygiene practices linked with product use. Qualitative notes were taken on events related to childcare, health and feeding. Post-observation, observers collected self-reported data on feeding practices by administering structured in-depth surveys to each household. The protocol was designed to minimize any Hawthorne effect. Village leaders were informed of observations, and consent was obtained from households. Family members were instructed to ignore the presence of the observer. Observers first spent a day in each household without taking notes to habituate their presence, and lodged elsewhere to reduce influence on normal practices.

Results: A total of 209 of the 224 selected households were observed; one household refused observation. Challenges included ensuring that observer presence did not noticeably influence practices, place undue burden on families, or induce social desirability bias. Additionally, it was challenging to create instruments that allowed efficient collection, entry and analysis of data. Advantages to conducting multi-day consecutive observations were habituation of the observed household to the presence of the observer, thoroughness and objectiveness of data, accurate time tracking of beneficiary opportunity costs, and validating reported versus observed behaviors. Observers report that acclimatization after multiple days may reduce social desirability bias, and that village leader buy-in was essential.

Conclusions: Multi-day in-home observations can provide rigorous data on observed food preparation and feeding practices and reduce the Hawthorne effect. Techniques, including using tablets, which may streamline data collection, should be further refined to address noted challenges.

CLASSIFICATION OF FOODS INTO FOOD GROUPS IN THE DIETSYS DATABASE

[1]Rodrigues, Marcela Perdomo; [2]Fung, Teresa T; [3]Beato, Gariel c; [4]Rossato, Sinara L.

[1]Post-graduation program in cardiology and cardiovascular disease. Federal University of Rio Grande do Sul. Porto Alegre. Rio Grande do Sul. Brazil; [2]Department of Nutrition. Harvard T.H. Chan School of Public Health. Boston. Massachusetts. Department of Nutrition. Simmons College. Boston. Massachusetts. USA; [3]Institute of Bioscience. Universidade Estadual Paulista "Julio Mesquita Filho". Botucatu (UNESP). Sao Paulo. Brazil; [4]Presenting author; Department of Nutrition. Harvard T.H. Chan School of Public Health. Boston. Massachusetts. USA. Department of Nursing. Universidade Estadual Paulista "Julio Mesquita Filho". Botucatu (UNESP). Sao Paulo. Brazil.

Background and objectives: The DietSys is a diet-data processing system for research that incorporates an international food database to maximize and improve the accuracy of diet-data assessment across countries. However, while using an international database it is difficult to locate a particular food due to the large number of items. This difficulty can be mitigated by classifying food items into food groups. This study aimed to describe the classification of foods into food groups in the DietSys database.

Methods: Three food composition tables were merged: the Argentinean food composition table (Argenfoods), the Brazilian food composition table (TACO), and the U.S. Department of Agriculture - Agricultural Research Service (USDA). Food items were classified into 21 food groups: Alcoholic beverages; Non-alcoholic beverages; Cereal and derivatives; Condiments and sauces;

Egg products; Fats and oils; Finfish and shellfish products; Fruits and derivatives; Infant formula & baby food; Legumes and derivatives; Meats and derivatives; Milk and Dairy; Miscellaneous; Mixed dishes; Nuts and seed products; Other; Sugars; Sausages and luncheon meats; Snacks and sweets; Soy products; Vegetables, leafy greens and derivatives.

Results: The DietSys database comprised 9851 food items; 4.7% (465 items) from Argenfoods, 6.1% (597 items) from TACO, and 89.2% (8789) from USDA. Food items from Argenfoods fell within 15 of the 21 food groups, with 21.7% categorized as finfish and shellfish products and 20.6% as milk and dairy. From TACO, 26% of food items belonged to miscellaneous, 19% to fruits and derivatives, and 4.6% to meats and derivatives. Of the 9851 food items in the DietSys database, the USDA accounted for 91% of meats and derivatives (N=2060), 96.8% of mixed dishes (1194 items) and 95.9% of snacks and sweets (N=1205 items).

Conclusions: The DietSys incorporates a comprehensive database making it feasible to assess diet-data from Argentina, Brazil, and the United States. Classifying foods into food groups expedited and facilitated the search for food items in the large database of the Dietsys system.

EFFECTS OF THE STIMULATION WITH DIFFERENT MIXES OF MONO, SATURATED AND POLYUNSATURATED FATTY ACIDS ON HEPATIC CELLS

[1]Castellanos Tapia, Lyssia; [2]Gómez Quiroz, Luis Enrique; [3]Aparicio Bautista, Diana Ivette; [3]Tejero, Maria Elizabeth.

[1]Instituto Nacional de Medicina Genómica; [2]PhD. Professor. Universidad Autónoma Metropolitana Iztapalapa. Mexico City. México.; [3]PhD. Researcher. Laboratorio de Nutrigenómica Instituto Nacional de Medicina Genómica. Mexico City. México.

Background and objectives: The rate of hepatic disease has increased worldwide over a decade. One of the causes may be the high intake of saturated fatty acids (SFA). These fatty acids acid have been considered as lipotoxic for hepatic cells, induce insulin resistance, inflammation and endoplasmic reticulum stress. Furthermore, oleic and omega 3 polyunsaturated fatty acids may revert the effects of SFA. However, the effect of mixtures of fatty acids that resemble their proportion and concentration in human plasma has not been tested. The purpose of this study is to evaluate the effect of the exposure to two mixtures of fatty acids similar to those found in plasma of subjects exposed to a diet rich in SFA and to a Mediterranean diet, on cultured HepG2 cells.

Methods: Cultured HepG2 cells were incubated with Mix 1 (67% saturated, 26% monounsaturated, and 6.5% polyunsaturated) or Mix 2 (55% saturated, 28% monounsaturated and 14.5% polyunsaturated), for 24 h and control. Three different concentrations were tested (100, 200 and 400 µM). Triglyceride accumulation, markers for apoptosis, inflammation and proteins of the insulin signaling cascade were tested using Oil red, immunofluorescence and Western blot, respectively.

Results: Both mixes induced apoptosis at 400 µM concentration as compared with lower concentrations. Mix 1 induced macrovesicular steatosis and Mix 2 treatment induced microvesicular steatosis. Higher expression of IL-6, IL-17 and IL-8 and lower expression of Akt protein found in Mix 1 as compared with Mix 2.

Conclusions: The results suggest that the mixture of fatty acids associated with the consumption of Mediterranean diet induced less inflammation, apoptosis, insulin resistance and macrovesicular steatosis than a mixture with higher content of SFA in hepatic cells.

Keywords: Fatty acids, hepatic cells, inflammation, steatosis.

Facultad de Farmacia y Bioquímica. Cátedra de Física. Argentine National Scientific and Technological Research Council (CONICET). Argentina.

Background and objectives: H. pylori could be involved in apetite regulation. Our study aimed to evaluate the nutritional anthropometric status, the appetite sensation and nutrient intake and the gastric pathology in patients before and after H. pylori erradication.

Methods: Dispeptic adults referred for an upper gastrointestinal endoscopy were enrolled. We assessed weight and height for body mass index determination. Nutrient intake was evaluated by 24-hour recalls and appetite sensation by a validated questionnaire (SNAQ). We obtained biopsies for gastric pathology analysis. Infected patients returned for control 12 weeks after eradication therapy. During the control we evaluated the same variables as in the first appointment. We used the proportion test and the Wilcoxon Signed Rank Test to perform statistical analysis.

Results: 117 patients (43.2±12.8y), 66.7% females (CI95%; 57.7-74.5), were included in this study. H. pylori infection preva-

lence was 69.0% (CI95%; 60.0–76.6%). In this population, 25.9% had low/normal weight, 48.3% overweight and 25.9% obesity, with no statistically significant differences between H. pylori positive and negative patients (P = 0.63). We administered eradication therapy to 80 patients. From 31 who have returned for control until now, 18 eradicated the infection (eradication rate 58.1%). We did not find statistically significant differences in the nutritional anthropometric status of the patients before and after eradication (27.7% normal-weight and 72.3% overweight/obesity pre-eradication, vs. 33.3% normal-weight, 66.7% overweight/obesity post-eradication, P=0.11). In addition, dietary intake of the patients did not differ pre- and post-eradication, either [energy (P=0.84), carbohydrates (P=0.87), protein (P=0.77) and fat (P=0.43)]. Results: **Conclusions:** Although dietary and anthropometric nutritional status did not differ before and after H. pylori eradication, a tendency towards an appetite sensation increase was observed after H. pylori cure that would be related to an improvement of gastric pathology of the patients.

Keywords: Nutritional status, appetite sensation, H. pylori, eradication treatment, gastric pathology.

Kenya.

Background and objectives: Optimal breastfeeding and childcare in the early life are critical for child growth and development, and eventually for achievement of sustainable development. Work environment is particularly important for optimal breastfeeding and childcare in sub-Saharan Africa as over 60% of women of reproductive age are in the workforce, majority in the agricultural sector. The main objective of this study is to establish the role of work on breastfeeding and childcare practices, and child nutritional status of children of low-income women working in the agricultural sector in Kenya; and views on potential feasibility of a workplace support initiative.

Methods: The study involved a baseline survey in an agricultural setting in Kenya using mixed methods approach involving qualitative, quantitative and participatory approaches (photovoice and participatory video). The Baseline quantitative data collection involved 645 women of reproductive age (15-49 years) with children up to 12 months and 139 managers and supervisors. Qualitative data was collected through 69 group and individual discussions, four photovoice sessions and three participatory videos. The purpose of the qualitative studies was to establish views on work environment including policies and practices. Descriptive analysis of quantitative data was done in STATA software while qualitative interviews were recorded, transcribed verbatim, coded using NVIVO and analysed thematically.

Results: Results indicate poor infant feeding and childcare practices with less than a quarter of children under six months (23%) being exclusively breastfed. Workplaces were not fully supportive to enable women to successfully combine work with breastfeeding and childcare. Narratives indicate that breastfeeding limits attainment of expected performance, hence mothers may forego breastfeeding in order to achieve the targets. Mothers also reported limited viable child care options after maternity leave as one of the barriers to exclusive breastfeeding when they resume work.

Conclusions: The imperative of consolidating women's workforce participation in order to secure a demographic dividend in sub-Saharan Africa underscore an urgent need for effective solutions that enable women to successfully combine work with breastfeeding and childcare. It is expected that the learning from this research will inform workplace support initiatives in Kenya and beyond.

Keywords: Workplace support, child care options, breastfeeding, working breastfeeding mothers

NUTRIENT-PROFILING ANALYSIS IN PACKAGED FOODS AND BEVERAGES WITH VOLUNTARY FORTIFICATION IN CENTRAL AMERICA AND DOMINICAN REPUBLIC, 2015-2016

(1)Roman, Ana Victoria; (1)Roman, Ana Victoria; (2)Roldan, Evelyng; (3)Perez, Wilton; (4)Ramirez, Nicté; (5)Espinoza, Leopoldo.

(1)PhD. Food Science and Technology. Nutrition and Micronutrient Department. Institute of Nutrition of Central America and Panama. Guatemala; (2)MSc. Nutritionist. Nutrition and Micronutrient Department. Institute of Nutrition of Central America and Panama. Guatemala; (3)PhD. Epidemiologist. Department of monitoring and evaluation. Institute of Nutrition of Central America and Panama. Guatemala; (4)MSc. Public Health. Nutrition and Micronutrient Department. Institute of Nutrition of Central America and Panama. Guatemala; (5)MSc. Public Health. Department of monitoring and evaluation. Institute of Nutrition of Central America and Panama. Guatemala.

Background and objectives: Voluntary fortification with micronutrients in packaged foods and beverages is growing as a marketing strategy used by food corporations. Consumption of these foods and beverages is increasing worldwide and potential links relate their intake with risk factors of non-communicable diseases. Critical nutrients added in excess may affect the human health. To our knowledge this is the first study performed combining data at regional level. This study aims to examine the nutrient profile of fortified packaged foods and beverages.

Methods: This study was carried-out in Central American countries and Dominican Republic. The nutritional content was obtained from the nutritional label and it was registered in an electronic platform. A convenience sampling technique was performed during 2015-2016. Foods groups were arranged based on the Central American food composition table. Macro and micronutrient information were determined and adequacy assessed for children less than two years old and for women of reproductive age. The WHO nutrient profile modelling was used to assess critical nutrient on each packaged food and beverage. The NutrINCAP 1.0 software was used to determine the nutrient content and Stata 14.0 for analysis. Descriptive and statistical inferences were determined. P-value < 0.05 is considered as significant.

Results: Based on INCAP's dietary recommendations from Central America, a considerable proportion of fortified foods and beverages showed adequacy levels of nutrient in children and women of reproductive age above the established recommendation. Some essential nutrients found in excess were vitamin A, zinc, folic acid, iron among other. Foods and beverages were highly energy dense reporting excess of more than one-third of the energy required in children and adults. Dehydrated soups reported the highest sodium energy density in our sample.

Conclusions: The packaged foods and beverages sample with voluntary fortification reported excess of nutrients added. Sodium was found in excess in several packaged foods and beverages. In contexts where nutritional deficiencies and nutritional excess coexist, our findings support the need for regulatory instruments regarding the level of fortified nutrient added in packaged foods and beverages.

Keywords: packaged foods and beverages, fortification, micronutrient

GETTING THE FOOD LIST "RIGHT": AN APPROACH FOR THE DEVELOPMENT OF A COMPREHENSIVE FOOD LIST FOR HOUSEHOLD FOOD CONSUMPTION SURVEYS

(1)Bell, Winnie; (2)Coates, Jennifer; (3)Rogers, Beatrice; (4)Bermudez, Odilia.

(1)MSc/MPH. PhD Candidate and Assistant Researcher. Tufts University Friedman School of Nutrition Science and Policy. Boston. USA; (2)PhD. Associate Professor. Tufts University Friedman School of Nutrition Science and Policy. Boston. USA; (3)PhD. Professor. Tufts University Friedman School of Nutrition Science and Policy. Boston. USA; (4)PhD/MPH. Associate Professor. Tufts University School of Medicine. Boston. USA.

Background and objectives: Due to under-investment in individual dietary data in many LMICs, detailed knowledge about dietary patterns is currently lacking. In an effort to fill this gap, researchers have turned to household consumption and expenditure surveys (HCES). However many HCES consumption modules do not capture sufficient detail in their food list. The objective of this paper was to use methods from nutritional epidemiology to demonstrate how quantitative 24-hour recall data can be used to generate a food list for HCES that can capture a comprehensive picture of nutrient intake.

Methods: The study analyzed dietary data from a large-scale, representative survey of rural Bangladesh. Four sequential steps commonly used in nutritional epidemiology for development of food frequency questionnaires were followed. First, similar foods were grouped; second a contribution analysis was conducted; third, stepwise regression was carried out; and finally, based on the results from the previous steps, a comprehensive food list was created.

Results: A total of 296 individual foods were grouped into 76 similar food categories and ranked based on the percent contribution of each food to total intake of pre-selected nutritional components (energy, protein, fat, calcium, iron, zinc, vitamin A). Results: **Conclusions:** This study illustrated a relatively straightforward method for developing a country-specific food list that can be used for HCES. Replicating these steps in other contexts depends on the availability of existing 24-hour dietary recall data and a sufficiently detailed food composition table to allow for accurate food to nutrient matches.

Keywords: Food list development; household consumption and expenditure surveys (HCES); food consumption data; method for food frequency questionnaire development

Mohamed V University. Morocco.

Background and objectives: Micronutrient deficiencies are a public health problem in Morocco. The aim of this study is to evaluate the mineral and vitamin status of children enrolled in a rural area in Kingdom of Morocco

Methods: The study involved a sample of 152 randomized school-aged children (7 to 9 years), from rural schools in the province of Azilal. The collected data were analyzed by the Nutrilog software integrating the Moroccan table of food composition and were subjected to a statistical analysis by the software SPSS version 2.1.

Results: The main results of this study showed that the Iron intakes are insufficient in more than 33% of children, Iodine and Zinc intakes are insufficient in more than 90% of children, Magnesium and Potassium intakes are insufficient in more than 50% of children whereas the excess of sodium is barely perceptible at 0.7%. The calcium, vitamin D and vitamin A intakes are are insufficient in more than 80% of children

Conclusions: The eating habits of the study population are highly unbalanced. The results of this study suggest strengthening school feeding program and nutrition awareness activities for children, teachers and parents.

Keywords: Vitamins. Minerals. School children, Intake.

Background and objectives: Background: Age-related hearing loss (ARHL) is one of the most common causes of disability in older people, affecting 1/3 of the population over 65-yr. Epidemiological studies have shown correlations among the nutritional condition, increased plasma homocysteine (Hcy) and HL, suggesting that nutritional supplementation may be beneficial. Accordingly, rodent experimental models have provided the molecular basis to understand the observed effects.

Objectives: Analyze the relevance of BHMT in the cochlea using Bhmt-/- mice, whose dependence on the metabolism of folate for the remetilacion of Hcy is greater, in the development of hearing loss and study of the contribution to gene silencing to damage by noise, and the influence of this genetic background on the effects by noise.

Methods: Three-month-old Bhmt-/- mice were used to determine hearing loss after exposure to noise.

Results: We present results showing that: 1) 3 month-old mice with Bhmt gene deleted present higher threshold shift after noise exposure; 2) an increase of plasma Hcy in knockout mice respect to wild type and heterozygous mice, with significant increase in total Hcy levels to 28 days of exposure to noise; 3) Noise exposure induced a significant decrease in MTR levels and a significant increase in the expression of Bhmt2 and Mtr in Bhmt gene deleted as compared to Bhmt null without exposure noise cochleae. In contrast, Bhmt-/- mice showed CBS protein levels similar to those in Bhmt+/+.

Conclusions: Our results confirm that the lack of BHMT in the cochlea alters cochlear Hcy metabolism. Deletion of BHMT makes the cochlea more sensitive to noise and expression and protein levels suggest changes in the mRNA or protein half-lives at several levels and a need to remethylate Hcy, either because of Hcy accumulation or an increased need of methionine

National Referece Center for Neonatology and Nutrition. Children's Hospital. Research Team on Mother and Child Health and Nutrition. Faculty of Medicine and Pharmacy of Rabat. CHU Rabat. Mohamed V University. Morocco.

Background and objectives: In Morocco, protein-energy malnutrition has virtually disappeared in pre-school children. However, there are few studies in school-aged children. The aim of this study is to assess the nutritional status of school children in a rural area in Morocco.

Methods: The study involved a sample of 152 randomized school-aged children from 7 to 9 years, recruited in Azilal province in kingdom of Morocco. The data collected were processed by WHO Anthro and the Nutrilog software on the basis of the Moroccan food composition table and were subjected to statistical analysis by the SPSS software version 2.1.

Results: The main results of this study show that emaciation measured by the BMI / A (Body Mass index for age) indicator ($\leq$-2SD standard deviation) according to WHO standards reaches 0.7%, the mean energy intake Daily per person is 1513 $\pm$ 35 Kcal with a prevalence of insufficient daily energy intake of 56% (below the recommended nutritional intake which is 1912Kcal). These daily caloric intakes come from 55% carbohydrates, 32% lipids and 13% protein

Conclusions: This study among school-aged children living in Moroccan rural area shows that the dietary intake are lower than those recommended for this category of the population. This situation requires a sound policy in nutrition education.

Keywords: School children.Carbohydrate.lipid.protein intake.

International Agency for Research on Cancer (IARC). Lyon. France.

Background and objectives: Individual food consumption surveys (IFCS) are performed in many countries and are intended to evaluate compliance with nutrient intake requirements or exposure to potential harmful dietary contaminants/components, or to develop food based dietary guidelines. Such data could potentially be used for investigating associations between dietary factors and disease outcomes. This review aims at inventoring methods and designs used in national IFCS and discusses the methodologies applied across countries and continents. We further evaluated the potential for embedding IFCS in national health surveys.

Methods: Literature searches were performed using fixed sets of search terms in different databases. The inventory was completed with all accessible information from retrieved publications. Surveys from individual countries, originating from different continents are listed in the inventory.

Results: We identified IFCS in 39 countries from six world continents. National IFCS systems are available in most of the high-income countries/continents, while such surveys are scarce in low- and middle-income countries. Few countries (n=9) have their national IFCS incorporated into national health and nutrition examination surveys, allowing the investigation of dietary-related disease outcomes. Most of these integrated surveys have the advantage of being continuous/regular in contrary to the other IFCS that are mostly erratic.

Conclusions: This review serves as the basis to define gaps and needs in IFCS worldwide and will help in defining priorities for resource allocation. In addition it can serve as an inspiration source for countries that do not have a IFCS system in place yet and advocates for national IFCS to be incorporated into national health and nutrition examination surveys in order to create (1) more research opportunities for investigating diet-disease relationships and (2) a frame to evaluate the effect of diet-related policies (e.g. promotion of local nutrient rich foods) and of nutrition recommendations such as food based dietary guidelines. The countries that integrat-

ed their IFCS within their National Health and Nutrition examination survey can serve as proof of principle for other countries.

COMPREHENSIVE PHENOTYPIC ANALYSIS OF LIVER HEPATOCYTE-SPECIFIC PHGDH DEFICIENT MICE

[1]*Hamano, Momoko;* [2]*Esaki, Kayoko;* [3]*Moriyasu, Kazuki;* [3]*Mori, Shinya;* [4]*Hirabayashi, Yoshio;* [5]*Furuya, Shigeki.*

[1]PhD student. Faculty of Agriculture. Kyushu University. Japan;
[2]Research Scientist. RIKEN Brain Science Institute. Japan;
[3]MS student. Faculty of Agriculture. Kyushu University. Japan;
[4]Senior Team Leader. RIKEN Brain Science Institute. Japan;
[5]Professor. Faculty of Agriculture. Kyushu University. Japan.

Background and objectives: L-Serine (Ser), a non-essential amino acid, is synthesized from 3-phosphoglycerate via the phosphorylated pathway composed of phosphoglycerate dehydrogenase (Phgdh), phosphoserine aminotransferase 1 (Psat1) and phosphoserine phosphatese (Psph). Ser is an important metabolic component as a precursor of various biological components such as glycine, nucleotide, glutathione and sphingolipids. We have investigated the physiological role for de novo Ser synthesis using mice and fibroblasts deficient in Phgdh. Our in vivo study revealed that the targeted disruption of Phgdh resulted in embryonic lethality associated with overall growth retardation, indicating that de novo Ser synthesis via the phosphorylated pathway is indispensable for embryonic growth and survival.

Methods: In the present study, to clarify the physiological significance of de novo Ser synthesis in liver, we generated the liver hepatocyte-specific Phgdh KO (LKO) mice using albumin-Cre transgene.

Results: LKO mice were born normally and fertile. Although the expression levels of Phgdh mRNA and protein were reduced significantly in the liver, free Ser level was not decreased in the liver and serum compared to those of Floxed control mice. On the other hand, in the kidney and muscle, free Ser level were raised significantly in LKO, which was associated with increased expression of Phgdh.

These observations suggest that the loss of Phgdh in the hepatocytes was compensated by activating the synthesis of Ser in the kidney and muscle. In addition, the body weight of LKO mice were significantly increased compared to control after 23 weeks old. Further, the systemic glucose metabolism was impaired in LKO mice.

Conclusions: These findings suggested that the Phgdh-dependent de novo Ser synthesis in the liver contributes to the maintenance of systemic glucose and energy metabolism. The underlying molecular mechanism is currently under investigation.

MATERNAL SUPPLEMENTATION OF AMINO ACIDS FOR BEST FETAL OUTCOMES

[1]*Nair, Sirimavo;* [2]*Banerjee, Reshmi;* [3]*Rodrigues, Anusha.*

[1]Associate Professor; [2]Gynaecologist. Kashiba-Govardhan Bhai Patel Trust hospital. Karelibaug. Vadodara. India; [3]Masters student. Dept. Of Foods and Nutrition. The M.S. University of Baroda. Vadodara. India.

Background and objectives: Background-India has the highest number of children with birth defects. Congenital anomalies affect approximately 2-3 per 100 children across the world. In India, 1 in 33 infants are born with birth defects resulting in approximately 3.2 million birth defect-related disabilities every year (Various data bases). Supplementing nutrients to observe the long term effects helps to look at fetal growth in progress during pregnancy and thereby role of Nutrigenomics.

Objective of the study was to observe the impact of supplementation of amino acids 8-10grams a day to meet 1/3rd RDA, to the deficient mothers and observe the changes occurring biochemically. Mass spectroscopy was carried out for assessments.

Methods: Mass Spectroscopy- Amino acid profiles, Acyl transporters, Carnitine transporters

Results: Results revealed 27% mothers had IUGR, 37% had Anemia and 17% were at risk of pre-term deliveries; on US scan 14% babies had low fetal heart rate. The various amino acids and transport systems, Acylcarnitines were quantified from the blood samples obtained from the mother by Mass spectroscopy showed a prevalence of both amino acid and acyl-carnitine deficiency in the mothers with 43.33% of the pregnant mothers were deficient with amino acid profiles, 40% of the mothers were deficient in the various markers of the acyl-carnitine panel; 16.66% of the mothers were deficient in both amino acids and acyl-carnitine panel

Conclusions: Conclusion-The affected pathways may cause physiological disturbances in the body of the mother and hence also will influence the fetal growth. Moreover the child is also at risk of inheriting the defect and it may be expressed in its phenotype. It was indicative of the prevalence of some defect in the enzyme or other transport proteins; hence supplementation of amino acids may lead to some rectification at the gene level which could help the child to lead a quality life free of disease.

ASSOCIATION OF FTO AND APELIN GENE EXPRESSION WITH DIETARY GLYCEMIC INDEX AND GLYCEMIC LOAD AMONG MORBID OBESE AND NON-OBESE SUBJECTS

[1]Safarian, Mohammad; [2]Yuzbashian, Emad; [3]Zarkesh, Maryam; [4]Asghari, Golaleh; [4]Mirmiran, Parvin; [4]Hedayati, Mehdi; [2]Mahmoodi, Behnaz.

[1]Biochemistry of Nutrition Research Center. School of Medicine, Mashhad University of Medical Sciences , Mashhad , Iran.; [2]MSc. Nutrition and Endocrine Research Center. Research Institute for Endocrine Sciences. Shahid Beheshti University of Medical Sciences. Tehran. Iran.; [3]PhD. Cellular and Molecular Endocrine Research Center. Research Institute for Endocrine Sciences. Shahid Beheshti University of Medical Sciences. Tehran. Iran; [4]PhD. Nutrition and Endocrine Research Center. Research Institute for Endocrine Sciences. Shahid Beheshti University of Medical Sciences. Tehran. Iran.

Background and objectives: To investigate the association between the apelin and FTO gene expression in adipose tissue and dietary glycemic index (GI) and glycemic load (GL) among non-diabetic morbid obese and non-obese subjects.

Methods: Visceral and subcutaneous adipose tissues were obtained from 32 morbidly obese and 32 age- and sex-matched non-obese subjects, who underwent open abdominal surgery. All of the subjects are free of diabetes and cancers and without using anti-lipid medication. Usual dietary intake during the previous year was measured using a validated semi-quantitative food frequency questionnaire. Dietary GI and GL were calculated using International Tables of Glycemic Index and Glycemic Load Values (2008). The gene expressions of apelin and FTO in visceral and subcutaneous adipose tissue were assessed by Real-Time PCR.

Results: The mean age was 39.6 years for both groups and body mass index for morbidly obese and non-obese subjects was 45.3 and 25.6 kg/m2, respectively. Apelin gene expression in visceral adipose tissue was correlated with dietary GI (r=0.455, P=0.009) and GL (r= 0.445, P=0.011) among non-obese subjects and, with GL (r= 0.351, P=0.049) among morbid obese subjects. Apelin gene expression in subcutaneous adipose tissue was correlated with GI among morbid obese(r= 0.395, P=0.025) and non-obese (r= 0.571, P=0.001) subjects. Moreover, we found significant correlations between apelin concentration and dietary GI among morbid obese (r=0.388, P=0.028) and non-obese (r=0.566, P=0.001) subjects. In addition, a positive correlation was observed between dietary GL and apelin concentration among non-obese subjects (r= 0.420, P=0.026). There were no significant findings between FTO gene expression and dietary GI and GL.

Conclusions: It seems that the apelin concentration and mRNA expression have positive correlation with dietary GL and GI among morbid obese and non-obese subjects; suggesting an important role for insulin pathways in the regulation of apelin expression.

Keywords: apelin; FTO; gene expression; glycemic index; glycemic load

DISTINCTIVE EFFECTS OF ISOCALORIC DIETS WITH DIFFERENT CARBOHYDRATE TO FAT RATIO ON PHENOTYPIC FLEXIBILITY: A RANDOMIZED, CROSSOVER STUDY

[1]Zanzer, Yoghatama Cindya; [2]Kalafati, Mirella; [1]Batista, Ângela; [3]Eijssen, Lars; [4]Steinbusch-Coort, Susan; [5]Evelo, Chris; [6]Östman, Elin.

[1]MSc. PhD candidate. Food for Health Science Centre. Lund University. Sweden.; [2]MSc. PhD candidate. Department of Bioinformatics. Maastricht University. The Netherlands.; [3]PhD. MD. Assistant Professor. Department of Bioinformatics. Maastricht University. The Netherlands.; [4]PhD. Assistant Professor. Department of Bioinformatics. Maastricht University. The Netherlands.; [5]PhD. Professor. Department of Bioinformatics. Maastricht University. The Netherlands.; [6]PhD. Associate Professor. Food for Health Science Centre. Lund University. Sweden.

Background and objectives: Acute and long term consumption of either high fat or high carbohydrate diet has several consequences on general metabolic disturbances (Silva FM et al. 2015; Qian F et al. 2016). Well-orchestrated physiological machinery maintains organisms' homeostasis which able to adapt continuously changing environment in which food and lifestyle play a major role. However, this so called 'phenotypic flexibility' has limited capacity and will shift soon towards 'phenotypic inflexibility' as the chronic stress condition present (van Ommen B et al. 2014). In the present study we aimed to investigate distinctive effects of breakfast with distinct carbohydrate and fat proportion on phenotypic flexibility indicated by genes and pathways involved in acute intervention.

Methods: This study was a randomized, single-blind, placebo-controlled crossover study. Twelve subjects (5 males and 7 females) aged 26.5±1.06 years with BMI: 23.79±0.63 kg/m^2 years fall in inclusion criteria were admitted to the study. Blood samples for peripheral blood mononuclear cells (PBMC's) isolation were collected at 0 and 4h after breakfast challenge. Illumina Human-HT-12 v4 Expression BeadChip Kit microarray was used for gene expression and data were processed for downstream analysis using R Bioconductor. Pathways analysis was conducted using PathVisio.

Results: After annotation, normalization and data filtering, amount of 106 (P<0.001), 482 (P<0.01) and 1668 (P<0.05) genes in PBMC's were significantly regulated in medium fat challenge (4h vs 0h). On the other hand, high fat challenge (4h vs 0h) resulted in modulation of 73 (P<0.001), 340 (P<0.01) and 1272 (P<0.05) genes postprandially.

Conclusions: We concluded that an acute high fat or carbohydrate breakfast challenge affects 'phenotypic flexibility' as indicated by involvements of some pathways such as inflammatory and fat metabolism pathways.

Keywords: PBMC's. high and medium fat breakfast. phenotypic flexibility. pathways analysis.

A RETROSPECTIVE OBSERVATIONAL STUDY OF MAXIMAL ENTERAL NUTRITION RATES IN A BURN PATIENT POPULATION

[1]Mitchell, Stephanie L.; [2]Shields, Beth; [3]Senne-Duff, Beth; [4]Sweet, Ralph; [5]Aden, James; [6]Chung, Kevin K.; [3]Bonilla, Joseph.

[1]MS. RD. LD. Adjunct Faculty. Nutrition. University of the Incarnate Word. United States; [2]MS. RD. LD. CNSC. Clinical Dietitian. United States Army Institute of Surgical Research. United States.; [3]PhD. RD. Faculty. Nutrition. University of the Incarnate Word. United States; [4]RN. Data Collection. United States Army Institute of Surgical Research. United States.; [5]PhD. Statistics. United States Army Institute of Surgical Research. United States.; [6]MD. Critical Care. United States Army Institute of Surgical Research. United States.

Background and objectives: The objective of this retrospective observational study was to establish if there was a maximum enteral feeding flow rate (MAX) that burn patients could tolerate in order to meet caloric needs during the time enteral nutrition (EN) is provided, working around frequent interruptions in EN. This study examined the hourly MAX rate received by each subject and evaluated outcomes and tolerance in an effort to determine if there is a threshold for the MAX rate. Demographics, treatment, and outcomes data were collected during the MAX rate that each subject received and were analyzed with descriptive and comparative statistics. The gastrointestinal (GI) intolerance data examined included emesis, residuals ≥500 mL, aspiration, ≥1L stool output in 24 hours, and necrotic bowel during or after MAX rate. IRB approval was obtained.

Methods: This study was conducted on an adult population admitted to a major burn center during a three year period who received EN and had ≥20% total body surface area (TBSA) burned requiring excision.

Results: Data were collected on 151 subjects with 48% ± 18% TBSA burn who were 33 ± 14 years old and met the inclusion criteria. The average MAX rate ordered and received was 154 ± 45 mL/hr. The factors that predicted mortality in this study were burn size

(p = <0.001), age (p = < .001), and the total number of GI intolerance symptoms per subject during the MAX rate (p = .011). The MAX rate had a weak correlation with mortality and with any individual type of GI intolerance (all R2 <.05). MAX rate also had a poor correlation with the total number of GI intolerance symptoms per subject during MAX rate (R2 = .01).

Conclusions: The total number of GI intolerance symptoms experienced per subject was a predictor of mortality, but the MAX rate was not associated with increased GI intolerance symptoms. The highest MAX rate without experiencing any GI intolerance symptoms was 255 mL/hr, however, there was no strong correlation between increase in MAX rate and incidence of negative outcomes, therefore a definitive MAX rate was not established.

Keywords: Enteral nutrition, burn, enteral intolerance, enteral rate

DIFFERENCE BETWEEN "VISCOSITY IN PHYSICS" AND VISCOSITY USED IN FOOD PROPERTIES OF INTESTINAL CONTENTS

[1]Takahashi, Toru; [2]Udagawa, Koko; [3]Horiuchi, Rie; [4]Tokunaga, Miki.

[1]Ph.D.. Graduate School of Human Environment Science. Fukuoka Women's University. Japan; [2]Ph.D.. Faculty of Family and Consumer Sciences. Kamakura Women's University. Japan; [3]Ph.D.. Faculty of Human Environmental Sciences. Mukogawa Women's University. Japan; [4]M.Sc.. Faculty of Health & Social Work. Kanagawa University of Human Services. Japan.

Background and objectives: Properties of viscosity of intestinal contents in pigs, chicken and rats were similar to those of fresh concrete (Takahashi et al Nutrition 2004). Properties of viscosity of fresh concrete have been studied in physics for long time, and would be one of a good example for understanding "viscosity in physics". Textbooks of physics said that main modulators of viscosity in fresh concrete are sand and stone. "Viscosity in physics" is defined as a fluid's internal resistance to flow. Sand and stone increase resistance against flow and increase "viscosity in physics" of fresh concrete. However, sand and stone don't increase viscosity used in food properties because of no sticky property. Thus, there should be differences between "viscosity in physics" and viscosity used in food properties. The present study shows differences of "viscosity in physics" and viscosity used in food properties using intestinal contents of animals. We also discussed applications of "viscosity in physics" in the intestine to understand physiology of intestine.

Methods: Viscosities of small intestinal and/or cecal contents with solid particles in rats, pig, and chicken were measured for "viscosity in physics". Viscosity of supernatant of cecal contents was measured for viscosity used in food properties.

Results: Range of "viscosity in physics" of small intestinal and cecal contents in rats, pig, and chicken was between 1 and 200 pa·s at a shear rate of 1s-1. Viscosity used in food properties of pig cecal contents (0.0015 pa·s) was 800 times smaller than "viscosity in physics" of pig cecal contents at 1 s-1. Thus, "viscosity in physics" would differ from viscosity used in food properties. "Viscosity in physics" can simulate flow behavior in intestine when contractions occur, and show behavior of nutrients in the lumen of the intestine, because of existence of equations, laws and theorems in physics.

Conclusions: "Viscosity in physics" can explain some phenomena in physiology in the intestine. However, viscosity used in food properties cannot translate to term of physics. Thus, viscosity used in food properties would not explain phenomena in intestine using equations, laws and theorems in physics.

Keywords: "viscosity in physics", digesta, intestine, animals

THE BODY COMPOSITION AND FAT DISTRIBUTION EFFECT ON BODY MINERAL DENSITY AND BONE METABOLISM BIOMARKERS OF PERIMENOPAUSAL WOMEN. PILOT STUDY

[1]Czlapka-Matyasik, Magdalena; [2]Przeorska, Dorota; [3]Marszalek, Andrzej.

[1]Poznan University of Life Sciences; [2]Msc. Food Technologist. Department of Human Nutrition and Hygiene. Poznan University of Life Sciences. Poland; [3]Ph.D MD. Synevo Sp. z o.o. Poland.

Background and objectives: Introduction: Bone turnover markers (BTMs) are widely used for the management of osteoporosis, and the perimenopausal women are the group where bone and fat metabolism (FM) is changing. Information about mutual relationship between BTM and FM is limited.

Objectives: The aim of this study was to asses relation between body mineral density (BMD), BTMs, fat percentage (FM%) and fat distribution in the group of perimenopausal women.

Methods: Method/Design: The study involved 52 women aged 47-56 years, BMI 24,2 kg/m2. BMD, Serum 25(OH)D3, bone turnover markers sP1NP, BcrossLabs sCTX and body composition, fat distribution included VAT (visceral adipose tissue) were examined. Biochemical markers were tested using routine laboratory methods. Fat mass, and bone mineral density were evaluated with dual-energy X-ray absorptiometry.

Results: Healthy, normal weight (BMI 24,2kg/m2; FM%: 37,7%) perimenopausal women were characterized by low serum 25(OH)D3 (28.19 ng/ml ± 7,21), normal bone mineralization (1,14 g/cm3 ± 0,10). T-score: 0,60 (-1,44 to 2,87), Z-score: 0,83 (-1,13 to 2,38). 6% of women presented T-score < -1.Level of the bone resorption marker β-CTX in the studied group was 0,190 ng/ml. We found correlation between sP1NP and VAT (r=-0,28; p<0,05). Additionally 5% presented sP1NP values <27,7 ng/ml.

Conclusions: Conclusion: Regular monitoring of bone markers included body fat distribution seems to be necessary in these patients and the early introduction of preventive strategies should be evaluated. Diet related behaviours should be analyzed in further studies.

THE "COST" OF COSTING NUTRITION INTERVENTIONS: A CASE STUDY IN RURAL UGANDA

[1]Richardson, Belinda; [2]Vosti, Stephen; [1]D'Agostino, Alexis; [1]Namaste, Sorrel.

[1]John Snow Research and Training Institute. USA; [2]University of California, Davis. USA

Background and objectives: While the importance of costing nutrition interventions is recognized for budgetary and planning purposes at both programmatic and national levels, resources allocation poses a challenge to organizations wanting to allocate resources to cost their programs. This micronutrient powder (MNP) cost study in Uganda highlights two key challenges and presents modifications to the cost data collection where the research methodology was scaled back due to resource constraints. We use various programmatic elements of this costing study as a guide to construct both ideal and minimum data collection scenarios for some key cost components and give corresponding resource estimates for each.

Methods: Using the Activity-Based Costing methodology (ABC), we conducted a total cost and cost-effectiveness study comparing two distinct MNP distribution arms in Namutumba, Uganda. To collect direct cost data on the prices and quantities of all inputs into the MNP intervention, program staff filled in spreadsheets on program activity costs corresponding to the activities for which they were responsible. Indirect costs were captured through a series of time allocation surveys with various stakeholders involved in MNP distribution.

Results: The time-consuming collection of time allocation data proved a challenge to data quality. Ideal time-and-motion studies were scaled back to individual and group interviews by two part time enumerators, striking a balance between maintaining sample size and limiting measurement error. Program staff should collect program activity cost data as activities are being carried out, to avoid errors due to long recall periods and incomplete records. The tradeoff here is managing resources to infer some smaller costs and spend more resources accurately measuring big cost drivers.

Conclusions: Cost studies, while expensive to conduct, are vital contributions to the process of translating research into evidence-based policy. The tradeoffs provided in this case study provide some pitfalls to avoid when costing nutritional interventions while remaining compatible with the larger initiative to standardize costing across programs and sectors. For programs that undertake cost studies for nutritional interventions with limited resources, identification of the big program cost drivers and the big cost study costs, will help in adjusting the scope and level of detail of a costing study.

SLEEP, ANXIETY AND MOOD PROFILE BEFORE A MILITARY PHYSICAL APTITUDE TEST

[1]Juzwiak, Claudia; [2]Daniel, Natalia; [3]Zimberg, Ioná; [3]Padovani, Ricardo; [3]Estadella, Debora.

[1]PhD. Departamento de Ciências do Movimento Humano. Universidade Federal de Sao Paulo. Brazil.; [2]MS. Universidade Federal de Sao Paulo. Brazil; [3]PhD. Universidade Federal de Sao Paulo. Brazil.

Background and objectives: Reduced sleep duration or impaired sleep quality are common conditions before important sport events and precompetitive anxiety is one of the main factors which affect sleep. The aim of this study was to assess sleep, anxiety and mood profile of military personnel before a Physical Aptitude Test (PAT), which evaluates whether physical performance is reached and/or maintained for purposes of fitness sufficiency assessment, and the score is considered for the military career.

Methods: Ten males, 31.4(8.3) years old, physically active, serving the Brazilian Army completed a sleep diary for six pre-PAT nights (N1 to N6), where N1-N5 were called "pre-PAT week"-PPW, and N6 "pre-PAT night"-PPN. The Sleep Quality Index of Pittsburgh-PSQI assessed their usual sleep quality on PPW. To analyze anxiety and mood, subjects answered the Brunel Mood Scale, and the short versions of the Competitive State Anxiety Inventory-CSAI-2R, and of the State-Trait Anxiety Inventory on PPN. To assess sleepiness, they answered the Epworth Sleepiness Scale on PAT morning.

Results: On the PPN participants presented state-anxiety of 11.8(2.7) and trait-anxiety of 14.9(2.7). The CSAI-2R mean scores were: self-confidence: 2.5(0.7), cognitive anxiety: 1.6(0.6), and somatic anxiety: 2.0(0.9). As for mood, vigor was the higher score factor [8.2(3.7)], but individuals presented heterogeneous results. Sleep quality was low (mean PSQI 6.5). On PAT morning, subjects showed low levels of anxiety and did not present daytime sleepiness [7.4(3.8)]. Mean PPW sleep duration was significantly different from PPN: 6.6(0.7)h and 5.4(1.2)h, respectively (p=0.01) with no significant difference in subjective sleep quality [PPW: 6.3(1.4); PPN: 5.5(2.1), p=0.09] or number of awakenings [PPW: 0.8(1.6); PPN: 0.8(1.2), p=0.9]. Most subjects slept later on PPN or woke up earlier on PAT morning.

Conclusions: Both during PPW and PPN volunteers slept less than recommended (7-9h) for individuals with the same age range. Although PPN sleep duration was lower than PPW, the low score suggests that anxiety was not the cause. The levels of anxiety and mood indicated good self-control. Sleep duration was affected by PAT, but not subjective sleep quality or number of awakenings.

Keywords: sleep, anxiety, military

DETERMINATION OF FACTORS RELATED TO MALNUTRITION IN PRE-SURGICAL ONCOLOGICAL PATIENTS

[1]Markmann, Carlos Alberto; [2]Croxatto, Maria Eugenia; [3]Dufau, Lucrecia; [3]Lavigna, Elisa.

[1]PhD. Doctor. Hospital Marie Curie. Argentina.; [2]MD. Hospital Marie Curie. Argentina.; [3]Nutritionist. Hospital Marie Curie. Argentina.

Background and objectives: During 2012 there were 14.1 million new cases of cancer, 8.2 million cancer deaths and 32.6 million people living with this type of disease. Malnutrition is the most common secondary diagnosis in cancer patients, with an incidence between 15-40% at the time of diagnosis and 80% in advanced disease; being one of the main causes of morbi-mortality.

To determine the alteration of malnutrition related factors in pre-surgical cancer patients.

Methods: Descriptive, transversal. By direct questionnaire and pre-surgical Nutrition Assessment sheets of patients who consulted from January 2015 to August 2016, where data on age, sex, cancer location, weight, percentage of weight loss were evaluated. Biochemical determinations were analyzed, being these Albumin (g / dl), Lymphocytes/mm3, Total cholesterol (mg / dl) and Hemoglobin (g / dl). The Malnutrition´s Degree Assessment by CONUT method was used to diagnose malnutrition.

Results: The total sample was 589 patients, of which 291 presented alteration related to malnutrition (49.4%), being 86.3% (n = 251) of the female sex, and 13.7% (n = 40) male; ages ranging from 18 to 90 years (mean 52.07 years). Cancer location, endometrial or cervical 45.7% (n = 133), 27.1% breast (n = 79), head and neck 8.9% (n = 26), 5.5% ovary (n = 16), 4.8% gastrointestinal tract (n = 14), remaining 7.9% (n = 29) to other cancers. According to the Malnutrition´s Degree Assessment by CONUT method, 68.4% (n = 403) showed no malnutrition, 30.2% had mild malnutrition (n = 178) and 1.3% (n = 8) moderate malnutrition. No patient presented severe malnutrition. Regarding weight loss in the last 6 months, values ranged from 1.5% to 27%, with an average value of 8.74%.

Conclusions: Malnutrition was observed in more than 30% of the patients in the pre-surgical evaluation, predisposing to an increased risk of complications and being the major cause of morbidity and mortality in advanced cancer. An assessment of nutritional status will play a fundamental role in the pathogenesis of malnutrition risk in order to establish nutritional support strategies.

Background and objectives: Osteoarthritis is a common joint disease for which there are currently no disease-modifying drugs available. Osteoarthritis (OA) affects most of the elderly population, the main features of which are cartilage damage. Degradation of the cartilage extracellular matrix is a central feature of the disease and is widely thought to be mediated by proteinases that degrade structural components of the matrix, The matrix metalloproteinases (MMPs) are a family of 23 human zinc endopeptidases that play significant roles in inflammatory diseases such az osteoarthritis.

Methods: In this experiential laboratory study. punicic acid of pomegranate seed oil was purchased from Clarodan Kerman Co, representative of LCG Co. in Iran. K562 cells (Pasteur Institute of Iran) were cultured and were administered with densities of 8 to 100 μg/ml (in 24h, 48h, and 72h). Cellular toxicity of punicic acid against K562 leukemic cells was estimated using the MTT Method, and to measure the inhibitory effects of PA on Matrix metalloproteinase proteinase activity, ELISA and Western blot, migration and invasion was performed. Data were analyzed with using T.student and ANOVA.

Results: Western blotting and ELISA were showed inhibitory effect on the expression of MMP-1 but not in MMP-3. Punicic acid of pomegranate seed oil shows the most cellular toxicity effect at lc50=50 micrograms per milliliters and 72 hours after treatment.

Conclusions: According to effect of Punicic Acid on MMP-1 expression, this material can be used as a potential candidate for further studies on the other MMPS and its replacing the chemical drugs.

Keywords: Punicic Acid, MMP-1, 3, K562, Osteoarthritis

Background and objectives: Changes in the nutritional condition of the elderly may be related to the aging process and / or pathological processes. With regard to the psychological aspect of this elderly person, the manifestation of neuropsychiatric disorders may also impair good nutrition. The fact that some also present underlying diseases reinforces the need for supply and nutrient balance, which can be found in foods of native cooking. Objective: to investigate the action of the Amazon diet during the period of home care for the elderly using psychotropic drugs.

Methods: It is an observational study in loco, to determine the effect of the food intake of the Amazonian diet on the improvement of signs and symptoms of adverse reactions to the use of psychotropics, by the elderly, with moderate and high risk for fragility.

Results: Some of the foods in the Amazon diet have natural compounds that may have activity in the fight against cardiometabolic diseases, chronic non-transmissible diseases, due to its antioxidant, anti-inflammatory, cholesterol-lowering, polyphenol-rich properties. The elderly, accompanied by the Pilot Health at Home Project and who presented neuropsychiatric disorders, were cared for by a multiprofessional team and oriented to the Amazonian diet, according to the categorization of Ribeiro and Cruz (2012) in fruits, flours and fish, and Its effects on health, quality of life, optimal amount of nutrient intake. It was verified that the elderly who started to insert in their daily food the native cuisine, have reported improvement of the symptoms related to the adverse effects of the administered psychotropics. The nutritional evaluation by

the health professionals of the team also showed improvement of nutritional standards, lipid profile, glucose, blood pressure, and self-esteem improvement.

Conclusions: Nutrition for the elderly population needs to be carefully discussed by the health team, especially when these elderly people use psychotropic drugs that are almost always associated with other medications. In view of the diversity and peculiarity of food in the Amazon region, the study also reveals the importance of the health team in the region to be bringing this information to the population and carrying out actions aimed at native nutritional education.

Keywords: Amazon diet; psychotropic drugs; elderly

Background and objectives: The inverse association between total dairy and milk consumption and the risk of developing colorectal cancer (CRC) has been previously reported in several prospective studies. Nonetheless, evidences regarding to dairy subtypes are scarce and inconsistent.

The objective was to assess the associations between total dairy and different dairy subtype consumption and the risk of developing CRC in a Mediterranean population at high cardiovascular risk.

Methods: We prospectively analyzed data from 7216 men and women (aged 55-80 y) without CRC at baseline from the PREvención con DIeta MEDiterránea (PREDIMED) study. Individuals were recruited between October 2003 and June 2009, and the intervention lasted until December 2010. However, the present analysis was based on an expanded follow-up until 2012. At baseline and yearly thereafter, total and specific dairy subtypes were repeatedly measured by using a 137-item validated food-frequency questionnaire. Time-dependent Cox proportional hazards models were conducted.

Results: During a median [inter-quartile range] follow-up of 6.4 [5.0-7.7] years, we documented and confirmed 101 incident cases of CRC. In the multivariable-adjusted model, HRs (95% CI) of CRC for the comparison of extreme tertiles of dairy product consumption were 0.50 (0.29-0.89) for total dairy consumption, 0.53 (0.31-0.89) for low-fat dairy, 0.52 (0.31-0.89) for total milk and 0.47 (0.27-0.83) for low-fat milk. No significant associations were found with other dairy subtype consumption.

Conclusions: The higher consumption of total dairy, low-fat dairy, total milk and low-fat milk was significantly associated with a reduced risk to develop CRC in Mediterranean individuals at high cardiovascular risk. The trial was registered at controlled-trials.com as ISRCTN35739639

FERMENTED DAIRY, DIET QUALITY DIET AND AND CARDIO-METABOLIC PROFILE IN A MEDITERRANEAN COHORT AT HIGH CARDIOVASCULAR RISK (CVR)

[1]Mena-Sánchez, Guillermo; [1]Mena-Sánchez, Guillermo; [2]Babio Sánchez, Nancy Elvira.

[1]PhD. Nutritionist. Human Nutrition Unit. Department of Biochemistry & Biotechnology. School of Medicine. Rovira i Virgili University. Reus, Spain.; [2]Doctor. Nutritionist.Human Nutrition Unit. Department of Biochemistry & Biotechnology. School of Medicine. Rovira i Virgili University. Reus, Spain.

Background and objectives: Fermented dairy products, such as yoghurt and cheese are usually consumed in Mediterranean diet. Their consumption has been associated with a better diet quality and a healthier metabolic profile in healthy adults. However, the relative contributions of fermented dairy products concerning diet quality and the prevalence of metabolic syndrome (MetS) components have not been yet fully studied in a Mediterranean population at high CVR.

Objective: To determine the association between fermented dairy product intake, quality diet profile and the prevalence of MetS components in a Mediterranean population at high CVR.

Methods: Cross-sectional analyses were performed on baseline data from 4,230 Spanish adults (aged 55-75y in men; 60-75y in women) with overweight/obesity and MetS, from October 2013 to October 2016, in the PREDIMED-PLUS trial. Multivariable-adjusted Cox regressions with robust variance and constant time (given the cross-sectional design) were fitted. The highest vs. the lowest quartiles (as reference category) of total fermented dairy products consumption, yogurt and cheese were compared.

Results: Comparing the highest and the lowest of fermented dairy products showed a better quality of diet. The highest consumers scored higher in the 17-point Mediterranean Diet Adherence Questionnaire and also they reported more consumption of fruit, vegetables, fish, nuts but less alcohol, cereals, cookies. Highest vs. lowest consumers of fermented dairy products showed higher HDL-cholesterol, lower plasma triglycerides concentrations and lower systolic and diastolic blood pressure.

Comparing the highest vs. reference quartile, the total fermented dairy, total yogurt and low-fat yogurt consumption were associated with 8% [0.92(95%CI: 0.88-0.97); P-trend <0.001], 7% [0.93(95%CI: 0.87-0.98); P-trend= 0.001] and 8% [0.92(95%CI: 0.87-0.96); P-trend = 0.002] lower risk of high blood pressure, respectively. Total fermented dairy and cheese were associated with 13% [0.87(95% CI 0.76-0.98); P-trend = 0.009] and 8% [0.82(95% CI 0.73-0.92); P-trend <0.001] lower risk of hypertriglyceridemia. Individuals allocated of the highest quartile of cheese consumption were associated with 13% lower risk of low HDL-cholesterol prevalence [0.87 (95% CI 0.78-0.97); P-trend = 0.017].

Conclusions: In the context of a Mediterranean diet, fermented dairy products were inversely associated with some of the MetS components and a better quality diet in individuals at CVR.

Keywords: Fermented dairy, yogurt, cheese, metabolic syndrome, quality diet.

Background and objectives: NAIP (NLR family apoptosis inhibitory protein) belongs to the IAP (Inhibitor of Apoptosis Protein) and NLR (NOD-Like Receptor protein) families. As a receptor of pathogen/damaged associated molecular patterns (PAMPs/DAMPs), NAIP is involved in the innate immune response, and is also a fundamental component of the NLRC4 inflammasome. As such, NAIP participates in caspase-1 activation leading to inflammatory cytokine secretion. Recently, our research group has reported the implication of NAIP in cell proliferation. The aim of this study was to analyze NAIP expression in the hepatic regenerative process.

Methods: Eight female Wistar rats weighing 260 g were used. The major liver lobe of the rats was removed. Hepatectomized rats were sacrificed 3 days (n=4) and 7 days (n=4) after surgery, and pieces from both regenerated and healthy liver were taken. Total RNA and proteins were extracted and analyzed by qRT-PCR and western blotting, respectively.

Results: NAIP mRNA showed a 3-fold increase at day 3 after hepatectomy, and a 2-fold increase at day 7 after hepatectomy. NAIP protein levels exhibited a 2-fold higher expression in the re-

generating liver lobe compared with the intact lobe from the same animal 3 days after hepatectomy.

Conclusions: This study shows the implication of NAIP in liver regeneration. Further studies are needed to elucidate the role of NAIP in both cell cycle progression and liver regeneration.

Keywords: NAIP, liver, hepatectomy

Laboratory Service. Dr. Felipe A. Fossati Balcarce Hospital. Balcarce. Buenos Aires. Argentina; [5]MD. Laboratory Service. Dr. Felipe A. Fossati Balcarce Hospital. Balcarce. Buenos Aires. Argentina; [6]PhD. Lipids and Atherosclerosis Laboratory. Institute of Pathophysiology and Clinical Biochemistry (INFIBIOC). Department of Clinical Biochemistry. Faculty of Pharmacy and Biochemistry. University of Buenos Aires. Argentina.

Background and objectives: Paraoxonase 1 (PON1) is a glycoprotein enzyme which is mainly carried by high density lipoproteins (HDL) in plasma. This enzyme has been proposed as one of the major contributors to HDL antioxidant activity. Its functionality is highly dependent on apolipoprotein (apo) A-I-mediated stabilization within the HDL particle. A previous study by our group showed a decrease in PON1 antioxidant capacity in hypertriglyceridemia. CETP is a plasma protein responsible for the exchange of cholesteryl-esters and triglycerides (TG) between HDL and apo B-containing lipoproteins, usually resulting in an increase in HDL TG content. Furthermore, TG enrichment of HDL has been shown to lead to particle remodeling and even loss of apo A-I.

Objective: To evaluate the effect of CETP activity on PON1 status.

Methods: 150 children between 7 and 14 years old were recruited from the city of Balcarce, Argentina. Anthropometric parameters were registered and body mass index was calculated (BMI). Glucose levels and lipid profile were evaluated by automatized methods. PON1 was measured employing paraoxon (PON activity) and phenylacetate (ARE activity) as substrates, given that PON activity better reflects the intrinsic antioxidant activity and ARE activity better correlates with the enzymatic concentration. CETP activity was quantified by a radiometric assay.

Results: The population as a whole was normoglycemic, normotryliceridemic and normocholesterolemic. In univariate association analysis PON1 correlated with ARE activity (r=0.4; p<0.01); ARE correlated with HDL cholesterol (HDL-C) (r=0.23; p<0.01) and total cholesterol (TC) (r=0.19; p<0.05); and CETP correlated with TG (r=0.53; p<0.01), HDL-C (r=-0.45; p<0.01) and TC (0.38; p<0.01). In multiple linear regression analysis adjusted by age, BMI-z and plasma TG levels, CETP remained as the only factor significantly associated with PON1 activity (beta=-0.19; p<0.05), whilst HDL-C (beta=0.34; p<0.01) was the only parameter associated with ARE activity.

Conclusions: CETP activity, and consequent HDL triglyceride enrichment, would lead to altered PON antioxidant function, as reflected by CETP negative association with PON activity. This alteration would be mostly independent of PON1 concentration, given the lack of CETP association with ARE activity, which would be in turn mainly dependent on HDL particle number.

APPARENT DISCORDANCE BETWEEN TWO ACTIVITIES OF THE ANTIOXIDANT PARAOXONASE 1 ENZYME AS A RESULT OF CHRONIC EXPOSURE TO HIGH ALTITUDE

[1]Martin, Maximiliano E.; [2]Hirschler, Valeria; [2]Oestreicher, Karina; [3]Botta, Eliana Elizabeth; [4]Molinari, Claudia; [5]Tetzlaff, Walter Francisco; [6]Boero, Laura; [6]Brites, Fernando D.

[1]Bsc. Lipids and Atherosclerosis Laboratory. Institute of Pathophysiology and Clinical Biochemistry (INFIBIOC). Department of Clinical Biochemistry. Faculty of Pharmacy and Biochemistry. University of Buenos Aires. Argentina; [2]MD. University of Buenos Aires. Buenos Aires. Argentina; [3]Bsc. Laboratory of Lipids and Atherosclerosis. Department of Clinical Biochemistry. School of Pharmacy and Biochemistry. University of Buenos Aires. CONICET. Buenos Aires. Argentina.; [4]BsC. University of Buenos Aires. Argentina.; [5]BsC. Lipids and Atherosclerosis Laboratory. Institute of Pathophysiology and Clinical Biochemistry (INFIBIOC). Department of Clinical Biochemistry. Faculty of Pharmacy and Biochemistry. University of Buenos Aires. Argentina.; [6]PhD. Lipids and Atherosclerosis Laboratory. Institute of Pathophysiology and Clinical Biochemistry (INFIBIOC). Department of Clinical Biochemistry. Faculty of Pharmacy and Biochemistry. University of Buenos Aires. Argentina.

Background and objectives: High altitude exposure has been associated with hypobaric hypoxia and oxidative stress. In individuals who live under those conditions, metabolic and enzymatic alterations could occur. Among high density lipoprotein (HDL) antiatherogenic functions, its antioxidant capacity is mainly attributed to paraoxonase 1 (PON1). This enzyme is in turn susceptible to oxidation which causes an impairment of its

activity. Children living at high altitude in San Antonio de los Cobres (SAC), Argentina, were shown to have lower HDL-cholesterol (HDL-C) levels than children from Buenos Aires (BA) who live at sea level. However, no prior study has analyzed PON 1 status in children exposed to high altitude.

Objective: To compare PON-1 activities in SAC versus BA children.

Methods: A cross-sectional study compared 158 SAC versus 97 BA children (6-16 years). Anthropometric parameters, lipoprotein profile, and PON1 activities were evaluated. PON1 was measured employing paraoxon (PON activity) and phenylacetate (ARE activity) as substrates, given that PON activity better reflects the intrinsic antioxidant activity and ARE activity better correlates with the enzymatic concentration.

Results: The prevalence of overweight/obesity was significantly lower in SAC than in BA children (18.3 vs. 30.9%; p<0.01). Triglycerides (1.34 vs. 0.90 mmol/L; p<0.01), apo B (0.84 vs.0.72 g/L; p<0.01) and apo A-I (1.33 vs. 1.27 g/L; p<0.01) levels were significantly higher, while HDL-C (1.16 vs. 1.32 mmol/L; p<0.01) concentration was significantly lower in SAC than in BA children. PON activity was significantly lower (170 vs. 203 nmol.ml-1. min-1; p<0.05), ARE activity higher (100 vs. 90 µmol.ml-1min-1; p<0.01) and PON/ARE ratio lower (1.7 vs. 2.2; p<0.05) in SAC compared with BA. Separate multiple linear regression analyses showed that all the above mentioned differences persisted even after adjusting for age, gender, and BMI.

Conclusions: SAC children showed an unfavorable lipoprotein profile, except for higher apo A-I levels compared with BA children. Furthermore, they presented lower PON and higher ARE activities. The presence of higher ARE activity and apo A-I concentration in combination with lower PON activity and HDL-C levels would be indicative of unaltered HDL particle number but deficient antioxidant function and capacity to promote cell cholesterol efflux.

Keywords: Paraoxonase 1, HDL, High altitude, Apolipoprotein A-I

ent effect of protein intake on skeletal muscle hypertrophy and the role of circadian rhythm for its effect.

Methods: Six-week-old male ICR and Clock mutant mice were kept under 12h light/dark cycle (Light was turned on at ZT0 and off at ZT12). Mice were fed the 2g meal twice a day at ZT12 (the beginning of active phase) and ZT20 (the end of active phase), which were defined as breakfast and supper, respectively. The overloading of plantaris muscle was induced by unilateral surgical removal of the distal tendon of soleus and gastrocnemius muscles, while contralateral leg was sham-treated on day 7 after twice meals per day schedule. The plantaris muscles were collected on day 14. Study1: Breakfast protein group (Breakfast-P) was fed 20% casein diet at breakfast and 3% casein diet at supper. Even protein group (Even-P) was fed 11.5% casein diet at each meal. Supper protein group (Supper-P) was fed 3% casein diet at breakfast and 20% casein diet at supper. Study2: Breakfast BCAA (Breakfast-B) and supper BCAA (Supper-B) groups were fed the BCAA-containing 3% casein diet (equivalent to BCAA of 20% casein diet) at breakfast and supper, respectively. Study3: Clock mutant mice were kept under the same feeding condition as the study1 and 2.

Results: Study1: The muscle growth rate (Overloading muscle / sham-treated muscle weight) in Breakfast-P was higher than that in Even-P (P=0.09) and Supper-P (P<0.05). Study2: Breakfast-B produced higher growth rate than Supper-B. The greater effect of Breakfast-B was not observed in the intake of other amino acids. Study3: The increases of muscle growth rate in mice fed protein and BCAA at breakfast were not also observed in the clock mutant mice.

Conclusions: These results suggested that protein intake for breakfast accelerated muscle hypertrophy, and BCAA and circadian rhythm were involved in such effects.

RECENT ADVANCES IN FORTIFICATION OF RICE – A REVIEW

[1]Hackl, Laura; [2]Zimmermann, Michael Bruce; [3]Moretti, Diego.

[1]Mag. pharm. Pharmacist/ PhD candidate. Laboratory for Human Nutrition. Institute of Food. Nutrition and Health. ETH Zürich. Zurich. Switzerland.; [2]2 Dr. med. Professor. Laboratory for Human Nutrition. Institute of Food. Nutrition and Health. ETH Zürich. Zurich. Switzerland.; [3]Dr. Senior Scientist. Laboratory for Human Nutrition, Institute of Food. Nutrition and Health. ETH Zürich. Zurich. Switzerland.

Background and objectives: Rice is a staple food for more than half the world's population, however, it is a poor source of micronutrients in its milled form. Iron deficiency (ID) and other micronutrient deficiencies are prevalent in many rice consuming

countries. Rice fortification is one of the remaining frontiers in food fortification and is particularly technically challenging as rice is consumed as intact grains and due to its white color. Iron fortification of rice can be an approach to combat ID in rice-consuming populations. Commonly used techniques for rice fortification are extrusion or coating with iron phosphates as iron source resulting in sensory acceptable fortified rice grains. However, iron bioavailability from those compounds is low. It is thus crucial to identify micronutrient formulations that increase human iron bioavailability while maintaining acceptable sensory properties.

Our objective is to present a narrative overview of the field of rice fortification including recent advances, identify knowledge gaps and research priorities to ensure optimal nutrient composition for rice fortification formulations.

Methods: A systematic review of the literature was conducted by searching public databases such as Pubmed, Web of Science and Scopus for relevant terms. We appraise currently used iron compounds and formulations to increase iron absorption, compare recent findings on iron bioavailability from fortified rice, evaluate fortification techniques regarding the acceptability of the fortified product and their applicability in different settings and suggest directions for further research.

Results: Fortified rice is a suitable vehicle to deliver bioavailable iron, zinc, vitamins B12 and A. Recent studies suggest optimized rice formulations containing iron chelators to substantially increase iron bioavailability, thus owning the potential to counteract ID in rice consuming populations.

Conclusions: The chosen fortification technique can affect nutrient bioavailability likely due to transformations in the starch microstructure. More data are required to further optimize the fortification technology regarding nutrient delivery and bioavailability in humans.

EFFECT OF THE YACON (SMALLANTHUS SONCHIFOLIUS) IN GLYCEMIC PROFILE OF THE WISTAR RATS

[1]Vasconcelos, Debora; [2]Goulart de Souza e Silva, Thaiany; [3]Henrique Costa, Lellis; [4]Aparecida Almeida Paula, Hudsara.

[1]PhD. Student in Biosciences Applied to Health. Nutritionist. Federal University of Alfenas. Brazil.; [2]BSc. Student in Nutrition. College of Nutrition. Federal University of Alfenas. Brazil.; [3]MSc in Pharmaceutical Sciences. Pharmaceutical. Federal University of Alfenas. Brazil.; [4]PhD in Food Science and Technology. Nutritionist. Professor of the College of Nutrition. Federal University of Alfenas. Brazil.

Background and objectives: Yacon is considered a functional food, which has among its properties a hypoglycemic capacity. The aim of this study was to evaluate the modulatory effect of yacon in the glycemic profile of Wistar rats.

Methods: The experiment lasted 60 days with 32 animals. It was used the dehydrated food matrix (yacon powder / YP) added to the diet of the groups that received intervention in the dose of 7.5% of inulin type fructan (ITF). The analyzed variables were: centesimal composition and content of inulin type frutans, weight gain, relative weight of cecum (RWC), food consumption, coefficient of food efficiency and glycemia. All analyzes followed the AOAC protocols. In the statistical analysis, the following tests were used: ANOVA or Kruskal Wallis followed by comparison tests of means, t test and paired t test. The level of statistical significance was $p < 0.05$ for all analyzes. This study was approved by the Ethics Committee on the Use of Animals of the Federal University of Alfenas, protocol no. 698/2015.

Results: The results showed that the control group receiving YP had a significant reduction in glycemic values. In all groups receiving YP there was a significant increase of cecum, as expected. The development of diabetes was not observed due to the use of streptozotocin with 35% sucrose.

Conclusions: Therefore, the evaluation of the effect of yacon on hypoglycaemia has been impaired. This suggests that studies in this line are encouraged for further elucidations.

Keywords: Glycemia, Rats, FOS and Inulin.

COMMUNITY PERCEPTIONS ON THE NEW ROLE OF TRADITIONAL BIRTH ATTENDANTS AS BIRTH COMPANIONS AND NUTRITION ADVOCATES IN KAKAMEGA COUNTY, KENYA: A QUALITATIVE STUDY

[1]Anono, Esther; [2]Ochola, Sophie; [3]Wawire, Salome; [4]Ogada, Irene; [5]Ndedda, Crispin; [6]Kung'u, Jacqueline.

[1]BSc. Researcher. Department of Food Nutrition and dietetics. Kenyatta university.Kenya.; [2]PhD. Senior Lecturer and Chairman. Department of Food, Nutrition and Dietetics. Kenyatta University. Kenya.; [3]PhD. Independent Researcher Medical Anthropology and Demography. Kenya.; [4]PhD. Lecturer. Department of Food, Nutrition and Dietetics. Kenyatta University. Kenya.; [5]MSc. Senior Programme Officer Maternal and New Born. Micronutrient Initiative. Kenya.; [6]PhD. Regional Advisor Research and Evaluation Africa. Micronutrient Initiative. Kenya.

Background and objectives: There is consensus that delivery at health facility assisted by skilled birth attendant is priority for reducing maternal mortality in areas with poor access to health facilities. Traditional Birth Attendants (TBAs) are known to conduct deliveries in such set-ups. One key intervention is the re-orientation of TBAs as birth companions for women to deliver at health facilities. The objective of this study was to explore community perceptions on the new role of TBAs as birth companions and nutrition advocates and their influence on health facility delivery.

Methods: This was qualitative component of an evaluation part of an intervention study whose aim was to reduce maternal mortality through increased health facility delivery. The study was

composed of intervention and control groups. Data was collected in both study groups through Key Informant Interviews with health workers and Focus Group Discussions with lactating and pregnant women, fathers, community leaders, Community Health Volunteers and TBAs. Data was analyzed through content analysis and was organized into sub-themes and conclusions made from each sub-theme using the Atlas ti software.

Results: In the intervention group, the re-oriented TBAs adopted their new role with ease as the majority offered companionship to mothers to deliver at health facilities. This led to increased health facility deliveries as reported by nurses and community members. The mothers and the community members were happy with the new role of the TBAs. They reported that the TBAs accompanied the women to deliver at the health facilities and offered them companionship after delivery. In contrast, TBAs did not adopt the nutrition advocacy role sufficiently. In comparison group majority of the TBAs continued with their traditional roles of delivering women at home. However, few of them were reported to advise mothers to seek skilled help after community sensitization by the health workers.

Conclusions: It is feasible and acceptable to mothers, community and the TBAs to be utilized as birth companions to increase health facility delivery. Nutrition advocacy by the TBAs should be strengthened to maximize on the opportunity provided by the close association between TBAs and mothers and the community.

EFFECT OF THE INGESTION OF VITAMIN K-DEFICIENT DIET ON GLUCOSE METABOLISM IN DIABETIC MODEL MICE

[1]*Shirakawa, Hitoshi;* [2]*Hirahara, Keisuke;* [2]*S, Masayori;* [3]*Giriwono, Puspo E.;* [2]*Katsurai, Tomoko;* [3]*Goto, Tomoko;* [3]*Komai, Michio.*

[1]PhD. Associate Professor. Laboratory of Nutrition. Graduate School of Agricultural Science. Tohoku University. Japan.; [2]MSc. Laboratory of Nutrition. Graduate School of Agricultural Science. Tohoku University. Japan.; [3]PhD. Laboratory of Nutrition. Graduate School of Agricultural Science. Tohoku University. Japan.

Background and objectives: Vitamin K (VK) plays as a co-enzyme for γ-glutamylcarboxylase and regulates blood coagulation system and bone formation via γ-glutamylcarboxylation of VK dependent proteins. VK1 is found in vegetables, and VK2 significantly in fermented-food products and animal meats. Ingested VK is known to be converted to menaquinone-4 (MK-4, a kind of VK2) in several tissues including pancreas and liver. Although this conversion is effectively occurred and the large amount of MK-4 is accumulated in pancreas, the role of MK-4 has not been well elucidated. Epidemiological researches suggested that VK intake correlated with plasma glucose and insulin levels. Here we examined the effect of VK deficient diet on glucose metabolism in genetically diabetic mice.

Methods: Male KK-Ay mice (4 weeks old) were divided into two groups and fed AIN-93G based standard diet (Cont group) or VK free diet (K free group) for 60 days. During the experimental period, their body weight, food intake, and plasma glucose level were measured. We performed oral glucose tolerance test (OGTT) and insulin tolerance test (ITT) on 33rd and 41st day of feeding, respectively. Mice were sacrificed after the experimental period, and their serum and organs were obtained. The VK contents in organs were measured by fluorescent-HPLC and mRNA levels of gene involved glucose metabolism in liver and pancreas were also analyzed by quantitative RT-PCR.

Results: During the experimental period, plasma glucose level was higher in K free group compared to Cont group. Severer glucose intolerance and insufficient insulin secretion were observed in K free group in OGTT. Pancreatic VK level was significantly lower in K free group.

Conclusions: Our results suggested that feeding of VK deficient diet reduces MK-4 content in pancreas and leads to the lowering of glucose-induced insulin secretion in diabetic mice.

VITAMIN K REGULATES THE GENE EXPRESSION OF DRUG-METABOLIZING GENES VIA PXR IN HUMAN COLON CANCER CELLS

[1]*Shirakawa, Hitoshi;* [2]*Sultana, Halima;* [3]*Kato, Ayaka;* [3]*Goto, Tomoko;* [3]*Komai, Michio.*

[1]PhD. Associate Professor. Laboratory of Nutrition. Graduate School of Agricultural Science. Tohoku University. Japan.; [2]MSc. Laboratory of Nutrition. Graduate School of Agricultural Science. Tohoku University. Japan.; [3]PhD. Laboratory of Nutrition. Graduate School of Agricultural Science. Tohoku University. Japan.

Background and objectives: Interaction between foods and drugs may inadvertently reduce or increase the effect of drug. Adverse effects of clinically relevant food-drug interactions are caused by food-induced changes in the bioavailability of the drug. The bioavailability of drug is tightly regulated by xenobiotic/drug metabolism system. The expression of genes involved in xenobiotic/drug metabolism is transcriptionally regulated by pregnane X receptor (PXR). PXR is a ligand-dependent nuclear receptor that functions as a xenobiotic sensor. PXR is activated by a diverse array of pharmaceutical agents and also nutrients. Therefore, our present study focused on vitamin K2 that is known as a PXR ligand, and investigated vitamin K2-drug interaction in cultured human colon cancer cells.

Methods: Human colon adenocarcinoma LS180 cells were treated with menaquinone-4 (MK-4), one of vitamin K2, and rifampicin (Rif), a typical ligand of PXR, and then expression levels of drug-metabolizing genes were measured by qRT-PCR and western blot analysis. The ligand-induced PXR activation was also analyzed with reporter gene assay.

Results: MK-4 significantly upregulated mRNA levels of CYP3A4 and MDR1 in dose- and time-dependent manner. Reporter activity from luciferase construct that has PXR binding element in its promoter was also increased by MK-4 treatment. These enhancements were abolished by PXR-targeted siRNA. These results indicated that MK-4 stimulates mRNA expression of CYP3A4 and MDR1 through PXR. In western blot analysis, MK-4 increased MDR1 protein levels whereas decreased CYP3A4 levels. Cotreatment with MK-4 and Rif showed synergistically enhanced mRNA expression of both genes.

Conclusions: These results suggested that MK-4 modulate drug-metabolizing genes and may cause inadvertent effects of prescribed medicines.

A MACRO AND MICRONUTRIENT FORTIFIED COMPLEMENTARY FOOD SUPPLEMENT ENHANCES PLASMA BRANCHED-CHAIN AMINO ACID LEVELS IN GHANAIAN INFANTS

[1]*Sato, Wataru;* [2]*Furuta, Chie;* [3]*Murakami, Hitoshi;* [4]*Suri, Devika;* [5]*Otoo, Gloria;* [5]*Tano-Debrah, Kwaku;* [6]*Ghosh, Shibani.*

[1]MSc. Institute for Innovation. Ajinomoto Co., Inc. Japan.; [2]DVM. PhD. Institute for Innovation. Ajinomoto Co., Inc. Japan.; [3]PhD. Institute for Innovation. Ajinomoto Co., Inc. Japan.; [4]MSc. MPH. Friedman School of Nutrition Science and Policy. Tufts University. USA.; [5]PhD. Department of Nutrition and Food Science. University of Ghana. Ghana.; [6]PhD. Nevin Scrimshaw International Nutrition Foundation. USA.

Background and objectives: A significant association was reported between stunting and low circulating levels of essential amino acids (AA). The study objectives were to examine the effect of providing a macro-micronutrient fortified complementary food supplement (energy, fat, protein, the essential amino acid lysine and micronutrients) called KOKO Plus on plasma AA in Ghanaian infants under two years of age.

Methods: This is a secondary analysis from a single blind cluster randomized controlled trial conducted in rural Ghana to examine the effect of KOKO Plus on linear growth. Thirty-eight communities (903 infants) were randomly assigned to KOKO Plus with nutrition education (KKP) or a multiple micronutrient powder with nutrition education (MN) or nutrition education only groups (NE) (n=301/group). KKP and MN supplements were delivered weekly with one sachet used daily. Infants were enrolled at 6 months of age and graduated at 18 months of age with blood sampling at 6 (baseline), 12 (midline) and 18 (endline) months. Plasma samples were separated, deproteinized and AA was measured using the ninhydrin method. Mixed models with adjusted for baseline concentration AA and clustering as random effects examined the effect of intervention.

Results: Adjusting for baseline AA, plasma levels of total branched-chain AA (BCAA) were significantly higher at midline and endline in the KKP and NE but not the MN group. Difference in difference between groups were; KKP-MN = 30.3 μM (95% confidence interval (CI) 12.3 to 48.2), p<0.001, NE-MN = 17.9 μM (95% CI -0.1 to 36.0), p=0.052 at midline and KKP-MN = 23.6 μM (95% CI 5.7 to 41.4), p=0.005, NE-MN = 22.4 μM (95% CI 4.5 to 40.4), p=0.009 at endline. Modeling by number of supplements consumed showed increases in plasma BCAA with increase in KKP supplement but not MN.

Conclusions: Infants in the KKP group had enhanced plasma BCAA level in Ghanaian infants compared to the MN group alone. A dose response is observed with higher the consumption in the KKP group leading to a higher BCAA level. BCAA have been linked to impaired growth and neurodevelopment in neonates. Further analysis is needed to understand the nature of the relationship with linear growth in these infants.

GENETIC TESTING FOR WEIGHT LOSS COUNSELING

[1]*James, Kathy;* [2]*Matsangas, Panagiotis;* [3]*Connelly, Cynthia.*

[1]DNSc. Nurse Practitioner. Associate Professor of Nursing. University of San Diego.Hahn School of Nursing and Health Sciences. California. USA; [2]PhD. National Research Council Postdoctoral Associate. Operations Research Department. Naval Postgraduate School. Monterey. California. USA; [3]PhD. Professor of Nursing. University of San Diego Hahn School of Nursing and Health Science. San Diego. California. USA.

Background and objectives: Most known dietary strategies or weight loss are aimed to reduce calories and increase physical activity. Standard treatments of dietary modification with various amounts of protein, carbohydrates and fat work for most but not all overweight patients. Obese patients are especially quick to stop treatment if they don't see an immediate response. Responses by individuals are highly variable. In addition to behavior modification, genetic evaluation based on metabolic genotypes has been found helpful in understanding which dietary and activity recommendations are a best fit for long term weight management. Individual variations in genes can affect nutrient transport and metabolism. This study

will investigate whether the inclusion of genetic information to personalize patients' diet can improve weight management after a 4 month intervention.

Methods: Twenty obese patients who have had difficulty losing weight will be offered a genotype test

screening for over 40 variants in genes that affect macro- and micro-nutrient utilization, and influence physiological response to exercise. Patients will volunteer and be selected based on a weight loss in past four months of 5 pounds or less. Gene assays will be collected by oral swab. Fasting blood sugar, lipid profile and A1c

---

will be obtained for all participants along with blood pressure, waist measure and body fat composition and demographic information. Surveys on stress, self efficacy for nutrition and physical activity and binge eating will be completed. Patients will follow the diet recommended for their gene specificity. Weight loss and measures will be compared at four months with prior measurements. Outcome measures will be BMI, weight, waist measure, changes in

lipid profile, A1C, fasting blood sugar.

Results: In progress.

Conclusions: Findings will help provide support for use of genetic nutrient testing in patient assessments.

Keywords: genetic-testing, obese, nutrition, activity

THE EFFECT OF TWO INTENSITIES OF ACUTE PHYSICAL EXERCISE ON THE PREFERENCE FOR SWEET TASTE OVER REST

[1]Espinosa, Alejandra; [2]Miranda, Camila; [3]Aravena, Javiera.

[1]MSc. Nutricionista. Universidad Católica de Chile. Chile;
[2]Estudiante de Nutricion. Universidad Católica de Chile. Chile;
[3]Estudiante de Nutrición. Universidad Católica de Chile. Chile.

Background and objectives: At a higher intensity of physical exercise, the preference for glucose solutions will be greater with respect to rest.

- Determine the taste preference according to the intensity of the exercise

Methods: Twelve healthy subjects with the following characteristics were evaluated: 18-23 years of age, sedentary, with normal nutritional status, without drug consumption and nonsmokers; pregnant and breastfeeding mothers were excluded. Subjects were cited on three occasions. In the first session, anthropometric, residual heart rate and maximum aerobic capacity measurements were performed according to the Bruce Protocol, in addition to the application of the 24-hour Reminder ingestion survey.

In the second and third sessions, subjects underwent static exercise on two different intensities at 50% VO2max and 85% VO2max., For 20 and 10 minutes respectively, in addition to determining the preference for sweet taste before and after physical exercise. Preference for sweet taste: it was determined by the Monell Test, which consists in giving the subject pairs of glasses with alternating glucose solutions in increasing and decreasing order, this should indicates the preference for each pair of glasses. The latter had 10 cc of solution, prepared with distilled water and glucose up to 3%, 6%, 12%, 24% and 36%.

Results: The preference for sweet taste (PSD) after exercise decreased significantly in high intensity physical exercise (p 0.02). When evaluating the relationship between sweet taste preference, time (before and after exercise) and intensity of exercise (50% VO2max and 85% VO2max), no significant differences were found (p 0.93).

Conclusions: It was not possible to verify that to a greater intensity of physical exercise, there is a greater preference for sweet

solutions. Future studies on the subject should consider their performance in athletes since their physical condition allows exercise for longer periods of time and therefore the generation of greater metabolic changes that lead to significant variations of sweetness preferences.

CARBOHYDRATES CONTENT AND GLYCAEMIC INDEX OF THREE TRADITIONAL CAMEROONIANS MEALS

[1]EtoundiOmgba, Cunégonde Blanche; [2]Mbock, Emilie Danielle; [3]Moussambe Abanga, Agate; [4]Ngom Ngom, Justice Trésor.

[1]Phd. Nutritionist. Department of Biochemistry. University of Douala. Cameroon.; [2]MSc. Nutritionist. Department of Biochemistry. University of Douala. Cameroon.; [3]MSc. Engineer in biology. Department of clinic biology. University of Douala. Cameroon.; [4]MSc. Molecular biologist. Department of Biochemistry. University of Douala. Cameroon.

Background and objectives: Glycaemic index (GI), is an adequate tool not only for diet schedule, but also for the management of metabolic pathologies. This study aimed to determine the carbohydrates content (Cc) and GI of three Cameroonians meals commonly consumed. The studied sauces were mainly constituted of Aframomum aulacocarpos/citratum species (A.sp), Manihot esculenta leaves (LM) with Arachis hypogaea seeds, Telfairia occidentalis leaves (LT) with Citrullus colocynthis seeds. They were all associated with Manihot esculenta tuber (TM).

Methods: We included 27 healthy male volunteers aged 19-29 years old, who gave their informed consent. They were separated into groups of eight (08) for each meal. After a 10-14 hours overnight fasting, 50 g/70Kg of glucose was administered day one of the experiment to the participants, and the tested food three other days spaced from two weeks each. Their capillary finger-prick blood samples were collected at 0, 15, 30, 60, 90, and 120 minutes after consumption. The GI values were computed from the area under the glycemic-response curve of each food with glucose as reference. The Cc of each sauce and TM alone was determined.

Results: The mean GI was respectively 96.85 ± 2.04; 91.22 ± 5.20; 88.68 ± 3.47 for A.sp, LM, LT (all combined with TM). The Cc values of TM was high (p<0.05) with 62.234 ± 2.235, compared to A.sp 28.610 ± 3.214, LM 18.141 ± 4.394, and LT 19.377 ± 8.441 g/100g.

Conclusion: All the GIs of the meals were high. The sauces presented a poor carbohydrates content, so they can be proposed to people with carbohydrates metabolism disorders. However, they should be associated with less carbohydrates accompaniment to prevent a high and/or a chronic postprandial glycaemia.

Keywords: Glycaemic index, traditional meals, carbohydrates content.

DIETARY CHOLINE INTAKES DO NOT REFLECT RECOMMENDED CONSUMPTION AMONG LACTATING WOMEN IN GUATEMALA

[1]Diaz-Jereda, Liza; [2]Vossenaar, Marieke; [3]Solomons, Noel W.

[1]BSc. Nutritionist. Center for Studies of Sensory Impairment Aging and Metabolism. Guatemala City. Guatemala.; [2]PhD. Center for Studies of Sensory Impairment. Aging and Metabolism (CeSSIAM).; [3]Center for Studies of Sensory Impairment. Aging and Metabolism (CeSSIAM). Guatemala City. Guatemala.

Background and objectives: No information is currently available on habitual intakes of choline, in the Guatemalan population. Guatemala has the highest national prevalence of under-5 stunting in the Americas, with a frequency of 46.5% in 2015; with that for the indigenous population is 61.2%. Choline is linked to short-stature through biochemical pathways for ossification of the growth plate for the elongation of long-bones of the human extremities. We sought to assess the dietary choline intake among lactating mothers in the Western Highlands of Guatemala.

Methods: The previous-day intakes of 118 low-income women, 55 recruited at a public health clinic in the city of Quetzaltenango and 63 interviewed across 8 Mam-speaking villages in the same province served as the data-base. These were coupled with the food choline content values from the USDA food composition software to produce intake estimates in mg/day. Estimated median choline intakes were compared to the 550 mg/day Adequate Intake (AI) for lactating women, established by the US Institute of Medicine, and expressed as percentages. The critical nutrient density for choline of 183 mg/1000 kcal was calculated for lactation. The principal food sources of choline were established by geographic setting.

Results: Reported daily choline intake ranged from 0–1115 mg, with median choline intake of 256 mg: 306 mg in urban and 199 mg in rural women (p<0.05). Respective median densities were 89% and 64% of the choline critical nutrient density. Eggs, chicken and maize tamalitos were the first 3 main sources in urban, whereas maize tamalitos, eggs and chicken occupied these places in rural-areas.

Conclusions: With median maternal choline intakes ranging from 56% to 36% of the AI recommendation during lactation in Guatemala, plausibility for its contribution to poor infant/toddler growth is established. Evaluation of human milk content and breast-feeding delivery of choline are warranted.

Keywords: choline, stunting, lactation, Guatemala

BRAZILIAN IMMIGRANT MOTHERS' BELIEFS AND PRACTICES RELATED TO INFANT FEEDING: A QUALITATIVE STUDY

[1]Lindsay, Ana Cristina; [2]Lindsay, Ana Cristina; [3]Greaney, Mary; [4]Wallington, Sherrie; [5]Hasselmann, Maria Helena; [6]Tavares Machado, Marcia Maria.

[1]University of Massachusetts Boston/Harvard. T. H. Chan School of Public Health. USA.; [2]University of Massachusetts Boston. USA.; [3]Kingston.Rhode Island. USA.; [4]Georgetown University. Washington DC. USA; [5]Rio de Janeiro State University. Brazi; [6]Federal University of Ceara. Brazil.

Background and objectives: Background: Exclusive breastfeeding for the first six months of life and the timely introduction of appropriate solid foods are important determinants of weight status in infancy and later life stages. Disparities in obesity rates among young children suggest that maternal feeding practices during the first two years of life may contribute to these disparities. Brazilians are a growing immigrant group in the U.S., yet little research has focused on parental beliefs and behaviors affecting health of Brazilian immigrant children living in the U.S.

Objective: Explore beliefs and infant feeding practices of Brazilian immigrant mothers in the U.S.

Methods: Focus group discussions were conducted with Brazilian immigrant mothers. Transcripts were analyzed using thematic analysis. Themes were categorized using the socioecological model.

Results: Twenty-nine immigrant Brazilian mothers participated in the study. Analyses revealed all participants breastfed their infants. The majority initiated breastfeeding soon after childbirth. However, most mothers stated that they did not exclusively breastfeed. They used breast and formula feeding concomitantly. Family and culture influenced mothers' infant feeding beliefs and practices early introduction of solid foods.

Conclusions: As the number of children in the U.S. growing up in families of immigrant parents increases, understanding influences on Brazilian immigrant mothers' infant feeding practices will be important to development of effective interventions to promote healthy infant feeding and weight status among Brazilian children. Interventions designed for Brazilian immigrant families should incorporate an understanding of social context, family and cultural factors to develop health promotion messages tailored to the needs of this ethnic group.

Keywords: Brazil, immigrant, mothers, infants, breastfeeding, complementary feeding.

AVERAGE DAILY CONSUMPTION, NUTRIENT DENSITY AND PRINCIPAL SOURCES OF CHOLINE AMONG SEMI-RURAL SCHOOLCHILDREN IN WESTERN GUATEMALA

[1]Escobar, Marta Lucía; [2]Solomons, Noel W.; [3]Vossenaar, Marieke.

[1]BSc. Nutritionist. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.; [2]Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala City. Guatemala.; [3]PhD. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM).

Background and objectives: Choline is an essential nutrient found in varying amounts in foods of both plant and animal origin. Adequate Intakes (AI), established by the US Institute of Medicine, recommended 250 mg daily for ages 4-8 years and 375 mg for ages 9-13 years. Sub-adequate choline intakes are being documented in adult Guatemalan women across the life-span, i.e., pregnant, lactating and neither. Our objective was to determine average intake and relative adequacy as well as principal sources of choline in semi-rural school children using a pictorial registry of dietary consumption.

Methods: Predominantly Mayan-indigenous, semi-rural, public school children (n=115) from Quetzaltenango were enrolled: 57 boys and 58 girls. 40 (35%) were 8 years old and 75 (65%) were 9-11 years old. Critical nutrient-density values for choline, based AI and energy requirements on specific for age were defined as 142 and 196 mg/1000 kcal, respectively. One-day choline intake was estimated from self-drawn depictions of each meal and snack consumed over a 24-h period. Choline intake was then derived using the USDA food composition table software values. A hierarchy of food contributions to total choline intake was tabulated.

Results: The total daily choline intakes ranged from 7.5-545mg, median=231 mg and mean=233±101 mg, without significant sex differences (p=0.92). The median for 8 y/o was 224 mg, and for 9-11 y/o, 234 mg. 83.5% consumed less than their age-specific AI value, whereas in 79.1%, nutrient density was below the reference critical-nutrient-density level. The five leading sources (eggs, maize tamalito, chicken, beef and milk) cumulatively constituted 70.6% of choline intake.

Conclusions: In semi-urban schoolchildren of the Guatemalan Western Highlands, choline intake is suboptimal according to AI, strategies are required to promote its consumption due to its critical role in the children health and development.

Keywords: Choline, schoolchildren, diet, growth, Guatemala

144/256

GUATEMALAN WOMEN CONSUME ABOUT HALF OF THE ADEQUATE INTAKE LEVEL FOR DIETARY CHOLINE, WITHOUT SIGNIFICANT CLASS OR REGIONAL VARIANCE

[1]Campos, Raquel; [2]Vossenaar, Marieke; [1]Diaz-Jereda, Liza; [3]Solomons, Noel W.

[1]BSc. Nutritionist. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala City. Guatemala.; [2]PhD. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.; [3]Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala City. Guatemala.

Background and objectives: Choline has heretofore been an ignored essential nutrient for the Guatemalan dietary context. Daily Adequate Intakes (AI) for non-pregnant and pregnant women has been set by the US Institute of Medicine at 425 and 450 mg, respectively, increasing to 550 mg in lactation. Western Highlands (WH) rural and urban women had respective median choline intakes of 199 and 304 mg (Díaz-Jereda, elsewhere at ICN, 2017). Here, our objective was to compare choline intakes of numerically-equivalent convenience samples of non-pregnant/non-lactating (NPNL) women across six groupings of socioeconomic class and regional setting in Guatemala.

Methods: Previous-day intakes were recorded among 240 adult NPNL Guatemalan women, 40 participants each across six subgroups: G1, WH rural peasantry; G2, WH urban low-income; G3, WH urban middle-income; G4, Pacific-coastal-plain middle-income; G5, Central-Highlands, peri-urban low-income; and G6, Central-Highlands, urban middle-income. Choline contents of foods from the USDA food composition table software were applied to 1-day intake records to generate choline intakes, expressed in mg.

Results: The global choline intake for the 240 participants had (in mg) a median of 204 and mean 227±131, ranging 18-790; this was 48% of the 425 mg AI reference value. By subgroups, respective median and limits-interval data were (in mg): G1, 199 (73-609); G2, 214 (30-515); G3, 211 (23-504); G4, 148 (18-570); G5, 225 (30-790); and G6, 215 (39-567). Subgroup differences were non-significant (p=0.579). Overall, choline from eggs (37%), beef (9.5%) and black beans (8.8%) comprised over half the intake, but hierarchies of main choline sources varied greatly across subgroups.

Conclusions: NPNL women in the G2 region had 30% lower choline intakes (214 mg) than corresponding lactating peers (304 mg), whereas inter-stage intakes were identical at 199 mg in the G1 region. Current dietary patterns for a diverse cross-section of NPNL Guatemalan women do not support the habitual consumption of adequate amounts of choline.

Keywords: Choline, dietary intake, women, Guatemala

ASSOCIATION OF RELATIVE BODY WEIGHT (BODY MASS INDEX) AND FATNESS (PERCENT BODY-WEIGHT AS FAT) IN A CONVENIENCE SAMPLE OF ADULT WOMEN IN THE SOLOLÁ PROVINCE OF GUATEMALA

[1]Zamora, Alejandra; [2]Arriaga, Claudia Lorena; [3]Orozco, Monica; [4]Solomons, Noel W; [5]Schümann, Klaus.

[1]BSc. Nutricionist. Center for Studies of Sensory Impairment, Aging and Metabolism. Guatemala.; [2]BSc. Chemistry. Center for Studies of Sensory Impairment, Aging and Metabolism. CeSSIAM. Guatemala.; [3]PhD. Nutricionist. Center for Studies of Sensory Impairment, Aging and Metabolism. CeSSIAM. Guatemala.; [4]MD. Scientific Director. Center for Studies of Sensory Impairment, Aging and Metabolism. CeSSIAM. Guatemala.; [5]MD. President. Hildegard Grunow Foundation. Germany.

Background and objectives: Quetelet´s body-mass index (BMI) is a measure of relative weight in kg/m2. States of underweight, normal-weight, overweight and obesity have been classified by specific BMI intervals. However, "excess" in body mass is a function of increased fat (fatness as % body-weight as fat, %BF). Therefore, these two indicators should have a complementary association. As part of a protocol to classify women as "normal" or "obese" by dual criteria among Mayan-indigenous women, we sought to explore the association of BMI with %BF.

Methods: Height and clothing-adjusted body weight were measured in women aged 30-45 years, and their BMI calculated. As per the classification protocol, only women with BMI in the ranges of 18.5 to <25 kg/m2 ("normal") or >30 kg/m2 ("obese") advanced to stage 2 for %BF assessment with bioimpedance analysis (BIA). With tetrapolar placement of skin electrodes of the mBCA 525 BIA instrument (SECA, Hamburg, Germany), the gamut of 25 output variables were measured, with specific attention to the %BF value.

Results: We successfully measured all variables in 38 women (median: 34y): n=24 "normal" (median BMI: 22 kg/m2) and n=14 "obese" (median BMI: 32 kg/m2). Respective median %BF were 32% and 43%. The overall Pearson r value for BMI vs %BF (n=38) was 0.87, with partial r values of 0.74 (n=24, normal) and 0.74 (n=14, obese). BIA-measured %BF were, on average, 2.7 percentage-points higher than the theoretical association from the Deurenberg equation (1991).

Conclusions: %BF was higher than the reference criteria for non-excessive and obesity-associated fat in relation to selected confines for both "normal" and "obese" BMI status. Genetic and/or environmental factors may modify associations from the textbook standards for the upper- and lower-limits of body fatness that, along with BMI, would co-define "leanness" and "obesity".

Keywords: body-composition, women, body-fat, BMI, Guatemala

HEAD CIRCUMFERENCE IS AMONG THE LEAST AFFECTED ANTHROPOMETRIC MEASURES IN INFANCY AND AT FOLLOW-UP IN A COHORT OF RURAL, MAM-MAYAN CHILDREN IN THE 3RD AND 4TH YEARS OF LIFE

[1]MALDONADO SOCH, CLAUDIA ALEJANDRA; [2]Escobar, Marta Lucía; [3]Garcia Meza, Rosario; [4]Chomat, Anne Marie; [5]Solomons, Noel W.

[1]Bs. Nutritionist. Center for Studies of Sensory Impairment, Aging and Metabolism. Guatemala; [2]BSc. Nutritionist. Center for Studies of Sensory Impairment, Aging and Metabolism. Guatemala.; [3]MDs. Nutritionist. Center for Studies of Sensory Impairment, Aging and Metabolism. Guatemala.; [4]MD. MPH. PhD. McGill Department of Family Medicine. McGill University. Montreal. Canada.; [5]Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala City. Guatemala.

Background and objectives: Environmentally-related short-stature or stunting is often termed "chronic undernutrition," projecting a connotation of a generalized under-nourishing process due to improper diet. This was called into question in the 1980s from observations on Negev Bedouin infants by Dagan et al. (AJCN 1983;38:747-753) examining the standard anthropometric measures of length, weight, head-circumference and skin-folds. More recently, Miller et al. (Pediatr Int Child Health 2016;36:91-101) found head-circumference z-scores (HCZ) to decline by 30% from birth to 4 years in Nepalese children. We sought to document for anthropometric measures of indigenous Guatemalans, the relative degrees of conservation versus deterioration from infancy to an average of ~4 years following initial assessment.

Methods: The same anthropometrists twice measured a cohort of 105 Mam-Mayan children: 85 enrolled before the 2nd month of life and 20 at ~5±1 months, with follow-up measurements between the 41th and 56th month (median:48.3mo). Weight, length/height and head circumference were measured, generating z-scores for HAZ, WAZ and HCZ (WHO-Anthro), with the paired t test used for statistical assessment.

Results: At baseline and at 4-y endline, respective median z-scores were (in order, n=105): HAZ, -1.15/-2.68; WAZ, +0.07/-1.51; and HCZ, -0.74/-1.06. Specifically, instances of HCZ <-2SD (microcephaly) were 19 (18.1%) in first-semester baseline and 15 (14.2%) at 4-y endline. Median z-scores differences from 1st-2nd measurements, respecting the vector sign, were: HAZ (-1.53, p<0.001); WAZ (-1.58, p<0.001), and HCZ (-0.32, p=0.135), respectively.

Conclusions: Although WAZ was best conserved among the z-scores in early infancy followed by HCZ, the latter was by far the index showing least longitudinal deterioration 4 years later, and its value was superior to the other indicators. The time-dependent status-dynamics for HCZ here differ from those reported for Nepalese children from birth through 4 years of life.

Keywords: Stunting, wasting, underweight, microcephaly, Guatemala

TWO-YEAR FOLLOW-UP OF A WEIGHT LOSS INTERVENTION AMONG POSTPARTUM WOMEN: RESULTS FROM A RANDOMIZED CONTROLLED TRIAL IN PRIMARY HEALTH CARE

[1]Huseinovic, Ena; [1]Bertz, Fredrik; [1]Brekke, Hilde Kristin; [2]Winkvist, Anna.

[1]PhD. Dietitian. Department of Internal Medicine and Clinical Nutrition. University of Gothenburg. Sweden.; [2]PhD. Nutritionist. Department of Internal Medicine and Clinical Nutrition. University of Gothenburg. Sweden.

Background and objectives: Weight regain is a critical problem in obesity treatment. We recently reported that a 12-wk diet intervention among postpartum women produced a weight loss of 12% after 1 y, compared to 5% in controls. Here, we present 2-y results after 1 y of unsupervised follow-up.

Methods: A total of 110 women with a self-reported BMI of ≥27 kg/m2 at 6-15 wk postpartum were randomized to diet group (D-group) or control group (C-group). D-group (n=54) received a 12-wk diet intervention by a dietitian followed by monthly e-mails up to the 1-y follow-up. C-group (n=56) received a brochure on healthy eating at the baseline visit. No contact was provided from 1-2 y to either group. Changes in anthropometric outcome measures from 0-2 y and 1-2 y are reported.

Results: Eighty-nine women (81%) completed the 2-y follow-up. Median (1st; 3rd quartile) weight change from 0-2 y was -6.9 (-11.0; -2.2) kg in D-group and -4.3 (-8.7; -0.2) kg in C-group. There was no group by time interaction at 2 y (p=0.082); however, when women with a new pregnancy between 1-2 y were excluded the interaction became significant (-8.2 kg vs -4.6 kg, p=0.038). From 1-2 y, women in D- and C-group gained 2.5±5.0 kg and 1.1±4.4 kg, respectively (p=0.186). Women who gained weight from 1-2 y reported a decrease in self-weighing frequency compared to women who maintained or lost weight (p=0.008). Finally, percent weight change at 12 wk was positively related to percent weight change at 2 y (p<0.001).

Conclusions: Both groups achieved clinically relevant 2-y weight loss but the significant between-group-difference observed at 1 y was not maintained at 2 y in the main analysis. However, when women with a new pregnancy between 1-2 y were excluded, a significant weight loss effect was observed also at 2 y.

HEALTH AND NUTRITION RELATED CHALLENGES ASSOCIATED WITH PEOPLE LIVING WITH DISABILITIES IN NAKURU COUNTY, KENYA

[1]Chege, Peter; [2]Gachuiri, Grace.

[1]Department of Food, Nutrition and Dieteics. Kenyatta University. Kenya.; [2]Nursing Department. Kenyatta University. Kenya.

Background and objectives: People living with disability (PLD) are among the most vulnerable groups to health and nutrition problems mainly due to limited access to essential services. Minimal information exists on health and nutrition related challenges among PLD as they are normally excluded from many researches due to challenges in conducting assessments. This study aimed to document the health and nutrition related challenges.

Methods: The study adopted a cross-sectional analytical research design, in Nakuru municipality on a randomly selected sample of 396 adults living with various forms of disability. Data was collected using semi-structured questionnaires, focus group discussions guides and key informants interviews. Quantitative data was analyzed using SPPSS while qualitative data using Nvivo software.

Results: Physical disability (67.2%) was the main disability problem, followed by mental disability (15.2%), deafness/dumbness (10.9%), and visual impairment (5.1%). Over 68% were dependent on other people for movement and accessibility to essential services. Most of the PLD (62.1%) earned an income of <2USD daily leading to about 40% being food insecure. A majority (78.9%) of the PLD had low nutrition knowledge with (68.8%) not meeting their daily dietary requirements while 85.2% engaged in low physical activity. Prevalence of hypertension, diabetes and CVDs was 25.8%, 5.5%, and 6.3% respectively. In addition, illness like malaria, pneumonia and diarrhea were prevalent. The prevalence of overweight, obesity and underweight was 21.5%, 10.2% and 23.4%, respectively, a clear indication of dual burden of malnutrition. Over a half (53.9%) were noted to be living with stigma towards disability.

Conclusions: Due to stigma, food insecurity and low nutrition knowledge, PLD practice poor dietary practices and live with lifestyle diseases. The disability condition led to engagement in low physical activity which contributed to overweight and obesity. There exists a dual burden of malnutrition. There is thus need to train PLD on good nutrition, dietary management of lifestyle diseases and on entrepreneurship for income generation.

FACTORS AFFECTING NUTRITIONAL STATUS OF ELDERLY PEOPLE OF RURAL NEPAL: A COMMUNITY BASED CROSS SECTIONAL STUDY

[1]Tamang, Man Kumar; [2]Yadav, Uday Narayan.

[1]MSc. Teaching Assistant. Department of nutrition and dietetics. Central Campus of Technology. Tribbuvan University. Nepal.; [2]MPH. Program officer. Forum for Health Research and Development. Dharan. Nepal.

Background and objectives: Every country in the world is facing a demographic challenge due to drastic growth of population over 60 years. Adequate diet and nutritional status are important determinants of health in elderly populations. This study aimed to assess the nutritional status among the elderly population and factors associated with malnutrition at the community setting in rural Nepal

Methods: This is a community based cross-sectional study among elderly of age 60 years or above in the three randomly selected VDCs of Morang district in eastern Nepal, between August and November, 2016. A multi stage cluster sampling was adopted with sample size of 345 of which 339 participated in the study. Nutritional status was assessed by MNA tool and associated socio-economic, demographic, psychological and nutritional factors were checked by binary logistic regression analysis

Results: Among 339 participants, 24.8% were found to be within normal nutritional status, 49.6% were at risk of malnutrition and 24.8% were malnourished. Independent factors associated with malnutrition status among the elderly people after controlling the cofounders in the bivariate analysis were: elderly who were malnourished were those who belonged to backward caste according to traditional Hindu caste system [OR=2.69, 95% CI: 1.17-6.21), being unemployed (OR=3.23, 95% CI: 1.63-6.41),who experienced any mistreatment from caregivers (OR=4.05, 95% CI: 1.90-8.60), being not involved in physical activity (OR=4.67, 95% CI: 1.87-11.66) and those taking medication for any co-morbidities.

Conclusions: Many socio-economic, psychological and physiological factors affect nutritional status in our sample population and these issues need to be addressed for bringing improvement in elderly nutrition and health status.

Keywords: elderly, nutritional status, rural Nepal

ASSESSMENT OF NUTRITIONAL STATUS IN OBESE CHILDREN DURING A 10 YEARS FOLLOW-UP AND CARDIO-METABOLIC RISK

[1]Andreoli, Angela; [2]Pitaro, Eugenio; [3]Neri, Anna; [4]Rizza, Stefano; [5]Sorge, Roberto; [6]Petrilli, Arianna; [6]Manca Bitti, Maria Luisa.

[1]MD. PhD. Nutritionisti. Physiologist. Human Physiology and Nutrition. Department Medicine of System. University of Rome Tor Vergata. Rome. Italy.; [2]MD. Pediatric Diabetology Unit, Policlinico di Tor Vergata. University of Rome Tor Vergata. Rome. Italy.; [3]Department of Biopathology and Imaging Diagnostics. University of Rome Tor Vergata. Rome. Italy.; [4]MD. Department Medicine of System. University of Rome Tor Vergata. Rome. Italy.; [5]PhD. Statistics Unit. University of Rome "Tor Vergata". Italy.; [6]MD. Pediatrician. Pediatric Diabetology Unit. Policlinico di Tor Vergata. University "Tor Vergata". Italy.

Background and objectives: Incidence of childhood obesity and its complications (cardiovascular disease, diabetes, etc.) is increasing. Aim of the study was to evaluated nutritional status of a cohort of obese children with ten years follow-up and to assessed the relationship between body composition, liver and cardiovascular function.

Methods: The cohort was 56 subjects (27 females and 29 males). The dropout was 10 subjects, 23 males and 23 females, aged respectively 10,6+/-1,8 and 9,8 +/-1,51 at time0 and 20,3+/-1.9 and 21,0+/-21.5 at 10 years follow-up.

Anamnesis and FFQ, blood pressure (DBP, SBP), blood analyses, weight, height was measured and Body Mass Index (BMI) was calculated; waist circumference (WC) and body composition (Fat, FFM, TBW, ECW, ICW, BCM) by Bioelectrical impedance analysis (BIA), epiaortic and hepatic ultrasounds was assessed.

Results: BMI, DBP, glycaemia, insulinemia, triglycerides, cholesterol, LDL, HDL, HOMA-IR and Tg/HDL was no statistical differences between males and females at the baseline and after ten years.

BMI in males was 32,55+/-6,20 and in female was 30,77+/-6,04; Fat Mass (FM) was 28,16+/-13,06 and 30,32+/-12,99 respectively; Free Fat Mass (FFM) was 68,57+/-11,19 and 49,19+/-8,36 respectively ; Total body water (TBW) was 50,20 +/-8,17 and 36,05+/- 8 respectively; Body cell Mass (BCM) was 40,76+/-5,38 and 30,16+/-8,19 respectively.

54 % of the subjects are still obese 26% overweight 20% normal weight at follow-up.

72% of patients were affected by liver steatosis (80% of obese, 83% overweight and 30% normal weight). FM (p=0,019), FFM (p=0,04), TBW (p=0,03), was significant difference between in subjects affected by steatosis and not.

A significant increment in males for SBP (p=0,001) and uric acid levels (UAL) (p=0,007), was observed. There was a significant correlation between WC and cIMT (P=0,003; R=0,441) which shows that cIMT is growing proportionally. There was a correlation between WC and UAL (p<0,001; R=0,58). 38% of these subjects have a high-moderate cardiovascular risk.

Conclusions: Results show that is necessary over the course of early life a complete evaluation of obese children and epiaortic and hepatic ultrasounds must be performed in each to established hepatic damage that can persist also after weight loss.

Keywords: Fat Mass, children, cardio-metabolic-risk, follow-up.

IMPACT OF CHILD NUTRITION POLICY IN MEDELLÍN, COLOMBIA

[1]Alvarez Castaño, Luz Stella; [2]Quintero Morales, Maria Teresa; [2]Goez Rueda, Juan Diego; [2]Gallego Osorio, Gloria Yaneth; [3]Cuesta Caicedo, Eimy Yaritza.

[1]PhD. Msc. Nutritionist. Escuela de Nutricion y Dietetica. Universidad de Antioquia. Colombia.; [2]MSC. Nutritionist. Escuela de Nutricion y Dietetica. Universidad de Antioquia. Colombia.; [3]Student. Escuela de Nutricion y Dietetica. Universidad de Antioquia. Colombia.

Background and objectives: Children´s Nutrition Programs are being considered a social protection strategy to guarantee the right to food. This study aimed to evaluate the "Buen Comienzo" Program of Medellin which is part of the Infant policy of the city, to establish the principles of this policy, how it is being implemented and what have been its results according to the perspective of the different actors involved.

Methods: An evaluation was carried out to the "Buen Comienzo" Program (BCP) which is targeted to children from two to six years of age; the Program seeks the integral development through pedagogical strategies and the supply of food to the children who remain eight hours daily, from Monday to Friday. The evaluation was carried out by using a methodology of multidimensional evaluation by triangulation of methods created by the School of Nutrition and Dietetics of the Universidad de Antioquia. 12 centers located in different zone of the city were evaluated. Anthropometric measures of height, weight and age were registered and semi-structured interviews to parents, educators and high level administrative officers of the Program were conducted.

Results: It was founded that children attending to the BCP have a better nutritional status as comparing with data from Colombia children as a whole and with Medellin children measured by the indicator low height to Age. (6.7% (BCP), 13% (Colombia) and 13.5% Medellin respectively. Parents and educators find positive changes in the eating habits of children, who are transformers of family habits. Related to right to food this principle supports all the infant policy guidelines and most of educators and Program Officers know it. However they state that it is implemented just because the adequate amount and quality of foods. Other aspects as universal coverage, no exclusion criteria, budget allocation are not considered in the analysis.

Conclusions: The "Buen Comienzo" Programe is a strategy to guarantee the right to food although other elements than quality and quantity of food must be added to its structure.

CONSUMPTION OF SUGAR-SWEETENED BEVERAGES IS NEGATIVELY ASSOCIATED WITH ACADEMIC OUTCOMES IN THE TRANSITION FROM SECONDARY TO HIGHER EDUCATION IN YOUTHS FROM AN INFANCY CHILEAN COHORT

[1]Loeff Wetzstein, Tamara; [2]Correa-Burrows, Paulina; [1]Rodriguez, Yanina; [1]Curi Quinto, Katherine; [3]Blanco, Estela; [4]Gahagan, Sheila; [5]Burrows, Raquel.

[1]MSc. Nutritionist. Institute of Nutrition and Food Technology. University of Chile. Chile.; [2]PhD. Social Science. Institute of Nutrition and Food Technology. University of Chile. Chile.; [3]MPH. Division of Child Development and Community Health. University of California San Diego. USA.; [4]MPH. MD. Division of Child Development and Community Health. University of California San Diego. USA.; [5]MD. Institute of Nutrition and Food Technology. University of Chile. Chile.

Background and objectives: A high consumption of sugar-sweetened beverages (SSB), made with high-fructose corn syrup (HFCS), is associated with excessive weight gain and cardiometabolic risk. Moreover, consumption of SSB also relates with impairment in hippocampal learning and memory processes, regardless of weight status. Impairment in memory consolidation and performance is a risk factor for learning difficulties, including, poor academic progress. In Latin-America, the Global School-based Healthy Survey shows that two thirds of adolescents in Argentina, Chile and Uruguay report daily intake of SSB. We aimed to study the association between daily consumption of SSB with academic results (school-grades and high school completion) in adolescent students from Santiago, Chile.

Methods: Observational study in n=678 youths participants in a follow-up beginning in infancy. Consumption of SSB at 16y was assessed using a validated food frequency questionnaire. Academic outcomes were approached as the odds of high school (HS) completion and HS grade-point average (GPA). Multivariate logistic regressions were performed to determine independent associations of snacking with having completed HS, after controlling sex, nutritional status and parental education. ANCOVA was used to estimate differences in high school GPA by consumption of SSB after controlling other influences. The effect size (ES) for difference was estimated using Cohen's d coefficients.

Results: In the sample, 43% of participants had daily consumption of SSB. After controlling other influences, the odds of high school completion were significantly lower among participants consuming SSB once (aOR: 0.60; 95% CI: 0.38-0.95) and twice (aOR: 0.36; 95% CI: 0.19-0.66) a day compared to participant with no SSB consumption. Adolescents consuming SSB once (mean difference: -25 points, p=0.003, d=0.19) and twice (mean difference: -36 points, p=0.011, d=0.28) a day had significantly lower GPA compared to adolescents with no SSB consumption.

Conclusions: In our sample, the consumption of SSB was negatively associated with academic performance in the transition from secondary to higher education. Consumption of SSB was associated with lower GPA and reduced odds of HS completion. Our findings are consistent with previous evidence of a relationship be-

BREASTFEEDING SELF-EFFICACY AND BREASTFEEDING PRACTICES AMONG LACTATING MOTHERS ATTENDING A MATERNITY TEACHING HOSPITAL. IBADAN. NIGERIA

[1]Ogundairo, Yetunde; [2]Samuel, Folake.

[1]MSc. Nutritionist. Department of Human Nutrition. University of Ibadan. Nigeria.; [2]PhD. Nutritionist. Department of Human Nutrition. University of Ibadan. Nigeria.

Background and objectives: Background: Breastfeeding self-efficacy is the confidence a mother has in her ability to breastfeed her infant. Mothers with low breastfeeding self-efficacy have been observed not to start early initiation of breastfeeding and not to continue exclusive breastfeeding for six months. Few studies have examined the relationship between breastfeeding self-efficacy and breastfeeding practice among lactating mothers in Nigeria. Therefore, this study assessed the relationship between breastfeeding self-efficacy and breastfeeding practices among lactating mothers in Ibadan.

Methods: The study was descriptive cross sectional in design. A total of four hundred and nineteen lactating mothers with infants aged 0-6 months were randomly selected from Adeoyo Maternity Teaching Hospital in Ibadan. A semi-structured interviewer administered questionnaire was used to obtain information on socio-demographic characteristics, breastfeeding knowledge, breastfeeding attitude, breastfeeding self-efficacy and breastfeeding practices (measured using the breastfeeding performance index). Data were analyzed using descriptive statistics such as frequencies, percentages, Mean ±SD and inferential analysis such as chi square, correlation at P < 0.05.

Results: The mean age of the mothers and infants was 28.8 ±5.3 years and 2.1 ±1.5 months respectively. Majority (76.4%) of the mothers had high breastfeeding self-efficacy. Almost all (98.8%) of the mothers had breastfed during the previous 24 hours, but despite this, 78.3% of infants were still bottle fed. The proportion of mothers who scored high breastfeeding performance index was 93.3%. There was good breastfeeding knowledge (82.8%) and positive breastfeeding attitude (23.2%) among the mothers. A significant positive correlation was observed between breastfeeding self-efficacy and breastfeeding practices; and also between breastfeeding self-efficacy and breastfeeding knowledge.

Conclusions: Breastfeeding self-efficacy was observed to positively influence breastfeeding knowledge, which was also positively associated with optimal breastfeeding practices. Mothers should be properly informed on the importance of breastfeeding to boost their confidence to breastfeed.

Keywords: Breastfeeding, Self-efficacy, Lactating mothers.

ASSOCIATION OF HELICOBACTER PYLORI IN-FECTION WITH ANTHROPOMETRIC INDICES AND BLOOD PRESSURE AMONG UNDERGRAD-UATE STUDENTS IN SOUTHEAST OF IRAN

[1]Shahraki, Mansour; [2]Eslami, Omid.

[1]Associated professor. Department of Nutrition. Medical Faculty. Zahedan University of Medical Sciences. Zahedan. Iran.; [2]Department of Nutrition. Faculty of Public Health. Iran University of Medical Sciences. Tehran. Iran.

Background and objectives: There are inconclusive evidence on the association of Helicobacter pylori (H.pylori) with cardiometabolic disorders such as obesity and hypertension. The aim of current study was to assess the association of H.pylori seropositivity with anthropometric indices and blood pressure among a group of young population in southeast of Iran, Zahedan.

Methods: A total of 363 undergraduate students at Zahedan University of Medical Sciences were participated in this cross-sectional study, in 2014. H.pylori positivity was examined by measuring serum anti- H.pylori IgG antibodies. Anthropometric indices including body mass index(BMI),waist circumference(WC),waist to hip ratio (WHpR),and waist to height ratio (WHtR),as well as systolic blood pressure(SBP) and diastolic blood pressure (DBP) were measured using standard protocols.

Results: H.pylori seropositivity In our study was 45.7%(166/363).H.pylori positive subjects had significantly lower mean values of BMI compared to H.pylori negative subjects.While WC,WHpR,WHtR,SBP,and DBP were not significantly different between the two groups. Also multiple regression analysis didn't show any significant association between H.pylori seropositivity and other study variables.

Conclusions: H.pylori seropositivity was significantly associated with BMI ,but not with central obesity indices and blood pressure among a group of young undergraduate students in southeast of Iran.

Keywords: Helicobacter pylori; Anthropometric indices; Blood pressure; Undergraduate students;Iran

ASSOCIATION BETWEEN NUTRITIONAL STA-TUS AND FOOD HABITS IN SCHOOL CHILDREN FROM SANTIAGO

[1]Leiva Rodriguez, Carla Andrea; [2]Reyes, Maria; [3]Ossa, Francisca; [4]Toledo Astudillo, Juan.

[1]Msc. Nutricionista. Carrera de nutrición y dietética. Pontificia Universidad Católica de Chile. Chile.; [2]Alumna Quinto año. Nutrición y Dietética. Pontificia Universidad Católica de Chile. Chile.; [3]Alumna Quinto año. Nutrición y Dietética. Pontificia Universidad Católica de Chile. Chile. ; [4]Medico Cirujano. Servicio de Salud Metropolitano Norte. Chile.

Background and objectives: Environmental and social changes can alter eating behavior, which flavors the development of overweight and obesity. The National Food Consumption Survey reveals the high rates of overweight in scholar children, and the lack of accomplishment from alimentary recommendations. Investigations must be done to discover possible behaviors that favours the increase of malnutrition by excess. This study seeks to associate alimentary habits with nutritional status in children from first to fourth grade.

Hypothesis: Children from first to fourth grade with malnutrition by excess have a higher prevalence of bad alimentary habits compared with their normal-weight peers.

Methods: Application of a pre-elaborated survey that measured alimentary habits to 82 students from first to fourth grade. It was measured weight, height, waist girth, skinfold thickness and muscular strength, and nutritional status was established by BMI/Age. Associations between nutritional status, muscular strength and waist girth with alimentary habits were made.

Results: The distribution according to nutritional status shows 54.8% (n = 45) of eutrophic schoolchildren and 45% (n = 37) with excess malnutrition; Within this category, 19.5% of the subjects are overweight, 19.5% are obese and 6% are severely obese. The association between alimentary habits and nutritional status shows that 29,3% of children presents poor nutritional habits and are eutrophic, and 20,7% have poor alimentary habits and have malnutrition by excess. A 25,6% have good alimentary habits and are eutrophic, and 24,4% have good alimentary habits and malnutrition by excess. There are no differences between alimentary habits and nutritional status.

Conclusions: It is recommend to depthly analyse the alimentary habits survey applied in this study, because the results revealed inconsistencies between children´s diet and their nutritional status.

FACTORS THAT MOTIVATE YOUNG WHITE MOTHERS FROM LOW SOCIO-ECONOMIC OR DEPRIVED BACKGROUNDS TO SUCCESSFULLY BREASTFEED - A QUALITATIVE EXPLORATORY STUDY IN BIRKENHEAD, UNITED KINGDOM

Tetteh, Jedidah.

PhD. Public Health Nutritionist. National Centre for Sport and Exercise Medicine. Loughborough University. United Kingdom.

Background and objectives: Breastmilk is the gold standard for all infants in terms of infant nutrition. In view of this, WHO has recommended that breastfeeding must be initiated during the first hour of life and continued until two years or over. Breastfeeding initiation rates continue to be very low in the United Kingdom (UK) (74%) with even lower rates in the Wirral (57%). In the UK, studies have proven that white adolescent mothers from deprived backgrounds are the least likely to breastfeed and therefore require additional support to their unique developmental position. The study investigated the factors that motivate the few mothers who breastfeed at Birkenhead to successfully breastfeed for at least six weeks.

Methods: The study was an explorative and inductive qualitative study involving four mothers aged between 18 and 30 years. Data were collected using semi –structured questionnaires . Interviews were audio-recorded and analysed using thematic analysis approach.

Results: The study identified some factors that motivate young white British mothers to successfully breastfeed. The study found that one-to-one support from midwives, and family and friends could positively influence them to adopt breastfeeding practices. Further, a positive societal attitude towards breastfeeding in the public could influence breastfeeding positively. Also, knowledge about breastfeeding, a beautiful baby growth and no sickness encouraged mothers to continue breastfeeding. The study also revealed that mothers were willing to sacrifice for their babies so far as they knew of the benefits for the baby.

Conclusions: The findings of this study suggest that young British white mothers require support to motivate them to breastfeed and sustain breastfeeding practices. However, because this study was a small scale qualitative study the findings are not generalisable. A further large scale study, adopting a mixed method approach, could be useful to investigate whether this is a general need or views of the white British young women.

Keywords: Breastmilk, motivate, breastfeed, young British white mothers.

THE CORRELATION OF OBESITY INDICES WITH BLOOD GLUCOSE AMONG A GROUP OF MEDICAL UNIVERSITY EMPLOYEES IN ZAHEDAN, SOUTH-EASTERN OF IRAN

[1]*Shahraki, Mansour;* [2]*Eslami, Omid.*

[1]Associated professor. Department of Nutrition. Medical Faculty. Zahedan University of Medical Sciences. Zahedan. Iran.; [2]Department of Nutrition. Faculty of Public Health. Iran University of Medical Sciences. Tehran. Iran.

Background and objectives: Employees are considered as an at-risk group for obesity and its adverse outcomes particularly cardiovascular (CV) disease. The present study was conducted to assess the correlation of obesity indices with blood glucose among a group of medical university employees in Zahedan, south-eastern of Iran.

Methods: This cross-sectional study recruited 211 healthy medical employees of Zahedan University of Medical Sciences during October 2015. Obesity indices including body mass index (BMI), waist circumference (WC), waist to hip ratio (WHpR) and waist to height ratio (WHtR) were measured in accordance to standard criteria. Blood glucose was measured after a full night fasting. Data analysis was done by SPSS using descriptive statistics, bivariate analysis and Pearson correlations.

Results: Women had significantly higher values of weight, WC, WHpR and fasting blood sugar than men (p < 0.05). Bivariate analysis showed that those with BMI, WC or WHtR above the cut-off-points levels had significantly higher serum levels of blood glucose compared to normal subjects. BMI and WC had significant positive correlation with blood glucose and these correlations were slightly stronger for WC compared to BMI.

Conclusions: BMI and WC had an almost moderate correlation with blood glucose among a sample of medical university employees in south-eastern of Iran. Therefore, using WC along with BMI is suggested as the preferred method for assessment of blood glucose among this at risk group.

LOW BIRTH WEIGHT AND FEEDING PRACTICES ARE ASSOCIATED WITH CHILD WASTING AND THE CO-OCCURRENCE OF WASTING AND STUNTING IN SOUTH ASIA

[1]Harding, Kassandra; [1]Webb, Patrick; [2]Aguayo, Victor.

[1]PhD. Friedman School of Nutrition Science and Policy. Tufts University. United States; [2]PhD. United Nations Children's Fund Programme Division. United States.

Background and objectives: Undernutrition remains a major public health and development problem in South Asia, where 15% of children <5 years of age are wasted and roughly 38% are stunted. Low birth weight (LBW) and poor infant and young child feeding (IYCF) practices are also prevalent across the region, likely contributing to undesirable child outcomes.

Methods: We examined associations between LBW and seven measures of IYCF with three anthropometric outcomes in children aged 0 to 59 months old (mo): being wasted (WHZ<-2), being severely wasted (WHZ<-3), and the co-occurrence of both wasting and stunting (HAZ<-2). Recent cross-sectional national surveys from South Asia were pooled and logistic regression accounting for the surveys' clustered designs and adjusted for a number of factors were used to examine the relationships of interest.

Results: Approximately 62,509 children from 6 countries were included in the analysis, of which 16% were wasted, 5% severely wasted and 6% were both wasted and stunted. Children with reported LBW had a higher odds of being wasted (AOR (95% CI): 1.60 (1.45, 1.76)) as well as severely wasted (1.57 (1.34, 1.83)), compared to children without reported LBW. Children 0 to 23 mo who were reportedly breastfed within the first hour postpartum, those not provided prelacteal feeds in the first three days of life, and 0 to 5 mo who were exclusively breastfed were significantly less likely to be wasted later in life (p<0.05 for all three predictors). Not meeting the minimum diet diversity was associated with the likelihood of wasting and the co-occurrence of wasting and stunting in India and not meeting the minimum acceptable diet was associated with the co-occurrence of wasting and stunting in India.

Conclusions: LBW and poor IYCF are associated with wasting, severe wasting and the co-occurrence of wasting and stunting among South Asian children. Programs to prevent LBW and promote improved IYCF need to be urgently scaled up to reduce the risk of wasting across the region.

Keywords: Wasting, low birth weight, infant and young child feeding, South Asia

IS MID UPPER ARM CIRCUMFERENCE (MUAC) CUT-OFFS BY WHO ALONE A SUFFICIENT CRITERION FOR DETECTING ACUTE MALNOURISHED PAKISTANI CHILDREN, AGED 6-59 MONTHS?

[1]Safdar, Nilofer Fatimi; [2]Kumar, Ratan; [3]Amir, Mehreen; [4]Zaheer, Sidra.

[1]MSc.MS.PhD. Nutritionist. School of Public Health. Dow University of Health Sciences. Karachi. Pakistan.; [2]MBBS. Graduate Student.School of Public Health. Dow University of Health Sciences. Karachi. Pakistan.; [3]MSc.Nutritionist.School of Public Health. Dow University of Health Sciences. Karachi. Pakistan; [4]MSc. Statistician.School of Public Health. Dow University of Health Sciences. Karachi. Pakistan.

Background and objectives: Weight for height Z score (WHZ) is a gold standard for identifying malnutrition in children <5 years of age. Whereas, mid upper arm circumference (MUAC) is a proxy for WHZ and is mostly used in Pakistan to identify malnutrition in children. Current WHO guide lines for community screening for malnutrition recommend MUAC < 11.5 cm for severe acute malnutrition (SAM), however it is abstruse how MUAC relates to WHZ to define acute malnutrition. Our aim was to estimate the cut-off values of MUAC and its sensitivity and appropriateness with WHZ scale for screening SAM in children from Sindh, Pakistan.

Methods: A cross-sectional study of 491 children < 5 years old from rural area of Adilpur village, Sind Pakistan was undertaken. Demographic information was taken from the parent/caretaker and anthropometric data was assessed according to WHO protocol. Receiver operator characteristics (ROC) curves and Youden index was constructed to present the relationship between MUAC and WHZ score for different cut-off values of MUAC for moderate acute malnutrition (MAM) and SAM. Sensitivity and specificity of MUAC < 11.5 cm was calculated in comparison with WHZ-score <-3 standard deviation (SD).

Results: The sensitivity and specificity of MUAC <11.5 cm was 25.5% and 98.6 % respectively. Using the current WHO cut-off <11.5 cm for MUAC to screen SAM, more than 74 % of children with WHZ-score < -3 were missed. The best and optimal cut-off for screening SAM was obtained at MUAC <12.8 cm with sensitivity 63.8 % and specificity 88.1 %.

Conclusions: Using the current WHO cut-off of MUAC can only capture a smaller proportion of children < 5 years of age with SAM. There is an urgent need to revise cutoff value of MUAC from <11.5 cm to 12.8 cm in the community for treatment of malnutrition in children < 5 years old or we need to apply both tools MUAC <11.5 cm and WHZ-score < -3 SD simultaneously to detect all SAM children in the community.

Keywords: Severe acute malnutrition (SAM), mid upper arm circumference (MUAC), WHZ-score, Pakistan

DIETARY DIVERSITY AND ADEQUACY OF NUTRIENTS CONSUMED BY SCHOOL CHILDREN IN NAIROBI CITY COUNTY, KENYA

[1]Ndungu, Zipporah; [2]Mbithe, Dorcus; [3]Mutie, Catherine.

[1]Lecturer. Department of food science and technology Jomo Kenyatta. University of agriculture and technology. Kenya; [2]PhD. Lecturer.Department of Food, Nutrition and Dietetics. Kenyatta University. Kenya; [3]PhD. Nutritionist. Global Alliance for Improved Nutrition. Kenya.

Background and objectives: School children experience changes in biological, psychological and social dimensions. Nutrition adequacy or inadequacy at this stage affects nutrition and health outcomes throughout the life cycle. The objective of the study was to analyze dietary diversity and adequacy of nutrient intake among school children in comparison with the global recommendations.

Methods: A cross sectional study design was used to collect data on a randomly selected sample of 202 children from urban day primary schools in Nairobi City County. Dietary diversity and 24-hour recall questionnaires were used to assess diversity and adequacy of the nutrients intake. Data from 24-hour recall was analyzed using Nutri-survey computer software to establish the amount of nutrients consumed in a day and compared with the reference values (FAO/WHO, 2001). The dietary diversity score (DDS) was calculated from 14 food groups. A score of ≤3 was considered as low, 4-6 was considered as moderate while a score of >6 was considered as high dietary diversity (FAO, 2008). Spearman's correlation was used to assess association between DDS and nutrients intake.

Results: The mean DDS for the children was 3.8(SD1.4) The diet was predominantly cereals, legumes and green leafy vegetables. There was inadequate consumption of vitamin A rich fruits and vegetables, organ meat, eggs, fish and flesh meat. Protein consumed was mainly from plant origin. Approximately a third of the children had inadequate consumption of crucial micronutrients such as iron (31.2%), vitamin A (28.7%), zinc (30.7%) and calcium (33.2%). Significant correlations were found between DDS and micronutrient intake and no association with energy intake. Energy intake was adequate for most (94.6%) children. Mean values for diet composition indicated that carbohydrate constituted 57.5% of the total energy, fat provided 33.1% and protein provided 9.4%.

Conclusions: The DDS of school children in Nairobi is low. Though the consumption of energy was generally adequate, the diet was devoid of protein and crucial micronutrients. This study recommends promotion of efforts to improve consumption of diversified, adequate diets by school children.

Keywords: Dietary diversity, nutrient adequacy, school children

MOTHER'S KNOWLEDGE, ATTITUDE AND PRACTICE OF INFANT NUTRITION AND HEALTH CARE STRATEGIES IN DELTA STATE, NIGERIA

[1]Ofili, Oghenefego; [2]Fadupin, Grace T.

[1]PhD Student. Department of Human Nutrition. University of Ibadan. Nigeria.; [2]PhD, Nutritionist. Senior Lecturer. Department of Human Nutrition. University of Ibadan. Nigeria.

Background and objectives: Knowledge of infant nutrition and health care strategies has been found to be high in numerous studies, but the lacunae have always been in the actual practice of the knowledge received. The nutrition education strategy currently used in disseminating information to pregnant and lactating mothers at Primary Health Care Centres during antenatal clinics does not seem to have yielded significant impact in improving the nutritional health of infants in Delta State. This could be linked to the assumption that programs are not designed to achieve behavior change; only to provide information. This study seeks to gather evidence for policy advocacy on nutrition behavior change communication as a key strategy to improving infant health and nutrition in Nigeria.

Methods: A cross sectional assessment as part of formative research was conducted to review the situation and gaps in knowledge, skill or other issues related to infant nutrition and health of mothers in Delta State. A semi-structured questionnaire was used to gather information on demographic characteristics, nutritional status of mother-child pair and KAP of infant nutrition and health care strategies in 6 communities in Delta State. Knowledge, attitude and practice scores were determined by the number of correctly answered questions.

Results: A total of 260 mother-child pairs participated in this study. Only 8.8% of mother had adequate knowledge of infant nutrition and health care strategies. 61.9% did not know what exclusive breastfeeding meant. 41.2% had negative attitudes towards infant nutrition and health care strategies. Results: **Conclusions:** It is evident from this study that there needs to be an improvement in the methods used in disseminating information on infant nutrition and health care at the community levels. It is possible to bridge the difference in educational gaps through the use of behavior change communication strategies for nutrition education.

NUTRITIONAL STATUS AND TREATMENT OUTCOME OF OUTPATIENTS WITH EATING DISORDERS IN AN INTERDISCIPLINARY THERAPEUTIC CENTER IN BUENOS AIRES

[1]Grippo, Beatriz; [2]Ricciardi, Olga; [3]Moretti, Mariana; [4]Rodriguez, Pedro; [5]Villar, Julieta.

[1]Nutritionist. Center specializing in eating disorders. Buenos Aires. Argentina.; [2]Licensed in psychology. Director. Center specializing in eating disorders. Professor. Faculty of psychology. Buenos Aires University. Buenos Aires. Argentina.; [3]Md. Nutritionist. Medical Director. Center specializing in eating disorders. Buenos Aires. Argentina.; [4]Licensed in Computer Science. Faculty of exact and natural sciences. Buenos Aires University. Buenos Aires. Argentina.; [5]Institutional relations manager. Center specializing in eating disorders. Buenos Aires. Argentina.

Background and objectives: Eating disorders (ED) are a psychiatric problem that affect mainly young women. The multidisciplinary team approach to patients with ED is widely recognized as the best practice. The Specialized Center for Eating Disorders provides individualized treatment to children, adolescent and adults with ED. The aim of this study is to describe demographic characteristics, nutritional status and treatment drop-out and success rates.

Methods: The database used contains data on diagnosed patients (DSM-IV) in 2010-2016. For nutritional status WHO body mass index categories are used, and data statistical analysis with software R Version 3.3.1.

Results: 991 patients (84% F, 16% M). Women /man rate was 9 in anorexia nervosa (AN) and bulimia nervosa (BN), and 4 in eating disorders not otherwise specified (EDNOS). Mean age was 38.5 ± 16.6y, for AN 21.6 ± 10.9y, for BN 35 ± 14.9y and for EDNOS 43.5 ± 15.7y. The age variable was found to be significant (p< 0.001) in a logistic regression model to predict among ED. The distribution of the admitted patients was 59.0% EDNOS, 29.2% BN, 11.5% AN, and 0.3% feeding disorder of infancy. Prevalence of excess weight was 75.4 % (overweight 22.6%, obesity 44.4% and morbid obesity 8.0%); 20.2% had normal weight and 4.5% underweight; 8.7% had psychiatrics comorbidities. 932 patients started treatment; 2% were derived; 60% dropped-out (9% returned to treatment); 13% finished treatment and 25% were still in treatment at the end of the study period. Drop-out was 49% in AN, 57% BN and 66% EDNOS. Patients with EDNOS showed a tendency for higher dropout (p=0.01). Patients who dropped out on the first 3 months (40%), were 38% for personal reasons, 20% for administratively discharged, 8% for time schedule, 4% went inpatient and 30% for unknown reasons. The average length of treatment was 443 ± 220 days.

Conclusions: EDNOS showed the highest prevalence of ED. More than half of the patients had 31-60 y old. The rate of obesity of the patients studied is in line with comparable studies. The multidisciplinary treatment approach and drop-out rates results were similar to reported from other countries.

Keywords: eating disorders, nutritional status, dropout

NUTRITION STATUS AND ACADEMIC PERFORMANCE OF PRIMARY SCHOOL CHILDREN IN UGANDA. A CASE OF MPIGI DISTRICT, CENTRAL UGANDA

Ssenyondo, Muzafaru; Ainomugisha, Prudence; Ahumuza, Gracious.

BSc. Department of Food Technology & Nutrition. Makerere University. Uganda.

Background and objectives: Background: The Education for All (EFA) Global Monitoring Report (UNESCO, 2011) states that more than a quarter of children below fifteen years of age in sub-Saharan Africa are underweight due to poor diet and malnutrition, making them more vulnerable to disease and less able to concentrate at school. Although studies relating schoolchildren's health and nutritional status and their learning have been conducted elsewhere, relatively little is known about the nutrition and health conditions of school aged children in Uganda and how these factors affect their learning.

Objective: To investigate the relationship between health, nutritional status and academic performance of primary school children in Mpigi district, a rural district in Central Uganda

Methods: The study was a cross-sectional comprising of total of 300 primary school children in class 4, between the ages of 7-14 years. All children sampled were from day schools. Sampling of schools was done using a modification of WHO 30x30 cluster sampling technique (using only grade one schools). The children were sampled randomly from a list of all children in the target class. Anthropometric measurements were done using standard methods. The educational performance of children was assessed using results scored for both English and Mathematics tests.

Results: The prevalence of stunting and wasting in the study group was 15.3% and 3%, respectively. Being wasted seemed to favor academic performance, as the likelihood of children scoring above cut- off increased with when the child was wasted (OR= 3.171). Stunting as expected had a negative effect on academic performance (OR=0.969). Factors that significantly affected academic performance included; feeding at school, suffering from disease, mother's education and main source of water (p<0.05)

Conclusions: Under nutrition and poor health in the primary school children in rural areas is likely to negatively affect educational performance, which could affect their quality of life in the long-term.

Keywords: Educational performance, nutritional status, school children, under nutrition.

DIETARY INTAKES ON GROWTH DEVELOPMENT IN THE FIRST DECADE FROM A BIRTH COHORT IN TAIWAN

[1]Lyu, Li-Ching; [2]Hsueh, Yu-Hui; [3]Lu, Yu-Ping; [3]Li, Shih-An; [4]Liu, Chih-Yi; [4]Chen, Yun-Lin.

[1]Professor. Program of Nutrition Science and Education. Department of Human Development and Family Studies. National Taiwan Normal University. Taiwan; [2]RD. MSc. Nutritionist. John Tung Foundation. Taipei. Taiwan.; [3]Msc. Graduate student. Program of Nutrition Science and Education. Department of Human Development and Family Studies. National Taiwan Normal University. Taiwan.; [4]Bsc. Granduate student. Porgram of Nutrition Science and Education. Department of Human Development and Family Studies. National Taiwan Normal University. Taiwan.

Background and objectives: The purpose of this study is to examine the dietary intakes and growth development including adiposity rebound from birth to 10 years old with different birth weights.

Methods: We follow and analyze the dietary and anthropometric parameters from 1 to 10 years old children with relative high (n=87 at 1, 43 at 10), normal (n=69 at 1, 12 at 10) and low (n=73 at 1, 39 at 10) birth weights from singlet pregnancies.

Results: The average energy intakes are from 890 kcal at 1, 1360 kcal at 5 and 1759 kcal at 10 years old with 93 kcal/kg at 1, 73 kcal/kg at 5 and 52 kcal/kg at 10, respectively (p for trend <0.05). The percent of energy from fat increases (23 to 30%) and carbohydrate decreases (64 to 54%) with age until 10; however, the protein intake is constant around 13-14% throughout the 10 years. The plant sources of protein (soy products) and fat (seed oil) consumption increase with age until 10 years old and the vitamin C and calcium intake decrease with age until 6 years old. The average BMI is 16.8 at 1 and reaches the lowest value of 15.5 at 5 and 17.4 at 10 years old. Although the relative high birth weight group is still with the higher means for weight and height at 10 years old, the relative low birth weight group shows the highest energy intake per kg with the fast growth rate from birth to 2 years old and catches up growth with the relative normal birth weight group. The early adiposity rebound group has the higher energy and nutrient intakes than the late adiposity rebound group, especially for the boys. The protein intake at 2 years old is positively related to the early adiposity rebound (p<0.05). The calcium intake at 6 years old is positively related to height at 7 (p<0.05).

Conclusions: Our data demonstrate that the birth weight has time-varying latent effect on growth development in the first decade of childhood. The nutrition status including energy and protein intakes have impact on adiposity rebound indicated by BMI changes for children.

CHANGES IN BODY COMPOSITION AND CARDIOMETABOLIC RISK AMONG BLACK SOUTH AFRICAN ADULTS

[1]Kruger, Salome.; [2]Kruger, Iolanthe Marike.; [3]Schutte, Aletta Elizabeth.

[1]Ph D. Dietitian. Centre of Excellence for Nutrition. North-West University. Potchefstroom. South Africa.; [2]Ph D. Africa Unit for Transdisciplinary Health Research. North-West University. Potchefstroom. South Africa.; [3]Ph D. Hypertension in Africa Research Unit. North-West University. Potchefstroom. South Africa.

Background and objectives: Obesity-related health risk may differ by ethnicity at the same body mass index (BMI). The objectives of this study were too determine the predictive value of the World Health Organization (WHO) overweight cut-point of BMI of 25 kg.m2 in men and women, respectively, to identify 10-year cardiometabolic risk and to determine optimal male (M) and female (F) BMI cut-points to identify 10-year cardiometabolic risk.

Methods: In the longitudinal PURE study of healthy black South Africans (n=2010), aged 30-90 years in 2005, demographic, lifestyle and anthropometric measures were taken and blood pressure, fasting serum triglycerides, high-density lipoprotein (HDL)-cholesterol and blood glucose were measured. Three or more risk factors according to international metabolic syndrome (MetS) criteria (fasting plasma glucose >5.6 mmol/L /oral hypoglycemic drugs, systolic blood pressure (SBP) >130 and/or diastolic blood pressure (DBP) >85 /anti-hypertensive drugs, serum TG >1.7 mmol/L, HDL-cholesterol <1 mmol/L M /<1.3 mmol/L F) and waist circumference (WC) above sex-specific cut-points (>94cm M/ >80cm F) in 2015 were defined as elevated cardiometabolic risk.

Results: Participants with WC above sex-specific cut-points in 2005 had significantly higher odds of having the MetS in 2015 (odds ratio, OR = 6.99, 95% CI 5.01, 9.75). Participants with BMI in the overweight/obese range (BMI > 25 kg/m2) in 2005 had significantly higher odds of having the MetS in 2015 (OR = 6.38, 95% CI 4.55, 8.94). Receiver Operating Characteristic curves to identify a sex-specific optimal BMI cut-point associated with increased 10-year risk indicated a BMI cut-point of 23.3 kg/m2 in men and 24.6 kg/m2 in women. A BMI cut-point of 30 kg/m2 had poor diagnostic performance. WC cut-points to predict 10-year risk of MetS were 78.0 cm in women and 84.0 cm in men. All cut-points were lower than international proposed cut-points for adiposity.

Conclusions: Baseline BMI and WC were significantly associated with increased cardiometabolic risk after follow-up. The predictive value of the WHO overweight cut-point of body mass index (BMI > 25 kg/m2) was similar to the new sex-specific cut-points (23.3 kg/m2 for men, 24.6 kg/m2 for women), but a BMI of 30 kg/m2 had poor diagnostic ability.

Keywords: obesity, body mass index, waist circumference, cardiometabolic risk, Africa

REDUCED CHILD STUNTING AND BETTER COGNITION: A CONTRIBUTION BY COMMUNITY HEALTH WORKERS IN A RURAL SETTING, KENYA

[1]Caroline, Sawe; [2]Grace Keverenge, Ettyang'; [3]Charles Obadiah, Kimamo; [4]Wambui, Kogi-Makau.

[1]MPH. Nutrition PhD student. Food Science, Nutrition and Technology. University of Nairobi. Kenya.; [2]PhD. Associate Professor. Human Nutrition. Moi University. Kenya.; [3]PhD. Psychologist. Psychology. University of Nairobi. Kenya.; [4]PhD. Professor. Food Science, Nutrition and Technology. University of Nairobi. Kenya.

Background and objectives: Globally an estimated 139 million children are stunted with a majority living in Low and Middle-Income countries. Stunting is an indicator of chronic malnutrition and after the second year of life, it becomes irreversible. It has been associated with infections, diminished survival and impaired cognitive development. Poor child cognition can be influenced by poor nutrition, health status, genetics and environmental factors. It has been linked to delayed school enrollment, performance and decreased economic activity in later years. Trained Community Health Workers have been proved effective in improving other health outcomes however, little research has been conducted if any of their contribution in stunting and cognitive development. This study assessed the impact of Community Health workers on stunting and cognition among children aged less than two years in a rural setting in Kenya.

Methods: A Comparative study design that recruited 192 children (101 intervention and 91 comparative arms). Community Health Workers provided key nutrition messages and counseling services to caregivers of children at specific times during child's growth. Stunting was computed based on WHO height-for-age Z-scores; and cognition determined by Bayleys Scale of Infant Development and composite scores.

Results: Child mean age was 11.84 (±6.90) months and height 70.86 (±8.82) cm. The prevalence of stunting was lower in intervention than in comparative arm (5.94% and 25.27% respectively; p<0.001) while poor cognition rates were higher in the comparative compared to intervention arm (34.07% and 14.85% respectively; p<0.001). After adjusting for confounders, children whose mother's had tertiary education had 0.03 times lower relative risks of being severely stunted comapred to those whose mothers had primary education [RRR:0.033: 95% CI:0.001-0.891; p=0.042]

Conclusions: Community Health Workers have proved effective in reducing child stunting and improving child cognition. Mother's education showed to be critical in improving these outcomes. Further research on factors associated with the outcomes is recommended. Program interventions should target children aged below two years as it is the window period of opportunity

Keywords: Stunting, cognition, Community Health Workers, intervention

University of Copenhagen. Copenhagen. Denmark.; [9]PhD. Nutritionist. Nutrition Section. International Atomic Energy Agency. Vienna. Austria.

Background and objectives: Malnutrition from early infancy in resource limited settings may result from among others low quality complementary foods with severe consequences later in life despite the rich food resources locally available, currently neglected but potentially useful as alternatives.

Objective: To evaluate the two developed WinFood products as replacement products for the standard corn-soy blend plus (CSB+) product meant for general distribution in food aid to combat moderate malnutrition. WinFood Classic (WFC) containing grain amaranth, maize, small fish(3%) and edible termites (10%) and WinFood Lite (WFL) with only grain amaranth, maize and fortified with minerals and vitamins as in CSB+ were tested against the existing purely plant based minerals and vitamins fortified CSB+.

Methods: Design: A randomized, double blind, controlled trial in 499 Kenyan children assigned aged 6 mo. To receive one of study foods for 9 months viz WFC (energy density 423.6Kcal/100g and 12.2mg/100g Iron; n=165); WFL (energy density 407.2Kcal/100g and 12.5mg/100g Iron; n=167); CSB+ (fortified with vitamin-mineral premix; n=167). The study was designed primarily to assess increments in fat-free mass by a deuterium dilution technique, linear growth and change in plasma ferritin, body iron stores and plasma transferrin receptor (sTfR). Secondary outcomes were changes in anthropometric variables including skin folds. Data were analyzed by the intention-to-treat approach.

Results: No differences between the WinFoods(WFC and WFL) and the CSB+ with respect to changes in fat free mass(FFM), length and haemoglobin(P=0.536,0.52 and 0.078 respectively). The mean length increased by 10.0cm (95% CI: 9.6, 10.5cm) during the 9 mo. Mean weight increased by 2.2kg (95% CI: 2.0, 2.4kg).The

weight gain was due to increase in mean FFM by 2.27kg (95% CI: 2.06, 2.48kg) and loss of fat mass by -0.09kg (95% CI:-0.28, 0.10kg). There were differences in plasma ferritin and sTfR (P=0.005 and 0.008 respectively). No differences between the WinFoods and the CSB+ in the changes from secondary outcomes except for head circumference of 3.5cm (95% CI: 1.1, 5.9cm) (P=0.002).

Conclusions: Locally produced products did not differ from CSB+. The small fish and the edible termites can potentially improve the nutritional quality of locally processed complementary foods and food aid products thus need further investigation.

Keywords: body composition, iron status, fortification, edible winged termites, Kenya.

Sao Paulo, Brazil.; [5]Department of Nutrition. School of Public Health. University of Sao Paulo. Sao Paulo, Brazil.

Background and objectives: Introduction. Studies suggest that the association between increased variability of hours of sleep and abdominal obesity can be explained by the energy intake, with special attention to carbohydrates and fats. Sedentary behavior linked to screen time has been strongly associated with sleep behavior disorders.

Objective. To describe the relationship between sleep duration, sedentary behavior and macronutrients dietary intake in adolescents aged 10 to 14 years old from João Pessoa, Paraíba, Brazil.

Methods: Design. Cross-sectional study developed with 1384. The data analyzed in this study are part of the first year (2014) collection of Longitudinal Study Sedentary Behavior, Physical Activity, Eating Habits and Health of Adolescents - The Loncaafs Study. Based on information of a whole week (week and weekend), sleep duration was measured as the mean difference between the time to

sleep and wake up. The time spent sited in a week represented the sedentary behavior. More than 100 minutes sited/day was considered sedentary. The consumption of macronutrients was rated by two 24hours recalls. Linear regression models were used to assess the relationship between sleep duration with diet and sedentary behavior.

Results: The sample comprised 54% of girls, with a mean age of 11.9 years old. The prevalence of sedentary behavior was 76.2%, being sited, in mean, for 243 minutes/day. The average calorie intake was 2226.90 kcal and the macronutrients were on average within the recommended for the age group studied. There was a negative association between sleep duration and the consumption of saturated fats only for girls and negative between sleep duration and sedentary behavior in both sexes.

Conclusion: Sleep duration was negatively associated with the consumption of saturated fat in girls and sedentary behavior in both sexes.

Keywords: Sleep; Diet; Adolescents.

RELATIONSHIPS BETWEEN CONSUMPTION OF ULTRA-PROCESSED FOODS, GESTATIONAL WEIGHT GAIN AND NEONATAL OUTCOMES IN A SAMPLE OF US PREGNANT WOMEN

[1]Rohatgi, Karthik; [2]Tinius, Rachel; [3]Cade, W. Todd; [4]Martinez Steele, Euridice; [5]Cahill, Alison; [6]Parra, Diana C.

[1]Student. Program in Physical Therapy. Washington University School of Medicine. USA.; [2]PhD. Assistant Professor of Exercise Science. School of Kinesiology, Recreation, and Sport. Western Kentucky University. Bowling Green. United States.; [3]PT. PhD. Professor of Physical Therapy. Medicine Program in Physical Therapy. Washington University School of Medicine. Saint Louis. United States.; [4]MS. Researcher. Department of Nutrition. University of São Paulo. São Paulo. Brazil.; [5]MD. Associate Professor. Obstetrics and Gynecology. Division of Maternal Fetal Medicine. Washington University School of Medicine. Saint Louis. United States.; [6]PhD. Assistant Professor. Program in Physical Therapy. Washington University School of Medicine. Saint Louis. United States.

Background and objectives: An increasingly large share of diet comes from ultra-processed foods (UPFs), which are assemblages of food substances designed to create durable, convenient and palatable ready-to-eat products. There is increasing evidence that high UPF consumption is indicative of poor diet and is associated with obesity and metabolic disorders. This study sought to examine the relationship between percent of energy intake from ultra-processed foods (PEI-UPF) during pregnancy and maternal gestational weight gain, maternal lipids and glycemia, and neonatal body composition. We also compared the PEI-UPF indicator against the US government's Healthy Eating Index-2010 (HEI-2010).

Methods: Data were used from a longitudinal study performed from 2013-2014 at the Women's Health Center and Obstetrics &

Gynecology Clinic in St. Louis, MO, USA. Subjects were pregnant women in the normal and obese weight ranges, as well as their newborns (n=45). PEI-UPF and the Healthy Eating Index-2010 (HEI-2010) were calculated for each subject from a one-month food frequency questionnaire (FFQ). Multiple regression analysis was used to analyze the relationship between PEI-UPF or HEI-2010 and various clinical outcomes. The ability of these dietary indices to predict gestational weight gain was also compared with the predictive abilities of total energy intake and total fat intake.

Results: An average of 54.4 ± 13.2% of energy intake was derived from UPFs. A 1% point increase in PEI-UPF was associated with a 1.57 kg increase in gestational weight gain (p=0.0036). Similarly, a 1% point increase in PEI-UPF was associated with increases of 0.23 mm in thigh skinfold (p=0.030), 0.14 mm in subscapular skinfold (p=0.017), and 0.59 percentage points in total body adiposity (p=0.038) of the neonate.

Conclusions: PEI-UPF was associated with and might be a useful predictor of several maternal and neonatal clinical outcomes. PEI-UPF was a better predictor of gestational weight gain and infant body fat than either total energy or fat intake, and a better predictor of infant body fat than HEI-2010. Thus, maternal UPF consumption may also affect long-term health outcomes (such as obesity) of the child. UPF consumption should be limited during pregnancy and diet quality should be maximized in order to improve maternal and neonatal health.

NUTRITIONAL STATUS AND FEEDING PRACTICES OF CHILDREN AGED 2 TO 5 YEARS IN VHEMBE DISTRICT, LIMPOPO PROVINCE, SOUTH AFRICA

[1]Mushaphi, Lindelani Fhumudzani; [2]Chauke, Tlangelani; [2]Mulabisano, Tshavhuyo; [2]Munene, Helen; [2]Matloga, Lufuno.

[1]PhD. Nutritionist. Department of Nutrition. School of Health Science. University of Venda. South Africa.; [2]BSc. Nutritionist. Department of Nutrition. School of Health Sciences. University of Venda. South Africa.

Background and objectives: Appropriate feeding practices are fundamental to child survival, growth and development. Poor infant feeding practices are associated with child death as well as poor growth.

To determine the nutritional status of children and feeding practices of children aged 2 to 5 years.

Methods: A cross-sectional study design was used. Five pre-schools were randomly selected from Vhembe District. 243 children aged 2 to 5 years were randomly selected from each pre-school. Caregivers were interviewed using the local language. The children's anthropometric measurements were also taken on the same day of interview by field workers. Data was analyzed using SPSS computer software version 23.

Results: More than half of children were females while 48% were males. The age of caregivers ranged from 20 to 36 years. Very few caregivers (3.3%) had no schooling while majority had secondary education and higher. However, two thirds of caregivers were unemployed and depended on child support grant for income. Majority of children were given three meals or more per day with very few who were given less than three meals per day. Almost all children were introduced to complementary foods before the age of six months. More than half of the children stopped breastfed at the age of 13 to 18 months. Majority of children were given starchy foods and very few children were given vegetables and fruits. Few children were stunted, 16.7% were wasted while 13.3% underweight.

Conclusions: A significant number of children were stunted, wasted and underweight. In addition, poor infant feeding practices were also observed as most children were given complementary foods before the age of six months.

Keywords: Malnutrition, children, nutritional status, feeding practices

PREVALENCE OF IRON, FOLIC ACID AND VITAMIN A DEFICIENCY IN COLOMBIAN SCHOOLCHILDREN AND ADOLESCENTS AND POSSIBLE RISK FACTORS

[1]Ramirez, Carmen Rosy; [2]Velasco, Carlos.

[1]Hospital Regional María Inmaculada. Florencia, Colombia; [2]Universidad del Valle. Cali, Colombia.

Background and objectives: According to the National Survey of Nutrition Status in Colombia 2010, 1:4 children aged 6 to 59 months, 11% between 13 and 17 years old and 8% from 5 to 12 years old presented anemia; and 1:4 children aged 1 to 4 years have vitamin A deficiency. The objective is to determine the prevalence and possible risk factors of iron (Fe +), folic acid (FolAc) and vitamin A (vitA) daily intake by means of a reminder of 24 hours in Colombian children, according to the Program for the Evaluation of Diets and Management of Food (DIAL).

Methods: Study of prevalence among schoolchildren (n=1221) and adolescents (n=1650) between 8-18 years of age in the Andean zone (La Unión=476), atlantic (Cartagena=427), pacific (Cali=1220, Quilichao=356) and amazonic (Florencia=392) zone and public (n=2342) and private (n=529) school, to whom sociodemographic (age, sex), anthropometric variables (weight, height, circumference of waist) and were diagnosed of malnutrition by body mass index, low height by height/age and abdominal obesity by waist circumference. Normal daily Fe+= 9-18 mg, FolAc=300-400 µg and VitA=500-700 µg were considered according to age and sex.

Results: 2871 Colombian children were included; 52.1% male, 12.9±2.4 years old, with Fe+=81.8±77.1 mg/d, FolAc=322.9±243.7 µg/d and VitA=665.6±1252.7 µg/d. With malnutrition=28.9%, low height=5.9% and 4.4% abdominal obesity. They presented Fe+=66.3%, FolAc=77.1% and VitA=63.2% deficiency; being possible risk factors for the Atlantic zone, adolescents, malnutrition, female sex and school (p <0.05).

Conclusions: More than 2/3 of these Colombian schoolchildren and adolescents presented deficiency of daily intake of Fe+, FolAc and VitA; being possible risk factors, geographical area, school, age group, sex and nutritional status.

Keywords: Iron deficiency, Folic acid deficiency, Vitamin A deficiency, Children

OVERWEIGHT, OBESITY, UNDERNUTRITION, ALTERED NUTRITIONAL HEIGHT AND ABDOMINAL OBESITY IN COLOMBIAN SCHOOLCHILDREN AND ADOLESCENTS

[1]*Ramirez, Carmen Rosy;* [2]*Velasco, Carlos.*

[1]Hospital Regional María Inmaculada. Florencia, Colombia;
[2]Universidad del Valle. Cali, Colombia.

Background and objectives: According to the National Survey of Nutrition Situation in Colombia 2010, 1:6 children and adolescents are overweight or obese; and 1:10 children and adolescents from 5 to 17 years of age present growth retardation. The objective is to determine the nutritional status in Colombian children, according to body mass index (BMI) and height for age (HA) using the WHO tables, and according to waist circumference (wc).

Methods: Prevalence study in schoolchildren (n=1235) and adolescents (n=1746) between 8-18 years of age in the Andean zone (La Unión=488), atlantic (Cartagena=489), pacific (Cali=1254, Quilichao=357) and socioeconomic variables (age, sex), anthropometric variables [weight (W), height (H), wc) and socio-demographic variables (age, sex), from public (n=2433) and private (n=548) schools. Were diagnosed by BMI in malnutrition (obesity, overweight, undernutrition and severe undernutrition), altered height (low height and severe low height) and abdominal obesity by wc (> p90%).

Results: 2981 Colombian children were included; 52.0% male, 12.9±2.3 years old, with W=48.0±13.3 kg, H=153.3±12.9 cm and wc=71.1±9.4 cm. They presented malnutrition=28.8%, altered heigth=6.0% and 4.2% abdominal obesity; being possible risk factors for malnutrition=the pacific zone, the private school and the adolescents (p<0.05), for the altered height=the public school, and for abdominal obesity=the pacific zone, the public school, the female sex, and the school children.

Conclusions: About 1/3 of these Colombian schoolchildren and adolescents presented malnutrition (undernutrition=2.3%, overweight and obesity=26.5%), and few had low height and abdominal obesity; being possible risk factors, the geographical area, the school, the age group and the sex.

DAILY CONSUMPTION OF ENERGY, MACRONUTRIENTS AND DIETARY FIBER IN COLOMBIAN SCHOOLCHILDREN AND ADOLESCENTS

[1]*Arias, Katherine;* [1]*Velasco, Carlos;* [2]*Ramirez, Carmen Rosy.*

[1]Universidad del Valle. Cali. Colombia.; [2]Hospital Regional María Inmaculada. Florencia. Colombia.

Background and objectives: In assessing the nutritional status of children, the daily consumption of ingested foods makes it possible to assess whether their diet is complete, balanced, adequate and adequate. The objective is to determine the prevalence and possible risk factors of the daily consumption of kilocalories (kcal), carbohydrates (CH), proteins (Prot), fats (Fat) and dietary fiber (Fib) in Colombians children, according to the Program for the Evaluation of Diets and Management of Food (DIAL).

Methods: Study of prevalence among schoolchildren (n=1221) and adolescents (n=1650) between 8-18 years of age in the Colombian andean (La Unión=476), atlantic (Cartagena=427), pacific (Cali=1220, Quilichao=356) and amazonic (Florencia=392) zone, from public (n=2342) and private (n=529) school, to whom socio-demographic (age, sex), anthropometric variables (weight, height, circumference of waist) and were diagnosed of malnutrition by body mass index, low height by height/age and abdominal obesity by waist circumference. Normal daily consumption of kcal=1750-2250 kcal/m2, CH=50-55% total caloric value (TCV), Prot=10-15% TCV, Fat=30-35% TCV and Fib=Age + 5 grams.

Results: 2871 Colombian children were included; 52.1% male, 12.9±2.4 years old, with kcal=1950.4±672.2 kcal/m2/d, CH=259.8±113.0 g/d, Prot=360.8±304.0 g/d, Fat=354.9±311.7 g/d and Fib=20.7±15.1 g/d, with malnutrition=28.9%, low height=5.9% and 4.4% abdominal obesity. They presented a hypocaloric daily consumption=75.0%, hypoglycemic=42.5%, hyperprotein=71.5%, hyperlipid=44.9% low in Fib=53.6%; being possible risk factors in the Atlantic and Andean zone, adolescents, malnutrition, female sex and private school (p <0.05).

Conclusions: The daily consumption of these Colombian schoolchildren and adolescents was hypocaloric, hypoglycemic, hyperprotein, hyperfat and low in fiber; being possible risk factors, geographical area, school, age group, sex and nutritional status.

Keywords: Daily consumption, Energy, Macronutrients, Dietary fiber, Children

DIETARY DIVERSITY WAS NOT ASSOCIATED WITH SERUM CONCENTRATIONS OF VITAMIN B12, IRON AND FOLATE IN A COHORT OF PREGNANT GHANAIAN ADOLESCENT GIRLS

[1]Intiful, Freda; [2]Asante, Matilda; [3]Asare, George; [4]Wiredu, Edwin.

[1]School of Biomedical and Allied Health Sciences. Department of Nutrition and Dietetics. University of Ghana. Ghana.; [2]Senior Lecturer. Department of Nutrition and Dietetics. University of Ghana. Ghana; [3]Professor. Department of Medical Laboratory Sciences. University of Ghana. Ghana; [4]Professor. Deparment of Pathology. University of Ghana. Ghana.

Background and objectives: Previous studies have suggested that good dietary diversity in the diet has an impact on micronutrient intakes and could be used as reliable measures for assessing nutrient adequacy. The objective of this study was to assess dietary diversity and determine its association with serum concentrations of iron, folate and vitamin B12.

Methods: A cross sectional study involving 203 pregnant adolescent girls was carried out. The minimum women dietary diversity score tool was assessed based on a 3-day 24-hour recall. Serum concentrations of vitamin B12, folate and iron were also measured

Results: The mean minimum dietary diversity score was 5.26±1.37. Z-test for proportions showed significant differences between the proportion of women who had good and poor diversities (41.3% vs 58.7%; P=0.013). Serum concentrations of iron, vitamin B12 and folate were 20.62±13.09μmol/L; 552.09±348.43ng/L and 3.72±ng/L respectively. Minimum dietary diversity score did not show any correlations with serum indices

Conclusions: Minimum dietary diversity score did not show any association with serum concentrations of iron, vitamin B12 and folate.

Keywords: Pregnant. Dietary diversity. Iron. Folate. Vitamin B12.

PREGNANT WOMEN'S FOOD IN TAKE DURING PREGNANCY – A CASE STUDY IN TESHIE, A SUBURB OF ACCRA

Akita, Morkor C.

FAO Regional Office For Africa. Nutrition Unit. Ghana

Background and objectives: The "Life Course Perspective" proposes that environmental exposures, such as, social, physical, biological, and behavioral factors, as well as life experiences, throughout the entire life span, influence health outcomes in current and future generations. Nutrition, from preconception to adulthood, encompasses all of these factors and has the potential to positively or negatively shape the individual or population health trajectories and their intergenerational differences. It is not just about eating food but it is about eating a well-balanced meal which has all the nutrients available to grow. A well-balanced diet is important for adequate nutrition to address common nutrient deficiencies among pregnant women that include iodine, iron, vitamin A and zinc. In settings where the prevalence of anaemia among women of reproductive age is 20% or higher, intermittent iron and folic acid supplementation is recommended as a public health intervention in menstruating women, to improve haemoglobin concentrations, iron status and reduce anaemia.

Methods: Study methods:
The study adopted a phenomenological case study approach. Using this qualitative methodology, this study fills a gap in the literature on pregnant women's experience in what to eat and why to eat that kind of foods during pregnancy. The voices of pregnant women were used in a form of narratives in the selected town. The kind of foods these women eat, during pregnancy forms the basis of this study.

Results: The research findings revealed different foods eaten by these pregnant women during pregnancy. Almost 75 percent of women between the ages of 18 – 25 years were eating what they were able to buy in terms of affordability, whilst the remaining 25 percent were following the prescribed menu from the antenatal clinics. Other findings were the social-cultural practices.

Conclusions: Poverty plays an important role in food intake and that it is not that awareness is not created or pregnant women have not been educated during antenatal about the kind of foods to eat during pregnancy but it is because they lack what it takes to buy the food. Majority confirmed that, they didn't have access to affordable healthy foods.

Institute of Hygiene, Epidemiology and Microbiology. Cuba; [5]BcS. Center of Nutrition and Food Hygiene. Institute of Hygiene, Epidemiology and Microbiology. Cuba; [6]BS. Center of Nutrition and Food Hygiene. Institute of Hygiene, Epidemiology and Microbiology. Cuba; [7]MSc. Statistc. Epidemiology Center. Institute of Hygiene, Epidemiology and Microbiology. Cuba.

Background and objectives: Background: Alzheimer's Disease, the most common form of dementia, is increasing at a rhythm without precedents at worldwide. Some epidemiological

studies have explored the relation between the diet and AD, some foods have been relationed with dementia, while others no.

Objectives: To evaluate the association between the food intake with MCI and AD with in Cuban elderly.

Methods: Cross sectional study in 424 subjects older than 65 years; 43 with AD, 131 with Mild Cognitive Impairment (MCI) and 250 normal subjects from Havana City. Dementia was diagnosed using the 10/66 Dementia and DSM-IV criteria and MCI with the Petersen criteria. Diet was evaluated using a weekly food-frequency questionnaire. Pearson's Chi square and prevalence ratios were used for data analysis.

Results: Food intake was not different between studied groups, with exception that cereals and tubers, intake was lowest in AD group. Fish, grains+fruits, vegetables, fats intake was inadequate in 80%, 60%, 50%, 50 % respectively, in the subjects of the three groups. It was not found any association between inadequate intake of different foods with the prevalence MCI and AD, only the inadequate intake of cereals and tubers was associated significantly with the prevalence of AD.

Conclusions: High frequency of older adults of three groups had insufficient intake of fish, grains+fruits, vegetables and fats. Only the insufficient intake the cereals and tubers was associated significantly with the prevalence of AD.

Keywords: Diet, Alzheimer's Disease, Cognitive Impairment.

DAILY CONSUMPTION OF CHOLESTEROL, SATURATED, MONO-UNSATURATED AND POLY-UNSATURATED FATTY ACIDS IN COLOMBIAN SCHOOLCHILDREN AND ADOLESCENTS

Tabares, Daniela; Arias, Katherine; Velasco, Carlos.

Universidad del Valle. Cali. Colombia.

Background and objectives: A diet that achieves a healthy lifestyle from the point of view of cardiovascular prevention corresponds to a prudent diet recommended for the whole pediatric healthy population. The objective is to determine the daily consumption of cholesterol (Cholest), saturated fatty acids (SFA), mono-unsaturated fatty acids (MFA) and polyunsaturated fatty acids (PUFAs) through a 24-hour reminder in Colombian children, according to the Program For the Evaluation of Diets and Food Data Management (DIAL)

Methods: Study of prevalence among schoolchildren (n=1221) and adolescents (n=1650) between 8-18 years of age in the Andean (La Unión=476), atlantic (Cartagena=427), pacific (Cali=1220, Quilichao=356) and amazonic (Florencia=392) zone, from public (n=2342) and private (n=529) school, to whom sociodemographic (age, sex) and anthropometric (weight, height, circumference of waist) variables and were diagnosed of malnutrition by body mass index, low height by height/age and abdominal obesity by waist circumference. Normal daily intake of Colest=300 mg/d, SAF=≤10% total caloric value (TCV), MFA=≤15% TCV and PUGAs=<10% TCV were considered according to age and sex

Results: 2871 Colombian children were included; 52.1% males; 12.9±2.4 years old; with kcal=1950.4±672.2 kcal/m2/d, Cholest=346.0±205.6 mg/d, SFA=149.6±129.7 mgr/d, MFA=165.5±145.0 mgr/d and PUFAs=144.4±142.8 mgr/d, with malnutrition=28.9%, low height=5.9% and 4.4% abdominal obesity. They presented a high daily consumption in Cholest=46.4%, SFA=49.3%, MFA=11.6% and PUFAs=43.7%; being possible risk factors for the consumption of Cholest, SFA and PUFAs, geographical area, school, sex and malnutrition (p <0.05)

Conclusions: The daily consumption of these Colombian schoolchildren and adolescents for Cholest, SFA and PUFAs is higher than 43.7%; being possible risk factors, geographical area, school, sex and nutritional status

Keywords: Cholesterol, Saturated fatty acids, Mono-unsaturated fatty acids, Polyunsaturated fatty acids, Children

THE INFLUENCE OF BREASTFEEDING HOSPITAL INITIATIVE ON NUTRITION KNOWLEDGE OF MOTHERS AND FEEDING PRACTICES OF CHILDREN IN LIMPOPO PROVINCE, SOUTH AFRICA

[1]*Mbhenyane, Xikombiso;* [2]*Mandiwana, Tshifhiwa;* [3]*Mushaphi, Lindelani Fhumudzani;* [2]*Mbhatsani, Vanessa;* [4]*Mabapa, Solomon;* [2]*Motadi, Selekane;* [2]*Mabasa, Eric;* [2]*Masia, Tirhani.*

[1]PhD. Dietitian. Division of Human Nutrition. Stellenbosch University. South Africa.; [2]Msc. Nutritionist. Department of Nutrition. University of Venda. South Africa.; [3]PhD. Dietitian. Department of Nutrition. University of Venda. South Africa; [4]Msc. Scientist. Department of Nutrition. University of Venda. South Africa.

Background and objectives: Baby Friendly Hospital initiative (BFHI) provides a vital contribution to achieving and sustaining the behaviours and practices necessary to enable every mother to give every child the best start in life by creating sustainable change beyond the hospital (WHO, 2008). The main aim was to evaluate the influence of BFHl on nutrition knowledge of mothers, breast feeding and feeding practices for children under two.

Methods: Cross sectional and exploratory with an analytical component. The target population was mothers with a new baby following their delivery either at the BHFI or Non-BFHI hospital. Mothers were purposefully recruited from randomly selected primary health care clinics located in the district. Data was collected by nutritionists using a validated questionnaire which had four sections namely demographic and environment factors, Nutrition knowledge on infant feeding, infant feeding practices, eating habits of children and mothers and a section for anthropometric data recording. Data was analyzed using SPSS, version 24. Descriptive statistics will percentiles, chi-square and Pearson's correlation with a p-value of >0.005.

Results: The final sample was 169 mothers and 169 children under two years. Data was analysed for 157 mother-child pairs with full data sets. 36.7% of mothers were from a BFHI status

hospital while 56.2% were from a Non-BFHI hospital. Mothers (61.7%) were aged between 21 – 30 years while children were between 7 – 24 months (91.5%).

Knowledge: 18.5% from BFHI status and 27.2% from Non-BFHI were taught on nutrition during pregnancy; 14.8% from BFHI status and 40.8% from Non-BFHI (p= 0.000) were taught on nutrition during breastfeeding; 15.4% from BFHI status and 35.4% from Non-BFHI (p = 0.009) were taught on nutrition during lactation.

Practices: 8.8% from BFHI status and 17.0% Non-BFHI exclusively breastfed their babies up to six months. 35.5% of all had already been started on formula with 24.3% having done so by 2 months. Many of the children had already been introduced to complementary feeds by 6 months with maizemeal porridge (65.1%) being the first food.

Conclusions: The level of knowledge was higher with mothers from the Non-BFHI hospitals and the feeding practices were also better.

Keywords: Breastfeeding hospital initiative; mothers; feeding practices of children

LEVEL OF KNOWLEDGE AND TEACHING OF INFANT AND YOUNG CHILD FEEDING (IYCF) PRACTICES AMONG HEALTH WORKERS IN DELTA STATE

[1]*Chrysanthus Chukwuemeka, Odo;* [2]*James, Okpoto;* [2]*Benson, Etchie.*

[1]BSc. Dietitian-Nutritionist. Deparament of Internal Medicine. Federal Medical Centre Asaba Delta State. Nigeria.; [2]Degree (Bsc). Nutritionist. Delta State Primary Health Care Development Agency (DSPHCDA). Delta State Ministry of Health. Nigeria.

Background and objectives: Background: Infant and young child nutrition can be improved if health workers (Nurses and Community Health Extension Workers) with adequate nutrition knowledge provide nutrition education to pregnant/lactating mothers who attend Ante-Natal/IYCF Welfare clinics.

Objectives: To determine the Level of knowledge and teaching of Infant and Young Child Feeding (IYCF) practices among Health Workers in Delta State.

Methods: 235 Primary Health Centres (PHCs) were randomly selected from 445 functioning PHCs in Delta State. The most senior health workers: 198 Nurses and 37 Community Health Extension Workers (CHEWs); one from each Centre were used for the study in May, 2015. The survey instrument was a structured and validated questionnaire. Data obtained were on the subjects` knowledge and teaching of early initiation, exclusive breastfeeding, complementary feeding, etc. The data was analyzed using Epi-info 7. Frequencies and percentages were the statistical methods adopted to separate and compare mean values.

Results: 98.7% of the subjects give nutrition education to pregnant/lactating mothers during Ante-Natal/IYCF welfare clinics.

31.9% teach mothers to initiate breastfeeding within 30 minutes of delivery, 1.3% could mention two signs of good attachment, 80% inform the mothers to request their babies weight any time they come to infant welfare clinics, 48.1% agreed that exclusive breastfeeding plus ARV drugs (for babies and positive mothers) is allowed respectively.

Conclusion: There is need to improve health workers` knowledge and counseling skills on IYCF practices through training and supportive supervision so as to enhancing the nutritional status of infants and young children.

Keywords: Knowledge, health workers, infant, young child, Delta state.

Dr. Lecturer. Department of Nutrition. Faculty of Medicine. Hasanuddin University. Indonesia.; [4]Ir. MKes. PhD Student. Airlangga University. Indonesia.; [5]Ir. MM. PhD Student at Brawijaya Malang. Indonesia.; [6]MD. MSc. Dr. Lecturer. Department of Nutrition. School of Public Health. Hasanuddin University. Indonesia.

Background and objectives: Antioxidant plays pivotal role to prevent abnormal pregnancy outcome that have correlation with oxidatif stress. This research aims to evaluate the effect of multiple (MMN) micronutrient supplementation in periconception period on the level of total antioxidant status (TAS).

Methods: Research was conducted in four sub-districts of the city of Makassar from January 2013 to October 2014 using a double-blind, randomized, controlled trial design. A total of 240 preconception women were recruited; 32 of these women became pregnant. The participants were randomly assigned into an intervention group (n=18) and a control group (n=14). The intervention group received (MMN) capsules, while the control group received iron/folic acid (IFA) capsules. The groups were instructed to take the capsules every day until a urine pregnancy test showed positive results for pregnancy. TAS eximinized using colorimetric tecnique. Statistical analysis was performed using the Wilcoxon and Mann-Whitney U tests.

Results: The results showed that the average level of TAS decreased in both the intervention (-0.09 ± 0.1 mmol/l; p=0.009) and control groups (-0.09 ± 0.1 mmol/l; p=0.01). However, these changes were not significant. Furthermore, the mean difference between the two groups was also not significant (p=0.76).

Conclusions: These findings suggest that periconceptional MMN supplementation can't prevent reduction of TAS in preg-

nant women. Future studies are needed to measure levels of vitamin A, C, and E as well as Iron, Zink, Selenium, and Copper to test their correlation with TAS in order to analyze the effect of multi micronutrient accurately.

Keywords: MMN, TAS, Periconception

NUTRITIONAL STATUS OF AUTISTIC AND NON-AUTISTIC SCHOOL GOING CHILDREN AGED 3-5 YEARS IN DHAKA CITY

[1]*Nourin, Israt;* [1]*Atiya, Naushin;* [1]*Jahan, Dilara;* [2]*Ratna, Moffashara Sultana;* [3]*Akter, Syeda Mahsina;* [4]*Ara, Ferdous;* [5]*Roy, Swapan Kumar.*

[1]BSc. Food & Nutrition. University of Dhaka. Bangladesh.; [2]MSc. Food & Nutrition. Assistant Professor. Dept. of Food & Nutrition. College of Home Economics. University of Dhaka. Bangladesh.; [3]MSc. (Food & Nutrition). MSc. (Nutrition and Health). Assistant Director. Bangladesh Breastfeeding Foundation. Bangladesh.; [4]MSc. MPhill. Senior Program Officer. Bangladesh Breastfeeding Foundation. Bangladesh.; [5]MBBS. MSc. Dip in Biotech. PhD. FRCP. Senior Scientist. Chairperson. Board of Trustees. Bangladesh Breastfeeding Foundation. Chairperson. Nutrition Foundation. Bangladesh.

Background and objectives: Early childhood (3-5 years) is very important for physical growth and nutritional development. Autistic children are one of the most vulnerable groups, so it is important to measure their growth & nutritional development. Their nutritional status is still unknown as no data about their nutritional status was found from previous studies in Bangladesh. So, the study objective was to observe and compare nutritional status of 3-5 years school going children with and without autism in Dhaka city, Bangladesh.

Methods: A cross-sectional study was conducted from April to December, 2016 among children aged 3-5 years with autism (n=53) and normal children (n=53), were selected from four schools in urban Dhaka city, Bangladesh.

Anthropometric data (height, weight & MUAC) were collected by following the standard method of WHO. Data was entered by WHO Anthro software and Z score classification was used to classify their nutritional status.

Results: The prevalence of stunting (<-2 HAZ) among autistic and normal children were 3.8% vs.1.9%. About 7.5 % wasting (<-2 WHZ) was seen in both groups of children. However, weight for age was significantly different in both groups of children. Among autistic and normal children underweight (<-2 WAZ) was found 1.9% vs. 7.5% and overweight (>2 WAZ) was 35.8% vs. 28.3%. According to MUAC reference value (>13.5) about 98.1% children of both groups had normal nutritional status.

Conclusions: It was seen that overweight percentage was found more among autistic and normal children. Many reasons

could be responsible for this condition such as lack of consciousness of parents about their children's dietary habit, inappropriate food intake, preference of fast foods, physical impairment of autistic children, less physical activity and so on. Awareness should be raised to pay attention to this vulnerable group for improving their situation. More future study on this field is now compulsory in Bangladesh to overcome the situation and reveal more about this area to add new knowledge and information.

COMPARATIVE STUDY ON FOOD PREFERENCE OF SCHOOL GOING CHILDREN AGED 3-5 YEARS WITH AND WITHOUT AUTISM IN DHAKA CITY

[1]*Atiya, Naushin;* [1]*Nourin, Israt;* [1]*Jahan, Dilara;* [2]*Ratna, Moffashara Sultana;* [3]*Akter, Syeda Mahsina;* [4]*Roy, Swapan Kumar.*

[1]BSc. Food & Nutrition. University of Dhaka. Bangladesh; [2]MSc. Food & Nutrition. Assistant Professor. Dept. of Food & Nutrition. College of Home Economics. University of Dhaka. Bangladesh.; [3]MSc. (Food & Nutrition). MSc. (Nutrition and Health). Assistant Director. Bangladesh Breastfeeding Foundation. Bangladesh.; [4]MBBS. MSc, Dip in Biotech. PhD. FRCP. Senior Scientist. Chairperson. Board of Trustees. Bangladesh Breastfeeding Foundation. Chairperson. Nutrition Foundation. Bangladesh.

Background and objectives: Food consumption pattern is one of the major contributors for optimal nutritional status of among children. A food consumption pattern varies due to food preference, acceptance and rejection behavior. It is therefore needed to explore the food preference, acceptance and refusal among the autistic children. The children with autism are most vulnerable who are disregarded from evidence. So, we considered autistic and non-autistic children of 3-5 years aged to compare their food preference, acceptance and rejection to understand their eating behavior. To the author's knowledge, such studies have not been conducted yet in Bangladesh. This research objective was to observe and compare food preference, acceptance and refusal of 3-5 years school going children with and without autism in Dhaka city, Bangladesh.

Methods: A cross-sectional study was conducted from April to December, 2016 among 3-5 years old children in four selected schools in urban Dhaka city, Bangladesh. Both normal and autistic groups contained 53 samples (n=53) each. The data was collected by a structured questionnaire to the parents of children about their children's food preferences, acceptance and refusal. The data was entered by IBM SPSS software (version 20.0) and analyzed by Chi-square test.

Results: There was a difference between the food preferences of two groups of children. However, both the group had special preferences. Homemade food was most accepted to the autistic children (58.5%), where the percentage for normal children was 52.8%; on the other hand 60.4 % normal children preferred fast food where the percentage for autistic was 56.6%. Soft drinks were

also more preferred by normal children (73.6%) than autistic children (58.5%). Street food was less preferred to the autistic children (22.6%), than normal children (15.1%).

Conclusions: The total amount and variety of consumed food by the autistic children was lower than children without autism. The reason could be their physical disability, chewing problem, carbohydrate intolerance, lack of caring practice etc.

Keywords: Food preferences, most preferred food, autistic children, and normal children.

DIET AND SEMEN QUALITY AMONG HEALTHY POLISH MEN

[(1)]*Danielewicz, Anna;* [(2)]*Przybylowicz, Katarzyna Eufemia.*

[(1)]MSc. Nutritionist. Department of Human Nutrition. University of Warmia and Mazury. Olsztyn. Poland.; [(2)]Associated Professor. Department of Human Nutrition. University of Warmia and Mazury. Olsztyn. Poland.

Background and objectives: It is estimated that in Central and Eastern Europe 8-12% of men are infertile, and in the case of 20% of infertile couples in the region, indicates a 56% part of the male factor in the occurrence of infertility [1]. Numerous studies have shown that a healthy diet with a high intake of fish and seafood, poultry, vegetables, fruits, legumes, through the high content of antioxidants are associated with better parameters of semen quality and reduced risk of asthenozoospermia [2].

To explore association between the frequency of intake of food groups and quality parameters of semen.

Methods: A study included 81men attending an infertility clinic. Diet was assessed using validated food frequency questionnaire (FFQ). Sperm concentration, progressive motility and morphology were evaluated by computer-aided semen analysis (CASA) according WHO criteria. Additionally evaluated weight and height, BMI and physical activity levels (IPAQ). Differences between tertiles of quality parameters of semen and the frequency of intake of food groups were assessed.

Results: We observed significant differences only between tertiles of sperm concentration and BMI (T2=25.0±2.0 vs. T3=25.4±2.3 times/day), progressive motility and processed meat (T1=0,22±0.32 vs. T3=0.43±0.46 times/day) and beer (T1=0.17±0.16 vs. T2=0.36±0.57 times/day). We also found differences in tertiles of sperm morphology and plant oils (T1=1.09±2.0 vs. T2=0.57±0.45 times/day), cottage cheese (T1=0.26±0.29 vs. T3=0.69±0.63 times/day), fresh legumes (T2=0.05±0.11 vs. T3=0.14±0.21 times/day), cruciferous vegetables (T2=0.29±0.24 vs. T3=0.59±0.48 times/day) vegetables rich on vitamin C or β-carotene (T2=1.15±0.81 vs. T3=2.20±1.86 times/day), and yellow-orange vegetables (T2=0.26±0.27 vs. T3=0.59±0.61 times/day). No relationship between physical activity and sperm parameters were identified.

Conclusions: Our findings suggest that a higher frequency of intake of cottage cheese, fresh legumes and various kind of vegetables may be associated with quality of semen. This positive associ-

DIETARY PATTERNS AND PRE-SARCOPENIA AMONG POLISH WOMEN

[(1)]*Danielewicz, Anna;* [(2)]*Przybylowicz, Katarzyna Eufemia;* [(3)]*Morze, Jakub.*

[(1)]MSc. Nutritionist. Department of Human Nutrition. University of Warmia and Mazury. Olsztyn. Poland.; [(2)]Associated Professor. Department of Human Nutrition. University of Warmia and Mazury. Olsztyn. Poland.; [(3)]Student. Department of Human Nutrition. University of Warmia and Mazury. Olsztyn. Poland.

Background and objectives: Pre-sarcopenia is a significant association factor for functional impairment among older adults [1]. Low muscle mass could be associated with increased morbi-mortality and should be identified for optimizing preventive and therapeutic nutritional strategies [2]. The aim of the present evaluation was describe association of the nutrients intake in dietary patterns and the risk of pre-sarcopenia in perimenopausal women.

Methods: A study included 530 women aged 32 - 63 years in Warmia and Mazury province in Poland. Low muscle mass was defined by Appendicular Lean Mass index based on Newman's equatation on the basis of total fat tissue mass and body height assuming the cut-off points for the Polish population. The nutrients intake evaluation was performed by a 24-hour recall repeated sevenfold at irregular intervals was taken into account. Dietary patterns were defined by principal component analysis with varimax rotation. Dietary patterns were included variables with loading vector > 0.7. The risk of pre-sarcopenia was assessed using logistic regression model.

Results: The Varied dietary pattern the risk of pre-sarcopenia decreased with the intake of total protein (OR=0.92, 95%CI=0.86-0.98), animal protein (OR=0.89, 95%CI=0.81-0.98), carbohydrates (OR=0.98, 95%CI=0.97-0.99), fiber (OR=0.85, 95%CI=0.72-1.00), calcium (OR=0.99, 95%CI=0.99-1.00), magnesium (OR=0.98, 95%CI=0.97-0.99), iron (OR=0.74, 95%CI=0.56-0.97), zinc (OR=0.61, 95%CI=0.41-0.90), vitamin A (OR=0.99, 95%CI=0.99-0.99), niacin (OR=0.78, 95%CI=0.63-0.97) and vitamin B6 (OR=0.17, 95%CI=0.02-0.83). There was no association between risk of pre-sarcopenia and nutrient intake in Fatty dietary pattern. In both dietary patterns, the risk of pre-sarcopenia decreased with increasing BMI and body fat content.

Conclusions: The identification of dietary patterns in pre-sarcopenia has important implications for dietary interventions that

---

might delay age-associated loss of skeletal muscle mass. It will allow to setting dietary recommendations to improve the quality of life of the elderly.

Internal Medicine Department. Institute of Biomedical Research in Malaga (IBIMA). Regional University Hospital of Malaga. CIBER Obn. Spain.

Background and objectives: The prevalence of child obesity is increasing rapidly worldwide. It is associated with several risk factors for later heart disease and other chronic diseases including hyperlipidaemia, hyperinsulinaemia, hypertension, and early atherosclerosis. A subgroup of obese subjects classified as "metabolically healthy obese" (MHO) present a favorable metabolic profile despite having excess body adiposity. The aims of this study were to study the obesity prevalence in our environment and analyzed how is the characteristics of their Mediterranean Diet (MedDiet) of a population of prepuberal MHO.

Methods: Seventy-eight prepuberal obese with a body mass index (BMI) ≥95 of 25.1±3.4 kg/m2 and aged 7.8±1.3 years. They present ≤1 of the following criteria: abdominal circumference and blood pressure, ≥90 percentile, impaired fasting glucose, HDL-C <40 mg/dL and triglycerides >90 mg/dL were included in this study. Food consumption was evaluated with a validated food-frequency questionnaire, exploring the consumption of carbohydrates, meat, milk derives, fish, fruit, vegetables, and olive oil. Adherence to the traditional MedDiet was assessed by a 13-point MedDiet scale that incorporated the main characteristics of this diet. Physical activity was evaluated by accelerometry (Actigraph TM GT3X).

Results: All population showed discrete levels of adherence to the MedDiet (7.1±1.8 points). On the other hand, we observed in baseline conditions an important energy intake in all subjects (2041.0±353 kcal), intake of total carbohydrate (217.0±44.2%), total proteins (85.2±15.1%), total fat (93.3±22.0%), saturated fatty acids (29.8±8.3), monounsaturated fatty acids (40.0±8.5), polyunsaturated fatty acids (14.6±5.7), cholesterol (336.8 ± 87.2 mg/d), fiber intake (12.7±4.0 g/d) and lastly, vitamin D intake was 1.6±1.2 g/d, without significant differences by gender. On the other hand, physical activity showed the high prevalence of sedentarism (866.1±284.3 min/d), and discrete physical exercise with light to moderate (94.5±52.6 min/d), moderate to vigorous (18.6±15.0 min/d) and total physical activity (367.7±148.8 counts/min*d).

Conclusions: A healthy lifestyle, adequate eating habits, and physical activity should be encouraged. A lack of physical activity has been reported to be a major predicting factor of childhood obesity, superseding compliance with a MedDiet.

KETOGENIC DIET (KD) FOR THE TREATMENT OF REFRACTORY EPILEPSY AND OTHER DISEASES IN CHILDREN AND ADOLESCENTS

[1]Grippo, Beatriz; [2]Gonzàlez, Silvana; [3]Benavente, Héctor Rodolfo.

[1]Licensed in Nutrition. Adolescence Program. Hospital of Clinics. Buenos Aires University. Buenos Aires. Argentina.; [2]Pediatric Resident Physician. Department of Pediatrics. Hospital of Clinics. Buenos Aires University. Buenos Aires. Argentina.; [3]Pediatric Neurologist. Children's Neurology Section. Hospital of Clinics. Buenos Aires University. Buenos Aires. Argentina.

Background and objectives: KD is a high fat, low carbohydrate diet, which controls refractory epilepsy when efficacy of antiepileptic drugs (AED) is limited. The aim of this study is analyze

efficacy, tolerability (T), and adverse effects (AE) of the KD on patients attended in KD program at Hospital of Clinics.

Methods: We used data of patients in KD between 2013-2017. Efficacy was measured by seizure frequency (SF) decrease and AED reduction. SF was evaluated according to parents´ chart SF per month prior to KD, and were compared with data obtained at baseline. Response to KD was measured after 6 months. T of diet acceptance by patients was evaluated as presence of nauseas or vomits. AE and reasons for diet discontinuation were registered. Response to KD was effective if was free of seizure from the start or if were seizure control >50%.

Results: The patients were 9 boys (82%) and 2 girls (18%). The ages, ranged from 18 months to 18 years and 10 months. Diet duration ranged from 3 months to 31 months. By the 6 month on diet, 7 patients (64 %) presented more than 50% decrease in SF, 3 of them (27%) were seizure free (one from the start; the others at 3 and 8 months, respectively). AED have been reduced, one patient (9%) cut drugs in half. All patients experienced cognitive improvement in life quality and cognitive skills. During the KD none patient refused the diet by its palatable characteristics, and none presented nauseas or vomiting. Adverse effects were observed in four patients (36%) that presented hypertriglyceridemia, symptomatic hypoglycemia, heartburn, selenium deficiency and hypocalcemia. The only reason for diet interruption was in one patient (9%) that presented psychiatrics symptoms.

Conclusions: KD has proven to be an effective clinical treatment for children with difficult- to-control seizures, often allowing medication reduction. All patients accepted KD very well. Adverse effects occurred, but none of patients needed discount the diet.

MODIFICATION OF DOCOSAHEXAENOIC ACID COMPOSITION OF MILK FROM WOMEN WHO RECEIVED DHA FROM A MILK FORMULA DURING THE PREGNANCY AND BREASTFEEDING PERIOD

(1)Valenzuela Baez, Rodrigo Wladimir; (2)Barrera, Cytnhia; (1)Bascuñan, Karla; (1)Chamorro, Rodrigo; (3)Valenzuela, Alfonso.

(1)Nutritionist. PhD. Nutrition Department, Faculty of Medicine, University of Chile. Chile; (2)Nutritionist. MSc. Nutrition Department, Faculty of Medicine, University of Chile. Chile; (3)Biochemistry. PhD. Lipid Center, Institute of Nutrition and Food Technology (INTA), University of Chile. Chile.

Background and objectives: Background: Docosahexaenoic acid (DHA, 22:6, n-3) is a LCPUFA fundamental for brain and visual function in humans. Western diet provides low DHA, which is reflected in low DHA in maternal milk. "Purita mama" is a milk formula distributed by the Chilean government as part of a social nutrition program (no cost by the beneficiary) for the women during of pregnancy and breastfeeding period. The formula provides 60 mg of DHA and 19 mg of eicosapentaenoic acid (EPA, 20:5, n-3)/ in 200 mL of formula when the product is reconstituted. The product was formulated as an alternative to provide n-3 PUFA with the aim to reduce deficit in the intake of DHA during the pregnancy and breastfeeding period.

Methods: Forty three healthy pregnant women (22-33 year-old), were randomly separated into two groups: control group (CG) with normal feeding (n = 21) and "Purita mama" group (PG) (n = 22), which received 400 mL/day of the formula from the third trimester of pregnancy until the first six months of nursing. The fatty acid profile of erythrocyte phospholipids, measured at six months of pregnancy, at the time of delivery and at six months of nursing, and the fatty acid profile of the milk collected during the first six months of breastfeeding period were assessed by gas-chromatography.

Results: PG, compared to the CG showed (i) a significant increase in DHA and EPA ingestion, no showing modification for ALA, linoleic acid (LA, 18:2, n-6) and arachidonic acid (AA, 20:4, n-6); (ii) a significant increase of erythrocyte DHA and EPA, whereas ALA, LA and AA were not modified; (iii) an increased milk content of DHA during the six months of breastfeeding period. ALA, LA, AA and EPA were not modified in breast milk in this period.

Conclusions: Consumption of "Purita mama" during the last trimester of pregnancy and the six months of breastfeeding increases the DHA content in breast milk. Acknowledgment: Supported by Grant 11140174 from FONDECYT (Initiation Program).

Keywords: Docosahexaenoic acid (DHA); pregnancy and breastfeeding period; milk formula "Purita mama"; breast milk.

INFANT FEEDING PRACTICES OF MOTHERS/CAREGIVERS AND ANTHROPOMETRIC INDICES OF INFANTS (0-12 MONTHS) IN ETCHE LOCAL GOVERNMENT AREA, RIVERS STATE, NIGERIA

(1)Oly-Alawuba, Nkeiruka; (2)Nwuzi, Ogechi.

(1)PhD. Nigeria. ; (2)BS. Nutrition. Nutrition and Dietetics. Imo State University. Nigeria.

Background and objectives: Infant nutrition is an integral part of infant health. The infant is more sensitive to abnormal nutritional situations and less adaptable than in later life to different types, forms, proportions and quantities of food (Ekpunobi, 2007). The study aims at assessing the infant feeding practices of mothers/caregivers and the Anthropometric Indices of infants (0-12 months) in Etche Local Government Area, Rivers State, Nigeria.

Methods: 207 infants (0-12 months) and their mothers were randomly selected from five communities in Etche by method of balloting without replacement. Information on infant feeding practices, demographic data, socio-economic data of the infants were obtained from the mothers using a structured and pre-tested questionnaire. Anthropometric measurement of the infants were carried out using standard methods and datas obtained were

converted to WHO standard using Anthro-Software. Information gathered from questionnaires were analyzed using the Statistical Package for Social Sciences (SPSS) Version 20. Results were presented in frequencies and percentages and categorized using (WHO) anthro software. Comparison was done using Chi- square test for statistics and variables were categorized using Anova.

Results: The study showed that 85% of mothers/caregivers practiced breastfeeding and put their infants to breast in less than one hour after delivery while 1.7% delayed till after 7days of delivery. 17% discarded the first milk after delivery, due to ignorance and lack of encouragement from the family. 49.1% of infants were breastfed for 5-10minutes at each feeding, 74.9% were given water and other foods apart from breastmilk. 44.5% were given complementary food, like pap. and 44.4% practiced bottle feeding.

The study depicted high rate of stunting as 39.1% and 8.7% of infants were severely and moderately stunted, 27.6% and 8% were severely and moderately wasted and 23.6% and 10.9% were severely and moderately overweight.

Conclusions: Poor infant feeding practices majorely resulted in high rate of stunting among the infants as observed in this study. Adaptation of appropriate infant and child feeding practices and Nutrition Education could remedy the situation and reduce the prevalence of malnutrition in children.

Keywords: Infant feeding practices, Caregivers, Anthropometric indices, Malnutrition.

MATERNAL DISSATISFACTION WITH CHILDREN'S BODY SIZE IN PRIVATE SCHOOLS IN THE FEDERAL DISTRICT, BRAZIL

[1]Pedroso da Silva, Jéssica; [2]Toral Bertolin, Maria Natacha; [2]Bauermann Gubert, Muriel.

[1]MSc. Nutritionist. Postgraduate Program in Human Nutrition. University of Brasília. Brazil.; [2]PhD. Nutritionist. Department of Nutrition. University of Brasília. Brazil.

Background and objectives: The presence of maternal dissatisfaction with the child's body size may affect maternal attitudes and practices related to child's food consumption. The aim of this study was to investigate the prevalence of maternal dissatisfaction with children's body size and its associated factors among mothers of first- to-third-grade elementary school students of private schools in the Federal District, Brazil.

Methods: A cross-sectional study with 554 mother-school-children pairs was conducted. Children had their weight and height measured and mothers completed an online questionnaire that evaluated sociodemographic data, maternal nutritional status (self-reported weight and height), maternal dissatisfaction with her own body size and maternal dissatisfaction with child's body size (using silhouette scales). Mothers identified the silhouettes that best represented them and their child's current and desired body. Disagreements were identified as dissatisfaction. Descriptive analyses, chi-square test, logistic regression and Spearman's corre-

lation were performed. This study was approved by the Research Ethics Committee of the University of Brasilia.

Results: Most mothers (50.9%) were dissatisfied with child's body size, 27.1% of those desired child weight gain and 23.8% child weight loss. 39.1% of mothers of normal weight children would like the child to gain weight. Regarding mothers of overweight and obese children, 48.7% and 83.1% wanted their child to loose weight, respectively. Mothers of boys and younger children were more likely to want their child to gain weight. Mothers of girls and overweight children were more likely to want their child to lose weight. A positive correlation was observed between maternal dissatisfaction with her own body size and with child's body size.

Conclusions: It was found that most mothers were dissatisfied with their child's body size and that mothers tend to transfer dissatisfaction with their own body size to their child's body size. Given this, it is important to control the silhouettes conveyed by the media, seeking to idealize a healthy silhouette as a pattern of beauty. In addition, it is also necessary to raise the awareness of families, so that, if dissatisfied with the child's body size, they seek qualified health professionals who can guide them.

Keywords: nutritional status; body size; children; mother-child relations.

PREVALENCE OF MALNUTRITION AND ASSOCIATED FACTORS IN ELDERLY IN GUALACEO TOWN, ECUADOR

[1]Espinosa Espinosa, Hermel Medardo; [2]Abril-Ulloa, Victoria; [1]Encalada Torres, Lorena Esperanza.

[1]MSc. Medical doctor. Faculty of Medicine. University of Cuenca. Ecuador.; [2]PhD. Nutrition and Metabolism. University of Cuenca. Ecuador.

Background and objectives: BACKGROUND
The progressive aging of the population brings with it several health problems; mainly nutritional. Malnutrition and factors that determine them are a worldwide concern; for this reason, the identification of these is fundamental because many of them could be modified, impacting in favor of a healthy aging.
OBJECTIVE
To determine the prevalence of malnutrition and associated factors in elderly in Gualaceo town, Ecuador.

Methods: Analytical cross-sectional study that involved 250 senior citizens. Sampling was probabilistic, stratified and randomized in 9 parishes of Gualaceo town, from the Azuay Province, in Ecuador. Nutritional status was assessed using the Mini Nutritional Assessment (MNA); associated factors such as depression, with the Yesavage Geriatric Depression Scale; physical activity with the International Physical Activity Questionnaire (IPAQ), socioeconomic level with the Survey Of Stratification of the Socioeconomic Level of the National Institute of Statistics and Censuses (INEC), and laboratory parameters: (hemoglobin, lymphocytes,

cholesterol and albumin). The analysis was performed using descriptive statistics and the association was measured with prevalence ratio (PR) and its 95% confidence interval (CI). A multivariate analysis was performed to corroborate this association.

Results: The prevalence of malnutrition was 20.4%, the risk of malnutrition was 47.2%, and 32.4% presented a satisfactory nutritional status. The mean age was 76.31 years (± 8.19). Factors with statistical association were: PR depression = 4.90 (95% CI: 3.08 - 7.79, p = 0.000); Sedentary lifestyle RP = 4.52 (95% CI: 2.81 - 7.28, p = 0.000); Low socioeconomic status RP = 4.04 (95% CI: 1.51-10.7, p = 0.001); Anemia in men and women PR = 2.43 (95% CI: 1.23 - 4.77, p = 0.018) and PR = 4.02 (95% CI: 2.17 - 7.63, p = 0.000) respectively. Hypoalbuminemia RP = 2.87 (95% CI: 1.08 - 4.58 p = 0.000). Multivariate analysis corroborated this association except for hypoalbuminemia.

Conclusions: One-fifth of the adult population of the Gualaceo town is malnourished and it is associated with: depression, sedentary lifestyle, low socioeconomic status and anemia.

Keywords: Older adults, elderly, malnutrition, associated factors

DIETARY PATTERNS AND BLOOD LIPIDS IN ADOLESCENTS AT 18 YEARS: CROSS-SECTIONAL ANALYSIS NESTED IN THE 1993 PELOTAS (BRAZIL) BIRTH COHORT

[1]Vaz, Juliana; [2]Buffarini, Romina; [3]Kac, Gilberto; [2]Bielemann, Renata; [4]Oliveira, Isabel; [5]Menezes, Ana; [6]Assuncao, Maria Cecilia.

[1]PhD. Nutritionist. Postgraduate Program in Epidemiology. Federal University of Pelotas. Pelotas. Brazil.; [2]PhD. Nutricionist. Postgraduate Program in Epidemiology. Federal University of Pelotas. Pelotas. Brazil.; [3]Professor. PhD. Nuritional Epidemiology Observatory. Federal University of Rio de Janeiro. Rio de Janeiro. Brazil.; [4]PhD. Institute of Biology. Federal University of Pelotas. Pelotas. Brazil.; [5]PhD. M.D. Post-Graduate Program in Epidemiology. Federal University of Pelotas. Pelotas. Brazil; [6]PhD. Post-Graduate Program in Epidemiology. Federal University of Pelotas. Pelotas. Brazil.

Background and objectives: Dyslipidemia in youth population indicates the need to understand its factors and the need to implement prevention measures. Dietary pattern analyses have emerged as a practical application to delivery information to the population. Here we aimed to establish dietary patterns and to examine whether these dietary patterns are associated with blood lipids at 18 years.

Methods: Cross-sectional analysis of 3,616 participants of the 1993 Pelotas (Brazil) Cohort Study followed up at 18th year. Semi-quantitative food frequency questionnaire was administered, and dietary patterns were established using principal component analysis. Total cholesterol, HDL-cholesterol, LDL-cholesterol and triglycerides were determined using an automatic enzymatic colorimetric method. Dietary pattern scores were analyzed by tertiles

of factor scores, and the independent association of each tertile on lipids was tested using crude and adjusted linear regression models stratified by sex. Triglycerides were log-transformed due to their asymmetric distribution.

Results: Meat and Fast Foods, Fruit and Vegetables, Candies, Sodas, and Dairies and Common-Brazilian patterns were derived. In the adjusted models in which the highest and lowest tertiles of DP scores were compared, we observed that for girls: 1) the third tertile of the Meat and Fast Food pattern presented 1.7 mg/dl (95%CI -3.21;-0.28) lower HDL-cholesterol; 2) the third tertile of the Candies, Soda and Diaries pattern presented triglycerides 5% higher; 3) the second (Beta -4.08, 95%CI -7.47;-0.68) and the third (Beta -4.46, 95%CI -8.41;-0.51) tertiles of the Common-Brazilian pattern presented 4 mg/dl lower total cholesterol, and 6% lower triglycerides; for boys 4) the third tertile of the Common-Brazilian presented 4.6 mg/dl (95%CI -7.91;-1.37) lower total cholesterol. The Fruit and Vegetables pattern was not associated with blood lipids.

Conclusions: Dietary patterns were associated with blood lipids in adolescents at the age of 18. Higher scores for the Common-Brazilian pattern were associated with lower total cholesterol in both sexes. Our results emphasize the importance in understanding the perception of eating patterns among adolescents and the efforts to maintain traditional foods in their diets.

CORRELATION OF PARENTAL ECONOMIC STATUS WITH LUNCH INTAKE AND LIFESTYLE BEHAVIORS IN PRESCHOOL CHILDREN IN JAPAN

[1]Naoko, Yamada; [2]Akiko, Shikano; [2]Shingo, Noi.

[1]MD. Nutritionist. Graduate school of Nippon Sports Science University. Japan.; [2]PhD. Nippon Sports Science University. Japan.

Background and objectives: In Japan, concerns about childhood poverty have recently increased, and the "Measures to Counter Child Poverty Law" was enacted in 2014. Various support initiatives have also been introduced at the community level; for example, cafeterias called "kodomo shokudo" have been established where local children and parents can gather for a low-priced meal and food banks. This reflects the fact that childhood poverty is a serious social problem in Japan, and that measures to combat it are urgently needed. In this context, there is concern that the eating and lifestyle behaviors of children who are raised in economically deprived households will negatively affect their health and subsequent development. Nevertheless, very few reports exist on these issues. Similarly, few studies have been published on the effects of poverty on childhood lifestyle behaviors, which can affect eating habits and health in japan. Thus, by focusing on the lunchbox that each child brings to preschool, this study aimed to investigate the relationship of parental economic status with children's lunch intake and lifestyle behaviors.

Methods: This study was conducted at a public kindergarten in Tokyo in November 2016, and it included 67 children and their parents. The study surveyed lifestyle behaviors and food intake (in weight) at lunchtime. For the survey on food intake, the lunchbox was weighed before and after the meal for 4 days, and the average was calculated. For the survey on lifestyle behaviors, a questionnaire was distributed for anonymous completion by parents. Data were collected on the child's physical activity, sleep, eating habits, and parental economic status.

Results: With body mass index as the control variable, the results showed a weak correlation (r=0.308, p=0.014) with lunch intake. By dividing economic status into two groups and using Fisher's exact test, a significant correlation was found between bedtime (p=0.014) on school nights and bedtime on non-school nights(p=0.043).

Conclusions: The results of this survey showed several links between economic status, food intake at lunchtime, and lifestyle behaviors; however, due to the small number of participants, further study with a larger numbers of test subjects is required.

Keywords: toddler, child, lifestyle, box lunch

THE BABY-FRIENDLY HOSPITAL INITIATIVE AND BREASTFEEDING AT BIRTH IN BRAZIL: A CROSS SECTIONAL STUDY

[1]Siqueira Boccolini, Cristiano; [2]Couto de Oliveira, Maria Inês; [2]Lázaro de Carvalho, Márcia; [2]Leal, Maria do Carmo.

[1]ICICT/Fiocruz. Brazil.; [2]Rio de Janeiro. Brazil.

Background and objectives: Breastfeeding in the first hour after birth is important for the success of breastfeeding and in reducing neonatal mortality. Government policies are being developed in this direction, highlighting the accreditation of hospitals in the Baby-Friendly Hospital (BFH) initiative. The aim of this study was to analyze the association between delivery in a BFH (main exposure), compared to non BFH, and timely initiation of breastfeeding (outcome).

Methods: Data came from the "Birth in Brazil" survey, a nationwide hospital-based study of postpartum women and their newborns, coordinated by the Oswaldo Cruz Foundation. A sample of 22,035 mothers/babies was analyzed through a hierarchical theoretical model on three levels, and all analyzes considered the complex sample design. Odds ratios were obtained by logistic regression, with a 99 % CI.

Results: Among all births, 40 % occurred in hospitals accredited or in accreditation process for the BFHI and 52 % of women underwent caesarean section. In the final model, at the distal level, mothers less than 35 years old, and those who lived in the North Region, had a higher chance of timely initiation of breastfeeding. At the intermediate level, prenatal care in the public sector and advice on breastfeeding during pregnancy were directly associated with the outcome. At the proximal level, being born in a Baby-Friendly Hospital and vaginal delivery increased the chance of

timely initiation of breastfeeding, while prematurity and low birth weight reduced the chance of the outcome.

Conclusions: The studied proximal factors were the most strongly associated with timely breastfeeding, bringing evidence about the importance of adopting Baby-Friendly Hospital Initiative to improve perinatal practices and timely breastfeeding initiation. Special attention should be given to the negative association found between caesarean section delivery without clinical indication and breastfeeding in the first hour after birth, bringing more evidence to the ongoing government efforts to diminish this harmful practice in Brazil. We recommend the reinforcement of BFHI implementation, extending this initiative to the private sector. This measure could contribute not only to improve timely breastfeeding rates, but also reducing unnecessary caesarean section delivery.

THE INFLUENCE OF PRENATAL EXPOSURE TO TRANS-FATTY ACIDS FOR DEVELOPMENT OF CHILDHOOD LEUKEMIA

[1]Specht, Ina Olmer; [2]Huybrechts, Inge; [3]Frederiksen, Peder; [4]Steliarova-Foucher, Eva; [2]Chajes, Veronique; [5]Heitmann, Berit Lilienthal.

[1]PhD. Research Unit for Dietary Studies at The Parker Institute. Bispebjerg and Frederiksberg Hospital. Denmark; [2]PhD. International Agency for Research on Cancer (IARC). Nutritional Epidemiology Group. France.; [3]Dr. Research Unit for Dietary Studies of The Parker Institute. Frederiksberg and Bispebjerg Hospital. Denmark.; [4]PhD. International Agency for Research on Cancer (IARC). Cancer Surveillance Section (CSU). France.; [5]Professor. Research Unit for Dietary Studies of The Parker Institute. Frederiksberg and Bispebjerg Hospital. Denmark.

Background and objectives: Industrial trans-fatty-acids (TFA) can be found in fried and industrially-processed baked foods and have been associated with negative health outcomes including cancers in adults. Neonates with high umbilical TFA levels have shown less favorable neurodevelopment and increased risk for metabolic diseases. TFA has pro-inflammatory properties and can inhibit metabolism of essential fatty-acids which might be the mechanisms behind the observed associations with cancer risk. Despite the alarming evidence and the fact that millions of Europeans have high TFA intake, currently no EU legislation regulates TFA in foods. In Denmark, a maximum TFA content of 2g/100g is allowed in all Danish produced and imported food since 2004. We aimed to investigate if low gestational TFA exposure, due to the TFA legislation in Denmark, decreased the offspring's childhood leukemia risk.

Methods: In this national, registry-based study, onset of leukemia before the age of 8 years was compared between the trans-

---

fat exposed cohorts born between January 1st 2000 – August 31st 2004, and the non-exposed cohorts born between September 1st 2004 – December 1st 2007. The incidence trends were evaluated using piecewise linear splines in a Cox proportional hazard model.

Results: Among all 305,220 children born in Denmark in the defined cohort before the TFA-legislation in 2004, 176 were diagnosed with leukemia before their 8th birthday, compared to 125 among 215,216 children born after the TFA-legislation. The hazard ratios and 95% confidence intervals were 1.10 (0.99,1.23) and 0.97 (0.84,1.04), respectively. This corresponds to an increase of 10% in leukemia rates per year before the TFA-legislation and a decrease of 3% per year after the legislation (p=0.38).

Conclusions: The small, albeit statistically non-significant, decrease in leukemia incidence after the legislation supports the need for further analysis including additional birth cohorts. Additional analysis of biomarkers of neonatal TFA in cases and matched controls on individual level will help to separate the TFA effect from other risk factors.

CONCENTRATIONS OF CAROTENOIDS AND TO-COPHEROLS IN BREAST MILK FROM URBAN CHINESE MOTHERS AND THEIR ASSOCIATIONS WITH MATERNAL CHARACTERISTICS

Xue, Yong; Zhang, Yumei; Zhao, Ai.

PhD. Nutritionist. Department of Nutrition & Food Hygiene. School of Public Health. Peking University Health Science Center. China.

Background and objectives: This cross-sectional study aims to quantify of carotenoids (β-carotene, β-cryptoxanthin, lutein, lycopene and zeaxanthin) and tocopherols (α-tocopherol and γ-tocopherol) in human milk from healthy Chinese women, to compare their concentrations between different regions and lactation stages, and to identify maternal socio-economic and obstetric factors that may affect these concentrations.

Methods: Human milk was obtained from 509 healthy nursing mothers from Beijing (n = 151), Suzhou (n = 180) and Guangzhou (n = 178) cities. The compounds of interest (β-carotene, β-cryptoxanthin, lutein, lycopene, zeaxanthin and vitamin E as α-tocopherol and γ-tocopherol) were analyzed by high-performance liquid chromatography after mild saponification and solvent extraction. Socio-economic and obstetric characteristics of the mothers and their dietary intakes through a single 24-hour dietary recall were evaluated.

Results: The concentration of the studied compounds in human milk varied greatly among individuals. The median contents of each component [microgram per 100 mL, median (interquartile range)] in colostrum and mature milk was, respectively, β-carotene 8.0 (4.7-15.2) and 1.8 (1.4-2.7), β cryptoxanthin 6.2 (2.4-12.9) and 1.8 (1.1-3.4), lutein 5.7 (2.9-10.2) and 3.4 (1.5-6.0), lycopene 6.3

(4.0-9.9) and 1.4 (1.1-2.0), zeaxanthin 1.0 (0.6-1.5) and 1.0 (0.6-1.4), α-tocopherol 645 (388-1176) and 211 (131-321), γ-tocopherol 68 (48-121) and 77 (45-120). The levels of all those vitamins presented regional differences, and decreased as lactation stage increased except for zeaxanthin and γ-tocopherol. Associations of carotenoid contents with maternal education, delivery mode, and present body mass index were found in multivariate analyses.

Conclusions: These results suggest that some regional, obstetric, and socio-economic factors have an effect on human milk concentrations of carotenoids and vitamin E in healthy Chinese mothers. Thus, it is necessary to continue research to provide biological significance of such results and improve knowledge on the unique composition of human milk.

Keywords: Breast milk; carotenoids; tocopherols; cross-sectional study

ADHERENCE TO DIETARY RECOMMENDATIONS MODIFIES GUT MICROBIOTA RICHNESS AND COMPOSITION DURING PREGNANCY

[1]*Laitinen, Kirsi;* [2]*Mokkala, Kati;* [3]*Vahlberg, Tero;* [4]*Röytiö, Henna.*

[1]PhD. Nutritionist. Institute of Biomedicine. University of Turku. Finland.; [2]MSc. Institute of Biomedicine. University of Turku. Finland.; [3]MSc. Department of Clinical Medicine. University of Turku. Finland.; [4]PhD. Institute of Biomedicine. University of Turku. Finland.

Background and objectives: Pregnant women, particularly those with manifest overweight or obesity, are encouraged to follow dietary recommendations to advance the health of both mother and child. The extent to which diet composition influences gut microbiota during pregnancy is not known. This regardless the increasing knowledge of the importance of gut microbiota in regulating host metabolism and health. The objective was to explore the impact of the adherence to the dietary reference values on gut microbiota in pregnant women.

Methods: Overweight and obese women (n=100) were studied at early pregnancy (<17 weeks). Intakes of nutrients were calculated from 3-day food diaries, and the subjects were grouped according to adherence to the dietary recommendations. Faecal microbiota composition was analysed using 16S rRNA gene sequencing. Chao1 index was defined as a measure of species richness. Differences in microbiota among dietary groups were tested by Mann-Whitney U-tests using Bonferroni corrections following significant Kruskal-Wallis tests.

Results: The recommended dietary intake of fibre and fat was related to higher gut microbiota richness: Chao1 index was higher in the high-fibre/moderate-fat group compared to the low-fibre/high-fat group (mean 406.2 vs. 341.0, P=0.006), whilst low-fibre/moderate-fat group did not differ from the other groups (Chao 1 index: 380.0). Moreover, the relative abundance of specific microbial phyla, families and genera were significantly different among the three dietary groups, the most evident difference being in the Bacteroidaceae.

Conclusions: Adherence to the recommended dietary intake, particularly that of fibre intake, was linked to a richer gut microbiota. Dietary manipulation could be an effective means for improving the gut microbiota balance during pregnancy with potential health benefits.

Keywords: diet, dietary recommendations, pregnancy, microbiota, microbiota richness

THE RELATIVE IMPORTANCE OF WASTING AS A PREDICTOR OF LATER STUNTING OR DEATH

[1]Wright, Charlotte; [2]Tough, Fraser; [3]McColl, John; [4]Cole, Tim; [5]Bland, Ruth; [6]Zaman, Shakila; [7]Ashorn, Per.

[1]MD. Dept Child Health. University of Glasgow. UK.; [2]PhD. Medical Statistics. University of Glasgow. UK.; [3]PhD. Medical Statistics. University of Glasgow. UK.; [4]ScD. UCL Great Ormond Street Institute of Child Health. UK.; [5]Wellcome Africa Centre. South Africa.; [6]PhD. School of Public Health. Lahore Medical and Dental College. Pakistan.; [7]Center for Child Health Research. University of Tampere. Finland.

Background and objectives: It is generally assumed that wasting occurs early in the malnourished state and then progresses onto stunting, but most studies lack the repeated measurements needed to establish this sequence. our objective was to combine longitudinal growth datasets to describe pathways through different nutritional states to later stunting or death and how this varies by age.

Methods: Existing longitudinal datasets from Malawi, South Africa and 4 socio-economically distinct Pakistani communities were combined and the 6907 individuals classified at ages 3, 6, 9 and 12 months as normal, wasted (BMI <-2SD;2-5%), stunted (Length <-2SD; 17-26%) or wasted&stunted (3-4%). In total 20% had died by 12 months.

Results: Up to 14% of all wasted&stunted children went on to die in the next 3 months, with relative risks (95%CI) compared to normal children at 3-6, 6-9 and 9-12 months of 11.1 (6.4, 19.1), 10.0 (1.7, 59.7) and 5.4 (2.6, 11.0). Wasted children also had higher mortality and had the highest risk between 9-12 months (11.5, 1.9 to 68.1). Stunted children were also significantly more likely to die between 3-6 months (3.0, 1.7 to 5.2) and 9-12 months (4.8; 1.2 to 18.5) but not 6-9 months (1.0, 0.5 to 2.1).

Children who were wasted were only significantly more likely than normal children to move into a stunted state between 3-6 months (1.75, 1.21 to 2.53). Over 3-6-9 months only 0.9% of children moved from normal to stunted via wasted, while 17% moved directly from normal to stunted. Once stunted 59-80% remained so, while 39-40% of wasted children reverted to normal.

Conclusions: Most children become stunted without prior wasting. Wasting is a major risk factor for death in infancy, but those wasted children who survive are likely to revert to normal rather than become stunted.

FACTORS ASSOCIATED WITH EARLY INITIATION OF BREASTFEEDING AND COMPLEMENTARY FEEDING PRACTICES IN INFANTS AND YOUNG CHILDREN IN RURAL AREA OF SENEGAL

[1]Badiane, Abdou; [2]Diouf, Adama; [3]Sarr, Mariama; [3]Dione, Justine; [2]IDOHOU-DOSSOU, Nicole; [2]Wade, Salimata.

[1]MSc. Nutritionist. Laboratoire de Nutrition. Faculté des Sciences et Techniques. Université Cheikh Anta Diop of Dakar. Senegal.; [2]PhD. Nutritionist. Laboratoire de Nutrition. Faculté des Sciences et Techniques. Université Cheikh Anta Diop. Senegal.; [3]MSc. Nutritionist. Laboratoire de Nutrition. Faculté des Sciences et Techniques. Université Cheikh Anta Diop. Senegal.

Background and objectives: Breastfeeding and complementary feeding practices in developing counties are influenced by variety of demographic, socio-cultural, and health-related factors. This study aimed to assess breastfeeding and complementary feeding practices and associated factors among mother-child pairs 0-23 months living in Mbadakhoune, a rural area of Senegal where malnutrition is still prevalent.

Methods: A total of 202 mother-child pairs (102 aged 0-5 months, and 100 aged 6-23 months) were interviewed using socio-demographic and child feeding questionnaire including Early Initiation of Breastfeeding (EIBF), Minimum Dietary Diversity (MDD). Weight and height were measured and WHZ and HAZ calculated. Descriptive statistics and multivariable logistic regression analysis were used to identify factors associated with EIBF and MDD.

Results: Stunting and wasting affected 12.7% and 13.7% of the children 6-23 months old, respectively. Among the 0-5 months old infants, 91% (n=96) have received the colostrum after birth but only 32% of the mothers have practiced EIBF. EIBF was associated with mother's occupation [odds ratio (OR) =2.7, p=0.02], breastmilk given as first food between 2-24 hrs after delivery (OR=3.0, p=0.01), and positive view about EIBF of the father (OR=4.1, p=0.005), and the family members or neighbours (OR=3.2, p=0.008). Among the 6-23 months old children, 59% (n=59) met MDD (score ≥ 4). MDD was significantly associated with consumption of family meal that contains at least 4 food groups (OR=7.2, p=0.004), number of meals consumed (OR=14.9, p<0.001), and age group (OR=3.0, p=0.01).

Conclusions: Breastfeeding practice is still low in this rural area of Senegal. EIBF was strongly influenced by socio-cultural factors particularly those related to family decision-makers. The prevalence of MDD in the children > 6 months old was more related to family meals consumed as complementary food rather than dietary diversity. Availability of nutrient-rich foods, along with new communication strategies targeting key decision-makers, are urgently need to improve infant and young child feeding.

DETERMINANTS OF ANEMIA AMONGST GERIATRIC SUBJECTS LIVING IN HIGH ALTITUDE REGIONS OF INDIA

Gupta, Aakriti.

PhD Scholar. Department of Food and Nutrition. Lady Irwin College. Delhi University. India.

Background and objectives: Anemia has been identified as a risk factor for increased morbidity and mortality amongst geriatric subjects. There is lack of scientific evidence on the prevalence of anemia amongst the geriatric population living in high altitude regions of India. Hence, we conducted the present study to fill the gap in the existing knowledge.

Methods: A community based cross-sectional study was conducted during 2015-2016 in District Nainital, Uttarakhand state, India. A total of 958 geriatric subjects were enrolled from 30 clusters (villages) identified by using population proportionate to size sampling methodology. Hemoglobin was estimated amongst the subjects using cyanmethemoglobin method. The Hemoglobin values were adjusted for smoking and altitude. Data was also collected on dietary pattern using 24hr recall, food frequency questionnaire from all the geriatric subjects.

Results: We found that all the geriatric subjects living at high altitude regions had anemia. The prevalence of moderate anemia (Hb 8-10g/dl) was 85% (n=814) and severe anemia (Hb <8g/dl) was observed in 15% (n=144) of the subjects. Female subjects (6.9±0.8g/dl) had significantly lower hemoglobin level than the male subjects (7.45±1.0g/dl) (p<0.001).

Majority of the geriatric subjects did not consume the recommended daily intake for nutrients such as energy (78%), protein (78%), iron (72%), folic acid (72%) and vitamin C (42%). Food groups rich in micronutrients such as pulses, green leafy vegetables, fruits, nonvegetarian food items, and were consumed irregularly (less than once a week) by the subjects. Subjects with severe anemia had significantly lower dietary intake of iron (16.8 ±12.3mg) (p<0.01), folic acid (161.3 ±87.7µg) (p<0.01) and vitamin C (57.9 ± 52.2 mg) (p<0.001) in the diet as compared to the subjects with moderate anemia for iron (23.8 ±16.3mg), folic acid (224.3 ± 125.6 µg) and vitamin C (97.0 ± 75.6mg).

Presence of fatigue was reported to be significantly higher in subjects with severe anemia (29.4%) as compared to subjects with moderate anemia (20.2%) (p<0.05).

Conclusions: The present study suggests that anemia is a major public health problem in the geriatric population residing in high altitude region of India, possibly due to less intake of total quantity of food with poor micronutrient quality.

Spain.; [8]PhD. Department of Pediatrics. Medical University of Vienna. Austria.; [9]PhD. GENUD (Growth, Exercise, Nutrition and Development) Research Group. Department of Physiatry and Nursery. University of Zaragoza. Spain.

Background and objectives: Among other predisposing factors, diet determines peak bone mass during adolescence. Describing and quantifying diet through dietary scores enables the study of the entire diet, rather than individual foods and nutrients. The aim of the present study was to assess the associations between different dietary scores and the bone mineral content (BMC) measured with dual-energy X-ray absorptiometry (DXA) at the whole body (WB), lumbar spine (LS), femoral neck (FN) and hip sites among Spanish adolescents.

Methods: 197 participants (48% males), 12.5-17.5 y, from the HELENA study were included. The Mediterranean diet score for Adolescents (MDS-A), and the Diet Quality Index for Adolescents (DQI-A) were calculated based on two 24h dietary recalls obtained with the HELENA DIAT software. The relationship between dietary patterns and bone outcomes was analyzed using logistic regression models taking into account different covariates as follows: model 1 included sex, Tanner, mother education and family affluent scale index and model 2 included model 1 + physical activity and lean mass.

Results: DQI-diversity was positively associated with WB BMC (1.089; 1.014-1.168). According to the MDS-A, fruits and nuts intake was positively associated with WB (3.613; 1.508-8.653) and FN (3.937; 2.003-18.652) BMC. Cereals and roots intake was positively associated with hip BMC (3.033; 1.436-6.406). According to the DQI-A, fruit equilibrium (1.018; 1.002-1.034) and adequacy (1.020; 1.004-1.037) were positively associated with WB BMC. Vegetable adequacy was inversely associated with WB (0.984; 0.969-0.997) and hip (0.986; 0.972-0.999).

Conclusions: A specific dietary score is not associated with bone health in European adolescents. Some dietary components, like diet diversity or fruit and nuts intake may be associated with an increased likelihood of having an adequate BMC during adolescence.

PREVALENCE, AND CO-OCCURRENCE OF CARDIO-METABOLIC DISEASE IN THE CONTEXT OF THE NUTRITION TRANSITION IN THE PHILIPPINES: THE CEBU LONGITUDINAL HEALTH AND NUTRITION SURVEY

[(1)]Adair, Linda; [(2)]Carba, Delia; [(2)]Duazo, Paulita.

[(1)]PhD. Professor. Department of Nutrition. University of North Carolina at Chapel Hill. North Carolina. USA.; [(2)]Senior Research Associate. Office of Population Studies Foundation Inc. University of San Carlos, Philippines.

Background and objectives: The nutrition transition, marked by changes in dietary patterns and physical activity, is associated with increases in obesity, hypertension, and diabetes in many low and middle income countries. Despite their contribution to mortality, the patterns and changes in co-occurrence of these conditions change with age and over time has not been studied in LMICs. We examine predictors of prevalence, and patterns of co-occurrence of overweight and obesity [OW=BMI>25 kg/m2], high waist circumference [WC>80 cm], diabetes, and hypertension from 1998-2016 among Filipino women participating in the Cebu Longitudinal Health and Nutrition Survey [CLHNS].

Methods: The CLHNS is a community-based study that recruited >3000 pregnant women in 1983-84, and has followed them in multiple survey rounds across > 30 years. Data from the 5 most recent survey rounds (1998-2016) also included blood pressure measured by trained interviewers, and diabetes status (self-reported in 1998 and 2002, fasting glucose in 2005, and HbA1c in 2012 and 2016). Hypertension and diabetes were defined according to International Diabetes Federation cutpoints. Women, who ranged in age from 29 to 62 in 1998, were grouped in each year according to the presence/absence of OW, high WC, Hypertension and diabetes, and we used multinomial logistic regression to identify factors associated with membership in each group

Results: Comparing 1998 to 2016: The occurrence of having none of these conditions declined from 50% to 20%; being "metabolically healthy" (OW or high WC but no hypertension or diabetes) declined from 26% to 17 %, hypertension increased from 21% to 59%, and diabetes increased from 2% to 14%. On average across all years, only about half of women with hypertension were OW or had high WC. In general, women in groups that included OW or high WC were older, taller, from more urbanized communities, and households with higher assets. The lowest prevalence of these adverse conditions was in rural, more disadvantaged women. Further analyses will explore the role of diet and other lifestyle factors.

Conclusions: Urbanization and increasing socioeconomic status are strongly related to rising prevalence and co-occurrence of cardio-metabolic diseases as women move from middle to older adulthood.

Keywords: nutrition transition, aging, cardiometabolic disease, Philippines

MATERNAL PERCEPTION OF CHILDREN'S NUTRITIONAL STATUS IN THE FEDERAL DISTRICT, BRAZIL

[(1)]Pedroso da Silva, Jéssica; [(2)]Toral Bertolin, Maria Natacha; [(2)]Bauermann Gubert, Muriel.

[(1)]MSc. Nutritionist. Postgraduate Program in Human Nutrition. University of Brasília. Brazil.; [(2)]PhD. Nutritionist. Department of Nutrition. University of Brasília. Brazil.

Background and objectives: Maternal perception of child's nutritional status can influence child's feeding, maternal controlling feeding practices and the prevention and treatment of childhood overweight. Thus, the aim of this study was to evaluate the prevalence of misperception and factors associated with maternal perception of the nutritional status of first- to third-grade elementary school students from private schools in the Federal District, Brazil.

Methods: This cross-sectional study was conducted with 554 mother-child pairs. Children's nutritional status was assessed by anthropometric measures. Mothers completed an online questionnaire about sociodemographic data, mother's self-reported weight and height and maternal perception of child's nutritional status (silhouette scale for children). Mothers identified the silhouette that best represented the current body of their child, and it was verified the agreement between this and the real silhouette of the child, measured by anthropometry. If the chosen silhouette was smaller than the real silhouette, it was considered that the mother underestimated the child's nutritional status, and if it was larger, it was considered that the mother overestimated the child's nutritional status. Descriptive analyses, chi-square test and logistic regression were performed. This study was approved by the Research Ethics Committee of the University of Brasilia.

Results: Only 30.0% of the mothers chose the appropriate silhouette to represent child's nutritional status, whereas 28.0% overestimated and 42.0% underestimated it. Regarding mothers of normal and overweight children, 46.2% and 39.3% underestimated the nutritional status of their child, respectively. About a quarter (25.3%) of the mothers of obese children, underestimated the nutritional status of their child, whereas almost half overestimated it (47.9%). Highly educated mothers and mothers of male children or of non-overweight children were more likely to underestimate child's nutritional status. Conversely, mothers below 35 years of age and mothers of female children or of overweight children were more likely to overestimate child's nutritional status.

Conclusions: There was a high prevalence of misperception, with most of the normal weight and overweight children having

their nutritional status underestimated. However, for obese children, almost half of mothers overestimated their nutritional status. This situation is worrying, since maternal distortion influences child feeding and can lead mothers to controlling feeding practices.

is a cause or a consequence of their malnutrition, but it does not seem to be a result of maternal feeding behaviour. A better understanding of the role of force-feeding and factors that motivate eating is required to design effective feeding interventions.

144/888

EATING AND FEEDING BEHAVIOURS IN HEALTHY AND MALNOURISHED CHILDREN AGED 6-24 MONTHS IN URBAN SLUMS IN NAIROBI

[1]*Mutoro, Antonina;* [2]*Garcia, Ada;* [3]*Kimani-Murage, Elizabeth;* [4]*Wright, Charlotte.*

[1]Msc. Human Nutrition. University of Glasgow. United Kingdom.; [2]PhD. Human Nutrition. University of Glasgow. Glasgow. United Kingdom.; [3]PhD. African Population and Health Center. Nairobi. Kenya.; [4]M.Sc MD. Child Health. University of Glasgow. Glasgow. United Kingdom.

Background and objectives: Feeding practices influence nutrient intake but few studies assess how child eating and maternal feeding behaviour relate to child malnutrition. This study aimed to describe eating and feeding behaviour in healthy and malnourished infants aged 6-24 months in Nairobi, Kenya.

Methods: We recruited 415 infants from child welfare clinics and outpatient therapeutic programs in urban slums in Nairobi, of whom 172 (41.4%) were healthy (weight for age >-2 Z scores) and 243 malnourished (weight for age or weight for length <- 2 Z scores or length for age <-3 Z scores) using WHO growth standards. A structured interview guide was used to collect information on breastfeeding, meal frequency and dietary diversity and generate scores for child interest in food and food refusal, maternal force-feeding and anxiety.

Results: Compared to healthy children, malnourished children were more likely not to be breastfeeding (malnourished 11.5%; healthy 5.2% P=0.002) but there was no association between meal frequency, dietary diversity and child nutritional status.

They also had lower interest in food (malnourished 34.2%; healthy 14.0% P=<0.001) and higher food refusal (malnourished 30.9%; healthy 10.5% P=<0.001); and their mothers were more likely to be anxious about feeding them (malnourished 20.6%; healthy 6.4% P=<0.001). Within the malnourished group, 49.4% had either low interest in food or high food refusal compared to 19.8% in the healthy group (P<0.001).

Force-feeding was common in both groups, with a non-significant trend towards more force-feeding in the malnourished infants (malnourished 41.4%; healthy 34.5% P=0.087). Children with low interest in food odds ratio [95% CI] 3.72 [1.93 to 7.15] P<0.001 and high food refusal 4.83 [2.38 to 9.78] P <0.001 were more likely to be force-fed, after controlling for maternal anxiety and child nutritional status.

Conclusions: This study shows that many malnourished children had a low interest in food and ate poorly. It is not clear if this

Background and objectives: Choline has been positively associated with weight and fat mass in animal and human studies. As evidence examining maternal choline status and offspring body composition in human infants/children is lacking, we investigated this in two cohorts.

Methods: Maternal plasma choline concentrations were assessed in the UK SWS (n=1002, 11 weeks gestation) and in Singapore GUSTO (n=970, 26-28 weeks gestation) mother-offspring cohorts. Infant anthropometry was measured from birth until 5 years of age at regular intervals. Total body fat mass was determined using DXA for SWS, and using air displacement plethysmography for GUSTO. Linear regression models were performed adjusting for confounders.

Results: Mean (SD) plasma choline concentrations were 6.03 (0.86) μmol/L for SWS and 9.2 (1.6) μmol/L for GUSTO. In SWS, higher maternal choline concentrations were associated with higher neonatal total body fat mass [β=0.60 SD/5 μmol/L maternal choline (95% CI 0.04-1.16)] and higher subscapular skinfold thickness [β=0.55 mm/5 μmol/L (0.12-1.00)] at birth. In GUSTO, higher maternal choline concentrations were associated with higher neonatal BMI-for-age z-score [β=0.31 SD/5 μmol/L (0.10-

0.51)], higher triceps [β=0.38 mm/5 μmol/L (0.11-0.65)] and sub-scapular skinfold thicknesses [β=0.26 mm/5 μmol/L (0.01-0.50)] at birth. No clear trends were observed between maternal choline and offspring growth in BMI-for-age, skinfolds, abdominal circumference, weight-for-age, length/height-for-age, and adiposity measures in later infancy and childhood.

Conclusions: Our study provides evidence that maternal choline concentrations status during pregnancy are positively associated with offspring BMI, skinfolds and adiposity at birth, but not with growth in the first 5 years of life.

Keywords: Choline, pregnancy, offspring, body composition, growth

Background and objectives: Evidence on the association between sleep, diet and dietary behaviours in pregnant women is lacking. We examined this in a cohort of pregnant women in Singapore.

Methods: Pregnant women at 26-28 weeks gestation (n=719) from the GUSTO cohort completed the Pittsburgh sleep quality index to assess sleep quality (score 0-21; higher scores represent poorer sleep), sleep duration (hours), dietary intake and behaviours were assessed. Diet quality was defined by the Healthy Eating Index for pregnant women in Singapore (HEI-SGP) on a 0-100 scale and three dietary patterns were derived from principal component analysis of food records: fruit-vegetables-rice, seafood-noodles, and pasta-cheese-meat. Dietary behaviours examined included longest fasting duration during night- (19:00-06:59), meal frequency, breakfast skipping, and predominantly night-time eating. Multivariate linear regression and Poisson regression were used to examine the relationship.

Results: Mean (SD) sleep quality score was 5.5 (2.9) and sleep duration 7.2 hours (1.5). Poorer sleep quality was associated with lower HEI-SGP sores [β -0.04 (95%CI -0.07, 0.00)], lower adherence to the fruit-vegetables-rice pattern [β -0.02 (-0.02, 0.00)], shorter night-time fasting intervals [β -0.05 hours (-0.09, -0.01)] and higher likelihood of skipping breakfast [prevalence ratio 1.06 (95% CI 1.01-1.10)]. Longer sleep duration was only associated with a longer night-time fasting interval [β 0.08 hours (95%CI 0.00, 0.16)].

Conclusions: Poorer sleep quality was associated with unhealthier diets and dietary behaviours, while longer sleep duration was associated with longer night-time fasting. Prospective studies are warranted to investigate the direction of causality.

Keywords: dietary patterns, diet quality, sleep quality, sleep duration, dietary behaviours

POTENTIAL STRATEGIES TO DECREASE THE HIGH SUGAR INTAKE IN ARGENTINIAN YOUNG CHILDREN TO GENERATE HEALTHIER EATING HABITS

(1)Desclée de Maredsous, Caroline; (2)Ketelhohn, Belen; (3)Zapata, María Elisa; (4)Oukid, Inès; (5)Van der Merwe, Liandré; (1)Delaere, Fabien; (6)Rovirosa, Alicia; (2)Olagnero, Gabriela; (7)Carmuega, Esteban.

Centro de Estudios Sobre Nutrición Infantil (CESNI). Buenos Aires. Argentina.; (7)MD. Centro de Estudios Sobre Nutrición Infantil (CESNI). Buenos Aires. Argentina.

Background and objectives: In Argentinian young children aged 6–23 months, table sugar and sodas alone represent 12% of the Total Energy Intake (TEI), which exceeds the 10% upper limit

for free sugar intake recommended by WHO. The present study aimed to evaluate a relevant and realistic dietary lever to reduce free sugar intakes, based on actual consumption practices.

Methods: The diets of 220 Argentinian 12-36 months toddlers were captured in a 7-day food diary. A probability-based statistical tool, which evaluates the potential of one food category to be substituted by another using actual dietary data, was applied. Potential nutritional effects of estimated switches were evaluated by simulation modeling.

Results: The main food categories contributing to sugar intake were cow's milk (18.3%), fruits (16.4%) -both containing mainly intrinsic sugars- and powdered juices and sodas (11.4%) containing exclusively free sugar. Powdered juices and sodas were consumed by 82% of the studied population (90% of the 24-36 mo population) at an average frequency of 1.21 times/day/individual, predominantly at lunch and dinner. In analyzing consumption dynamics, water was identified as the most probable, realistic substitution alternative (far above all other food and drinks categories), with a potential to substitute an estimated 0.97 and 1.02 consumption acts/individual/week during lunch and dinner, respectively. Considering this realistic switching scenario at lunch and dinner, simulation modeling estimated a reduction of free sugar intake of 18.5 g/individual/week (2.64 g/individual/day), based on only this one dietary modification.

Conclusions: This probability-based statistical tool has shown, through actual practices, that a few simple food replacements in young children's diet can be a successful strategy, not only to help achieve WHO recommendations, but also to accomplish a gradual development of healthier early eating habits.

Keywords: sweet drinks, free sugars, switch, simulation, substitution alternatives

Comisión de Investigaciones Científicas. Pcia. De Bs As. Argentina.

Background and objectives: The metabolic complications of overweight and obesity are widely studied in children above 6 years and adolescents. However, little is known about such complications in children less than six years.

Aim

To compare glucose metabolism in children aged 1-5 years with normal weight and overweight/obesity.

Methods: A prospective, analytical, cross-sectional study was conducted in 2011 on children aged 1-5 years attending primary health care units from the cities of Berisso and Arturo Segui, province of Buenos Aires, Argentina.

Anthropometric assessments included weight, height and waist circumference (WC). Fasting blood tests were taken in all children to determine blood glucose and insulin, insulin resistance by the homeostasis assessment model for insulin resistance (HOMA-IR) and the blood glucose/insulin (G/I) ratio. Comparisons between groups were analyzed with Mann-Whitney test.

Results: We evaluated 795 children aged 1-5 years. Sixty-six percent of children were normal weight, whereas 34% were overweight (24%) and obese (10%). Mean age was 3.35 ± 1.56 years (49.6% male, 50.4% female).

Mean blood glucose levels were similar in normal weight as compared with overweight/obese children. Blood insulin results were higher in overweight/obese (2.21 μU/ml; 1.39-3.95) compared with normal weight children (1.96 μU/ml; 1.32-3.18) (p=0.016). HOMA-IR was higher in overweight/obese (0.43; 0.25-0.80) than in normal weight children (0.37; 0.23-0.60) (p=0.011). The G/I ratio was lower in overweight/obese 35.9 (20.6; 54.0) compared with normal weight children 38.7 (24.9; 58.0) (p=0.039).

The analysis of differences according to sex showed that they remained the same in normal weight and overweight/obese girls, but disappeared in boys.

We found correlation between WC and blood insulin, WC and HOMA-IR and WC and G/I ratio in the whole study sample. Again, when analyzing by sex, such correlations remained only

in girls (WC- blood insulin rho0.32 p<0.0001; WC-HOMA-IR rho0.34 p<0.0001 ; WC-G/I ratio rho-0.16 p=0.046).

Conclusions: We found differences in glucose metabolism parameters in overweight/obese children aged 1-5 years as compared with those of normal weight children. Analysis according to sex showed that such differences remained in girls, but were not significant among boys.

IMPROVING AWARENESS ABOUT EXCLUSIVE BREAST FEEDING AMONG MOTHERS ATTENDING POST-NATAL CLINICS IN HEALTH CENTERS OF KAMPALA CITY, UGANDA

[1]Nyakake, Lynn; [2]Ssenyondo, Muzafaru; [3]Murungi, Solomon; [4]Ainomugisha, Prudence; [2]Ahumuza, Gracious.

[1]Bsc. Nutritionist. Department of Food Technology and Nutrition. Makerere University. Uganda.; [2]Bsc. Nutritionist. Department of Food Technology and Nutrition. Makerere University. Kampala. Uganda.; [3]Bsc. Information Technology Specialist. Department of Information Technology. Makerere University. Kampala. Uganda.; [4]Bcs. Nutritionist. Department of Food Technology and Nutrition. Makerere University. Kampala. Uganda.

Background and objectives: Background:

According to findings from the recent Lancet breastfeeding series, improving breastfeeding practices worldwide will be a fundamental driver in achieving the Sustainable Development Goals by 2030 (Meara, 2015). Among the 17 proposed sustainable goals, breastfeeding; a simple, smart and cost effective practice contributes to the realization of four of these specific goals that is; 1) ending hunger and improving nutrition; 2) ensuring healthy lives and promoting well-being; 3) ensuring equitable education and 4) ensuring sustainable agricultural production and consumption (Meara, 2015). However in Uganda, less than 20 health facilities are designated as "baby friendly" where mothers can safely and readily practice breastfeeding. Objectives: To increase awareness about the benefits of exclusive breastfeeding (EBF), advocate for breast feeding corners in Mulago Hospital and establish factors influencing adherence to EBF by the mothers.

Methods: Behavioral change communication using Information, Education and Communication (IEC) materials and nutrition education counselling of 150 participants. Pre and post semi-structured questionnaires were used to determine adherence of the mothers to EBF as well as factors for adherence before and after the intervention.

Results: Out of 150 breastfeeding mothers, 64% reported adhering to exclusive breast feeding before nutrition education and counselling was done. 87% were willing to exclusively breastfeed their children after improving their awareness about EBF and its advantages. The following factors significantly influenced adherence to EBF positively (p< 0.05): 1) accessibility of antenatal care

clinic p= 0.002); 2) attending Anti-Retroviral therapy (ART) clinics for ARV's (p= 0.001), 3) knowledge on risk of MTCT of HIV during mixed feeding (p=0.000).

Conclusions: Nutrition education and counselling improved the mother's willingness to exclusively breastfeed their children. Therefore this should be routinely done in health facilities to improve adherence to EBF. While infant and young child feeding regulations are in place, enforcement of the practices needs to be strengthened to increase access to nutrition for the poorest and most vulnerable urban communities.

Keywords: Exclusive breast feeding, health centers, breast feeding corners

Superior Polytechnic School of Chimborazo. Riobamba. Ecuador.; [6]MCs. Nutritionist. Institute of Collective Health. Federal University of Bahia. Campus Canela. Salvador. Brazil.

Background and objectives: In Ecuador, adolescents represent 19.3% of the population INEC-Ecuador (2010). This period is characterized by a stage of physical, psychological and psychological changes in which a child becomes an adult. This transition requires an adaptation of the factors that allow the adolescent to develop all the normal functions with normality. Aims: To evaluate the dietary intake, eating disorders and physical activity of adolescents from a population of the Andean region of Ecuador and their difference between urban and rural areas.

Methods: Cross-sectional study (n = 131). It was applied: a 24-hour reminder and food consumption frequency questionnaire; It was evaluated anthropometry, physical activity and risk of eating disorder.

Results: 19.1% of the population presented short stature by age and 17.6% risk of overweight according to BMI//Age. Macronutrient adequacy percentages throughout the population were low (66.5% carbohydrate, 60.5% protein and 79.8% fat).

Statistically significant differences were found between protein (p = 0.012), fats (p <0.001) carbohydrates (p = 0.013) and energy

---

(p <0.001) according to the zones; (Urban areas showed higher consumption compared to rural areas).

Statistically significant differences were found between the levels of physical activity of adolescents in urban areas (less activity) compared to adolescents in rural areas (greater activity). According to the Scoff questionnaire, 32.3% of adolescents were classified as having an Eating Disorder Risk, clinical differences were found by sex being greater in women than in men. However differences between sex and area were not statistically significant.

Conclusions: The adolescents' diet differs according to the geographical area, showing worse consumption in the rural area.

Department of Nutrition Research. Faculty of Chemical Sciences. National University of Asuncion. Paraguay.

Background and objectives: In old age, sarcopenia is a frequent condition, characterized by the gradual and widespread loss of skeletal muscle mass and strength. Older adults with sarcopenia have an unfavorable clinical prognosis and evidence suggests that older adults that are in nursing homes would have a worse prognosis. Therefore, we aimed to determine the frequency of primary sarcopenia in older adults in nursing homes in the peri-urban area of Asunción during the month of January, 2014.

Methods: We performed a descriptive cross-sectional study in which we evaluated demographic characteristics, nutritional status using Body Mass Index (BMI) and the Mini Nutritional Assessment (MNA) screening tool. In addition, we evaluated the presence or absence of sarcopenia according to bioimpedanciometry and muscle strength levels, based on the dynamometric grip force.

Results: In 41 elderly people living in three institutions for elderly people, the average age was 73 ± 10 years. We found that mean BMI was 25.8 ± 4.4 kg/m2 and that 24% of the elderly had malnutrition (underweight), 20% overweight and 15% obese.

However, according to the overall MNA score, 49% had normal nutritional status, 39% had a risk of malnutrition and 12% had malnutrition. The median Muscular Mass Index (MMI) was 7.62 kg/m2. Severe sarcopenia was observed in 54% of the elderly and this percentage was higher in men than in women. The mean right and left hand pressure force was 19.20 ± 9.53 and 18.85 ± 9.79 kg, respectively. Of the total of elderly 61% presented very bad pressure force in the left hand and 54% in the right hand.

Conclusions: In older adults that are in nursing homes in the peri-urban area of Asunción, the malnutrition is frecuent, the force of hand pressure is very poor and sarcopenia affects half of the population.

Keywords: older adults, sarcopenia, muscle strength, nutritional status

ESTABLISHING THE RELATIONSHIP BETWEEN DIETARY PRACTICES, ATTITUDES AND NUTRITION KNOWLEDGE OF ADOLESCENTS AGED 15-19 YEARS IN NANSANA MUNICIPALITY, CENTRAL REGION, UGANDA

[1]Nyakake, Lynn; [2]Ssenyondo, Muzafaru; [3]Murungi, Solomon; [4]Ainomugisha, Prudence; [5]Opolot, Phillip; [2]Ahumuza, Gracious.

[1]Bsc. Nutritionist. Department of Food Technology and Nutrition. Makerere University. Uganda; [2]Bsc. Nutritionist. Department of Food Technology and Nutrition. Makerere University. Kampala. Uganda.; [3]Bsc. Information Technology Specialist. Department of Information Technology. Makerere University. Kampala. Uganda.; [4]Bcs. Nutritionist. Department of Food Technology and Nutrition. Makerere University. Kampala. Uganda.; [5]Bsc. Statistician. Department of Statistics and Applied Economics. Makerere University. Kampala. Uganda.

Background and objectives: Background: During the period of adolescence, individuals undergo major psychological and physical changes as well as changes in social interactions and relationships (WHO, 2009). Health related behaviors around food, physical activity and alcohol use are also formed (Sawyer, et al., 2012). There is an epidemic of overweight and obesity among adolescents in the world today with adolescents developing obesity related conditions previously mostly confined to adults (Carroquino, 2009). Despite majority of fruits and vegetables being transported to central region from other regions of the country, their consumption among adolescents in this region is really low. However, the adolescence period is a window of opportunity through which healthy dietary practices such as intake of fruits and vegetables can be adopted. Objectives: To assess the nutritional knowledge of adolescents in Nansana Municipality, identify their common dietary practices and determine the factors responsible for the observed dietary practices.

Methods: A cross-sectional study was done. Simple Random Sampling and snowball sampling techniques were used to select school going and non-school going adolescents respectively.

Semi-structured questionnaires were used to collect data on 363 adolescents (120 non-school going, 109 boarding scholars and 122 day scholars) in a cross-sectional survey. Data was analyzed using SPPS version 20.0.

Results: Out of the 363 participants, 81.8% snacked frequently with majority snacking on salted snacks (40.4%) and confectionery (23.7%). Only 6.1% of them snacked on fruits and vegetables while 88.7% consumed fast foods frequently. Significant influences of adolescent dietary practices were taste and preference, lack of appetite, lack of money, readily available fast foods and snacks and busy schedule (p< 0.05). Nutritional knowledge of the adolescents positively influenced their frequency of supper consumption (r= 0.120, p= 0.022) and frequency of breakfast consumption (r= 0.127, p= 0.016) while it negatively influenced their fast food consumption(r= -0.134, p= 0.010).

Conclusions: Majority of the adolescents had unhealthy dietary practices and lacked nutrition knowledge. Nutrition education should be widely done to improve the adolescents' nutrition knowledge and hence influence their dietary practices.

Keywords: Adolescents, Dietary practices, Attitudes, Nutritional knowledge

ANTHROPOMETRIC NUTRITIONAL RISK FACTORS AND NUTRITIONAL STATUS OF NEWBORN

[1]Salomón de Torres, Viviana Raquel; [2]Morínigo Martínez, Macarena.

[1]Nutritionist. Faculty of Medical Sciences. National University of Asuncion. Paraguay.; [2]Nutritionist. Department of Nutrition Research. Faculty of Chemical Sciences. National University of Asuncion. Paraguay.

Background and objectives: Maternal anthropometry taken before and during pregnancy has a close relationship with fetal growth and birth weight, therefore a descriptive observational research with analytical component was designed to determine the maternal anthropometric risk factors and nutritional status of children of women treated Hospital de Clínicas, Department of Gynecology and Obstetrics, during the months of May 2016.

Methods: The pre-gestational nutritional status by BMI, gestational by Atalah et al and weight gain as Casanueva et al evaluated. The nutritional status of the child was assessed according to the current WHO growth curves. The data were extracted from the records of patients.

Results: The women began their pregnancies overweight (25.6±5,6kg/m2), they earned on average 13.25 ± 6,17kg, as recommended greater (p <0.05). 73.7% were children and the highest percentage AEG presented adequate nutritional status by anthropometric indicators (weight, length and head circumference). Women with excess nutritional status and gestational weight gain excessive weight who had a higher proportion GEG children (p <0.05), respectively). The children of obese women and earning pesos excessively during pregnancy was significantly higher (p<0.05).

Conclusions: the results indicate that maternal anthropometric risk factors would be one gestational nutritional status of overweight and excessive weight gain with the birth weight of the newborn

Keywords: Maternal and child nutrition, anthropometry, newborn

ANTHROPOMETRY, INSULIN RESISTANCE INDEX, LIPID PROFILE AND PHYSICAL ACTIVITY IN A GROUP OF CHEERLEADERS OF CALI, COLOMBIA

Tabares, Daniela; Arias, Katherine; Velasco, Carlos.

Universidad del Valle. Cali, Colombia.

Background and objectives: The assessment of nutritional status in children is part of the main objective of the Obesity and Overweight Monitoring Program of the Pediatric Gastroenterology, Hepatology and Pediatric Research Group of the University of Valle del Cali, Colombia. The objective is to determine body mass index, height for age, insulin resistance index (HOMA), lipid profile and physical activity in a group of cheerleaders from Cali, Colombia

Methods: Non-experimental descriptive observational study type prevalence in schoolchildren (n=3) and adolescents (n=14) who were given socio-demographic (age, sex), nutritional (weight, height, waist circumference), biochemical (glycemia, insulin, lipid profile) variables and physical activity (strength/endurance and aerobic tests)

Results: A total of 17 girls, 14.7±27 years (range=9-18), weight=50.3±12.4 kg (range=32.4-74.2), height=157.7±7.9 cm (range=141.6-169.7), circumference (range=57.0-94.5), blood glucose=85.7±6.8 g/dl (range=71-99), insulin=13.4±8.1 g/dl (range=3.6-36.0), cholesterol=155.4±25.4 (range=107-208), triglycerides=119.7±151.9 g/dl (range=49-704), arterial index=2.8±0.5 (range=2.2-4.5), HOMA=2.7±1.6 (range=0.6-6.6) and physical activity=4.6±0.2 (range=4.1-5.0). They presented 11.8% of malnutrition and overweight, respectively; 5.9% hypercholesterolemia, 11.8% hypoglycemia and elevated insulin, respectively; 29.4% HOMA altered and 100.0% good physical activity

Conclusions: Despite good physical activity, about 1/3 of this group of cheerleaders presented altered HOMA; 24% altered lipid profile, and 12% malnutrition, overweight, hypoglycemia and altered insulin

Keywords: Anthropometry, Insulin resistance index, Lipid profile, Physical activity, Children

THE MEDIA INFLUENCE ON BODY IMAGE AND DISORDERED EATING ATTITUDES OF BRAZILIAN FEMALE TEENAGERS

[1]Galhardi Lira, Ariana; [2]dos Santos Alvarenga, Marle; [3]Sinhorini Lodi, Aline; [4]de Piano Ganen, Aline.

[1]MSc. Nutritionist. Professional Master Program of Nutrition. São Camilo Center. Brazil.; [2]PhD. Nutritionist. Departament of Nutrition. University of São Paulo (USP). Public Health. Brazil.; [3]Nutritionist. São Camilo University Center. Brazil.; [4]PhD. Nutritionist. Master Professional Program of Nutrition. São Camilo University Center. Brazil.

Background and objectives: Between the many sources of influence, the media exerts an impact on eating behaviors and body image, being pointed as an important factor for Eating Disorders (ED) development. The Disordered eating, which are unhealthy attitudes to lose or control weight, although less severe than the ED are more frequent, highlighting the female and adolescent public as the most vulnerable group to this behavior due to quick body modifications and body image dissatisfaction. In this way, the objective of the present study was to evaluate the media influence in the body image in the disordered eating with age, nutritional status, body image perception and dissatisfaction, income and maternal schooling level in Brazilian teenagers.

Methods: 212 female adolescents of São Paulo State from Brazil answered to the Kakeshita Silhouettes Scale and the subscale 1 of the Internalization-general of the Sociocultural Attitudes Towards Appearance Scale (SATAQ-3), and the Disordered Eating Attitude Scale (EAAT). It was measured the anthropometric variables, such as BMI/age and sociademographics informations were collected. Student's t-test and Anova followed by the Bonferroni post-hoc were used to compare the SATAQ means. Meanwhile, for EAAT, the Mann-whitney and Kruskall-Wallis tests were used. It was adopted the significance of p <0.05.

Results: It was noted statistically major values in SATAQ subscale of teenagers who showed body image dissatisfaction, who desire to lose weight compared to satisfied with body image. Indeed, the EAAT score, which evaluated the eating atitudes associated to disordered eating behavior, was significantly elevated in overweight and obese compared to eutrophic adolescents, as well as, in female tennagers with body image distortion and dissatisfaction with desire to lose weight. Age, family income and maternal schooling appear to have not influenced the disordered eating.

Conclusions: The media can influence body image dissatisfaction of adolescents, which can be considered an important fator, as well as the nutritional status, to disordered eating development.

Keywords: adolescence; nutrition; eating attitudes; media influence; disordered eating.

CONSUMPTION OF COW'S MILK, MILK PRODUCTS AND DAIRY SUBSTITUTES: FINDINGS FROM THE FEEDING INFANTS AND TODDLERS STUDY (FITS) 2016

[1]Jacquier, Emma; [2]Catellier, Diane; [3]Anater, Andrea; [4]Eldridge, Alison.

[1]PhD. MSc. Country Lead Scientist, Institute of Nutritional Science. Nestlé Research Center. Switzerland.; [2]PhD. Senior Statistician. Research Triangle Institute. Chapel Hill. North Carolina. United States of America.; [3]PhD Public Health Analyst. Food and Nutrition Policy Research. Research Triangle Institute. Chapel Hill. North Carolina. United States of America.; [4]PhD. Principle Investigator FITS/KNHS Research. Institute of Nutritional Science. Nestlé Research Center. Switzerland.

Background and objectives: Introduction of cow's milk is inappropriate for infants <1-year of age. Whole cow's milk is recommended for children from 12-23.9 months. There is little information on the introduction and patterns of cow's milk and milk product consumption in the first few years of life. The aim of this study is to describe the consumption patterns of cow's milk, milk products and plant milks/dairy substitutes, including both prevalence and amounts consumed, amongst U.S. children aged 0-3.9y, using data from the Feeding Infants and Toddlers Study (FITS) 2016.

Methods: The FITS 2016 is a cross-sectional, nationwide survey of caregivers of children aged 0-3.9y in the US. Data about respondent and child characteristics, feeding practices and health-behaviours were collected using a recruitment questionnaire (n=4380). A 24-h dietary recall was used to collect details on food, beverage and supplement intake (n=3428). Each item was assigned to a food group designed for FITS; one-day intakes were used to calculate the percentage of children consuming specific food groups on a given day, along with the amount consumed (g).

Results: Among 0-5.9 month olds and 6.11.9 month olds, infant formula was consumed by 62.2% and 64.8%, while breast milk was consumed by 53.5% and 39.2%, respectively. Breast milk consumption was more prevalent that infant formula amongst 12-17.9 month olds (18.4% vs. 7.3%). Only 1.4% of 0-5.9 month olds and 5.8% of 6-11.9 month olds consumed ~480g of whole cow's milk. Plant milk/dairy substitute consumption was very low (0.5% of 6-11.9 month olds), and amount consumed was ~316g. Prevalence of whole milk consumption was 69.3% at 12 months but was only 26.9% at 2y when children began consuming reduced-fat milk. The prevalence and amount of low-fat, non-fat and flavored milk consumed was higher with increasing age, however, only 23% of preschool children consumed low-fat milk. Prevalence of cheese and yogurt consumption, and the amounts consumed, was higher with increasing age.

Conclusions: Opportunities exist to improve the prevalence of breastfeeding, to reduce cow's milk consumption before 12 months of age, and to promote reduced-fat milk consumption beyond 24 months of age in line with dietary recommendations.

Keywords: Milk, infant nutrition, breast milk, infant formula, dairy substitutes.

MILD SEX DISPARITIES ARE SUGGESTIVE IN ANTHROPOMETRIC INDICES AND INDICATORS AMONG PRESCHOOL CHILDREN FROM THE WESTERN HIGHLANDS OF GUATEMALA

[1]Shiu, Kimberly; [2]LIEM, WINDY MULIA; [3]Garcia-Meza, Rosario; [4]Solomons, Noel W.

[1]Intern. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala City, Guatemala.; [2]MSc. Wageningen University. Netherlands.; [3]MDS. Coordinator. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.; [4]MD. Scientific Director. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.

Background and objectives: CeSSIAM has an interest in the origins and biology of acquired linear growth retardation, also referred to as "stunting" or "chronic undernutrition." A photographic approach has been developed to estimate differential body-segment lengths (trunk vs legs) to accompany conventional anthropometric indicators. The purpose of this study was to ascertain whether any sexual dimorphism was evident in comparisons across sexes in preschool children from the Western Highlands of Guatemala.

Methods: We measured the height, clothing-adjusted weight, and head and waist circumferences of 212 individuals between 4–7 y from zones of established high stunting prevalence comprising La Estancia, Quetzaltenango and Santa María Chiquimula, Totonicapán. We further generated height-for-age (HAZ); weight-for-age (WAZ); body-mass-index for age (BAZ); and head-circumference (HCZ) Z-scores along with waist-to-height ratio (WHtR). Sagittal photographs were taken with a digital camera with the children in an erect posture with the Frankfort gaze standing on a stadiometer platform. After printing out the photo, the lengths of the trunk and the legs were measured in mm, allowing the generation of trunk-to-stature ratios. Assorted indicators or ratios are consistently presented in the order of female vs male, along with the probability-value in parenthesis.

Results: Comparisons of median indicators or ratios across sexes were: HAZ: -2.36 vs -2.29 (p=0.94); WAZ: -1.51 vs -1.64 (p=0.40); BAZ: -0.16 vs -0.14 (p=0.79); HCZ: -0.53 vs -0.73 (p=0.002); and WHtR: 0.49 vs 0.49 (p=0.08)(n=212). The overall trunk-to-stature median ratios were 0.46 for girls and 0.45 for boys (p=0.001).

Conclusions: In every situation in which values were numerically different, males were in quantitative disadvantage; but it was only with HCZ that a statistically-significant diminution was seen for the male participants. With respect to trunk-to-stature ratio, there was high statistical significance. As girls had a slightly higher trunk-to-stature ratio, they are in disadvantage.

Keywords: stunting, anthropometric Z-scores, body-segments, Guatemala

MATERNAL CHARACTERISTICS ASSOCIATED WITH BIRTH LENGTH IN A SAMPLE OF ARGENTINIAN WOMEN

[1]Calvo, Elvira Beatriz; [2]Poy, Mabel Susana; [3]López, Laura Beatriz.

[1]PhD. Medical Doctor. Instituto Nacional de Epidemiología Dr. Juan H Jara.Mar del Plata. Argentina.; [2]BS. Nutritionist. Escuela de Nutrición. Facultad de Medicina.Universidad de Buenos Aires. Argentina; [3]PhD. Nutritionist. Escuela de Nutrición. Facultad de Medicina. Universidad de Buenos Aires. Argentina.

Background and objectives: Prenatal growth has been related to risk factors for chronic disease in adult life, specifically, small body size at birth was associated with elevated blood pressure, insulin resistance and metabolic syndrome. The knowledge of maternal characteristics associated with birth length can be useful information for programming public health interventions focusing in prenatal care. The objectives of this research were to evaluate the relationship between maternal nutritional status and birth length in a sample of Argentinian women.

Methods: A sample of 760 healthy pregnant women was selected from antenatal clinics in six different urban regions in Argentina. Height and initial weight were determined in the first control (before 12 weeks of gestation), BMI and weight increments were calculated in the last prenatal control. Infant birth weight, height and gestational age were recorded from the neonate clinical history. Descriptive statistics and adjusted lineal regression models were fitted using R-program, version 3.1.0.

Results: Most women were primiparous (43.9%) and attended the public health sector (56.6%). Maternal and neonatal characteristics were: (Mean ± SD): age (years) 26.6 ± 5.7; maternal height (m) 1.58 ± 0.06; initial BMI (kg/m2) 24.08 ± 4.5; BMI increment (kg/m2) 4.7 ± 0.4; birth weight (g) 3284 ± 509; gestational age (weeks) 38.7 ± 1.7; length (cm) 48.8 ± 2.4. According to gestational age, birth length was 44.9 ± 3.9 cm (mean ± SD) in preterm and 49.1 ± 2.0 cm in term newborns.

After adjusting for gestational age, gender of the newborn, mother's age, province, type of care and income level, variables associated with length at birth were (Coefficient; p-Value): parity (0.137; 0.043), maternal height (2.881;0.014), BMI at the beginning of pregnancy (0.065;0.000) and BMI increment (0.101;0.009)

Conclusions: Although parity and maternal height can not be influenced by health interventions, the relationship of maternal BMI and its increment during pregnancy with length at birth emphasize the need to recognize prenatal care as a valuable opportunity to promote adequate prenatal growth.

Keywords: prenatal care, pregnancy weight gain, birth length

DETERMINANTS OF ANEMIA AMONG CHILDREN 6 TO 12 MONTHS OF AGE IN EASTERN BURKINA FASO

[1]Bliznashka, Lilia; [2]Becquey, Elodie; [3]Ruel, Marie; [3]Olney, Deanna.

[1]MA. International Relations. International Food Policy Research Institute (IFPRI). Washington DC. USA.; [2]PhD. Public Health. International Food Policy Research Institute (IFPRI). Dakar. Senegal.; [3]PhD. Nutritionist. International Food Policy Research Institute (IFPRI). Washington DC. USA.

Background and objectives: Anemia is nearly universal (92%) among young Burkinabe children, yet scant evidence on its determinants exists for this population. To better understand these predictors, we used structural equation modeling to test a theoretical model of anemia among young Burkinabe children.

Methods: We used baseline data on 930 children aged 6-12 mo, their mothers and households from a cluster-randomized trial of Helen Keller International's Creating Homestead Agriculture for Nutrition and Gender Equity program. We tested model fit and examined predictors of anemia (hemoglobin concentration<11 g/dL) considering direct and indirect relationships. Child-level predictors included age, sex, malaria infection, iron deficiency (ID) (plasma ferritin< 12ug/L or transferrin receptor> 8.3 mg/L), inflammation (C-reactive protein> 5 mg/L or alpha-1-acid glycoprotein>1 g/L), and diet. Maternal predictors were knowledge, anemia, stress, age and education. Lastly, household-level predictors included diet, wealth, size, food security, and bednet ownership.

Results: Anemia (88%) and ID (90%) prevalence was high. Malaria was also common (21%). The model fit the data well (standard root mean square residual 0.08, coefficient of determination, 0.14). ID (standardized total effect (STE) 0.17, P=0.00), malaria (STE 0.11, P=0.00), inflammation (STE 0.06, P=0.01), maternal anemia (STE 0.04, P=0.06) and child age (STE 0.02, P=0.00) significantly predicted anemia. Malaria directly and indirectly predicted anemia (direct, 0.09 (P=0.00); indirect, 0.02 (P=0.00)). Twenty-two percent of the child age effect on anemia was indirect through ID and malaria. Bednet ownership marginally predicted anemia through its effect on malaria (indirect -0.02, P=0.05). Additionally, maternal knowledge directly predicted lower malaria prevalence (STE -0.01, P=0.02) and higher child consumption of animal-source foods (STE 0.01, P=0.03). Similar results were seen for hemoglobin.

Conclusions: This analysis confirms the contributions of ID, malaria and inflammation to anemia among young Burkinabe children. However, the current set of predictors only accounts for 45% of anemia and thus the contribution of predictors such as intestinal helminth infections, genetic factors and other micronutrient deficiencies (e.g. folate and vitamin B-12) should be considered. Programs that aim to reduce anemia among young Burkinabe children should address at least ID and malaria, but should also consider ways to address the other potential predictors of anemia.

Keywords: Burkina Faso, child anemia, malaria, iron deficiency, maternal anemia

THE SOCIO-ECONOMIC AND GEOGRAPHIC FACTORS ASSOCIATED WITH ULTRA-PROCESSED FOOD CONSUMPTION IN COLOMBIA

[1]Khandpur, Neha; [2]Cediel, Gustavo; [3]Parra, Diana C; [4]Jaime, Patricia; [4]Monteiro, Carlos.

[1]Postdoctoral research fellow. Department of Nutrition. University of Sao Paulo. Brazil; [2]Postdoctoral research fellow. Department of Nutrition. University of Sao Paulo. Brazil; [3]Instructor. Institute for Public Health. University of Washington. USA..; [4]Professor. Department of Nutrition. University of São Paulo. Brazil.

Background and objectives: Understanding the socio-economic and geographic inequities in the intake of ultra-processed food (UPF) is important to effectively address their consumption and associated health consequences. This study examined variations in UPF consumption in Colombia by sex, age, socio-economic status (SES), and place of residence.

Methods: Secondary analysis of nationally representative data from the 2005 Colombian National Nutrition Survey (ENSIN) and National Demographic and Health Survey (ENDS) was conducted. Diet from individuals aged 2 – 64 years was measured using a 24-hour food recall. Food consumption was categorized into the 4 NOVA groups. Individual sample weights were applied to all adjusted regression analysis of SES and geographic variables and their association with mean percentage calories from UPF.

Results: The mean age within this weighted sample (n = 39,232) was 26 years. Over 50% of the sample were female, urban residents, with low SES. Mean percentage total calorie intake from UPF for the total sample was 16.7%. Sex, age, SES, geographic regions and areas of residence were all significantly associated with mean percentage calories from UPF in the unadjusted analysis (p<0.05). Multivariate adjusted analysis demonstrated that mean percentage calories from UPF was significantly higher for women than men (16.3% vs 15.4%, p<0.00), highest among individuals <10 years of age and least in those over 50 years of age (20.5% vs 11.2%, p<0.00). Additionally, participants within the highest SES group reported higher UPF consumption compared to those in the lowest group (22.1% vs 12.8%, p<0.00). Significantly high UPF intake was also found among urban residents compared to those in rural areas (17.1% vs 11.3%, p<0.00) and among residents in the Bogota region (21.5%). Lowest consumption was reported among participants in the Atlantic region (12.5%).

Conclusions: While overall UPF consumption in Colombia is lower than those in high income countries, marked differences in consumption patterns by SES and geographic factors were evident

within this representative sample. The highest UPF intake was reported among the young, urban-dwelling, high SES residents. This trend may be reflective of the high purchasing power, access to UPFs and susceptibility to marketing, within these segments of the population.

Keywords: Ultra-processed foods, Socio-economic factors, Geographic factors, Colombia.

DIETARY SOURCES OF SODIUM INTAKE IN ADOLESCENTS FROM A PUBLIC SCHOOL IN NITERÓI - RJ, BRAZIL

[1]Lavourinha Pinto, Rafael; [2]da Silva Nalin de Souza, Bárbara; [1]da Silva Couto, Camilla; [3]Sichieri, Rosely; [2]Massae Yokoo, Edna.

[1]BSc. Nutritionist. Collective Health Post-Graduation Program. Collective Health Institute. Federal Fluminense University. Brazil.; [2]PhD. Nutritionist. Collective Health Post-Graduation Program. Collective Health Institute. Federal Fluminense University. Brazil.; [3]PhD. Physician. Department of Epidemiology. Social Medicine Institute. Rio de Janeiro State University. Brazil.

Background and objectives: Sodium intake among adolescents is above the recommendations. The objective of this study is to identify the major sources of sodium intake among adolescent students.

Methods: The data is from PAPPAS study, which stands for "Parents, students and teachers for healthy eating" in Portuguese, conducted in a public school from Niterói-Rio de Janeiro, Brazil, in 2015, with students from 5th to 9th grade. Daily sodium intake was estimated by the mean of two 24-hour dietary recall. The food items mentioned was classified into 31 groups. Contribution to total daily sodium intake (%) and sodium density (mg sodium/100g of food items from the group) for each food group were estimated. The software SAS v.9.3 was used to data analysis.

Results: A total of 347 adolescents participated in the study and 51% were male. The average age was 12.7 years old. The average daily intake of sodium was 3777.5mg, over the maximum tolerable level (2200mg/d for 9-13 years and 2300 mg/d for 14-18 years). The ten major sources of sodium intake were rice (11.2%), beans (10.2%), sugar-sweetened beverages (9.9%), sweets (6.8%), milk and dairy products (6.3%), bread (6.2%), soft drinks (6.1%), meat (4.8%), poultry (3.7%) and processed meat (3.7%). Among them, processed meat (950mg/100g), bread (642mg/100g) and meat (414mg/100g) presented the highest sodium density. The groups were mostly consumed at home. However, savory biscuits (11th position in the contribution) were mostly consumed at school.

Conclusions: Total daily sodium intake among students was over the recommended and high at home. Despite the important contribution of ultra-processed foods, major sources included groups which comprise part of the traditional Brazilian diet. Particular attention should be directed toward educational strategies focused on reducing ultra-processed foods intake, as well as the reduction in voluntary use of salt in food preparation.

Keywords: food intake, adolescents, students, sodium.

FRUIT AND VEGETABLE INTAKE BEHAVIOUR AMONG ELDERLY PATIENTS ATTENDING ROUTINE OUT-PATIENT CLINIC: A CROSS-SECTIONAL STUDY

[1]Hayford, Frank Ekow Atta; [2]Lartey, Louisa; [3]Dolman, Robin.

[1]PhD Candidate. Dietitian. Centre of Excellence in Nutrition. Faculty of Health Sciences. North West University. Potchefstroom. South Africa; [2]BSc. Dietitian. Department of Nutrition and Dietetics. School of Biomedical and Allied Health Sciences. College of Health Sciences. University of Ghana. Ghana; [3]PhD .Dietitian. Centre of Excellence for Nutrition. Faculty of Health Sciences. North West University. Potchefstroom. South Africa.

Background and objectives: As human body gets older, it's nutritional and health needs change due to increasing susceptibility to degenerative diseases. The elderly population is one demographic group at risk of inadequate dietary intake and micro-nutrient deficiencies, due to physiological changes such as reduce efficiency of the gastrointestinal tract and loss of appetite due to decline sensory perception. Fruits and vegetables provide essential nutrients and nutritive compounds, considered vital for healthy as it improves micro-nutrient status. Failure to meet daily recommended intakes may result in micro-nutrient deficiencies, hence the need for this assessment in this important population of Ghanaian. The study sought to investigate and collect data on fruits and vegetable intake among elderly patients attending routine out-patient clinic in a teaching hospital in Accra, Ghana.

Methods: A cross sectional study, involving one hundred and fifty (150) ≥60+ year old subjects purposely sampled. Old and fragile subjects with complicated medical conditions with severe nutritional consequences/implications and with severe memory and cognitive impairments were excluded. A validated FFQ and two day 24hr dietary recall (a weekday and a weekend) were used to assess frequency and nutrient adequacy of fruits and vegetables intake respectively. Dietary data was analyzed using FAO infood composition database and MICRODIET software version 3.0 (Downlee, UK). Pearson correlation and ANOVA were used to test for associations of variables of interest using SPSS version 20.0.All data were two-tail and statistically significant set at $p \leq 0.05$.

Results: Though majority alluded to fruits (83.9%) and vegetables (83.2%) intake because of their health benefits, mean daily servings of fruits and vegetables consumed were 1.49 ± 1.66 and 2.22 ± 1.17 respectively. Mean total daily caloric (1331.53 ± 663.77 Kcal), fibre (9.03 ± 7.25 g) and most micro-nutrient intakes were low. Educational level was significantly associated with fruit and vegetable intake ($p \leq 0.04$), as subject disease conditions significantly correlated with their vegetable intake (F=0.55; P< 0.01)

Conclusions: Most participants did not meet WHO recommended daily intake of 5 servings of fruits and vegetables and this may result in micro-nutrient deficiencies. Therefore, health facilities must aim at educating patients on the benefits of fruits and

---

vegetables via health promotion out-patient daily talks in order to promote frequent and adequate intakes.

MATERNAL DIET DURING PREGNANCY AND LACTATION: CURRENT EVIDENCE AND IMPLICATIONS FOR PROGRAMS

[1]Kavle, Justine; [2]Landry, Megan.

[1]PhD. Senior Nutrition Advisor. Maternal Newborn Child Health and Nutrition Division. Maternal and Child Survival Program (MCSP)/ PATH. USA.; [2]PhD. Consultant and Adjunct Faculty. Department of Prevention and Community Health. Milken Institute of Public Health. George Washington University. USA.

Background and objectives: Background and Objective: Adequate maternal nutrition during the "first 1000 days" window is critical from conception through the first 6 months of life to improve nutritional status and reduce the risk of poor birth outcomes, such as low birth weight and pre term birth. Unfortunately, many programs have focused implementation and evaluation efforts on outcomes of nutrition interventions for infants and young children and not maternal dietary consumption during pregnancy and lactation. A literature review was conducted to identify factors that influence women's food choice and consumption during pregnancy and lactation and to examine how low and middle income countries (LMIC) countries have addressed maternal nutrition in programs.

Methods: Literature review of peer-reviewed and grey literature was conducted and titles and abstracts reviewed by authors. Twenty-four studies were included in this review.

Results: Barriers to adequate nutrition during pregnancy included cultural beliefs related to knowledge of quantity of food to eat during pregnancy, amount of weight to gain during pregnancy, and "eating down" during pregnancy for fear of delivering a large baby. Foods considered inappropriate for consumption during pregnancy or lactation contributed to food restriction. Drivers of food choice were influenced by food aversions, economic constraints, and household food availability. Counseling on maternal diet and weight gain during pregnancy was seldom carried out.

Conclusions: Programming to support healthy maternal diet and gestational weight gain during pregnancy are scant, in light of this evidence and recently released World Health Organization antenatal care guidelines. Nutrition education and counseling on diet during pregnancy and lactation and optimal weight gain during pregnancy is an area of needed attention.

Keywords: maternal diet, gestational weight gain, pregnancy, lactation, barriers

CAN PEER COUNSELLORS INFLUENCE BREASTFEEDING PRACTICES OF WOMEN EMPLOYED IN FACTORIES? A PRELIMINARY REPORT FROM BANGLADESH

[1]Haider, Rukhsana; [2]Karim, Rezaul; [3]Gomes, Ratna; [4]Omer-Salim, Amal.

[1]MBBS. MSc. IBCLC- PhD. Public Health Nutritionist. TAHN Foundation and WABA. Bangladesh and Malaysia. Bangladesh.; [2]BUMS. MPH. Programme Coordinator. TAHN Foundation. Dhaka. Bangladesh.; [3]MSS. Field Manager. TAHN Foundation. Dhaka. Bangladesh.; [4]Co-Executive Director. World Alliance for Breastfeeding Action (WABA). Penang. Malaysia.

Background and objectives: Women in the workforce in Bangladesh are mainly employed in readymade garments and other manufacturing industries. Inadequate access to health care, lack of correct information, and long working hours reportedly contribute to their poor breastfeeding practices. A project trained seven female peer counsellors to provide home-based counselling and skills to encourage factory workers to breastfeed optimally. An end line survey was conducted to assess whether the peer counsellors had influenced these workers' breastfeeding practices.

Methods: A cross-sectional survey was conducted among factory mothers with children aged 0-18 months of age in the counselled Intervention areas and neighbouring uncounselled Comparison areas during two weeks in March 2017 in Chittagong. Six external female interviewers trained over 3 days by experienced trainers, interviewed mothers after they returned from work. Data collected was checked, entered into computer and analysed using SPSS.

Results: A total of 382 working mothers with children aged 0-18 months were interviewed in Intervention areas (n=188) and neighbouring Comparison areas (n=194). Preliminary analysis shows 167 (89%) of Intervention mothers initiated breastfeeding within one hour of birth versus 42 (22%) of mothers in Comparison areas. Exclusive breastfeeding on 24-hour recall in infants below 6 months of age was 73/75 (97%) in Intervention areas, versus 3/83 (4%) in Comparison areas. Among mothers of older infants, 96/113 (85%) those in the Intervention areas reported having breastfed exclusively from birth for complete 6 months, versus 10/111 (9%) mothers in the Comparison areas. Whereas 182/194 (94%) of the Comparison area infants were bottle fed in the past 24 hours, only 16/188 (8%) of Intervention area infants had done so.

Conclusions: With peer counsellors encouragement and support, it seems most of the counselled factory workers could practice 6 months of exclusive breastfeeding compared to those who did not receive such services. These preliminary results highlight an urgent need for establishing and sustaining community-based support systems to improve breastfeeding practices of factory workers.

Keywords: Breastfeeding, peer counsellors, factory, workers

RELATIONSHIP BETWEEN FOOD INTAKE AND AGE VALUE IN FEMALE UNIVERSITY STUDENTS

Nakajima, Sanae.

PhD.

Background and objectives: Advance Glycation End-Products (AGE) are a harmful substances formed through an excess of protein and sugar in human body. Excessive accumulation of these substances has been reported to accelerate the aging process and contribute to multiple diseases such as arteriosclerosis and diabetes. It has also been reported that AGE accumulation is related to food intake. However, AGE data from younger populations has been sparse compared to data collected from older ones, which come with a higher risk of lifestyle-related diseases. This experiment was designed to determine the relationship between food intake and AGE value by researching the food intake of female university students and then measuring their AGE values.

Methods: The AGE values presented here are measured with a TruAge scanner, and the measurement is taken from front part of left forearm. This nonintrusive method measures in vivo AGE accumulation by exposing and exciting accumulated AGE to light (mild ultraviolet exposure). The specific fluorescence of AGE is used to measure the amount of AGE accumulation under the skin. The food intake survey was created based on Food Frequency Questionnaire (FFQg).

Results: The younger population shows no AGE value differences compared to food intake, and, instead, the AGE values correspond with subjects' ages. Food intake does not appear to have any impact on the subjects' AGE values, either.

Conclusions: Further data is necessary, as data from a younger population can be a useful comparison against that collected from middle-age or elderly populations, who tend to show higher AGE accumulation values.

Keywords: Advance Glycation End-Products, FFQg

ERYTHROCYTE FATTY ACID COMPOSITION IN GUATEMALAN PRESCHOOLERS FROM THREE DIFFERENT SETTINGS OF THE WESTERN HIGHLANDS WITH A COMMON INSTITUTIONAL DIET

[1]*Soto-Méndez, María José;* [2]*Campos, Raquel;* [3]*Mesa, María Dolores;* [4]*Solomons, Noel W;* [5]*Schuemann, Klaus;* [6]*Gil, Ángel.*

[1]PhD. Fellow. Center for Studies of Sensory Impairment Aging and Metabolism (CESSIAM). Guatemala. PhD. Researcher. Department of Biochemistry and Molecular Biology II. University of Granada. Spain.; [2]Bsc. Researcher. Center for Studies of Sensory Impairment, Aging, and Metabolism (CeSSIAM). Guatemala.; [3]PhD. Professor. Department of Biochemistry and Molecular Biology II. University of Granada. Spain.; [4]MD. Scientific Director. Center for Studies of Sensory Impairment, Aging, and Metabolism (CESSIAM). Guatemala.; [5]MD. Professor. Molecular Nutrition Unit. ZIEL Research Center for Nutrition and Food Science. Technical University of Munich. Germany; [6]PhD. Professor. Department of Biochemistry and Molecular Biology II. University of Granada. Spain.

Background and objectives: Polyunsaturated fatty acids (PUFA) are important for normal brain development and immune function. Low levels of n-3 fatty acids (FA) have been previously reported for children living in the Pacific coast of Guatemala. This work is aimed to describe the fatty acids status in children from 3 settings of the Western Highlands of Guatemala with a mutually similar dietary intake.

Methods: 79 preschoolers (36 girls and 43 boys), beneficiaries of the Guatemalan government's "community homes" system attending one semi-urban (n=19), one marginal-urban (n=23) and one rural center (n=37) delivered a blood sample, fatty acids concentrations in erythrocytes were analyzed using gas-liquid chromatography. Descriptive statistics are presented as mean ± SD. Student t-test, Mann-Whitney U-test, one-way ANOVA or Kruskal-Wallis were used to compare between sexes and among settings.

Results: Erythrocyte percentages of selected fatty acids, for the total sample, expressed in weight percentage were arachidonic acid (ARA) 13.03 ± 1.7, eicosapentaenoic acid (EPA) 0.12 ± 0.2, docosahexaenoic acid (DHA) 1.7 ± 0.4, long-chain PUFA n-6 29.7 ± 3.1, long-chain PUFA n-3 2.5 ± 0.5, unsaturation index (UI) 2.4 ± 0.3, and omega-3 Index (EPA+DHA) 1.9 ± 0.4, respectively. Semi-urban center presented significantly lower concentrations of ARA than the rural center. DHA concentration was significantly lower in the marginal-urban center, whereas long-chain PUFA n-3 and n-3 index were significantly higher in the semi-urban center. EPA, long-chain PUFA n-6, and UI did not present any significant difference among settings. No significant differences were found between sexes.

Conclusions: Even when low omega-3 biomarkers are consistently found in Guatemalan subjects, children from the Western Highlands presented half of the concentration values for DHA and EPA than those reported in the Pacific Coast. Even with such low values, differences among settings are still present for some variables.

Keywords: omega-3, omega-6, omega-3 index, unsaturation index, Guatemalan children

CARBOHYDRATES FROM SOURCES WITH A HIGHER GLYCAEMIC INDEX DURING ADOLESCENCE: EVENING INTAKE IS RELEVANT FOR RISK MARKERS OF TYPE 2 DIABETES IN YOUNG ADULTHOOD

[1]Buyken, Anette; [2]Diederichs, Tanja; [2]Roßbach, Sarah; [3]Herder, Christian; [4]Roden, Michael; [5]Wudy, Stefan; [6]Nöthlings, Ute; [7]Alexy, Ute.

[1]Professor of Public Health Nutrition. Institute of Nutrition, Consumption and Health. Faculty of Natural Sciences. University Paderborn. Germany; [2]MSc. Nutritionist. DONALD Study Dortmund. Institute of Nutrition and Food Sciences. University of Bonn. Germany.; [3]PhD. Senior Researcher. Institute for Clinical Diabetology. German Diabetes Center. Düsseldorf. Germany.; [4]Professor. Director German Diabetes Center. Düsseldorf. Germany; [5]Professor. Pediatric Endocrinology & Diabetology. University of Gießen. Germany.; [6]Professor. Nutritional Epidemiology. Institute of Nutrition and Food Sciences. University of Bonn. Germany.; [7]PhD. Senior Researcher. DONALD Study Dortmund. Institute of Nutrition and Food Sciences. University of Bonn. Germany.

Background and objectives: A higher dietary glycaemic index (GI) and carbohydrates from higher GI food sources consumed during adolescence may affect subsequent type 2 diabetes risk. This study investigated whether morning or evening intakes during adolescence are relevant for insulin sensitivity, hepatic steatosis or low-grade inflammation in young adulthood.

Methods: Analyses were based on data from participants of an open cohort study (DONALD study) who had provided at least two 3-day weighed dietary records during adolescence (♀:9-15y, ♂:10-16y) and one blood sample in young adulthood (18-39y). Day-time specific data were used to estimate morning (before 11am) and evening (after 6pm) GI and glycaemic load (GL) as well as carbohydrate intake from low and higher GI sources [low-GI-CHO (GI<55) and higher-GI-CHO (GI≥55) in En%]. Multivariable linear regression models were used to analyse associations with insulin sensitivity (HOMA2%S in %) (N=252), hepatic steatosis index (HSI), fatty liver index (FLI) (both N=253), and a pro-inflammatory-score (N=249).

Results: Morning intakes during adolescence were not related to adult risk markers. In contrast, a higher evening intake of higher-GI-CHO (p=0.046) and GL (p=0.07) were related to lower levels of insulin sensitivity (adjusted means of HOMA2%S [95%-CI] in tertiles of higher-GI-CHO: T1: 84.1 [77.8;90.8], T2: 81.9 [75.9;88.0], T3: 76.7 [70.7;82.9]). A higher evening GI (p=0.003) and a higher evening intake of higher-GI-CHO (p=0.006) were associated with a higher HSI (adjusted means of HSI in tertiles of GI: T1: 29.3 [28.6;30.0], T2: 30.4 [29.7;31.2], T3: 30.6 [29.9;31.4]), while a higher evening intake of low-GI-CHO was related to lower indices (p=0.009). No prospective associations were observed with FLI or the pro-inflammatory-score in young adulthood.

Conclusions: Our data suggest that young adult insulin sensitivity and hepatic steatosis index are responsive to evening, but not morning adolescent intakes of higher-GI-carbohydrates

GLUCOSE AND INSULIN RESPONSES TO DIFFERENT INFANT FORMULAS AND BREAST MILK

[1]Shahkhalili Dulloo, Yassaman; [2]Beaumont, Maurice; [3]Sauser, Julien; [4]Frappier, Sonia; [5]Mace, Catherine.

[1]PhD. Nutrition Scientist. Institute of Nutritional Science. Nestlé Research Center. Lausanne. Switzerland; [2]MD. Medical director. Clinical Development Unit. Nestlé Research Center. 1000 Lausanne. Switzerland; [3]MSc. Biostatistician and data managment. Clinical Development Unit. Nestlé Research Center. 1000 Lausanne. Switzerland; [4]MSc. Head of Clinical Project Managment. Clinical Development Unit. Nestlé Research Center. 1000 Lausanne. Switzerland; [5]PhD. Head of Metabolic Health Department. Institute of Nutritional Science. Nestlé Research Center. 1000 Lausanne. Switzerland.

Background and objectives: Different infant formulas are available for infants who are not exclusively breastfed. The impact of such formulas on postprandial insulinemia and glycaemia is not known. As repeated blood sampling required for such studies is not feasible in infants, this study compared cow's milk-based formulas containing either intact (INTACT) or partially hydrolyzed (PH) protein, as well as a PH preterm formula (preterm infants ≥ 1.8-2.1 kg when discharged from hospital, DISCH), on postprandial glucose/insulin responses in healthy adults. A breast milk (BM) reference was studied in a subgroup.

Methods: Randomized, double blind, cross-over study in healthy volunteers consuming 600ml of 3 different infant formulas: INTACT (whey/casein ratio of 70/30, 1.9 g protein/100 kcal; 63 kcal/100 ml), PH whey (PHw, 1.96 g protein/100 kcal; 63 kcal/100 ml) and DISCH (PHw, 2.8 g/100 kcal; 73 kcal/100 ml) (n=34); and a BM subgroup (n=10). Formulas had similar fat and total carbohydrate (g/100 kcal): 5.1-5.2 and 10.5-11.6 (3.15 as maltodextrin in DISCH), respectively. Insulin and glucose were measured in venous blood collected after overnight fast, and at different intervals for 2 hr following a meal.

Results: INTACT and PHw groups had similar postprandial insulinaemia or glycaemia (Cmax and IAUC) that were not different from those of the BM group. The DISCH group had a higher (p<0.05) insulin response than all other groups, and a glucose response which was higher than those of INTACT and PHw groups (P>0.05), but not different from that of the BM group.

Conclusions: This study indicates that glucose and insulin responses to infant formulas with INTACT and PHw proteins are similar and not different from BM in adult subjects. Higher insulin and glucose responses to DISCH formula might be desirable for catch-up growth in low-birth weight infants. There is a

need to gain knowledge on the consequence of insulin and glucose responses to early diet and later metabolic health (i.e., metabolic programming)

National and Kapodistrian University of Athens. Greece.; [7]PhD. Nutritionist. Department of Nutrition and Dietetics. Harokopio University. Greece.

Background and objectives: Given the rapid increase of older people, especially of the older elderly, the investigation of modifiable factors that can affect healthy ageing, including diet, is of paramount importance. The aim of the present study was to explore the adherence to an a priori defined Mediterranean dietary pattern, as well as the consumption of specific food groups, in younger elderly compared to older elderly adults in a large population-representative sample in Greece.

Methods: Participants from the Hellenic Longitudinal Investigation of Ageing and Diet (HELIAD) were included. The sample consisted of adults ≥65 years old, and was stratified by age, i.e. those aged ≤75 years old and those aged >75 years old, representing the younger and the older elderly, respectively. Habitual diet during the previous month was assessed using a validated semi-quantitative food frequency questionnaire whereas adherence to the Mediterranean Diet was assessed by an a priori score, the MedDietScore.

Results: Among 1835 individuals, 1249 participants were ≤75 years old and 586 >75 years old. Energy and macronutrient intake did not differ by age group. The younger elderly consumed more fruits, vegetables, fish as well as coffee/tea and fewer refined cereals compared to the older elderly. However, when total energy intake, sex and years of education were entered as covariates, the association remained significant only for fruits, vegetables and coffee/tea (B=-0.098, p=0.023, B=-0.094, p<0.001 and B=-0.079, p=0.001, respectively). Furthermore, the younger elderly adhered more closely to the Mediterranean diet compared to the older elderly even when covariates were entered (B=-0.092, p<0.001).

Conclusions: Our results suggest that the younger elderly adhere more closely to the Mediterranean diet than the older elderly. Although additional studies are needed, the results are valuable in order to design tailored interventions in terms of public health policy that take into account the special characteristics and needs of the different age groups among older people.

BABY FRIENDLY COMMUNITY INITIATIVE (BFCI): FROM GUIDELINES TO IMPLEMENTATION – DEMONSTRATED RESULTS FROM WESTERN KENYA

[1]Ahoya, Brenda; [2]Kavle, Justine; [3]Gathi, Constance; [4]Obade, Mary; [5]Mwando, Rael; [5]Akeyo, Florence; [6]Straubinger, Sarah.

[1]Msc. Nutrition Advisor. Maternal Neonatal Child Health. Maternal and Child Survival Program/PATH. Kenya.; [2]2. PhD. Senior Nutrition Advisor. Maternal Neonatal Child Health. Maternal and Child Survival Program/PATH. Washington DC. USA.; [3]Bsc. Nutrition Officer. Maternal Neonatal Child Health. Maternal and Child Survival Program/PATH. Kenya.; [4]PhD. County Director of Nutrition Services. Nutrition. Ministry of Health. Kenya.; [5]Bsc. County Nutrition Coordinator. Nutrition. Ministry of Health. Kenya; [6]BA. Senior Program Coordinator. Maternal Neonatal Child Health. Maternal and Child Survival Program/PATH. Washington DC. USA.

Background and objectives: According to Kenya Demographic and Health Surveys (KDHS), a two-fold increase in exclusive breastfeeding (EBF) was documented from 2008/9 to 2014 in Kenya. Yet, according to KDHS, only 22% of children 6 -23 months are fed a minimum acceptable diet. Misconceptions and myths which impede exclusive breastfeeding, inadequate capacity of health workers & community health volunteers (CHVs) to support optimal maternal, IYCF and limited scale-up of community support groups (CSGs) are key challenges facing the country. Working hand-in hand with Ministry of Health, United States Agency for International Development Maternal and Child Survival program (MCSP), an integrated maternal, newborn child health and nutrition program, introduces high-impact interventions with the goal of ending preventable child and maternal deaths in Kisumu and Migori counties. MCSP rolled out Baby Friendly Community Initiative (BFCI), to address these challenges at the community level. The objective of this presentation is to share program experience of BFCI roll-out using recently developed national Ministry of Health guidelines.

Methods: The Ministry of Health BFCI implementation package (Implementation Guidelines, Training Package, Communication & Advocacy Material, External Assessment protocols) was developed with technical leadership and support from MCSP, UNICEF and other partners. Using the BFCI implementation guidelines, MCSP held sensitizations meetings, BFCI trainings, and formed mother to mother support groups (M2MGs),

---

and community support groups. Agriculture was incorporated through the establishment of kitchen gardens.

Results: Eighty BFCI M2MSGs were created, and offered an opportunity for community health volunteers taught mothers on one topic from the national MIYCN counseling cards (i.e. initiation, importance of colostrum, positioning and attachment, resolving breastfeeding problems, and maternal nutrition), cooking demonstrations on complementary feeding using locally developed recipes and income generating activities. These mothers were taught to establish household kitchen gardens which were used to improve complementary feeding practices. MIYCN knowledge and skills of health workers and CHVs improved. Monitoring using the newly developed BFCI tools demonstrated improvement in IYCF indicators.

Conclusions: BFCI is a successful approach to improve MIYCN at the community level.

PARADOXES OF WAIST CIRCUMFERENCE IN SHORT-STATURE AND STUNTED GUATEMALAN WOMEN

[1]Kenkhuis, Marlou Floor; [2]Diaz-Jereda, Liza; [3]Garcia-Meza, Rosario; [4]Solomons, Noel W.

[1]Msc Student. Nutritionist. Centre for Studies of Sensory Impairment, Aging, and Metabolism (CeSSIAM). Guatemala.; [2]Nutritionist. Centre for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.; [3]Centre for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.; [4]Executive Director. Centre for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.

Background and objectives: With decreasing stature, anatomical alterations affecting waist circumference (WC) and derivative indices may modify conventional relationships and associations with intra-abdominal visceral adipose tissue. This is of interest to Guatemala, with the highest prevalence of childhood stunting in the Americas.

Methods: Anthropometric measures of clothing-adjusted weight, standing-height (without shoes) and WC (with skin contact) were recorded, 156 adult women aged >35 years, residents of the municipality of Nahualá in the Province of Sololá in the western highlands of Guatemala. The WC "action-levels" classification as normal (0), elevated (1) and excessive (2) from international reference were, respectively: <80, 80-88, and >88 cm. Conventional WHO cut-offs for body-mass index (BMI, weight (kg)/height (cm)^2) for not-elevated, overweight and obesity were used. The criterion of <0.5 for "healthy" WC-to-height ratio (WHtR), as proposed by M. H. was adopted.

Results: Median stature women was 141 cm, with a range of 126-156 cm, with 78.2% stunted, and the respective values for BMI were 24.9 kg/m^2, range 16.8–40.7 kg/m^2. The median WC was

81 cm, range 57–101 cm. WC assorted by action-level as 46.8% (0); 22.4% (1) and 30.8% (2), compared to BMI classification as 51.3% (non-elevated), 32.7% (overweight), and 16.0% (obese). For WHtR, the median ratio was 0.58, range 0.41–0.73, with of 20 values (12.8%) of <0.5.

Conclusions: Severe low stature influences WC and WHtR in relation to international references. The median WC would have to be <71 cm for approaching the reference "healthy" WHtR of <0.5. Correspondence of WC action-levels and BMI categories was overdistributed toward higher WC at lesser BMI. Thus, the degree to which abdominal girth dimensions relate to visceral fat and metabolic risk in low-stature women merits further examination with ancillary measures.

FEEDING BEHAVIOURS AS RISK FACTORS FOR UNDERNUTRITION IN INFANTS LIVING IN SEMI-URBAN COMMUNITIES OF THE VOLTA REGION, GHANA

[1]Arthur, Eunice; [1]McDonald, Matthew; [2]Agbozo, Faith; [3]Ellahi, Basma; [1]Mutoro, Antonina; [4]Wright, Charlotte; [4]Garcia, Ada.

[1]MSc. Human Nutrition. University of Glasgow. UK.; [2]MPhil Nutrition. Department of Family and Community Health. University of Health and Allied Sciences. Ghana.; [3]PhD. University of Chester. UK.; [4]PhD. Human Nutrition. University of Glasgow. UK.

Background and objectives: Infant malnutrition is a continuing concern in middle-income countries like Ghana but it is still not clear why some infants become malnourished and others do not. Feeding behaviour could be a contributing factor. Therefore we aimed to determine the association between child and maternal feeding behaviour and nutritional status of infants 6-24 months in the Volta Region of Ghana.

Methods: A convenience sample of caregiver-infant pairs (n=153, mean age 14 months) were recruited from Child Welfare Clinics in eight semi-urban communities in Ho, the Volta Region's capital. A structured interview was used to collect information on feeding behaviours (force-feeding, food interest and food refusal) and socioeconomic status. Height and weight were measured and converted into Z-scores using WHO reference data. Underweight, stunting and wasting were defined as weight-for-age (WAZ), height-for-age (HAZ) and weight-for-height (WHZ) <-2 standard deviations respectively.

Results: Prevalence of underweight, wasting and stunting were 15%, 11.1% and 13.8% respectively. HAZ decreased with age (Mean (SD) 6-9 months -0.04 (1.5), 9-12 months, -0.43 (0.76), 12-24 months -0.86 (1.2), p=0.001). However, there was no association between socioeconomic status and infants' nutritional status. Moderate to high food refusal was reported for 30.6% and the food refusal scores were significantly correlated with force feed-

ing (spearman's r=0.2, p=0.01) and strongly inversely correlated with interest in food (r=-0.638, p<0.001). Over half of the mothers (54%) used some force feeding; the amount of force feeding was significantly inversely associated with WAZ (β=-0.19, p=0.004) and WHZ (β=-0.18, p=0.03). In a multivariable linear regression model including all behavioural variables adjusted for age, food refusal was significantly inversely associated with WAZ (β=-0.21, p=0.04), while both interest in food (β=-0.20, p=0.06) and force feeding (β=-0.19, p=0.06) showed borderline associations respectively, with similar findings for WHZ.

Conclusions: Child eating behaviour and the caregiver's response may be important factors in an infant's nutrition. In order to clarify whether force-feeding is a cause or a response to low weight, better measures of infant feeding behaviour are needed as well as trials of interventions to train mothers to feed responsively.

Physical educator. Exercise Biology Research Group (BioEx). Federal University of Triangulo Mineiro (UFTM). Brazil.; (4)Physical educator. Exercise Biology Research Group (BioEx). Federal University of Triangulo Mineiro (UFTM). Brazil.; (5)PhD. Physical educator. Department of Sport Sciences. Federal University of Triangulo Mineiro (UFTM). Brazil.; (6)PhD. Nutritionist. School of Medicine. Federal University of Uberlândia (UFU). Brazil.

Background and objectives: The correlation between changes in lean mass and changes in muscle function after resistance exercise intervention is not well stablished. Additionally, the effect of protein intake on these correlations is not known. Therefore, the aim of this study was to correlate the changes in lean mass with changes in muscle function (strength and functional capacity) according to protein intake in postmenopausal women after resistance training protocol.

Methods: Twenty-three postmenopausal women (63.2±7.8 years) were randomized in two groups: normal protein (NP) (n=12), who received a dietary plan with ~0.8 g protein·kg-1·d-1, and high protein (HP) (n=11), being recommended ~1.2 g protein·kg-1·d-1. Resistance training was performed 3 times/week and the intervention lasted 10 weeks. Muscle strength was assessed by handgrip strength (HGS) and one repetition maximum test. Func-

tional capacity was measured by the Short Physical Performance Battery, 6-minute walk test, 400-meter walk, 10-meter walk and time up and go test. Lean mass (total, arm and leg) was assessed by dual energy x-ray absorptiometry scanning and dietary intake was assessed by nine 24-hour food recall. Pearson's correlation was performed with delta (Δ) of lean mass (total, arm and leg) and Δ of the strength and functional capacity tests.

Results: Both groups increased similarly the total lean mass, arm lean mass, leg lean mass, strength and functional capacities tests after intervention. In HP group, Δ total lean mass correlated positively with Δ right HGS (r=0.64; p=0.033) and negatively with Δ time of 400-meter walk test (r=-0.61; p=0.046). In addition, Δ leg lean mass correlated negatively with Δ 400-meter walk test (r=-0.63; p=0.038), also in HP group. There were no significant correlations for NP group.

Conclusions: Changes in lean mass correlated with changes in strength and functional capacity tests only in postmenopausal women who consumed higher amounts of protein.

APOE RS429358 AND RS7412 POLYMORPHISM AND GENDER DIFFERENCES OF SERUM LIPID PROFILE AND COGNITION IN AGING CHINESE POPULATION

(1)Yuan, linhong; (2)Zhen, Jie; (2)Huang, Xiaocheng; (2)Dong, Shengqi; (3)Xiao, Rong.

(1)Capital Medical University. China.; (2)MD. Capital Medical University. Beijing. China. ; (3)PhD. Capital Medical University. Beijing. China.

Background and objectives: ApoE gene polymorphism has been reportedly associated with serum lipids and cognition. However, very few studies have explored the combined effects of ApoE gene polymorphism and gender on serum lipid profile with subsequent impacts on cognition in Chinese population.

Methods: A total of 1000 Chinese community dwellers aged 55 years and above were recruited in this cross-sectional study. Demographic information of the participants was collected using well designed self-administered questionnaires. The Montreal Cognitive Assessment (MoCA) test was employed to evaluate the cognitive status of the participants. Semi-quantitative food frequency questionnaire (FFQ) was used to obtain the dietary intake information. Fasting venous blood samples were taken for ApoE genotyping and serum lipid measurements.

Results: Significant gender differences in cognition, serum lipid profile and dietary fat-rich foods consumption were observed (p < 0.05). Cognition of the subjects was found to be associated with ApoE genotypes (p < 0.05). ApoE rs429358 and rs7412 variants demonstrated a significant effect on cognitive performance in the male subjects; especially within the attention and language ability domains as well as the total MoCA score (p < 0.05) respectively.

Conclusions: Serum lipid profile and cognition of Chinese adults are significantly linked with gender and ApoE genetic polymorphism. The ApoE variant rs429358 is found to be notably associated with cognition in aging male Chinese population.

Keywords: Apolipoprotein E, Polymorphism, Gender, Lipid Profile, Cognitive Function, Geriatrics

NUTRITIONAL STATUS AND ACADEMIC PERFORMANCE OF SCHOOL-AGE CHILDREN ENROLLED IN TWO FEEDING PROGRAMMES IN GHANA

[1]Owusu, Justina Serwaah; [2]Colecraft, Esi; [3]Aryeetey, Richmond; [4]Vaccaro, Joan; [5]Darko, Daniel; [6]Huffman, Fatma.

[1]M.Phil. Doctoral Student. Dietetics and Nutrition Department. Florida International University. Miami. Florida. USA.; [2]DrPH. Lecturer. Department of Nutrition and Food Science. University of Ghana. Legon. Accra. Ghana.; [3]PhD. Senior Lecturer. School of Public Health. University of Ghana. Legon. Accra. Ghana.; [4]PhD. Adjunct Lecturer. Dietetics and Nutrition Department. Florida International University. Miami. Florida. USA.; [5]PhD. Research Fellow. Institute for Environment and Sanitation Studies. College of Basic and Applied Sciences. University of Ghana. Legon. Accra.; [6]PhD. RD. Professor and Chair. Dietetics and Nutrition Department. Florida International University. Miami. Florida. USA.

Background and objectives: School-age children (SAC) are vulnerable to malnutrition which can negatively influence their academic attainment. There is limited information on relationship between nutritional status and school attendance and performance of school age children enrolled in school feeding programmes in Ghana. We assessed the association between current nutritional status of SAC participating in school feeding programmes, and attendance and performance in selected subjects in the past term.

Methods: This was a cross sectional study involving one hundred and eighty-two school age children enrolled in either the Ghana School Feeding Programme or a Non-government Feeding Programme. Haemoglobin concentration, and weight and height of all children were measured using standard procedures. Data on school attendance and performance of SAC were abstracted from class and academic performance registers. Independent t-test was done to assess the differences in school attendance and performance by nutritional status of SAC.

Results: About two-thirds (67.0%) of children were either stunted, underweight, or anaemic. No significant associations were observed between haemoglobin levels, body mass index (BMI)-for-age, or height-for-age z-score and either performance or school attendance in the past school term. Albeit, having at least one nutritional deficit was associated with lower scores in mathematics (mean difference = 4.62), English (mean difference = 4.49) and creative arts (mean difference = 4.50) in the past term than better nourished participants $p< 0.05$.

Conclusions: Addressing malnutrition among SAC is an important contribution to academic success.

COVERAGE OF AND FACTORS ASSOCIATED WITH UPTAKE OF ROUTINE VITAMIN A SUPPLEMENTATION IN SUB-SAHARAN AFRICA

Gebremicael, Gebremedhin.

PhD. Epidemiologist. School of Public and Environmental Health. Hawassa University. Hawassa. Ethiopia.

Background and objectives: In many sub-Saharan Africa (SSA) countries routine vitamin A supplementation (VAS) of children has been implemented as a short- to medium-term strategy to combat Vitamin A deficiency (VAD). However, in the subcontinent limited information is available regarding the coverage VAS. The objective of the current study is to assess the coverage of and factors associated with utilization of VAS for preschool children in SSA.

Methods: The analysis was made based on the data of 28 Demographic and Health Surveys conducted in SSA since 2010. The data of 152,406 children were included in the analysis. The VAS status in the preceding 6 months was determined based on the reports of the caregivers. Factors association with VAS uptake and it's with common childhood ailments (diarrhea, cough, fever and anemia) were assessed using mixed effect logistic regression model.

Results: The coverage of VAS was 56.3% (95% CI: 56.1-56.5%). Among the 28 countries represented, six countries (Rwanda, Senegal, Malawi, Namibia, Serra Leone and Togo) achieved 80% or higher coverage; conversely, four countries (Guinea, Nigeria, Comoros and Benin) had less than 50% coverage. VAS coverage appears to vary across categories of children's age and socio-economic status. Children 6-11 months of age were less likely to have received VAS (48.6%) than older children (57.9%). The coverage in urban areas (63.9%) was significantly higher than that of rural areas (53.9%). Better maternal education and household wealth index were associated with higher uptake of VAS. VAS was modestly associated with increased odds of fever [AOR=1.20 (95% CI: 1.17-1.23)], diarrhea [AOR=1.16 (95% CI: 1.13-1.20)] and cough [AOR=1.23 (95%: 1.17-1.29)]. Conversely, in the supplemented children the odds of anemia was reduced by 10.8% (95% CI: 8.2-13.3%). All the associations translated into trivial effect sizes.

Conclusions: In SSA the coverage of VAS is unsatisfactory. VAS is associated with trivial increase in the occurrence of common childhood ailments.

USE OF 'DESIGN THINKING' TO ASSESS PARTICIPANT BEHAVIORS TO INFORM THE DESIGN OF A SMALL-QUANTITY LIPID-BASED NUTRIENT SUPPLEMENT (SQ-LNS) COMMUNICATION STRATEGY IN PASTO, COLOMBIA: FORMATIVE RESEARCH

[1]*Gust Duque, Tiffany;* [2]*Cabrera, Leah;* [3]*Bernal, Ines Jennifer;* [4]*Gonzalez, Wendy;* [5]*Bonvecchio, Anabelle;* [2]*Wheeler, Joseph Robert;* [2]*Varona, Michael;* [4]*Tumilowicz, Alison.*

[1]MPH RDN. Global Nutrition Consultant. Global Alliance for Improved Nutrition (GAIN). Switzerland.; [2]MFA. SOMOS Design Thinking. USA.; [3]PhD. Consultant. Global Alliance for Improved Nutrition (GAIN). Switzerland.; [4]PhD. Monitoring, Learning and Research. Global Alliance for Improved Nutrition (GAIN). Switzerland.; [5]PhD. Directora. Centro de Investigación en Nutrición y Salud (CINyS). Instituto de Salud Pública de México (INSP). México.

Background and objectives: The SPOON project aims to design a social and behavior change communication (SBCC) strategy to prevent malnutrition among children aged 0-24 months through adequate infant and young child (IYC) feeding practices, including home-fortification with SQ-LNS. Design thinking brings together creative methods and graphic design to develop innovative assessment instruments. We aimed to understand participant context and behaviors using these instruments to inform the design of a SBCC strategy for SQ-LNS.

Methods: Research and design-thinking teams collaborated to develop unique data collection approaches for use as part of in-depth interviews. The three instruments (communication, free time, and community influence) were administered to a convenience sample of 12 key informants (KI), 28 caregivers (CG), and 10 health professionals (HP) to understand the best methods for reaching them with messaging and communication components. Exercises included elements of graphic design, pictures, and stories that helped respondents identify how they communicate, use free time, and seek advice regarding their children.

Results: The design thinking materials were well understood by participants, easy to administer, provided a change of pace and reprieve from open-ended questioning, and enhanced respondent participation. KI, CG, and HP differ in preferred communication methods. HP frequently use computers (100%), WhatsApp (90%), smartphones (80%) and television (80%), while KI and CG frequently use television (89%), radio (67%), and smartphones (44%). In their free time both KI and CG frequent parks (58%), churches (50%), and family homes (47%). In cases of child illness, respondents seek help at hospitals, while in cases of routine checkups for growth and development they seek advice at health centers.

Conclusions: This innovative research technique allowed us to explore practical and available options for the delivery of the SBCC strategy for SQ-LNS. Design thinking instruments can be designed and included in formative studies to capture the local context and develop relevant interventions. In the Pasto setting, the SQ-LNS SBCC strategy should consider use of mass commu-

nication such as television and radio, but also more personal and targeted methods such as short message service (SMS) and community spaces to reach the various target populations.

INAPPROPRIATE TIMING OF INTRODUCTION OF COMPLEMENTARY FOODS: PRACTICES AND PERCEPTIONS AMONG MOTHERS OF INFANTS AND YOUNG CHILDREN IN BAJA VERAPAZ, GUATEMALA

[1]Garcia-Meza, Rosario; [2]Montenegro-Bethancourt, Gabriela; [3]Gonzalez, Wendy; [4]Bonvecchio, Anabelle; [5]Vossenaar, Marieke; [6]Tumilowicz, Alison.

[1]MA. Nutritionist. Center for Studies in Sensory Impairment, Aging and Metabolism. Guatemala.; [2]PhD. Consultant. Research Institute and Higher Education on Health Sciences (IECIS) Rafael Landívar University. Guatemala City. Guatemala.; [3]PdD. Consultant. Global Alliance for Improved Nutrition (GAIN). Geneva. Switzerland.; [4]PhD. Chief of Community Nutrition. Centro de Investigación en Nutrición y Salud (CINyS). Instituto de Salud Pública de México. Cuernavaca. Morelos. México.; [5]PhD. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.; [6]PhD. Senior Technical Specialist Monitoring, Learning and Research. Global Alliance for Improved Nutrition (GAIN). Geneva. Switzerland.

Background and objectives: The WHO recommends exclusive breastfeeding, followed be the timely introduction of adequate complementary foods (CF) at 6 months of age. Little is known about the specific age of introduction of CF in some areas of Guatemala and the perceptions which guide this practice. We aimed to assess the feeding practices of 6-23 months old infant and young children from Baja Verapaz.

Methods: As part of the formative research for SPOON, which aims to design social and behavior change communication (SBCC) strategy to prevent chronic malnutrition and reduce the risk of future obesity in children aged 0-23 months, qualitative and quantitative research methods were used to explore infant and young child (IYC) feeding practices and perceptions in 3 municipalities of Baja Verapaz. In-depth Interviews were conducted with 9 mothers and 28 mothers completed a structured survey.

Results: A theme that emerged from the in-depth interviews is that mothers delayed the introduction of CF until the infant was 7 or 8 months old, or even beyond the first year of life. Nine of the surveyed mothers started CF at <6 months, 10 at 6 months, 4 at 7 months, and 5 at 8 months. First foods offered included bean-broth, corn-tortilla, potatoes and rice. Fussiness, perceived negative effects of food on children's health, such as diarrhea or indigestion, are some of the reasons for delaying CF. Mother's perceptions are inspired by negative experiences with CF among older siblings and advice from role models, such as grandmothers. Economic restrictions also played a role in delaying CF.

Conclusions: Determinants that affect the timely initiation, establishment and continuation of CF are varied and specific to Baja Verapaz. Findings provide a foundation to design further behavior change interventions that promote appropriate feeding practices among infants and young children.

Keywords: Infant and young child feeding practices, complementary feeding, formative research

TOWARD A BETTER UNDERSTANDING OF ADHERENCE TO MICRONUTRIENT POWDERS: GENERATING THEORIES TO GUIDE PROGRAM DESIGN AND EVALUATION BASED ON A REVIEW OF PUBLISHED RESULTS

[1]Tumilowicz, Alison; [2]Schnefke, Courtney H.; [3]Neufeld, Lynnette M.; [4]Pelto, Gretel.

[1]PhD. Senior Technical Specialist. Global Alliance for Improved Nutrition. Geneva. Switzerland.; [2]MPH. RD. RTI International. Research Triangle Park. North Carolina. USA.; [3]PhD. Global Alliance for Improved Nutrition. Geneva. Switzerland.; [4]PhD. Division of Nutritional Sciences. Cornell University. Ithaca. New York. USA.

Background and objectives: To generate preliminary theories about factors affecting caregiver adherence to recommendations regarding point-of-use fortification of complementary foods with micronutrient powders (MNP).

Methods: A literature search was conducted to identify MNP studies and program descriptions using the following criteria: (1) MNP as an intervention provided to children 6 to 59 months of age at home, (2) content related to adherence, and (3) full text available in English. Thirty-seven studies and 6 program descriptions, representing 27 countries, were identified. We used thematic analyses to generate a comprehensive list of factors that could influence adherence, followed by content analysis to quantify the results. We developed a Program Impact Pathway to concretize the points at which the factors identified in our analysis affect the sequence of caregiver behaviours involved in the process of adherence.

Results: We identified 24 factors that pertain to child, caregiver and household levels that are reported to potentially influence adherence. The most influential factors, measured by number of documents reporting the factor having an effect, are: caregivers' perception of positive changes as a result of MNP use (n=14), caregivers' perceived child acceptance of food with MNP (n=12), and caregivers' knowledge of MNP's purpose (n=11). The majority of factors (n=22) identified by investigators can be characterized as pertaining to the "cultural" or "ideational systems".

Conclusions: The preponderance of knowledge and perception factors identified likely reflects an underlying assumption by investigators that caregiver behaviour is primarily driven by these two aspects, which may result in emphasis on questions related to these in research related to adherence. To achieve greater impact

we need to adopt a more cultural-ecological perspective to inform the design of programs that take into account a broader set of determinants. New studies that assess the progress across the impact pathway, particularly from caregiver adherence to biological outcomes would be useful to guide future program evaluation design, particularly where time or other constraints may limit potential to measure biological outcomes. Greater understanding of caregivers' perceptions and other facilitators and constraints to adherence is also critical for designing and monitoring behavior change strategies to encourage MNP use.

Keywords: Micronutrient powders, adherence, infant and young child feeding, micronutrient deficiency, cultural-ecological

THE MOTHER-CHILD DYAD IS A CENTRAL FACTOR IN POINT-OF-USE FORTIFICATION OF COMPLEMENTARY FOODS WITH MICRONUTRIENT POWDERS IN ETHIOPIA AND MOZAMBIQUE

[1]*Pelto, Gretel;* [2]*Tumilowicz, Alison;* [3]*Kjaer Pedersen, Kirstine;* [4]*Schnefke, Courtney H.;* [5]*Vettersand, Julia;* [6]*Possolo, Edna;* [7]*Hagos, Seifu.*

[1]PhD. Division of Nutritional Sciences. Cornell University. Ithaca. New York. USA.; [2]PhD. Global Alliance for Improved Nutrition. Geneva. Switzerland.; [3]CandScientAnth. Consultant for Global Alliance for Improved Nutrition. Geneva. Switzerland.; [4]MPH. RD. RTI International. Research Triangle Park. North Carolina. USA.; [5]Consultant for Global Alliance for Improved Nutrition. Geneva. Switzerland.; [6]Ministry of Health. Mozambique.; [7]PhD. Nutrition Unit. School of Public Health. Addis Ababa University. Ethiopia.

Background and objectives: To identify household level barriers and facilitators for initiating and sustaining point-of-use fortification of complementary foods with micronutrient powders (MNP) in Ethiopia and Mozambique.

Methods: As part of a mixed-method process evaluation, we used the focused ethnographic technique of guided, in-depth interviews to generate narratives of caregivers' experiences and beliefs with respect to MNP, from initial "trying out" through continuation or discontinuation. Interviews were conducted in samples of 30 caregivers in Ethiopia and 60 caregivers in Mozambique by experienced, trained interviewers. Interviews were audio-recorded, transcribed and translated. Coding was facilitated with NVivo software, and a subsample of transcripts were double coded to check for coding bias. Higher level analyses were facilitated by the use of Excel spreadsheets and narrative text notes were compiled to illustrate themes.

Results: Child responses to foods prepared with MNP emerged as a central factor in mothers' experiences, assessments and use of MNP. Initial positive child behavioral and physical reactions facilitated continued MNP use. Mother-reported positive child reactions included acceptance of food, visual signs of enjoyment, and consuming the portion. Initial negative child reactions included refusing food, vomiting, crying. Negative child reactions did not always lead to stopping, but depended on mothers' beliefs and re-

sponses. The spectrum of mothers' responses included techniques to encourage eating, mixing MNP with different foods, hiding the MNP packet, continuing to try or stopping MNP. Many caregivers described an eventual acceptance of MNP by the child after repeated exposure. After adherence was established, some children went on to develop negative behavioral and physical reactions. As with initiation, the effects of these on continuing use were also mediated by mothers' beliefs and responses.

Conclusions: Like breastfeeding, complementary feeding, utilization of MNP involves a mother-child dyad. Further studies are needed to better define characteristics of mother-child interactions with MNP and differences in cross-cultural and intra-cultural manifestations. It is likely that current promotion efforts would benefit from reorienting key messages and activities to encompass strategies for MNP use as a dyadic interaction, as has been the case with breastfeeding promotion.

Keywords: Mother-child dyad, barriers and facilitators for MNP use, child responses to MNP, mother responses to child MNP reactions

INTRODUCTION TO OBESOGENIC FOODS AND OVERWEIGHT IN CHILDREN AT 2 YEARS

[1]*Forster Lopes, Amanda;* [1]*Forster Lopes, Amanda;* [2]*Mara Braga Rocha, Elida;* [3]*Leone, Claudio.*

[1]Msc. Nutritionist. Department of Maternal and Child Health. School of Public Health. University of São Paulo. Brazil.; [2]PhD. Nutritionist. Department of Nutrition. School of Public Health. University of São Paulo. Brazil.; [3]PhD. Pediatrician. Department of Maternal and Child Health. School of Public Health. University of São Paulo. Brazil.

Background and objectives: The prevalence of overweight (OW) has been increasing, even among young children. There is no conclusive evidence on the relationship between the development of childhood OW and the time of food introduction. Even if the relationship exists, it is not known if there is any peculiarity regarding the association of this condition and the type of food introduced. Studies show that complementary feeding (CF) starts early and with food not always nutritionally adequate. The purpose of the study was to find if there is a relationship between the time of introduction of obesogenic foods and the OW in children in early preschool age.

Methods: A historical cohort study of children attending municipal day care centers in Taubaté – State of São Paulo. Weight and height of children and information on the age of introduction of obesogenic foods were collected – using a self-filled questionnaire completed by those responsible. The classification of the nutritional status was by the body mass index z-score (zBMI), and children with zBMI $\geq$ 1 were classified as having OW. The data analysis was performed using the Stata statistical package, version 9.2. The study was approved by the Research Ethics Committee - School of Public Health/University of São Paulo.

Results: The final sample consisted of 463 children, 50.5% female, with a mean age of 2.4 years. The prevalence of OW was high (27.5%). The mean age at the beginning of the introduction of obesogenic foods was 10.4 months (median: 10.0; SD: 4.9) and the mode was to start consuming these foods between 9 and 12 months. In this sense, it should be noted that almost half of the children (46.9%) started eating obesogenic foods between the ages of 3 and 9 months. It was found that the age at the beginning of the introduction of obesogenic food did not correlate with the BMI z-score (r= -0.07, 95% CI from -0.16 to 0.02, p=0.1021).

Conclusions: It was observed that there is an important prevalence of overweight children, however, in this population, no correlation with the time of introduction of obesogenic foods occurring early in age was observed.

Keywords: Obesity, Overweight, Preschool, Complementary feeding, Obesogenic Food.

Kathmandu. Nepal.; [6]Senior Vice-President of Programs. Heifer International. Little Rock. AR. USA; [7]Professor of Food Policy and Applied Nutrition. Friedman School of Nutrition Science and Policy. Tufts University. Boston. USA..; [8]Regional Center for Child and Youth Mental Health and Child Welfare. Uni Research Health. Bergen. Norway.; [9]Adjunct Professor. Centre for International Health. University of Bergen. Bergen. Norway.

Background and objectives: More than 200 million children <5 years of age in low/middle-income countries are at risk of not reaching their full developmental potential. This deficit has important economic consequences. Multiple factors contribute to this burden, including poor stimulation/learning opportunities, environmental toxins, and nutritional deficiencies, particularly diets deficient in animal source foods (ASF). However, few studies have explored longitudinal associations between household livestock ownership, child ASF consumption, and child development.

Methods: Child development was assessed using the Ages & Stages Questionnaire (ASQ-3, 3rd edition) in all 307 children age 23-38 months whose families were enrolled in a randomized trial of an intervention implemented over 33 months by Heifer Nepal in Banke, Nepal. Groups included (1) Intensive community development plus nutrition/livestock training ("full intervention") (2) Nutrition/livestock training alone, or (3) Control. Regular household visits were made to administer surveys/conduct child growth monitoring. The ASQ-3 was included in the 3rd visit (15 months after baseline). We used logistic regression to explore longitudinal associations between household livestock score, child ASF consumption (24-hr recall), and total ASQ-3 score in the bottom 25% of the distribution, adjusting for household wealth and maternal education.

Results: Mean number of ASFs consumed by children was low (Rounds 1-2-3, respectively): 0.51+/-0.73, 0.87+/-0.88, 0.90+/-0.92. Maternal education, household wealth and livestock ownership, participation in Heifer full intervention, and greater ASF consumption were significant or meaningful factors protecting children from an ASQ-3 score in the lowest quartile in unadjusted models. In multivariate models adjusted for wealth and maternal

education, the sum of ASFs consumed during the three 24-hour recalls collected over 15 months of observation significantly protected against a lower child development score (OR [95%CI]: 0.74 [0.60, 0.90]).

Conclusions: In this prospective longitudinal study, household livestock ownership, child ASF consumption, and participation in full Heifer intervention were each associated with better developmental testing results, even after accounting for socioeconomic status. Importantly, ASF consumption in early life (ages 8-23 months) was associated with later developmental performance. A trial to explore the potential benefits of ASF production and consumption on child development may be warranted.

EMPOWERING PRESCHOOLERS TO BECOME HEALTHY HABITS MESSENGER THROUGH SELECTED COMMUNICATION CHANNELS: STORIES MUSIC DANCE AND MAGIC TRICKS

[1]Zoumenou, Virginie; [2]Khan, Muhammad; [3]Ray, Dionne; [3]Jayne, Susan.

[1]PhD. Professor of Dietetics and Nutrition. Human Ecology Department. 1890 University of Maryland Extension Program. University of Maryland Eastern Shore. USA.; [2]MS. Faculty Research Assistant. 1890 University of Maryland Extension Program. University of Maryland Eastern Shore. USA.; [3]BS. Extension Nutrition Program Assistant. 1890 University of Maryland Extension Program. University of Maryland Eastern Shore. USA.

Background and objectives: Education has shifted away from simple dissemination of knowledge to using reinforcing communication channels (i.e. stories, music, dance, and magic tricks). Piaget's theory suggests that 2-7-year olds are in the pre-operational stage. The preschoolers think symbolically, use language, classify and represent objects by images and words. In addition, studies indicated that preschool children need appropriate outlets to express their energy in a positive and creative way. Two outlets, dance and music, should be considered among preschoolers. By adapting an established curriculum to include creative movement and music, preschoolers will have a better understanding of the arts while learning. Magic tricks are ageless and relevant across cultures.

The present program aimed to empower the preschoolers through stories, dance, music, and magic tricks to influence health behavior at school and at home and to measure the effectiveness of selected communication channels in reinforcing nutrition education among 3-5-year old preschoolers.

Methods: A two year longitudinal and experimental study design was used. Approximately 300 preschoolers (150/experimental group; 150/control group) participated at three Head START Centers. The Socio-ecological Framework was used. The curriculum, "Eagle Book Series" developed by the Center for Disease Control and Prevention (CDC) in response to the burden of diabetes among Native Americans was evaluated among African American children and implemented. Four lyrics with accompanying movement were created emphasizing each book's main message. The reading of each book was followed by music, dance, visual tools, and magic tricks. The effectiveness of the selected communication channels was measured using surveys and caregivers' feedback. Descriptive statistics (STATA 14), Paired-T-test, and content analysis were used.

Results: Approximately 300 preschoolers participated: 90% were African American. More than 80% of the participants in the experimental group understood the main message in each book and remembered the lyrics of the songs. Direct observation indicated that magic tricks increased their attention. Qualitative data indicated that preschoolers were able to share the messages at home with their siblings and caregivers.

Conclusions: Overall teaching an established curriculum using the right communication channels could make a difference in nutrition education among preschoolers. Preschoolers may affect the food decision making at home and at school.

Keywords: Preschoolers. communication channels. healthy behaviors.

IMPAIRED NEURAL TUBE CLOSURE IN MICE LACKING HIGH DENSITY LIPOPROTEIN RECEPTOR SR-BI IS ASSOCIATED WITH DEFICIENT VITAMIN E UPTAKE AND ABERRANT GENE EXPRESSION

[1]Santander, Nicolas; [2]Quiroz, Alonso; [3]Perez, Druso; [4]Echeverría, Guadalupe; [5]Rigotti, Attilio; [6]Busso, Dolores.

[1]Biochemist. Ph.D. Department of Nutrition, Diabetes and Metabolism. School of Medicine. Pontificia Universidad Católica de Chile. Chile.; [2]Biochemist. Department of Nutrition, Diabetes and Metabolism. School of Medicine. Pontificia Universidad Católica de Chile. Chile.; [3]MSc. Center of Molecular Nutrition and Chronic Diseases. School of Medicine. Pontificia Universidad Católica de Chile. Chile.; [4]Industrial engineer. Center of Molecular Nutrition and Chronic Diseases. School of Medicine. Pontificia Universidad Católica de Chile. Chile.; [5]MD. PhD. Department of Nutrition, Diabetes and Metabolism & Center of Molecular Nutrition and Chronic Diseases. School of Medicine. Pontificia Universidad Católica de Chile. Chile.; [6]PhD. Department of Nutrition, Diabetes and metabolism. School of Medicine. Pontificia Universidad Católica de Chile. Chile.

Background and objectives: SR-BI is the main receptor for high density lipoproteins (HDL) and mediates the bidirectional

---

transport of lipids, such as cholesterol and vitamin E, between these particles and cells. During early development, SR-BI is expressed in extraembryonic tissue, specifically in trophoblast giant cells in the parietal yolk sac. We previously showed that approximately half of the embryos in SR-BI-/- conceptuses fail to close the anterior neural tube and develop exencephaly, a perinatal lethal condition, suggesting that SR-BI-mediated transport of lipids is important for neural tube closure. In this work, we evaluated the role of SR-BI in embryonic vitamin E uptake during murine neural tube closure.

Methods: We generated heterozygous intercrosses, fed the dams with control chow or a vitamin E-supplemented diet, and obtained the embryos at E9.5, when the neural tube is normally recently closed. We determined the vitamin E content in embryos by HPLC, their reactive oxygen species (ROS) content with dichlorodihydrofluorescein, and gene expression by real time PCR.

Results: Our results showed that all the SR-BI-/- embryos analyzed had very low vitamin E content in comparison to SR-BI+/+ embryos. SR-BI-/- embryos with closed neural tubes (nSR-BI-/-) exhibited high reactive oxygen species (ROS), whereas SR-BI-/- with NTD (NTD SR-BI-/-) showed intermediate ROS levels between SR-BI+/+ and nSR-BI-/- embryos. Reduced expression of genes involved in neural tube closure was only found in NTD SR-BI-/- embryos. Maternal α-tocopherol dietary supplementation prevented NTD almost completely (from 54% to 2%, p<0.001), and SR-BI-/- embryos retrieved from those dams showed normal ROS and gene expression levels.

Conclusions: Altogether, our results suggest that SR-BI contributes in the provision of appropriate levels of vitamin E to the embryo, suggesting that an abnormal vitamin E uptake transfer from the mother to the embryo mediates NTD in this model.

Pontificia Universidad Católica de Chile. Santiago. Chile; [4]MD. Department of Clinical Laboratories. School of Medicine. Faculty of Medicine. Pontificia Universidad Católica de Chile. Santiago. Chile; [5]PhD. Nutritionist. UDA Health Sciences, Nutrition and Dietetics. Faculty of Medicine. Pontificia Universidad Católica de Chile. Santiago. Chile.; [6]Nutritionist. Division of Obstetrics and Gynecology. School of Medicine. Faculty of Medicine. Pontificia Universidad Católica de Chile. Santiago. Chile.

Background and objectives: Long chain polyunsaturated fatty acids are an essential component for normal growth and development of the fetus and newborn. They participate in the control of cellular growth, metabolism, intercellular communication and gene expression, relevant for the physiopathology of metabolic and cardiovascular diseases. Docosahexaenoic (DHA) and eicosapentaenoic are the most known fatty acids from omega 3 family. It is known that low concentrations of omega-3 in humans is associated with disturbance of cellular metabolism, including neurological and visual development.

The objective of this study was to describe and compare fatty acid profile from normal and obese pregnant woman, then determine the relationship of mother´s nutritional status with neonatal DHA levels.

Methods: 17 pregnant women (7 normal weight, 10 obese) were recruited at the Clinical Hospital of Pontificia Universidad Católica de Chile after Ethical Committee approval and informed consent. Mother venous blood was collected, and newborn's blood samples were obtained from the umbilical cord vein at the moment of delivery. Fatty acids profile was determined in red blood cell by liquid gas chromatography.

Results: There was a trend of higher omega-6/omega-3 ratio in newborn erythrocytes from obese pregnant women compared to controls (3.78±0.37 vs 2.81±0.09, respectively, p= 0.065, Mean±SEM). There was a negative association between newborn DHA levels and mother's body mass index (r²=0.7, p=0.037). A lower concentration of DHA occurred in neonatal erythrocytes from obese mothers, compared to those with normal weight for height and gestational age at the end of pregnancy (140.3±7.68 vs 103.9±6.83 mg/dL, respectively, p=0.016, Mean±SEM).

Conclusions: There is a decreased concentration of DHA in neonatal erythrocytes from obese women. Due to the relevance of DHA during pregnancy and development of the newborn, the results of the present study put in evidence the importance of considering an

adequate reposition of DHA in obese pregnant women. Nutritional status, fatty acid profile, DHA concentrations, their relationship and physiopathology mechanisms involved require further research.

Keywords: Long chain polyunsaturated fatty acids; Docosahexaenoic acid; obesity; newborn.

ASSOCIATION BETWEEN DOMAINS OF NUTRITION RISK AND HOSPITALISATIONS AND MORTALITY AT FIVE YEARS FOLLOW UP AMONG OCTOGENARIANS PARTICIPATING IN LIFE AND LIVING IN ADVANCED AGE: COHORT STUDY NEW ZEALAND

(1)Wham, Carol; (2)North, Sylvia; (3)Wham, Carol; (4)Teh, Ruth; (5)Moyes, Simon; (6)Rolleston, Anna.

(1)PhD. Associate Professor of Nutrition and Dietetics. Massey University. Auckland. New Zealand.; (2)MSc. Dietitian. Massey University. Auckland. New Zealand.; (3)PhD. Associate Professor of Nutrition and Dietetics. Massey University. Auckland. New Zealand.; (4)PhD. Senior Lecturer. School of Population Health. University of Auckland. New Zealand.; (5)MSc. Data Manager/Analyst. School of Population Health. University of Auckland. New Zealand.; (6)PhD. Senior Research Fellow. School of Population Health. University of Auckland. New Zealand.

Background and objectives: A high prevalence of nutrition risk was previously reported for Māori (49.4%) and non-Māori (38.3%) octogenarians in in Life and Living in Advanced Age a Cohort Study New Zealand. Māori are the indigenous people of Aotearoa, New Zealand comprising 14% of the total population. This study aimed to investigate the association between domains of nutrition risk with hospitalisations and mortality at five years follow up.

Methods: Sociodemographic and health characteristics were obtained by face-to-face interviews at baseline. The validated screening tool, Seniors in the Community: Risk Evaluation for Eating and Nutrition, Version II (SCREEN II) was used to evaluate nutrition risk according to three domains of risk: 1) "Weight Change", 2) "Dietary Intake", and 3) "Factors Affecting Intake." Five years from inception, participant hospitalisations and mortality were matched using National Health Index numbers. Survival analyses were performed to examine independent associations between nutrition risk scores from the three domains of SCREEN II with five year all-cause hospital admissions and mortality.

Results: Adjusted for age, gender, socioeconomic deprivation, education level, previous hospital admission, comorbidities and activities of daily living, lower nutrition risk in the "Dietary Intake" domain was associated with reduced hospitalisations and mortality [Hazard Ratios (HR) (95% CI) 0.97 (0.95-0.99), p=0.009 and 0.91 (0.86-0.98), p=0.005 respectively] and the "Factors Affecting Intake" domain was associated with mortality [HR, (95% CI) 0.94 (0.89-1.00) p=0.048] for Māori but not non-Māori.

Conclusions: Nutrition risk measured from "Dietary Intake" domain of SCREEN II was significantly related to all-cause hospitalisations and mortality for older Māori and suggests dietary inadequacy and potential lifestyle influences of diet may be the most important factors associated with nutrition risk for Māori.

INFANT FEEDING PRACTICES AMONG MOTHERS WITH CHILDREN 6 TO 24 MONTHS OF AGE IN THE ADENTAN MUNICIPALITY OF THE GREATER ACCRA REGION, GHANA

(1)Klevor, Moses Kwashie; (2)Asomboya, Mirabel; (3)Setorglo, Jacob; (4)Pereko, Kingsley.

(1)PhD. Lecturer. Department of Clinical Nutrition and Dietetics. School of Allied Health Sciences. University of Cape Coast. Cape Coast. Ghana.; (2)MPH. Department of Community Health. Ensign College of Public Health. Kpong. Ghana.; (3)PhD. Senior Lecturer. Department of Medical Biochemistry. School of Medical Sciences. University of Cape Coast. Cape Coast. Ghana.; (4)Pereko. PhD. Senior Lecturer. Department of Community Medicine. School of Medical Sciences. University of Cape Coast. Cape Coast. Ghana.

Background and objectives: The World Health Organization (WHO) recommends exclusive breastfeeding (EBF) for the first 6 months of life and appropriate complementary feeding from 6 to 24 months of age, with continued breast breastfeeding. Optimal feeding practices promote the growth, development and health of infants. The aim of this study was to assess infant feeding practices amongst mothers with babies 6-24 months old in the Adentan Municipality of the Greater Accra Region of Ghana.

Methods: This was a descriptive cross-sectional study among 391 mothers. Data were collected through face-to-face interviews. Bivariate analysis was used to evaluate the associations between independent variables and infant feeding practices.

Results: The age range of women was 17-45 years; half of the mothers had secondary or vocational education and were self-employed. About 98% of the children had normal birth weight ($\geq$ 2.5kg). Most women had more than 4 antenatal visits (81%), delivered at a government (54%) or private (37%) health facility with skilled attendance (90%), and were informed about the importance of EBF at least once during antenatal services (92%). About 70% of mothers initiated breastfeeding within 30 minutes to 1 hour after delivery, 59% exclusively breastfed their infants for the first 6 months postpartum, and 46% initiated complementary feeding at 6 months postpartum. Most mothers fed their children 3-4 times (72%) and gave at least one snack in a day (70%).

Antenatal clinic attendance (p = 0.003), skilled attendance at delivery (p = 0.003), place of delivery (p < 0.001) and time of breastfeeding initiation (p < 0.0001) were positively associated with EBF for the first 6 months postpartum. None of the independent variables were significantly associated with timely introduction of complementary foods at 6 months postpartum.

Conclusions: The rate of EBF was low among respondents. Less than half of respondents initiated complementary feeding at 6 months postpartum. Place of delivery, time of breastfeeding initiation, skilled attendance at delivery and antenatal clinic attendance were significantly associated with EBF for the first 6 months postpartum.

ROLE OF PRECONCEPTION NUTRITION IN OFF-SPRING GROWTH AND RISK OF STUNTING ACROSS THE FIRST 1000 DAYS IN VIETNAM

[1]Young, Melissa; [2]Hong Nguyen, Phuong; [3]Gonzalez Canaova, Ines; [4]Addo, Yaw; [5]Tran Mai, Lan; [6]Nguyen, Son; [7]Martorell, Reynaldo; [7]Ramakrishnan, Usha.

[1]PhD. Hubert Department of Global Health. Emory University. USA; [2]MD. PhD. Research Fellow. International Food Policy Research Institute. USA.; [3]PhD. Post Doctoral Fellow. Hubert Department of Global Health. Emory University. USA.; [4]PhD. Assistant Professor. Hubert Department of Global Health. Emory University. USA.; [5]BS. Research Analyst. Thai Nguyen University of Pharmacy and Medicine. Vietnam.; [6]MD, PhD. Pediatrician. Thai Nguyen University of Pharmacy and Medicine. Vietnam.; [7]PhD. Professor. Hubert Department of Global Health. Emory University. USA.

Background and objectives: There is growing interest in the health implications of preconception maternal nutritional status (PMNS), but gaps remain. We examine associations between PMNS and offspring growth during the first 1000 days.

Methods: This is a secondary analysis using prospective data from women who participated in PRECONCEPT, a randomized controlled trial of preconception micronutrient supplementation in Vietnam. Women/children pairs with information on preconception height/weight, at least one ultrasound measurement before 30 weeks (head and abdomen circumferences, biparietal diameter, and femoral length), singleton birth size and child length at two years were included in this analysis. We used structural equation and multivariate linear and logistic regression models to examine associations between three PMNS indicators (weight, height, BMI) on offspring growth (height for age Z-score, HAZ), and risk of stunting (< -2 HAZ) at 2 years of age. Models were adjusted for child age, gender, gestational weight gain, maternal education, socioeconomic status and treatment group.

Results: Of the 1,409 women included in study, a third of the women had a prepregnancy BMI <18.5kg/m2, height < 150cm or weight less than 43 kg. PMNS was significantly and positively associated with fetal growth and offspring HAZ at birth and 2 years. For each 1 standard deviation (SD) increase in maternal height, offspring HAZ at 2 years increased by 0.30 SD. A 1SD increase in maternal preconception weight or 1 SD increase in BMI was associated with an increase in HAZ at 2 years of 0.23 (p < 0.001) and 0.06 SD (p < 0.1), respectively. In structural equation modeling, the indirect effects of mother's height, weight and BMI on HAZ at 2 years were 14%, 31% and 86% of the total effect (through impact on fetal growth and size at birth). Women with pre-pregnancy height < 150 cm, a weight less than 43 kg or BMI < 18.5kg/m2 had 2.7 (2.1-3.6), 2.1 (1.6-2.7) and 1.2 (0.96-1.7) times, respectively, the risk for stunting at 2 years of age.

Conclusions: Maternal preconception nutritional status is a critical indicator of offspring linear growth and risk of child stunting across the first 1000 days.

Keywords: preconception, nutrition, stunting, Vietnam

DIETARY INTAKE, WEIGHT GAIN AND SLEEP PATTERNS IN YOUNG CHILDREN PREDISPOSED TO OVERWEIGHT

[1]Rangan, Anna; [2]Zheng, Miaobing; [3]Olsen, Nanna Julie; [4]Rohde, Jeanett Friis; [5]Heitmann, Berit Lilienthal.

[1]PhD. Associate Professor. Discipline of Nutrition and Dietetics. The University of Sydney. Australia; [2]PhD. Dietitian. Discipline of Nutrition and Dietetics. The University of Sydney. Australia.; [3]PhD. Nutritionist. Research Unit for Dietary Studies. The Parker Institute Bispebjerg and Frederiksberg Hospitals. the Capital Region. Copenhagen. Denmark.; [4]MSc. Nutritionist. Research Unit for Dietary Studies. The Parker Institute. Bispebjerg and Frederiksberg Hospitals. the Capital Region. Copenhagen. Denmark.; [5]PhD. Professor. Research Unit for Dietary Studies. The Parker Institute. Bispebjerg and Frederiksberg Hospitals. the Capital Region. Copenhagen. Denmark.

Background and objectives: Poor sleep patterns have been shown to be a contributor to obesity in both children and adults. Less evidence is available during toddlerhood period and among those with higher obesity risk. The objective of this study was to examine the relationship between sleep patterns and body weight development in a group of young obesity-predisposed children, and to assess whether dietary factors affect this relationship.

Methods: Participants included 368 Danish children aged 2-6 years from the Healthy Start Study, a 1.2 year randomised controlled intervention trial. Sleep habits were measured using a 7-day sleep diary, and dietary intake was assessed using 4 day food records at baseline. Multivariate linear regression with adjustment for confounders was used to assess the association of sleep duration and sleep variability with 1.2 year changes (Δ) in BMI z-score from baseline to follow-up. Energy intake was tested as a mediator in this relationship. Dietary factors associated with sleep duration and sleep variability were also examined.

Results: A significant inverse association was observed between nighttime sleep duration and ΔBMI z-score (β=-0.090, P= 0.046) with a 1-hour difference in sleep being associated with a 239 kJ energy intake. Energy intake was found to mediate this association with all macronutrients contributing to this effect. Sleep variability, although not associated with ΔBMI z-score, was associated with several dietary factors including higher consumption of added sugars and sugary beverages and lower consumption of fruit and vegetables.

Conclusions: Shorter sleep duration, mediated by energy intake in early in life, seems a risk factor for weight gain among young obesity-predisposed children. Additionally, dietary factors contribute to sleep variability during childhood.

Keywords: children, obesity, sleep duration, sleep variability, diet

HOW NUTRITION AND ENVIRONMENTAL IN-FLUENCES SHAPE CHILD DEVELOPMENT DURING THE FIRST 1000 DAYS: DIRECT AND INDIRECT ASSOCIATIONS IN FOUR PROSPECTIVE COHORTS OF YOUNG CHILDREN IN AFRICA

[1]*Prado, Elizabeth;* [2]*Adu-Afarwuah, Seth;* [3]*Ashorn, Per;* [1]*Hess, Sonja Y;* [4]*Lartey, Anna;* [5]*Maleta, Kenneth;* [6]*Ouédraogo, Jean Bosco;* [1]*Dewey, Kathryn G;* [7]*Study Group, The iLiNS Project.*

University of Malawi College of Medicine. Malawi; [6]PhD. Institut de Recherche en Sciences de la Santé/DRO. Burkina Faso; [7]The iLiNS Project.

Background and objectives: As countries mobilize to reach Sustainable Development Goal 4.2, to ensure "access to quality early childhood development" (ECD), evidence is needed to inform the design of interventions. Previous reviews have identified 44 risk factors for poor ECD in low- and middle-income countries. Our objective was to examine associations of these risk factors with ECD in four prospective cohorts of children who participated in trials conducted as part of the International Lipid-Based Nutrient Supplements (iLiNS) Project in Ghana (n=1023), Malawi (n=675 and 1385), and Burkina Faso (n=1122).

Methods: In two cohorts, women were enrolled during pregnancy. In two cohorts, infants were enrolled at 6 or 9 months. In all cohorts, motor and language development were assessed at 18 months. In multiple linear regression and structural equation models (SEM), we examined 22 out of 44 factors identified in previous reviews, plus 12 additional factors hypothesized to be associated with ECD.

Results: Out of 42 indicators of 34 risk factors examined, six indicators of five factors were consistently associated with 18-month language and/or motor development in three or four cohorts: children's variety of play materials, activities with caregivers, dietary diversity, linear and ponderal growth, and hemoglobin/iron status. Caregiving and child factors showed stronger associations with child development, as compared to environmental and maternal factors, even when considering both indirect and direct effects. At age 18 months, children from low socio-economic status (SES) households had fallen behind those from higher-SES households in language development in all four cohorts and in motor development in two cohorts, highlighting the importance of child development interventions targeting this early period. Associations between SES and language development were consistently mediated to a greater extent by caregiving practices than by maternal or child bio-medical conditions. This pattern for motor development was not consistent across cohorts.

Conclusions: Key elements of interventions to ensure quality ECD are likely to be promotion of caregiver activities with children, a variety of play materials, and a diverse diet, and prevention of faltering in linear and ponderal growth and improvement in child hemoglobin/iron status. Interventions to reduce socioeconomic disparities in ECD should target caregiving behavior.

Professor. Hubert Department of Global Health. Emory University. USA.

Background and objectives: Home fortification of multiple micronutrient powders (MMP) is a globally recommended strat-

---

egy to reduce anemia. However, further information is needed on program implementation and factors associated with household utilization.

Methods: A cluster randomized effectiveness trial in children 6-18 months was conducted in Bihar, India within the context of an ongoing program (CARE, India: Integrated Family Health Initiative). MMPs were delivered by existing community front line workers along with counseling over the course of a year for the intervention group. The primary objective was to examine program effectiveness in reducing child anemia, stunting and improving feeding practices. For this abstract, we examine factors associated with MMP utilization and caregiver perspectives using data that were obtained at endline (n= 4292).

Results: There was high program exposure with 82% of caregivers in the intervention group reporting having heard/seen MMP. Of these households, 70% had ever received MMP and of those, 85% had ever consumed MMP. The top reasons caregivers reported for never feeding MMP to their child were the child was not yet receiving food (30%) or the mother/family member did not like/accept MMP (12%). Among children (n= 1523) who received MMP at endline: 91% reported finding the MMP easy to use, 66% felt the child liked the powder, 85% thought it was important to give to the child, 81% would recommend the MMP to other families. 64% had consumed MMP in the previous month, 43% had consumed MMP in the previous week. The top reasons for not consuming MMP were ran out of supply (48%) or child did not like to eat the food with MMP (31%). MMP use was significantly higher among lower SES households [OR 1.3 (95%CI:1.0-1.7); compared to high SES], lower caste [OR: 1.6(95%CI:1.0-2.5) scheduled tribe, 0.7(95%CI:0.6-0.9) other-backward-class, 0.6(95%CI:0.4-0.9) other; compared to scheduled caste] and older children 12-18mo [OR 3.6 (95%CI:3.0-4.3); compared to 6-11mo]. There were no differences by maternal age, education, religion of child gender.

Conclusions: Home fortification of complementary foods was a well-accepted strategy by caregivers. Key barriers to program uptake include interruptions in supply and poor complementary feeding practices.

FATTY ACIDS PROFILE IN BREAST MILK FROM WOMEN LIVING IN BUENOS AIRES. PRELIMINARY STUDY

[1]Ronayne de Ferrer, Patricia Ana; [2]Giacomino, María Silvia; [3]Pellegrino, Néstor; [4]Carola Beatriz, Greco; [5]Gibson, Verónica.

[1]PhD. Biochemist. Universidad de Buenos Aires. Facultad de Farmacia y Bioquímica. Cátedra de Bromatología. Argentina.; [2]BsC. Biochemist. Universidad de Buenos Aires. Facultad de Farmacia y Bioquímica. Cátedra de Bromatología. Argentina.; [3]PhD. Biochemist. Universidad de Buenos Aires. Facultad de Farmacia y Bioquímica. Cátedra de Bromatología. Argentina.; [4]PhD. Biochemist. Universidad de Buenos Aires. Facultad de Farmacia y Bioquímica. Cátedra de Bromatología. Argentina.; [5]MD. Sanatorio Mater Dei. Buenos Aires. Argentina.

Background and objectives: Fatty acids profile in breast milk is modified by maternal diet; this profile is important for the growing infant since it is reflected in child's tissues, particularly in the central nervous system. In recent years, the role of long chain polyunsaturated fatty acids (LCPUFA) on neurological development has been recognized. In our country, information about arachidonic acid (ARA) and docosahexaenoic acid (DHA) levels in human milk is scarce. The objective of the present study was to determine the fatty acids profile in breast milk from a high-income urban population.

Methods: Lactating women at 6 months postpartum attending the pediatric control visits (at a private clinic in Buenos Aires) consented to participate (n= 13). Morning milk samples were obtained by complete manual extraction from one breast and kept at -20°C. They were analyzed for fatty acids profile by gas chromatography (Perkin Elmer Claurus 500, capillary column Supelco SP2560 and FID detector) previous derivatization according to Lepage et al (J. Lipid Res 27:114-20, 1986) using nitrogen as carrier gas. Fatty acids were identified against SUPELCO FAME Mix NHI-C and FAME Mix C14-C22 standards.

Results: Fatty acids percentages were determined (% methyl esters /100 g total fatty acids). Median values together with maximum and minimum values are shown.

The contents of saturated, monounsaturated and polyunsaturated fatty acids were: 43.92% (50.42-29.56); 38.64% (47.79-32.46); 16.74% (23.46-11.67), respectively.

The three most abundant fatty acids, oleic, palmitic and linoleic acids, represented about 60% of total fatty acids; medians were 33.33% (41.58-25.64); 19.98% (23.87-17.25); 14.77% (20.48-9.32), respectively. For LCPUFA, ARA and DHA the following values were obtained: 0.44% (0.60-0.30) and 0.18% (0.71-0.08), respectively.

Conclusions: Global fatty acids profile was in agreement with published values. Regarding LCPUFA, ARA levels were similar to literature reports. This fatty acid tends to be stable and less dependent on dietary intake. On the other hand, DHA showed levels similar to those reported by other local investigators but lower than values published in other countries, particularly those corresponding to populations consuming marine foods. It would

be advisable in our country to increase intake of DHA providing foods both in pregnant and lactating women. Project UBACyT 20020130100520BA

MATERNAL, BREAST MILK AND INFANT B12 STATUS IN RURAL GAMBIA

[1]Eriksen, Kamilla; [2]Allen, Lindsay H.; [2]Shahab-ferdows, Setareh; [2]Hampel, Daniela; [3]Moore, Sophie E.

[1]PhD candidate. Medical Research Council (MRC) Elsie Widdowson Laboratory. University of Cambridge. Cambridge. United Kingdom.; [2]Dr. USDA. ARS Western Human Nutrition Research Center. University of California. Davis. California. USA; [3]Dr. Division of Women's Health. King's College London. London. United Kingdom.

Background and objectives: Vitamin B12 is vital for infant growth and development. In rural Gambia animal source food consumption is low, placing both mothers and infants at risk of B12 deficiency. Here we investigate the relationship between maternal, breast milk and infant B12 status in a population at risk of B12 deficiency.

Methods: The current analysis used data collected as part of the Early Nutrition and Immune Development (ENID) study a randomised trial, conducted in rural Gambia, West Africa (IS-RCTN49285450). For this analysis, only women supplemented with either multiple micronutrients (MMN) or iron and folic acid (FeFol) during pregnancy were included. Plasma and breast milk samples from 350 mother-infant dyads were analysed for vitamin B12 during pregnancy and lactation.

Results: In early pregnancy 7% of mothers were below the threshold for low serum B12 concentrations (<150 pmol/l), and 16% had concentrations between 150-221 pmol/l. Maternal plasma B12 was significantly higher in the MMN group at 30 weeks gestation compared to the FeFol group (p<0.01). Median breast milk B12 for the FeFol group was 161, 146 and 185 pmol/l vs. 174, 162, 207 pmol/l in the MMN group at 8, 12 and 24 weeks postpartum, respectively (not significantly different, p>0.1). Infant plasma B12 was significantly higher at birth and at 12 weeks postpartum in the MMN group vs. the FeFol group (p<0.02). Median infant plasma B12 for the FeFol group was 354, 259 and 240 pmol/l vs 368, 297, 234 pmol/l in the MMN group at birth, 12 and 24 weeks, respectively.

Conclusions: Mothers were mildly B12 deficient in early pregnancy, but breast milk B12 concentrations and infant B12 status indicated a greater level of deficiency. Supplementation with MMNs during pregnancy had an effect on maternal and infant B12 status, but not on breast milk B12 concentration.

Keywords: pregnancy, B12, breast milk, infant, multiple micronutrient supplementation

University of Gothenburg. Sweden.; [3]PhD. MD. Department of Obstetrics and Gynecology. University of Gothenburg. Sweden.; [4]PhD. MD. Department of Antenatal Care. Gothenburg. Sweden.; [5]Professor. Nutritionist. Department of Internal Medicine and Clinical Nutrition. University of Gothenburg. Sweden.; [6]MD. Department of Antenatal Care. Södra Bohuslän. Sweden.; [7]Midwife. Department of Antenatal Care. Gothenburg. Sweden.; [8]PhD. Medical School. University of East Anglia. United Kingdom.; [9]Professor. Department of Internal Medicine and Clinical Nutrition. University of Gothenburg. Sweden.

Background and objectives: Fetal growth depends on placenta function. Maternal vitamin D status has been inversely associated with uteroplacental dysfunction. We aimed to investigate the associations between vitamin D status in early and late pregnancy with prevalence of neonatal small for gestational age (SGA), low birth weight (LBW), preterm delivery and pregnancy loss.

Methods: Pregnant women were recruited at antenatal clinics in Sweden (latitude 57-58°N). Serum 25-hydroxyvitamin D (25OHD) was analyzed in gestational week ≤16 (trimester 1 (T1), N=2046) and >31 (trimester 3 (T3), N=1816) by liquid chromatography tandem mass spectrometry. Gestational and neonatal data were retrieved from medical records.

Results: Logistic regression showed that 25OHD at T1 was only associated with pregnancy loss (OR 0.99, p=0.041). 25OHD at T3 ≥100 nmol/L was associated with lower odds of SGA (OR 0.3, p= 0.031) and LBW (OR 0.2, p= 0.046), compared to vitamin D deficiency (25OHD <30 nmol/L). Women with a ≥30 nmol/L increment in 25OHD from T1 to T3 had the lowest odds of SGA, LBW and preterm delivery.

Conclusions: In early pregnancy, higher vitamin D status was associated with lower odds of pregnancy loss. In late pregnancy, high vitamin D status was associated with lower odds of fetal growth restriction. A higher increment in 25OHD during pregnancy was associated with lower odds of adverse neonatal birth outcomes. This emphasise the importance of adequate maternal vitamin D status for healthy pregnancy.

Keywords: pregnancy, 25-hydroxyvitamin D, fetal growth restriction

National Institute for Hygiene, Epidemiology and Microbiology. Cuba; [3]Dr. Center for Nutrition and Food Hygiene. National Institute for Hygiene, Epidemiology and Microbiology. Cuba.; [4]MS. Center for Nutrition and Food Hygiene. National Institute for Hygiene, Epidemiology and Microbiology. Cuba.; [5]Dr. PhD. Autonomous University of Nuevo León. Mexico.; [6]Dr. Polyclinic Jesús Vantroi. Cuba.; [7]Dr. Center for Alzhéimer Research. Cuba.; [8]Tec. Center for Nutrition and Food Hygiene. National Institute for Hygiene, Epidemiology and Microbiology. Cuba.; [9]Tec. Center for Nutrition and Food Hygiene. National Institute for Hygiene, Epidemiology and Microbiology. Cuba.

Background and objectives: Early stages of life course are crucial for detection of risk for adultness-common chronic diseases, in terms of applying early preventive interventions. In the elderly, evaluation of similar risk markers are useful to stop disease progression. Urban areas have shown a higher prevalence of chronic diseases risk factors. Our aim was to determine the prevalence of vascular risk values from main glucidic and lipidic metabolic parameters in Cuban scholars, adolescents and elders from urban areas.

Methods: A transversal study was carried out on 113 scholars (mean age 8, 9 years), 469 adolescents (mean age 13, 8 years), and 395 elders (mean age 78, 9 years), all from both sexes. All individuals were living in urban areas and were attending to urban schools or urban institutions for elders. Children and adolescents were apparently healthy without toxic habits. Elders had no previous diagnosis of common chronic diseases except for variable cognitive impairment. Groups were evaluated for serum glucose, triglycerides, total cholesterol (TC), HDL cholesterol, LDL cholesterol and VLDL cholesterol using standard enzymatic colorimetric assays.

Results: In scholars, triglycerides (49, 6%) and TC (31%) showed the highest frequencies of risk levels, as they did in adolescents: triglycerides (35,6%), TC (23.9%). In contrast, LDL (58,2%) and TC (48,6%) were the most altered in elders. Frequencies of risk levels for glucose were similar between elders and adolescents and were markedly higher between them and scholars. Both, percentages of individuals with risky values, and mean serum levels, were overtly higher in elders than in the other groups for TC and LDL. Scholars showed the highest frequency of risk levels for triglycerides, followed in order by adolescents and elders. In general, study groups did not differ in risk frequencies for HDL. Younger groups presented considerable percentages of individuals with more than one parameter altered.

Conclusions: This work shows an elevated prevalence of vascular risk values of metabolic parameters related to Nutrition in scholars, adolescents and elders of urban areas. This prevalence appears to increase with age but only for some of those parameters pinpointing the need for application of risk-modifying interventions since the early stages.

Keywords: scholars, adolescents, elders, urban areas, lipids risk values.

Research Investigator. Initiative for Climate Change and Health. Health Systems and Population Studies Division. icddrb. Dhaka. Bangladesh.; [7]MSc. Statistician. James P Grant School of public Health. BRAC University. Dhaka. Bangladesh.; [8]PhD. Director. Program in International & Community Nutrition. Distinguished Professor. Department of Nutrition. Nutritionist in Agricultural Experiment Station. University of California. Davis. USA.

Background and objectives: Background: Several strategies for reducing child undernutrition in low and middle income countries are being implemented, which may affect child morbidity either positively or negatively. Objective: To examine the effects of providing lipid-based nutrient supplements (LNS) to pregnant and lactating women or providing LNS or micronutrient powder (MNP) to their children from 6 to 24 months on common childhood illnesses.

Methods: In a four-arm cluster-randomized effectiveness trial, women were enrolled at ≤20 wk gestation (n=4011) and received either: a) LNS during pregnancy and the first 6 months postpartum, and LNS for the offspring from 6-24 months (LNS-LNS); b) Iron and folic acid (IFA) during pregnancy and the first 3 months postpartum, and LNS for the offspring as described above (IFA-LNS); c) IFA as described above and MNP for the offspring from 6-24 months (IFA-MNP); or d) IFA as described above and no supplement for the offspring (IFA-Control). Information on acute lower and upper respiratory infection (ALRI/AURI), diarrhea and fever in the previous 14 days was collected at 6, 12, 18 and 24 months of age.

Results: At 6 months, prevalence of ALRI, fever or diarrhea did not differ between infants of women who received LNS vs IFA, but infants in the LNS-LNS group had lower prevalence of AURI

compared to the other three groups combined (27.7% vs 31.7%; OR 0.83(0.70, 0.99)). At 12, 18 and 24 months, there were no significant differences among the 4 arms in prevalence of fever or ALRI, but compared to IFA-Control infants, IFA-LNS infants had lower prevalence of AURI at 12 months (27.6% vs 33.9%, OR 0.74(0.56, 0.99)), and higher prevalence of diarrhea at 18 months (9.3% vs 6.0%; OR 1.74(1.00; 3.04)) after covariate adjustment. No other pairwise group differences were significant.

Conclusions: LNS provided pre- or post-natally may reduce AURI among infants but results were inconsistent. The difference in diarrhea prevalence in the IFA-LNS arm at 18 months was not evident in the LNS-LNS arm nor at any other time point. We conclude that providing LNS to women or LNS or MNP to children generally did not increase or decrease common childhood illnesses.

Keywords: child morbidity, childhood illness.

NUTRITION AND DYSPHAGIA RISK AMONG RECENTLY HOSPITALISED ADULTS OF ADVANCED AGE

(1)Wham, Carol; (1)Wham, Carol; (2)Popman, Amy; (3)Richter, Marilize.

(1)PhD. Associate Professor of Nutrition and Dietetics. Massey University. Auckland. New Zealand.; (2)MSc. Dietitian. Massey University. Auckland. New Zealand.; (3)PhD. Dietitian. Massey University. Auckland. New Zealand.

Background and objectives: Older adults aged over 85 years are the fastest growing population segment in New Zealand. Maintaining a high level of nutritional well being is fundamental to successful ageing. Previously the prevalence of nutrition risk among community living octogenarians has been reported to range between 31-49%, but is unknown in people of advanced age recently admitted to hospital Admission, Treatment and Rehabilitation (AT&R) wards. The aim of this study was to establish the prevalence of nutrition risk and related factors among adults 85 years and older newly admitted to the AT&R wards at North Shore and Waitakere Hospitals in Auckland.

Methods: Participants were recruited within five days of admission to the AT&R wards. An interviewer administered questionnaire was used to assess sociodemographic and health characteristics, nutrition risk was assessed using the Mini Nutritional Assessment-Short Form (MNA-SF) and dysphagia risk assessed using the 10-item Eating Assessment Tool. Anthropometric measures were taken to assess body mass index (BMI), muscle mass (using bioimpedance scales) and grip strength (using a handgrip dynamometer). Pearson Chi-Square tests were used to examine differences in dysphagia risk between MNA-SF nutrition status groups. Pearson correlations were used to identify correlations between participant characteristics and nutrition status

Results: Assessments were completed in 88 advanced age adults (31 men), mean age 90.0±3.7 years. As determined from the MNA-SF over two thirds (71.6%) of the participants were either malnourished (28.4%) or at high nutrition risk (43.2%). A third (29.5%) of the participants was at risk of dysphagia. Malnourished participants were more likely to be at risk of dysphagia (p=0.015). The MNA-SF score positively correlated with BMI (r=0.484, p<0.001); grip strength in the dominant hand (r=0.250, p=0.026), and negatively correlated with dysphagia risk (r=-0.383, p<0.001).

Conclusions: Malnutrition and high nutrition risk was prevalent among newly hospitalised adults of advanced age. Routine screening on admission is an important first step to identify those at nutrition risk. Findings highlight the importance of screening for dysphagia in the malnourished to help shape appropriate interventions aimed at improving nutrition status.

Keywords: older adults, nutrition risk, dysphagia risk, hospitalisation, New Zealand

ASSOCIATION BETWEEN SLEEP DURATION AND FOOD INTAKE IN ADOLESCENTS

(1)da Silva Couto, Camilla; (2)da Silva Nalin de Souza, Bárbara; (1)Lavourinha Pinto, Rafael; (1)Guerra Cardoso, Luciana; (3)Sichieri, Rosely; (2)Massae Yokoo, Edna.

(1)BSc. Nutritionist. Collective Health Post-Graduation Program. Collective Health Institute. Federal Fluminense University. Brazil.; (2)PhD. Nutritionist. Collective Health Post-Graduation Program. Collective Health Institute. Federal Fluminense University. Brazil.; (3)PhD. Physician. Department of Epidemiology. Social Medicine Institute. Rio de Janeiro State University. Brazil.

Background and objectives: Short sleep duration is prevalent among adolescents and it is indicated as a factor that can interfere with food intake. The objective of the present study is to estimate the association between sleep duration and food intake data in adolescents.

Methods: The data is from PAPPAS study, which stands for "Parents, students and teachers for healthy eating" in Portuguese, conducted in a public school from Niterói-Rio de Janeiro, Brazil, in 2015, with students from 5th to 9th grade, aged 10 to 17 years. Sleep duration was collected by questionnaire and categorized as insufficient, adequate and excessive, according to age, as recommended by the National Sleep Foundation. To estimate nutrient intake, the mean of two 24-hour food-recall applied on two non-consecutive days was used. Multiple linear regression was performed, considering p≤0.05. The analysis was performed with SPSS v.21.

Results: A total of 307 adolescents were included, 49.2% (n= 151) males, with a mean age of 12.8 (± 1.6) years. Of these, 52.1% (n= 160) presented insufficient sleep. Crude regression models estimated that sleep duration was positively associated with energy

consumption (β= 48.35, p= 0.049), protein (β= 2.72, p= 0.010), lipids (β=1,98, p= 0,037), total fiber (β= 0.57, p= 0.034) and cholesterol (β= 9.07, p= 0.019), and was not associated with carbohydrate consumption (β= 5.35, p= 0.161) and added sugar (β= 0.13, p= 0.949). After adjusting for energy consumption, sleep duration lost significance in the models, but became significant in added sugar analysis. It was observed that, at each hour of sleep, the consumption of added sugar was reduced by 2.8g (β= -2,79, p= 0.049). After adjusting for sex and age, an increase in the magnitude of this association was estimated (β=-3.36, p= 0.023).

Conclusions: This study showed that sleep duration was negatively associated with the consumption of added sugar in adolescents. Currently sleep becomes an important field of study for understanding its influence on the composition and quality of adolescents' diet and health.

Keywords: sleep, adolescent, food intake.

CROSS-SECTIONAL AND LONGITUDINAL ASSOCIATIONS BETWEEN CLUSTERING OF MULTIPLE LIFESTYLE BEHAVIORS AND ADIPOSITY INDICATORS: THE ELANA MIDDLE SCHOOL COHORT

[1]Moraes, Milena; [2]Fernández-Alvira, Juan Miguel; [3]da Veiga, Gloria Valeria; [4]Moreno, Luis A.

[1]PhD. Nutritionist. Department of Social Nutrition. State University of Rio de Janeiro. Brazil.; [2]PhD. Nutritionist. Department of Epidemiology, Atherothrombosis and Imaging. Spanish National Centre for Cardiovascular Research. Spain; [3]PhD. Nutritionist. Social and Applied Nutrition Department. Federal University of Rio de Janeiro. Brazil.; [4]PhD. Growth, Exercise, Nutrition and Development Research Group. Faculty of Health Science. University of Zaragoza. Spain.

Background and objectives: Cluster analysis has been used to identify the coexistence and clustering of multiple lifestyle behaviors in childhood, as well as its relation with adiposity indicators. However, few studies have applied a longitudinal perspective. Our objectives were: a) to explore how clustering of physical activity, sedentary behavior, sugar-sweetened beverages (SSB) intake and fruits and vegetables (FV) consumption is drawn among Brazilian middle school students; b) to investigate the associations between identified clusters and adiposity indicators, both in baseline and at the end of follow-up; c) to investigate the association between identified clusters with excessive weight gain over four years.

Methods: Lifestyle behaviors were assessed through self-report questionnaires. A combination of hierarchical and non-hierarchical gender-specific clustering analysis was applied, in order to identify clusters with similar behaviors. Analysis of variance and logistic regression were applied to examine the association between behavioral clusters and adiposity indicators (BMI and body fat percentage). Linear mixed effects models were used to assess trajectories of adiposity indicators according to clusters member-

ship. Conditional relative gain in adiposity indicators over four years were assessed by regressing z-score measures at the last evaluation on all previous z-score measures and sexual maturation.

Results: For 732 adolescents (mean age 11.8 years, SD 1.15 years) evaluated, four reliable clusters were identified. The "active cluster", with high physical activity level, had more boys than girls. Among boys, "neutral cluster" (with low z-scores to all behaviors) was mainly represented by students from private schools, while the "mixed cluster" (with higher z-scores to SSB and FV consumption) comprised significantly more public school students than the others. The "sedentary cluster" presented the highest proportion of overweight boys. Boys in the sedentary cluster had higher odds of having body fat percentage >1 z-score at the end of follow-up (OR = 3.18; 95% CI = 1.43–7.10), as well as excessive weight gain after four years (OR = 2.92; 95% CI = 1.04–8.20).

Conclusions: Especially for boys, our findings provide evidence to support the concern around sedentary behaviors worldwide, and can be useful to guide effective interventions that account for diversity of lifestyles.

VIDEOS ABOUT DIETS BROADCAST ON YOUTUBE: A COMMUNICATION CHANNEL VERY ACCESSED BY ADOLESCENT

[1]Gurgel, Carolina Albuquerque; [2]Polo, Gabriela Parise; [3]dos Santos, Monica Srour Rodrigues Ferreira; [4]Ganen, Aline; [5]dos Santos, Juliana Grazini.

[1]MSc. Nutritionist. Mestrado Profissional em Nutrição do nascimento à adolescência. Centro Universitário São Camilo. Brazil.; [2]Nutrition Student. Centro Universitário São Camilo. Brazil.; [3]BSc. Nutritionist. Universidade Santa Úrsula. Brazil.; [4]PhD. Nutritionist. Mestrado Profissional em Nutrição do nascimento à adolescência. Centro Universitário São Camilo. Brazil.; [5]PhD. Nutritionist. Universidade de Paris VII. France.

Background and objectives: The number of adolescent who access websites such as YouTube for information on weight loss grows every day. This age group shows frequent dissatisfaction with body image, being more sensitive and vulnerable to the information contained in these videos, mainly on how to reach the ideal body through diets. Therefore, attention should be paid to the quality of the content posted, to avoid possible inappropriate eating behaviors and health damage in this specific population. Thus, the purpose of this work is to identify the contents of videos on YouTube about diets and weight loss.

Methods: This is an exploratory research, with a quantitative approach, carried out on the website YouTube, to characterize YouTube videos addressing diets for weight loss. A search of the videos was made from March 23 to March 27 2017 using the descriptor "diet". 2,160,000 videos were identified, but only the first fifty-five were analyzed. The exclusion criteria were humor vide-

os and / or parodies about diets and videos with an emphasis on physical activity (hypertrophy).

Results: 67,3% of the analyzed videos had as approach, restrictive diets, with main content short-term weight loss practices. These videos were also the ones that had the higher viewers, approximately 2 million and were transmitted by lay people (94,6%). Only 5,5% of the videos were transmitted by health professionals, such as nutritionist (33,3%) and nutrologist (66,7%) addressing guidelines for healthy eating.

Conclusions: Most of the videos showed inadequate weight loss practices being reported mainly by lay people. In this scenario, we identify the importance of nutritionists and government health agencies, through Public Policies, to join this growing communication channel (YouTube) in promoting healthy eating habits.

Keywords: Diet. Youtube. Adolescent Behavior.

ADHERENCE TO HEALTHY EATING INDEX FOR PREGNANT WOMEN IS ASSOCIATED WITH LOWER NEONATAL ADIPOSITY IN A MULTIETHNIC ASIAN COHORT: THE GROWING UP IN SINGAPORE TOWARDS HEALTHY OUTCOMES (GUSTO) STUDY

Background and objectives: Evidence linking maternal diet quality during pregnancy with infant birth outcomes is limited in Asian populations. We investigated the association of maternal diet quality with risk of preterm birth, offspring birth size and adiposity in a multi-ethnic Asian birth cohort study.

Methods: Dietary intakes of 1051 pregnant women were ascertained at 26-28 weeks of gestation with the use of 24 h recalls and 3 d food diaries, from which diet quality (score range: 0 – 100) was measured by the Healthy Eating Index for pregnant women in Singapore (HEI-SGP). Gestational age was established by first trimester ultrasound. Neonatal weight and length were measured

at birth. Body composition was assessed by air displacement plethysmography in a subset of infants (n=313) within 72 h after birth and abdominal adiposity was assessed by magnetic resonance imaging (MRI) (n=316) within the first 2 weeks of life. Associations were assessed by multivariable linear regression for continuous outcomes and logistic regression for preterm birth with adjustment for confounding factors.

Results: The mean (SD) maternal HEI-SGP score was 52.1 (13.6). Maternal diet quality during pregnancy was not associated with preterm birth or birth weight. Greater adherence to HEI-SGP (per 10-point increment in HEI-SGP score) was associated with longer birth length (β (95% CI) 0.13 (0.02, 0.23) cm), lower sum of neonatal triceps and subscapular skinfold thickness (β -0.16 (-0.27, -0.06) mm), lower percentage body fat (β -0.53 (-0.84, -0.21) %), lower fat-mass (β -17.52 (-29.54, -5.51) g), lower percentage abdominal superficial subcutaneous adipose tissue (β -0.16 (-0.30, -0.02) %) and lower percentage deep subcutaneous adipose tissue (β -0.05 (-0.10, -0.01) %).

Conclusions: Higher maternal diet quality during pregnancy was associated with longer birth length and lower neonatal adiposity, but not with birth weight and preterm birth. These findings warrant further investigation in independent studies.

Keywords: Maternal diet, diet quality, preterm birth, birth size, adiposity

[1]Loukili, Bouchra; [2]Bour, Abdellatif.

[1]Phd. Nutrition and food transition Équipe de la Transition Alimentaire et Nutritionnelle [ETAN]. Laboratoire des Essais[LEB]. Département de Biologie . Université Ibn Tofaïl Kenitra. Morocco; [2]Directeur PhD. Équipe de la Transition Alimentaire et Nutritionnelle [ETAN]. Laboratoire des Essais[LEB]. Département de Biologie . Université Ibn Tofaïl Kenitra. Morocco.

Background and objectives: Moroccan food retail transition (Supermarket) introducing a changes in food retailing.

The aim the transition of food retail and its impact onhealth, overwieght and high blood pressure;

Methods: An exploratory transverse survey with a 264 people (131 men and 133 women, sex-ratio=0.98, old of 35.5 ± 9.3 years) in Casablanca; the participants completed a questionnaire bringing socioeconomic and demographic data; some concerning preferences in food supply, as well as their dietary habits of anthropometric measures (the weight, the size and the calculation of body mass index BMI) and blood pressure

Results: Biological data shows that 76 participants are overweight and 87 have a high blood pressure .

The used of food stores and the purchase rate are significantly different between participants in overweight and normal participants (p0.001 and p0.05, respectively). We observed that our participants use often a combination of two or three point of purchase. The most frequent combinations are supermarkets / traditional markets with or without convenience store. Furthermore, the participants in overweight prefer shopping food before the meals, while the participants with normal weight prefer after the meals (p0.01).

An increase of overweight according to:

- The use of supermarkets (OR): 3.77; 95 % IC: 1.63-8.74, p=0.002), within the population of the men (OR): 18.58; 95 % IC: 2.44-141.80, p=0.005);

- Shopping before meals (OR): 2.44; 95 % IC: 1.28-4.67, p0.01), for the women (OR): 3.92; 95 % IC: 1.61-9.52, p0.0001); Higher study Level (OR): 2.41; 95 % IC: 1.21-4.81, p=0.012), within women (OR): 6.18; 95 % IC: 2.15-17.81, p0.001).

A reduction of this risk according to:

- Marital status (single men) reduced (OR): 0.45; 95 % IC: 0.21-0.98, p0.045);

- Habits of supermarkets purchase: by comparison with those who never go to supermarkets (OR): 0.23; 95 % IC: 0.09-0.56), for men

Conclusions: Grocery shopping in large department stores is now part of most Moroccan families no matter their income and education levels.

The survey shows that while the use of food department stores regularly is significant for most participants, it remains higher among overweight and high blood pressure participants.

Keywords: Food retail, overweight, blood pressure.

EFFECT OF DIETARY VITAMIN E DEFICIENCY ON SOCIAL RECOGNITION IN MICE

[1]Watanabe, Tasuku; [2]Hattori, Tatsuya; [2]Kawaguchi, Makiko; [3]Takenaka, Asako.

[1]Department of Agricultural Chemistry. Graduate School of Agriculture. Meiji University. Japan.; [2]Department of Agriculture. School of Agriculture. Meiji University. Japan.; [3]Department of Agricultural Chemistry. School of Agriculture. Meiji University. Japan.

Background and objectives: Vitamin E (VE) is a fat-soluble vitamin that has anti-oxidant properties. In our previous study, dietary vitamin E deficiency for 4 weeks caused a decrease in plasma α-tocopherol levels, and an increase in anxiety in rats. However, there are no studies on the relationship between VE and social recognition. Thus, in this study, we investigated the effect of dietary vitamin E deficiency on social recognition in mice.

Methods: Female C57Bl/6J mice were bred, and fed control diet (CON) or VE deficient diet (E-) from 16th day of pregnancy. Male pups were weaned, and fed the same diet as the mothers (CON: n - 10, E-: n - 11). These mice (74 day old) were bred in group housing (5–6/ cage), and isolated from day 75. We performed the olfactory habituation test on day 83, and the social recognition test on day 85, and then decapitated them. In these behavioral tests, we investigated mice behavior for 3 min and this 3-min investigation was repeated 3 times. The same stimulus was provided to the responder mice from the 1st to 2nd replicates, and novel stimulus and familiarity stimulus were provided during the 3rd replicate. We measured the time required by the responder to access to the stimulus. Mice were used as the stimuli in social recognition test and odor was used in the olfactory habituation test.

Results: α-tocopherol concentration in the back cortex decreased due to vitamin E deficiency. The result of the olfactory habituation test, in the CON and E- treatments showed that significantly more investigation time was required for the novel stimulus than for the familiarity stimulus presented at the same time. In contrast, the results of social recognition showed that, in the CON treatment, significantly more investigation time was required for the novel stimulus than for the familiarity stimulus presented at the same time; however, in the E- treatment, no significant difference was observed.

Conclusions: In conclusion, the intake of vitamin E deficient diet during the prenatal, neonatal and infant periods causes disability of social familiarly in mice.

Keywords: Social recognition, vitamin E

IMPACT OF EXPOSURE TO LIPID-BASED NUTRIENT SUPPLEMENTS IN EARLY LIFE ON SWEET TASTE PREFERENCE OF GHANAIAN CHILDREN AGED 4-6 YEARS: A NON-INFERIORITY STUDY

[1]Okronipa, Harriet; [1]Arimond, Mary; [1]Arnold, Charles D.; [1]Young, Rebecca R.; [2]Tamakloe, Solace M; [3]Adu-Afarwuah, Seth; [4]Ocansey, Maku Eugenia; [4]Kumordzie, Sika; [5]Oaks, Brietta; [5]Dewey, Kathryn G.

[1]MSc. Department of Nutrition. University of California. Davis. USA; [2]MPH. Department of Nutrition and Food Science. University of Ghana. Legon. Ghana; [3]PhD. Department of Nutrition and Food Science. University of Ghana. Legon. Ghana; [4]MPhil. Department of Nutrition. University of California. Davis. USA; [5]PhD. Department of Nutrition. University of California. Davis. USA.

Background and objectives: Little research involving the measurement of sweet taste preference in children has been done in a developing country setting. Between 2010 and 2014, we conducted a randomized controlled trial in Ghana (iLiNS-DYAD trial) in which women (n=1320) received daily, a moderately sweet small-quantity lipid-based nutrient supplement (SQ-LNS) or a multiple micronutrient tablet during pregnancy through 6 months postpartum or iron/folic acid tablets during pregnancy and placebo for 6 months postpartum. Infants whose mothers received SQ-LNS also received SQ-LNS from 6 to 18 months. We followed up these children at 4-6 years of age to test the hypothesis that the sweet taste preference of children who were exposed to SQ-LNS (LNS group) would not be greater than that of children who were never exposed to SQ-LNS (non-LNS group).

Methods: We used the Monell 2-series, forced-choice, paired-comparison tracking procedure to measure sucrose concentration (SC) preferences of 624 children (LNS group, 323; non-LNS group, 301) randomly selected from participants who were eligible for the follow-up study. Each series included a number of forced choices between two concentrations of sucrose in water, one lower and one higher, across a range of 3 – 36% w/v. The preferred concentration was calculated as the geometric mean of the concentrations preferred in the two series. The difference in SC preference between the two groups was examined using negative binomial modelling techniques. The pre-defined non-inferiority margin was an effect size of 0.2, which corresponds to an 11% difference between groups in preferred SC.

Results: The test required on average 8 presentations of sucrose solution pairs. The mean preferred SC was 14.9±8.7 %w/v in the LNS group and 14.2±8.4 %w/v in the non-LNS group, which corresponds to a difference of 6.3% (95% CI -5.5%, 19.6%).

Conclusions: The preferred SC was not significantly higher in the LNS group, but because the confidence interval included our pre-defined non-inferiority margin we cannot establish non-inferiority. Thus, we cannot definitively conclude that at 4-6 years of age, the sweet taste preference of Ghanaian children who received SQ-LNS in early life was the same as (or lower than) that of children who did not receive SQ-LNS.

Health Challenges and Systems. African Population Health Research Center. Kenya.; [5]Msc. Programme manager. Maternal, Infant and Young Child Nutrition. Ministry of Health, Nutrition and Dietetics Unit. Kenya.; [6]PhD. Prof. Population Health. Department of Human Sciences. Loughborough University. United Kingdom.; [7]PhD. Prof. Demography and social statistics. Co-Director center for global Health Population, Poverty and Policy. University of Southampton. United. Kingdom.; [8]PhD. Epidemiology and anthropology. Director Health Institute. Brown University. United States of America.

Background and objectives: The child survival and development strategy in Kenya aims at improving child health and reduction in child mortality through the acceleration and scale-up of evidence-based high-impact interventions. Promotion of optimal maternal infant and young child delivery of such high impact interventions is marred by lack of clear evidence on what works, how it works and why. The Baby Friendly Community Initiative (BFCI) project conducted a formative qualitative study whose specific objectives were to determine the local contexts and cultural factors that influence breastfeeding and other maternal, infant and young child feeding practices in order to tailor the intervention package to the communities and to determine the enablers and barriers associated with the implementation of Baby Friendly Community Initiative and how to address them

Methods: The formative study employed a cluster randomized trial which used a participatory action research design for qualitative data collection. A total of 205 participants were interviewed in the study which covered 13 community units which were used as sampling units for the main project. A total of 52 interviews were done, 16 Focus Group Discussions, 14 In-depth Interviews and 22 Key Informant Interviews. The key informants included chiefs, village elders, religious leaders, women leaders, CBO leaders, Traditional Birth Attendants and health professionals at sub county and health facilities. In-depth interviews included pregnant women, breastfeeding women, HIV positive women and Health professionals. Focus group discussions were done with fathers, old and young mothers, grandmothers and Community Health Volunteers.

Results: Results revealed that cultural factors and traditions had great influence on maternal and child feeding practices. Mothers' decisions were also highly influenced by the health workers, community and family members, religious leaders and Traditional birth attendants. This information was used to develop appropriate and targeted intervention strategies for effective BFCI implementation.

Conclusions: End line qualitative data showed a great improvement in addressing some of the key barriers and enhancement of the existing enablers. There were significant positive outcomes for key indicators; the number of antenatal visits, health facility deliveries, exclusive breastfeeding, growth monitoring, motivation and capacity building of community health volunteers and functional mothers support groups.

IMPACT OF HEALTH AND NUTRITION EDUCATION ON HEALTHY LIFESTYLE TO IMPROVE NUTRITIONAL STATUS AND REDUCE FREQUENCY OF ILLNESS OF ELDERLY PEOPLE IN URBAN DHAKA

[1]Laboni, Fatema; [2]Sultana, Syeda Saliha Saliheen; [3]Roy, Swapan Kumar.

[1]MSc. Food Science and Nutrition. University of Mysore. Research Officer. Bangladesh Breastfeeding Foundation (BBF). Bangladesh.; [2]MSc. Food and Nutrition. University of Dhaka. Associate Professor. Dept. of Food & Nutrition. College of Home Economics. University of Dhaka. Bangladesh.; [3]PhD. Nutrition. University of London. Senior Scientist. BOT and Chairperson. Bangladesh Breastfeeding Foundation (BBF). Bangladesh.

Background and objectives: According to BBS (2007) the number of the elderly people aged 60 and over in Bangladesh was 9.41 million and by 2025, along with four other Asian countries, will account for 44% of world's total elderly population. This rapidly increasing population is an important group urging for the need of health and nutrition intervention. The objective of the study was to see the impact of nutrition and health education towards improving food consumption practice, nutritional status and morbidity rate among elderly population.

Methods: A 6 months longitudinal comparative study was conducted in Dhaka, Bangladesh. Data were collected from 164 elderly people (Intervention group=82, Control group=82) aged > 60 years both male and female in selected old homes. Health and nutrition education with minimum one hour duration within 2 contacts were given only in the intervention group following both face to face and in group intervention method. Baseline and end line anthropometric (weight, height, BMI) data, disease morbidity history and dietary intake (using 24 hours recall method) were recorded for both the intervention and control group using same standard questionnaire. Participant response, encouragements, dietary diversity, food frequency and health & disease status were observed.

Results: There was significant weight gain in the intervention group. The mean of weight of intervention group before intervention was 48.86 ± 6.18 and after intervention was 49.92 ± 5.97.

Prevalence of hygiene practice was higher in intervention group comparing to control group. Habit of hand washing was 48.7% higher in the intervention group.

The intervention resulted in reduced morbidity among the elderly population. At the end line 76.8% of control group and 43.9% of intervention group were attacked by any contagious disease (cough, Diarrhea, pain, anorexia, nausea). Food diversity and balanced food choice were also improved in the intervention group comparing to the control group.

Conclusions: Nutrition and health education to elderly people has great potential to increase their nutritional status, hygiene practice and decreasing disease morbidity. The result of this study will be effective constructing strategy for addressing the urgent issues of reducing the short life expectancy among elderly people.

Background and objectives: One obstacle to increasing compliance with multi-micronutrient (MMN) or iron-folic acid (IFA) supplementation in pregnant women is the side effects, such as a bad smell, nausea, vomiting, stomachache, or headache. To address this problem, in this study, IFA and MMN were each encapsulated in soft capsules, and we evaluated the compliance and acceptance reported by respondents.

Methods: This study was conducted in three sub-districts of Banggai district from October 2016 to February 2017. The subjects were preconception women who were newlywed and 18-35 years of age and who did not have serious diseases, such as tuberculosis, heart disease, or kidney failure. Both IFA and MMN tablets were crushed and then placed in capsule shells with the same color and size. The capsules were randomly delivered to the respondents, who consumed a capsule once per week unless they were menstruating, at which time consumption was daily. Of the 102 preconception women who were recruited, 40 were interviewed about consumption and any side effects that they felt. The level of pleasure was scored on a 3-point hedonic scale, and the response for each sensory quality, namely, color, odor, taste and size, was rated 2 or 3 (likable or very likable).The data were analyzed based on distribution and frequency.

Results: The results showed that 36 respondents (90%) consumed the capsules consistently, as recommended. As many as 38 respondents (95%) liked the color, 37(92.5%) described no odor, 37(92.5%) liked the flavor, and 37 (92.5%) liked the size. Ten respondents (25%) reported an increase in appetite, and 5 respondents (12.5%) reported deeper sleep. Approximately 4 respondents (10%) reported headache, and 2 (5%) complained of constipation.

Conclusions: Encapsulation of MMN or IFA may be an alternative approach for increasing compliance with consumption and reducing side effects.

Background and objectives: Gestational diabetes mellitus (GDM) is a global health challenge, and its prevalence is expect-

ed to increase further along with increasing obesity rates. Infants born to GDM mothers have reduced docosahexaenoic acid (DHA) levels in cord blood which could affect their neurological development. Recently, the membrane transporter Major Family Super Domain 2a (MFSD2a) was associated with the selective DHA transport as lysophospholipids. MFSD2a is an orphan transporter, whose ligands range from carbohydrates to amino acids, drugs, or organic anions, with great importance in regulating metabolism. Mean MFSD2a levels are lower in GDM placentas which could affect materno-fetal DHA transport and child development. We aimed to to evaluate whether MFSD2a in blood of pregnant women can serve as a biomarker of placental MFSD2a at delivery

Methods: Three groups of pregnant women were recruited: 25 health controls, 23 GDM with dietary treatment, and 20 GDM with insulin treatment. Maternal and neonatal anthropometric and biochemical parameters were evaluated. The MFSD2a expression was analysed by Western-blotting in maternal whole blood and serum obtained in the third trimester and in placenta at parturition

Results: MFSD2a level in maternal whole blood, but not in serum, was significantly lower in both GDM groups than i controls (GDM-diet 0.56±0.07b, GDM-insulin 0.49±0.46b, controls 0.9 ±0.08a, p<0.001). MFSD2a in maternal blood was positively correlated with placental MFSD2a ($r = 0.287$, $p = 0.035$) and inversely with the concentration of DHA in maternal serum lysophospholipids ($r = 0.34$, $p = 0.018$). MFSD2a in maternal blood correlated with cord insulin resistance ($r=0.340$, $p=0.013$), cord serum total protein ($r=0.276$, $p=0.05$) and cord serum triglycerides ($r=0.280$, $p=0.05$). MFSD2a in maternal blood also correlated to neonatal head circumference at 15 days and 1 month of age with similar trend during the first year of life of the baby.

Conclusions: MFSD2a concentrations in maternal whole blood are associated with MFSD2a levels in placenta and appear to affect placental DHA transport as well as offspring head size. MFSD2a in whole blood of pregnant women during the third trimester may serve as a biomarker of placental DHA transport capacity

International Agency for Research on Cancer. France.

Background and objectives: There is evidence to suggest that obesity in later life could be determined by nutrition during the early life period. The type of nutrition during the postnatal period may play a critical role in appetite control during early and later life. The aim of this study was to examine whether breastfeeding during infancy is associated with breakfast consumption in adolescence. Previous evidence already demonstrated positive associations between breakfast skipping and body fat content in the same HELENA adolescent population.

Methods: Cross-sectional school-based study with 2929 adolescents of nine European cities participating in the HELENA study. Parents completed a questionnaire about breastfeeding duration. Breakfast habits were assessed by different agreement categories to the statement 'I often skip breakfast'. Agreement categories were grouped into breakfast 'consumers', 'occasional consumers' and 'skippers'.

Results: Twenty nine percent of the adolescents were breakfast skippers. Significant differences were found for skipping breakfast according to breastfeeding duration for female adolescents only. The chance of skipping breakfast was higher for girls who had been breastfed less than 4 months (OR = 2.77, 95% CI 1.35-2.32) than those who had been breastfed for 4 months or more. Girls who had never been breastfed, had also larger chance of skipping breakfast (OR = 2.20, 95% CI 1.56-3.12), compared to those who had been breastfed for 4 months or more.

Conclusions: Breastfeeding for more than 4 months was inversely associated with breakfast skipping among adolescent girls suggesting that breastfeeding may encourage the development of appetite control in later life.

EXPLORING THE INFLUENCE AND TRANSFER OF INFANT AND YOUNG CHILD FEEDING PRACTICES TO MOTHERS: FORMATIVE RESEARCH FOR THE SPOON PROJECT IN COLOMBIA, GUATEMALA AND MEXICO

[1]Bernal, Ines Jennifer; [2]Garcia-Meza, Rosario; [3]Duque, Tiffany; [4]Bonvecchio, Anabelle; [5]Cosio, Izchel; [6]Gonzalez, Wendy; [6]Tumilowicz, Alison.

[1]PhD. Consultant for Global Alliance for Improved Nutrition (GAIN). Switzerland.; [2]MA. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.; [3]MPH.RDN. Consultant for Global Alliance for Improved Nutrition (GAIN). Switzerland.; [4]PhD. Centro de Investigación en Nutrición y Salud (CINyS). Instituto de Salud Pública de México (INSP). México.; [5]Msc. Centro de Investigación en Nutrición y Salud (CINyS). Instituto de Salud Pública de México (INSP). México.; [6]PhD. Monitoring, Learning and Research. Global Alliance for Improved Nutrition (GAIN). Switzerland.

Background and objectives: Exclusive breastfeeding (EBF) for 6 mo and adequate complementary feeding (CF) practices remain a challenge in Colombia, Guatemala and Mexico. Mothers typically receive advice on adequate infant and young child feeding (IYCF) practices from health professionals, as well as from informal sources such as family members. Little is known about the content and strategies used by different actors to influence these IYCF practices. Our aim was to explore sources of information, messages, and actors that influence IYCF practices.

Methods: As part of the formative research of the SPOON project, which aims to implement a strategy to prevent chronic malnutrition and reduce the risk of future obesity in children aged 0-23 months, in-depth interviews were conducted with health professionals (n=26), key informants (n=37) and mothers/caregivers (n=70) in Colombia, Guatemala and Mexico. Interviews were translated-transcribed verbatim, coded and analyzed using N-Vivo.11.

Results: In all settings, formal IYCF advice is commonly provided by doctors, nurses and health educators during the provision of health services and informal advice is provided mostly by grandmothers, and sometimes husbands in a home setting. Mothers value receiving counseling from health professionals because they are trusted, as well as from grandmothers because they are experienced and knowledgeable, and often provide foods. Advice provided from both sources sometimes contradicts IYCF practices as recommended by the WHO. Common advice given by grandmothers includes the importance of offering colostrum (Guatemala), the timing of introduction of specific foods (often resulting in premature of delayed complementary feeding), and the limited duration of continued breastfeeding among girls (Colombia), the importance to give different foods beside only the baby bottle. Influential strategies used by grandmothers include sharing successful-unsuccessful experiences and timely advice.

Conclusions: Mothers' IYCF practices are influenced by a dynamic integration of advice received from health providers, preceding generations, past experiences on infant nutrition and personal beliefs. Behavior Change Communication strategies must consider influential figures and cultural determinants that influence the adoption of appropriate IYCF practices.

EFFECTS OF GESTATIONAL WEIGHT GAIN, NUTRIENT INTAKE, AND PASSIVE SMOKING ON LOW-BIRTH-WEIGHT DELIVERY

[1]Hsu, Wen- Yin; [2]Lo, Hui-Chen; [3]Wu, Cheng-Hsuan; [4]Kao, Mei-Ding.

[1]PhD. LD. Department of Nutrition. Puli Christian Hospital. Puli. Taiwan.; [2]PhD. LD. Department of Nutritional Science. Fu Jen Catholic University. New Taipei City. Taiwan.; [3]MD.Department of Obstetrics & Gynecology. Changhua Christian Hospital. Changhua. Taiwan.; [4]MS. Department of Food and Nutrition. Providence University. Taichung. Taiwan.

Background and objectives: Evidence showed that maternal anthropometrics and nutritional status before and during pregnancy may affect the birth weight of neonates and increase the risk of low-birth-weight (birth weight<2500g, LBW) delivery. The aim of this study was to investigate the effects of pre-pregnancy body mass index (BMI) and maternal body weight gain, dietary intake, and blood biochemical parameters during pregnancy on the incidence of LBW delivery in Taiwan.

Methods: Healthy women (n=520, age 29.1 ± 4.2 y) at 8 to 12 weeks of pregnancy were recruited from prenatal clinics. Background information, anthropometrics, biochemical parameters, and dietary intake from 24 h-recall were obtained from the first, second, and third trimesters to delivery. Clinical outcomes of neonates were also collected.

Results: The results showed that 53.7% of women were primiparous with 4.31% of LBW delivery. Gestational weight gains (GWG) in the first trimester and throughout pregnancy were significantly lower in mothers with LBW delivery (LBW group) than those with non-low-birth-weight delivery (non-LBW group, p<0.05). Mothers who had lower GWG than the Institute of Medicine (IOM) guidelines had increased risk of LBW delivery (OR=7.64, 95% CI=1.56, 37.3, p<0.05). Mothers in the LBW group exposed to passive smoking for longer periods of time than those in the non-LBW group. In addition, maternal intakes of protein, cholesterol, calcium, phosphorus, potassium, iron, and vitamin B2, circulating white blood cell counts (WBC), and serum albumin levels were significantly lower, whereas serum magnesium and ferritin levels were significantly higher in the LBW group than in the non-LBW group.

Conclusions: Maternal gestational weight gain, WBC, micronutrient intakes, protein, magnesium and iron status, and passive

BREAST MILK FATTY ACIDS AND INFANT EXECUTIVE FUNCTION: A PROSPECTIVE STUDY

[(1)]Gao, Ying; [(2)]Jia, Keyu.

[(1)]Shanghai Institutes for Biological Sciences. Chinese Academy of Science. China.; [(2)]BS. Shanghai Institutes for Biological Sciences. Chinese Academy of Sciences. China.

Background and objectives: Studies have shown that nutritional status during early life (including prenatal and postnatal nutrition) could affect individual's epigenetic profile, which subsequently influence the infant growth, including neural development. We aimed to study the relationship between fatty acids profile in breast milk and infant executive function.

Methods: Eight hundred new born infants were recruited and followed up for 30 months. Breast milk was sampled at 42nd day and 8th month old, and the fatty acids profiling of breast milk were evaluated with GC-FID. The executive function of infants was tested with Bayley Scale, AB task, and planning task at 8th month and 30th month. The relationship between fatty acid level and executive function was evaluated with linear regression. iCluster analysis was also used to classify the study subjects into subgroups according to fatty acids pattern..

Results: We found that the levels of saturated fatty acids (SFA) were increased in breast milk of 8th month compared to 42nd day (P=0.10). In contrast, poly-unsaturated fatty acids (PUFA) levels (P=0.04) and the n3/n6 PUFA ratio (P<0.001) were decreased. In 42nd day breast milk, the levels of C10:0, C14:0, and C14:1n5 were negatively correlated with distraction score of full term infants. In 8th month breast milk, the levels of C12:0 and C14:0 were positively correlated with finer motor score; and C20:0 level was positively correlated with distraction score of full term infants. For pre-term infants, levels of C14:1n5, C16:1n7, C18:3n3, C18:3n6, and C20:4n6 in both 42nd day and 8th month breast milk were positively correlated with gross motor and planning score.

Conclusions: Fatty acids levels in breast milk were changing at different time and individual fatty acids had different effects on executive function at different time. More fatty acids were found to be correlated with executive function of pre-term infants compared to full term infants.

Keywords: fatty acids, executive function, breast milk

Agricultural Economist. Feed the Future Innovation Lab for Nutrition. Friedman School of Nutrition Science and Policy. Tufts University. Boston. USA; [(8)]PhD. Agricultural Economist. College of Agricultural and Environmental Sciences. Makerere University. Kampala. Uganda.

Background and objectives: Rates of overweight have been increasing in Uganda women of reproductive age while stunting rates in children under five remain high. The objective of this analysis is to assess the association of being a stunted child in a household with an underweight versus overweight female caregiver within the context of the changing profile of the nutrition burden in Uganda.

Methods: This analysis utilizes data from two rounds of data collected on the households in 2012 and 2014 on a female caregiver and all children under five years of age in 3 North and 3 South West Ugandan districts (random self weighting sample, n= 8589 women and children). Anthropometric data were collected on both female caregivers and all children under five. Data were collected on socio-demographics, household food security, agricultural production, individual health and dietary pattern (caregiver and children under five). Mixed effects logistic regressions, accounting for repeated measures, were conducted using STATA 14.

Results: Stunting prevalence in children under five in the pooled sample was 28.2% and in households with underweight, normal and overweight caregivers 27.2%, 28.3% and 29%, respectively. Controlling for confounders and survey year, children with an overweight caregiver were less likely to be stunted than children with underweight caregivers (OR=0.68, CI=0.50-0.93, p=0.016). Being stunted was also significantly strongly associated with being boy (OR=1.47 CI=1.29-1.68, p=0.000), older age group (13- 24 months, OR 5.10, CI 4.06- 6.40, p=0.000, 25-59 months, OR=5.18 CI 4.26- 6.30, p=0.000) and geographical location with children from the South West more likely to be stunted than children from

the North. (OR 4.45 CI 3.75-5.27, p=0.000). Other important factors include caregiver age (OR =0.98, CI=0.97-0.99, p=-0.003), caregiver education (OR=0.95, CI=0.93-0.98,p=0.000) and household wealth (OR=0.83, CI=0.76-0.89, p=0.000).

Conclusions: Stunting in children under five and overweight in women co-exist in the same rural Ugandan households. But nature of this relationship is confounded by factors such as gender of the child, age, geographical location, caregiver's age and education and household wealth. Particular emphasis needs to be given to future analysis to determine the extent of the difference in the association by geographical location.

Sri Lanka.; [8]PhD. Postdoctoral Research Associate. Sydney School of Public Health. University of Sydney. Australia.; [9]MPH. Professor in Global public health nutrition. Sydney School of Public Health. University of Sydney.

Background and objectives: Sri Lankan health indicators are relatively better when compared to similar socio-economic countries. But the progress on child under-nutrition is poor, which is prominent in plantation sector. M-health is a possible technology to deliver feeding counselling, with relatively lower costs in these settings by improving access, quality, and timeliness.

The aim of this study was to develop an M-health intervention suitable for the plantation sector of Sri Lanka for infant and young child feeding counselling.

Methods: The research team conducted a formative study in the plantation sector to assess the acceptability of an intervention using mobile phones, registration of the clients, mode (text or voice) and timing of messages and signal strength. This lead to the development of an intervention with four stages.

Results: Stage I

Age appropriate sequence of text and voice messages were developed, aiming pregnant mothers with gestational age over 28 weeks and mothers of infants up to 2 years of age. Messages focused on encouraging mothers on exclusive breastfeeding, appropriate complementary feeding, relevant hygienic practices, immunization and micronutrient supplementation. Text messages were in Tamil text and voice messages were in female Tamil voice. Both were interactive messages and at the end of each massage the receiver was asked whether there are any feeding issues and the urgency of the issue. All the issues were notified to Public Health Midwife (PHM) through another text message.

Stage II

A mobile platform was developed to send the above messages to registered clients in partnership with a professional mobile service provider in Sri Lanka - Dialog Axiata PLC Messages sent on fixed dates and times during the week.

Stage III

Mobile application was developed for the use of the PHM, with the same mobile service provider for the registration of the clients. The application worked online and offline and was able to operate through smart phones or computers.

Stage IV

Clients and PHM were trained on use of mobile phones.

Conclusions: An M-health intervention was developed for infant and young child feeding counselling for the plantation sector of Sri Lanka which needs to be pilot tested.

PROLONGING MICRONUTRIENTS SUPPLEMENTATION 2-6 MONTHS PRIOR TO PREGNANCY SIGNIFICANTLY IMPROVES BIRTH WEIGHT BY INCREASING HPL PRODUCTION AND CONTROLLING IL-12 CONCENTRATION: A RANDOMIZED DOUBLE BLIND CONTROLLED STUDY

[1]Sri Sumarmi, Sri Sumarmi; [2]Melaniani, Soenarnatalina; [3]Kuntoro, Kuntoro; [4]Wirjatmadi, Bambang; [5]Dachlan, Erry Gumilar; [6]Thaha, Abdul Razak; [7]Soekirman, Soekirman.

Surabaya. Indonesia; [4]Professor. Nutritionist. Department of Nutrition. faculty of Public Health. Universitas Airlangga. Surabaya. Indonesia.; [5]Professor. Gynecologist. Department of Fetomaternal. Dr Soetomo General Hospital. Surabaya. Indonesia.; [6]Professor. Nutritionist. Department of Nutrition. Faculty of Public Health. Hasannudin University. Makassar. Indonesia; [7]Professor. Nutritionist. Indonesian Nutritional Fortification Foundation. Jakarta. Indonesia.

Background and objectives: The role of multi-micronutrients (MMN) supplementation to improve birth weight is still debatable. Its role on pregnancy outcomes may involve the Interleukin 12 (IL-12) and human Placental Lactogen (hPL). This research was conducted to evaluate the effect of prolonging multi-micronutrients supplementation 2-6 months prior to pregnancy on birth weight in relation to IL-12 and hPL concentration during the 3rd trimester of pregnancy.

Methods: A randomized double blind community-based trial was conducted at District of Probolinggo East Java, Indonesia. A two-arms study consists of group I received placebo before pregnancy and continued with daily iron and folic acid (IFA) during pregnancy, and group II received multi-micronutrient containing 15 micronutrients, 2 other days before pregnancy and continued with daily dose during pregnancy. A sample size of 115 pregnancy outcomes was obtained from 420 eligible brides-to-be. The primary outcome variable is birth weight. Concentration of IL-12 and hPL in the last trimester, gestational age, maternal weight gain and placental weight were assessed as the intervening variables. Preconceptional BMI, concentration of serum retinol, serum zinc, and serum ferritin prior to pregnancy were assed as baseline data. Data were analyzed using analysis of covariance to evaluate effect of supplementation. Causal relationship among variables was tested by using analysis of structural equation modelling.

Results: The characteristic between treatment group and control group were not different (Box's M value p = 0,398; Hotelling's Trace value p = 0,478I). Results show that compare to iron folic acid supplementation, subjects who received multi-micronutrients supplementation 2-6 months prior to pregnancy have lower IL-12 concentration by 0.10 pg/mL (p=0,665), higher hPL concentration by 1.14 mg/L (p=0,014), longer gestational age by 1.66 weeks (p=0,539), but no difference of total weight gain (p=0,995). There is significantly higher of placental weight and birth weight by 83.59 grams (p=0,000) and 309.89 grams (p=0,000) respectively (p=0,000).

Conclusions: It implies that prolonging multi-micronutrient supplementation 2-6 months prior to pregnancy and being continued during pregnancy improves birth weight by increasing hPL production and placental weight, as well as controlling maternal immune response, particularly reducing IL-12 concentration in last trimester.

Ghana.; [4]MSc. Statistician. Program in International and Community Nutrition. Department of Nutrition. University of California. Davis. USA.; [5]MPhil. Graduate Student Researcher. Program in International and Community Nutrition. Department of Nutrition. University of California. Davis. USA.; [6]MSc. Graduate Student Researcher. Program in International and Community Nutrition. Department of Nutrition. University of California. Davis. USA.; [7]PhD. Assistant Project Scientist. Program in International and Community Nutrition. Department of Nutrition. University of California. Davis. USA.; [8]PhD. Postdoctoral Scholar. Program in International and Community Nutrition. Department of Nutrition. University of California. Davis. USA.; [9]PhD. Professor. Program in International and Community Nutrition. Department of Nutrition. University of California. Davis. USA.

Background and objectives: Nutrition during the first 1000 days influences short and long term health outcomes including growth. Although several studies have examined the effect of nutritional supplementation on growth from birth to 24 months, few have evaluated the long-term effects of early supplementation beyond this period. We previously reported that maternal and child lipid-based nutrient supplements (LNS) provided during pregnancy and 6 months postpartum for the mother and from 6 to 18 months for the child increased mean attained length at 18 months. Our current objective is to report effects on growth and body composition at 4-6 years of age.

Methods: We conducted a follow-up study of children born to women who participated in the International Lipid-based Nutrient Supplements (iLiNS)-DYAD trial in Ghana. Women (n=1320) were randomized to receive 1 of 3 treatments at ≤20 weeks gestation: 1) iron and folic acid during pregnancy and placebo calcium tablet for 6 months postpartum, 2) daily multiple micronutrient tablets during both periods, or 3) LNS during both periods. Children whose mothers received LNS also received LNS from 6 to 18 months of age. At 4-6 years of age, we determined the effect of the intervention (LNS vs. non-LNS) on the primary outcomes height, height-for-age z-score (HAZ) and percent body fat determined by the deuterium dilution method. Other growth indicators were secondary outcomes.

Results: Follow-up anthropometric results represent 76.8% of live births from the main trial (n=966). There were no significant differences between LNS vs non-LNS groups in height [106.7 vs. 106.3 cm (β = 0.37; 95% CI -0.19, 0.93; p=0.347)], HAZ [-0.50 vs.-0.56 (β = 0.06; 95% CI -0.06, 0.18; p=0.347)], stunting (<-2 SD) [6.2 vs. 5.8% (β = 1.12; 95% CI 0.62, 2.03; p=0.706)], or percent body fat [15.7 vs. 15.6% (β = 0.09; 95% CI -0.60, 0.78; p=0.802)].

Conclusions: Although we had previously observed a difference in length at 18 months, there was no effect of LNS on height at 4-6 years of age in this cohort, which had a low stunting rate. There was no adverse impact of LNS on body composition or overweight.

KNOWLEDGE, ATTITUDES AND PRACTICES OF FIRST LEVEL HEALTH WORKERS TOWARDS BREASTFEEDING, COMPLEMENTARY FEEDING AND MICRONUTRIENTS SUPPLEMENTS IN MEXICO: FORMATIVE RESEARCH FOR THE SPOON PROJECT

[1]*Armendariz, Gabriela;* [2]*Alvarado, Rocio;* [3]*Bonvecchio, Anabelle;* [4]*Gonzalez, Wendy.*

[1]MHP. MD. Centro de Investigación en Nutrición y Salud (CINyS). Instituto de Salud Pública de México (INSP). México; [2]MPH. Nutritionist. Centro de Investigación en Nutrición y Salud (CINyS). Instituto de Salud Pública de México (INSP). México.; [3]PhD. Nutritionist. Centro de Investigación en Nutrición y Salud (CINyS). Instituto de Salud Pública de México (INSP). México.; [4]PhD. Nutritionist. Consultant for Global Alliance for Improved Nutrition (GAIN). Switzerland.

Background and objectives: Adequate breastfeeding (BF), complementary feeding (CF) and micronutrients intake (MI) are important determinants of children growth and development. The first-level health workers in most cases are the gatekeepers of child nutrition information to mothers or caregivers during their visits to primary health care. The objective of this work was to identify first-level health workers' knowledge, attitudes and practices related to the promotion of BF, CF and micronutrient supplements (MS).

Methods: As part of the formative research of the SPOON project, which aims to implement a strategy to prevent chronic malnutrition and reduce the risk of future obesity in children aged 0-23 months, in-depth interviews with health workers (HW, n=8) were conducted to document their knowledge, attitudes and practices towards BF, CF and MS. Interviews were transcribed in verbatim, coded and analyzed using N-Vivo.11.

Results: HW recognize that BF is the best food for children, and they recommend exclusive breastfeeding (EBF) without any other type of food or liquid during the first six months. They mentioned that illness is a motive to interrupt BF (HIV, or with intake of strong medicine such as penicillin). According to them weaning starts at six months, some think that during this period breastmilk is useless or less nutritious for infants. They also think that the total duration of BF should be one year, and prolonging BF beyond than a year might causes emotional dependence and problems with social integration. They recommend that CF starts with semisolid foods, and they prescribe MS, however their information about appropriate CF and MS is scarce. Most of their information about BF, CF and MS, comes from personal/familiar experiences and some from vocational training

Conclusions: Even though HW recommend EBF, certainly their knowledge, attitudes and practices contradicts WHO recommendations towards total duration of BF. Since HW are important sources of information to mothers, they affect mother`s knowledge and practices related to child nutrition. Therefore, it is important to design a multidimensional strategy that address HW' lack of knowledge to the adequate promotion of CF and the use of MS.

ACCEPTABILITY OF UNSWEETENED SMALL QUANTITY LIPID-BASED NUTRIENT SUPPLEMENT (SQ-LNS) IN CHILDREN AGED 6 TO 23 MONTHS: FORMATIVE RESEARCH FOR THE SPOON PROJECT IN COLOMBIA, GUATEMALA AND MEXICO

[1]*Gonzalez, Wendy;* [2]*Bonvecchio, Anabelle;* [2]*Duque, Tiffany;* [2]*Bernal, Ines Jennifer;* [3]*Montenegro-Bethancourt, Gabriela;* [2]*Alvarado, Rocio;* [2]*Armendariz, Gabriela;* [2]*Cosio, Izchel;* [4]*Vossenaar, Marieke;* [5]*Tumilowicz, Alison.*

[1]Global Alliance for Improved Nutrition (GAIN). Switzerland.; [2]Consultant for the Global Alliance for Improved Nutrition (GAIN). Switzerland.; [3]Research Institute and Higher Education on Health Sciences (IECIS). Rafael Landívar University. Guatemala.; [4]PhD. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.; [5]Monitoring, Learning and Research. Global Alliance for Improved Nutrition (GAIN). Switzerland.

Background and objectives: The SPOON project aims to design a social and behavior change communication (SBCC) strat-

egy to prevent malnutrition among children aged 0-24 months through adequate infant and young child (IYC) feeding practices, including home-fortification with SQ-LNS. In the context of the nutrition transition and the evidence linking IYC feeding to overweight and obesity, we aimed to assess acceptability of unsweetened SQ-LNS, and to identify context-specific barriers and facilitators of use.

Methods: As part of extensive formative research, a 14-day home feeding trial was conducted with a convenience sample of caregivers of children aged 6-24 months in poor urban communities of Pasto, Colombia (n=16), Baja Verapaz, Guatemala (n=28) and Nayarit, Mexico (n=30). Caregivers were instructed to administer a daily 20-g portion of SQ-LNS directly from the sachet or mixed with foods. Participants received three home-visits during which interviews were conducted to investigate use; in addition "used" sachets were collected. Focus groups discussions were also conducted.

Results: The proportion of caregivers who reported offering SQ-LNS on all 14 days was 71% in Guatemala, and approximately half in Colombia (47%) and Mexico (53%). Most caregivers chose to mix SQ-LNS with food (80% Colombia, 75% Guatemala, 71% Mexico) and approximately half reported children finishing the portion (52% Colombia, 60% Guatemala, 45% Mexico). At the level of the child, barriers included dislike of the flavor (peanut), rejection, and large portion size. At the level of the caregiver, barriers included difficulty in finding the right food to mix with, lack of patience to feed, activities outside the house and lack of collaboration of the father. Side effects such as diarrhea, change in stool color and constipation were mentioned. Perceived benefits included prevention of illness, increased appetite, activity, wellbeing and weight gain. Caregivers' recommendations for use of SQ-LNS include mixing it with a variety of favorite foods such as sweet foods and feeding with patience and playfulness.

Conclusions: To maximize acceptability and adherence, the SBCC strategies across the 3 settings must emphasize the variation in feeding practices and barriers uncovered through the study.

Keywords: small quantity - lipid-based nutrient supplement (SQ-LNS), acceptability, Colombia, Guatemala, Mexico

Sri Lanka with the support of UNICEF in 2007. The intervention was implemented in 12 of the most nutritionally vulnerable districts. The children aged 6 to 23 months were eligible to receive MMN supplement. The purpose of the present evaluation is to assess the effectiveness of MMN supplementation programme in the 12 intervention districts including a comparison between recipients and non-recipients.

Methods: We conducted secondary data analyses of 2 national surveys conducted early and late phases of the MMN intervention. The secondary data analysis employed data from the Nutrition and Food Security Survey 2009 (NFSS 2009) and the National Nutrition and Micronutrient Survey 2012 (NNMS 2012).

Results: The analysis revealed that only 45.2% of the children in the age group 6-23 months in the 12 intervention districts have received MMN powder in 2012. The comparison between the two surveys showed a significant and substantial reduction in the prevalence of anaemia in children aged 6-23 months by 11.7%, and an increase in mean Hb level by 0.3 g per dl between 2009 and 2012. Using the NNMS 2012 data, the micronutrient status was compared between children who received MMN and never received MMN in the 12 intervention districts. The results revealed that the prevalence of anaemia was lower (25.2%) among those who have received MMN powder compared to those who haven't received it (29.7%), but this difference was statistically non-significant. However, there was a statistically significant reduction in the prevalence of Iron Deficiency Anaemia among recipients of MMN (10.1%) in comparison to non-recipients (15.7%). There is also a significant improvement in the mean Haemoglobin level by 0.15 g per dl in the recipients.

Conclusions: The present evaluation has demonstrated that MMN supplementation for home fortification has clear benefits in reducing Iron deficiency anaemia in infants and young children in the pilot districts. In conforming to global guidelines, it is recommended that prevalence of anaemia more than 20% in the age group 6-23 months be used as the cut-off in determining scale up.

Menzies Centre for Health Policy. School of Public Health. University of Sydney. Sydney. Australia.

Background and objectives: Child nutrition indicators have not improved on par with other health indicators in Sri Lanka. Evidence-based interventions to improve infant and young child feeding(IYCF) practices are well documented. Adoption of such interventions, guided by robust polices, and backed by unstinted support from all stakeholders are pre-requisites for successful IYCF programmes, to tackle childhood malnutrition. This study was designed to describe the role of stakeholders in IYCF policies and programmes in Sri Lanka, in order to identify opportunities for improvement.

Methods: Technical and funding links of stakeholders involved in IYCF policies and programmes in Sri Lanka were analysed using Net-Map technique. Thirty five experts knowledgeable about IYCF programmes were selected for this purpose, and individually interviewed.

Data were analysed using ORA(Organizational Risk Analyzer) software. Relative importance of stakeholders was assessed through 'centrality' measures ('in-degree', 'out-degree', 'closeness' and 'betweenness'). In addition, 'level of influence' and 'support' of each stakeholder were also measured. The ORA software identified 'communities', i.e. groups of stakeholders closely connected.

Results: For technical and funding support for IYCF policies and programmes, 56 and 37 stakeholders respectively were identified.

Regarding technical support, stakeholders in the government health sector had the highest 'centrality' measures, 'level of influence' and 'support', followed by development partners. The research and academic, non-governmental organization (NGO) and government non-health stakeholders had relatively low 'centrality' and 'level of influence', though most of them were 'supportive'.

In the funding support map also government health sector stakeholders were prominent. High 'in-degree' suggested adequacy of funds for this main sector. Generally high 'supportiveness', 'level of influence' and 'centrality' of these stakeholders facilitate favourable distribution and utilization of funds for IYCF activities. Development partners had high 'out-degree' and 'level of influence' measures. Government non-health and NGO sectors had low 'in-degree', 'closeness' and 'level of influence' measures, though 'supportive'.

'Communities' in both technical and funding support maps were diverse, indicating healthy support and collaboration between stakeholders of various sectors.

Conclusions: The stakeholder analysis demonstrated that the government health sector was most active in IYCF programmes in Sri Lanka. For further improvement, strategic involvement of stakeholders in other sectors seems an attractive option.

NUTRITIONAL SITUATION, FEEDING PRACTICES OF CHILDREN AND REPRODUCTIVE AGE MOTHERS FROM BANGANG RURAL COMMUNITY, CAMEROUN

(1)Kana Sop, Marie Modestine; (2)Mananga, Marlyne-Josephine; (3)Nolla, Nicolas Polycarpes.

(1)University of Douala. Faculty of Science. Department of Biochemistry. Douala.; (2)PhD. Biochemist/Nutritionist. Department of Biochemistry Faculty of Science. University of Yaoundé I. Youndé. Cameroon.; (3)PhD. Biocmemist/Nutritionist. Department of Biochemistry. Faculty of Science. University of Douala. Cameroon.

Background and objectives: Health and nutrition problems are the result of unsatisfactory food intake or severe and repeated infection, or a combination of both. In Cameroon, malnutrition rate among pregnant and lactating women, infant and young children is increasing. This work aimed at evaluating feedings practices, anthropometric measurements (aged, weights and heights), the nutritional status of the mothers and children aged 0 to 59 months, in order to prepare nutrition education and intervention.

Methods: A cross-sectional study was conducted in six pilot health centers at Bangang Rural Community in western Cameroon. Two hundred and ninety six (296) mothers with 440 children (214 male, 226 female) aged 0 to 59 months were randomly selected. Anthropometric measurements were taken on mothers and their children using NCHS/WHO international growth reference. A questionnaire was developed to collect information on

the socio-economic and demographic status of mothers. Statistical analyses were done using ENA Smart and SPSS software

Results: With BMI classification of mothers according to WHO criteria, 3.38 %, 55.40 %, and 42.22 % of the mothers were underweight, normal and overweight respectively. For the children, from Z-scores, 2.6 %, 10 %, and 42.22 % were wasted, underweight and stunted respectively. Very low rate of exclusive breastfeeding (3.54%) before 6 months, early complementary feeding were observed. The most frequents consumed food were cereals and tubers whose nutrients are poorly bioavailable. The daily proteins, minerals, vitamins, were generally poor

Conclusions: In Bangang rural community, many the high rate of malnutrition was linked to lack of knowledge, inappropriate breastfeeding and complementary feeding practices, poor access to health infrastructure, illiteracy and poverty. Hence, effective mother's nutrition education should be implemented to improve good feeding practices and then, reduce malnutrition

NUTRITION IMPROVEMENT FOR PRECONCEPTION WOMEN: FIELD EXPERIENCE OF THE SCALING UP NUTRITION (SUN) PROGRAM IN BANGGAI DISTRICT INDONESIA

[1]Razak Thaha, Abdul; [2]Yatim, Herwin; [3]Labolo, Mustar; [4]Tongko, Ramli; [5]Rahmat, Rusdi; [5]Rahmat, Rusdi; [6]Wayan Suartika, I; [7]Monoarfa, Yustiyanty; [8]S. Otoluwa, Anang.

[1]Prof. Department Nutrition of Sciene. Faculty of Public Health. Hasanuddin University. ; [2]Regent of Banggai District. Indonesia.; [3]Vice Regent of Banggai District. Indonedia; [4]Head of Banggai District Planning. Development,and Training Board. Indonesia.; [5]Head of Banggai District Food Security Board. Indonesia.; [6]Head of Banggai District Women Empowering and Child Protection Office. Indonesia.; [7]PhD Student in Airlangga University. Indonesia; [8]Head of Banggai District Health Office. Indonesia.

Background and objectives: MMR in Banggai district (2014) is relatively high (279/100.000) compare to thenational target 2015 (102/100.000). Stunting is also high, 36,8% based on Basic Health Research (2013), as well as low birth weight baby (LBW) that reach 164 cases (2015). Root cause for all these problem is malnutrition in the first 1000 days of life especially in pregnancy. One of the program to improve the nutrition status of pregnant is the improvement of the nutritional and health status of women pre-conception through Integrated Health Post (Posyandu) for pre-conception women (PcW).

Methods: The program started at the beginning of January 2015, by organizing national seminar and workshop inviting prominent scholars and stakeholders in the field to share their knowledge and experiences. The output of the seminar and workshop is the commitment of local government and stakeholders to support the SUN Program. We visited mutlisector office and public health center (Puskesmas) to do socialization. A pilot project was initiated in the village namely Padangon, and we launched Posyandu for PcW in every village. Program started with health and nutrition classes for bridegroom. After that, all the bride included as a member of the Posyandu for PcW. In Posyandu, we did counseling on health reproduction, nutrition education, check up of BMI, HB concentration, upper arm circumference (UAC), and blood pressure, and delivering multi micronutrient (MMN) supplement. To analyze the result, we compare data before and after program implementation from facility report.

Results: From the begining of the program until the end of 2016: MMR decreased from 13 become 7 cases; LBW from 164 to 138 cases; prevalence of chronic enegy deficiency of PcW (UAC < 23 cm) from 23.5% to 12% and anemia prevalence of PcW decreased from 56% to 38%.

Conclusions: Preconception care offers great opportunities to improve nutrition status, prevent anemia, reduced maternal mortality, and low birth weight baby. It's important to implement the preconception care as part of maternal and child health and nutrition program in SUN Movement. It takes a strong commitment from local leaders.

Keywords: Preconception, SUN, MMR, LBW, anemia, local leader

University Clinical Hospital "Virgen de la Arrixaca". University of Murcia, Murcia. Spain.

Background and objectives: The incidence of obesity during pregnancy is increasing. Early programming of obesity could take place since very early stages of life, even during gestation. However, little is known about the mechanisms involved in this process. Our aim was to investigate the in vivo metabolism and placental transfer of fatty acids (FA) labelled with stable isotopes across the placenta in obese and normal weight pregnant women.

Methods: 10 controls (BMI 20-25kg/m2) and 10 obese pregnant women (BMI >30kg/m2) received orally, 12h before elective caesarean section, 0.05mg/kg 13C-oleic acid (13C-OA), 0.05mg/kg 13C-linoleic acid (13C-LA) and 0.01mg/kg 13C-docosahexaenoic acid (13C-DHA). Maternal blood was collected at -8h, -4h, -2h and at time of caesarean section; placental tissue and cord blood were also collected at delivery. VLDL, LDL and HDL were isolated by ultracentrifugation. Lipid fractions from serum and placenta were isolated by thing layer chromatography. All samples were analysed for 13C enrichment by gas chromatography combustion isotope ratio mass spectrometry (GC-C-IRMS).

Results: Both maternal serum triglycerides and cholesterol levels were similar in obese and normal weight pregnant women. Maternal insulin, placental weight and cord glucose tended to higher values in the obese group (n.s.). Both DHA and LA were significantly higher in plasma non-esterified fatty acids in obese vs. normal weight women (LA: 1.19±0.16% vs. 0.83±0.08%, P=0.058, DHA: 0.18±0.04% vs. 0.09±0.01%, P=0.046). HDL and LDL lipoproteins showed higher enrichment of LA and especially of DHA in the obese group, which may affect placental uptake of these FA. Tracer concentrations in total lipids of placenta were similar in both groups. However, the FA transfer to the fetus, evaluated by the ratio between cord and maternal 13C-FA plasma concentrations, was lower in obese women compared to controls, with a significant difference for LA (0.25±0.03% vs. 0.39±0.06%, P=0.04).

Conclusions: The materno-fetal placental fatty acid transfer of LA and DHA is lower in obese pregnant women without hyperlipidemia than in women with normal body weight.

SCALING UP REVITALIZED BABY FRIENDLY HOSPITAL INITIATIVE: DAY OF BIRTH TO 24 MONTHS - MALAWI CASE STUDY

(1)Nyaku, Albertha; (2)Guta, Janet; (3)Straubinger, Sarah; (4)Bwanali, Florence.

(1)MPH. Nutrition Team Lead. Maternal and Child Survival Project. PATH. Washington DC. USA; (2)MSC. Deputy Director. Ministry of Health. Lilongwe. Malawi; (3)BA. Program Coordinator. Maternal and Child Survival Project. PATH. Washington DC. USA; (4)BA. Nutrition Advisor. Maternal and Child Survival Project. Lilongwe. Malawi.

Background and objectives: Malawi 2016 DHS indicates a 10% decline in exclusive breastfeeding (EBF) and 37% of children under 5 are stunted. Only 31% of children under 2 years who had diarrhoea were breastfed. The Baby Friendly Hospital Initiative (BFHI) initiated in 1993 had collapsed since 2005. With limited tools and training, health providers aren't able to effectively support mothers, track and refer children under 2 years who are not thriving nutritionally.

Building on the ongoing scale-up of BFHI, the Maternal and Child Survival Program (MCSP), worked with the Ministry of

Health in collaboration with the World Health Organization in more than 20 districts, reaching over 1000 health workers to revitalize and scale up BFHI. Main objective: through effective integration along the continuum of care (COC), improve rates of early initiation of breastfeeding, EBF and timely complementary feeding at six months.

Methods: Designed and implemented an innovative package of interventions that optimized opportunities to strengthen and integrate along CoC at three main levels: 1) district health management teams plan, budget and implement, 2) sustainable on-site mentoring of health facilities to integrate BFHI into CoC of maternal, newborn and child health services including continuous assessment, and 3) operationalization of the community infant and child tracking system linked to health facilities. Data along the value chain of the CoC linked to the District Health Information System.

Results: Over 60% increase in early initiation of BF (2015-2016). More than 1000 health workers and over 1000 village volunteers have been trained whilst nearly 200 high volume health facilities and hospitals have been revitalized and operational in BFHI. Functioning linkages established between new mothers and trained community counsellors including new tools for messaging on the benefits of breastfeeding and sustaining behaviour for EBF and timely complementary feeding. Referral kits in use for tracking infants and children who are failing to breastfeed and not thriving nutritionally.

Conclusions: Globally BFHI continues to experience many challenges, which has resulted in slow scale-up. However, the Malawi case study demonstrates that scale-up and sustainability can be achieved using the systems strengthening along the continuum of care and community linkages approach.

SENSITIVITY OF INFANT AND YOUNG CHILD FEEDING INDICATORS IN SEASONAL DIFFERENCES TO INFORM EARLY WARNING SYSTEMS

[1]Farhikhtah, Arghanoon; [2]Aburto, Nancy; [3]Mlambo, Trust; [4]Dinucci, Alessandro; [5]Nyirenda, Jason.

[1]MSc. RD. UN World Food Programme. Nutrition Division. Rome. Italy.; [2]MSc. Phd. Nutritionist. Nutrition Divison. UN World Food Programme. Rome. Italy.; [3]MPH. Nutritionist. Nutrition Unit. UN World Food Programme. Lilongwe. Malawi; [4]MA. MSc. Nutrition Divison. UN World Food Programme. Rome. Italy.; [5]MSc. Nutrition Unit. UN World Food Programme. Lilongwe. Malawi.

Background and objectives: The goverment of Malawi, the World Food Programme (WFP) and World Vision are implementing a stunting prevention programme as part of 'Scaling Up Nutrition (SUN)' in Ntchisi district, Malawi. The programme has nutrition specific and sensitive components as well as a robust monitoring system that includes representative surveys every four months, measuring a range of indicators, including Minimum Acceptable Diet (MAD) and Minimum Dietary Diversity (MDD) for children 6-23 months of age. Currently, early warning systems to detect vulnerability to food insecurity and malnutrition rely primarily on household food security indicators. Nutrition indicators, such as MAD or MDD, if sufficiently sensitive to dietary changes, have potential to enhance such systems through capture of vulnerable household members' nutrition information.

The objective is to explore the sensitivity of MAD and MDD to predictable changes based on Malawi's seasonal calendar to inform design of early warning surveillance systems.

Methods: WFP analysed data from the representative surveys conducted in the programme district from 2015 to present. MAD and MDD measured at different times of the year were compared to the agricultural seasons (January (lean season), May (harvest), September (post-harvest)). IBM SPSS (v 20.0) was used to generate contingency table chi-square test ($\alpha=0.05$).

Results: Monitoring activities revealed that MAD and MDD changed in a predictable manner with the agricultural seasons across a 24-month period. In 2015, values for MAD were lowest during the lean season, highest during harvest, and intermediate post-harvest (10% vs 28% vs 14%; p<0.05). Values for MDD were also lowest during the lean season, highest during harvest, and intermediate post-harvest (12% vs 34% vs 20%; p<0.05). The same patterns were found in 2016 and 2017.

Conclusions: The regularly conducted surveys revealed that the two key nutrition indicators were sensitive to predictable changes in seasons. These findings suggest that MAD and MDD could be useful as early warning indicators in food security and nutrition surveillance systems.

Keywords: Minimum Acceptable Diet (MAD), Malawi, seasonality, stunting prevention, early warning

Conflict of Interest Disclosure: As a part of this SUN Stunting prevention programme in Malawi, Ntchisi district, World Food Programme collects trimesterly monitoring surveys where Minimum Acceptable Diet and Minimum Dietary Diversity indicators are assessed.

FOOD CONSUMPTION PROFILE AND PHYSICAL ACTIVITY IN CHILDREN AT PRESCHOOL CARED AT HEALTH SCHOOL CENTER BUTANTÃ/ COLLEGE OF MEDICINE UNIVERSITY OF SÃO PAULO

[1]Prado de Lima Ramos, Bianca; [1]Tomaz Cabral Ribas Martins, Bruna; [1]Guimarães de Angelis, Karina; [1]Kupper Lima, Victoria; [2]Harumi Miranda Omori, Luciana; [3]Bechere Fernandes, Maria Teresa.

[1]Student. Nutritionist. Faculdade de Saúde Pública da Universidade de São Paulo. Brazil; [2]MD. Faculdade de Medicina da Universidade de São Paulo. Brazil; [3]PhD. MD. Faculdade de Medicina da Universidade de São Paulo.Brazil.

Background and objectives: Healthy dietary behavior formation along the period of preschool consists with the prevention of childhood obesity.

1. Check the risk of prevalence for overweight at preschool children cared at Pediatric nutrition clinic in the Health School Center Butantã

2. Check the food consumption profile of the preschool children

3. Compare the dietary frequency consume of the preschool children with the risk for overweight and weight excess in eutrophic children.

Methods: Studied Population: Preschool children attended at pediatric service care at Health School Center Butantã in which mothers accepted the participation of the attendance at the Pediatric nutrition clinic (N=69).

Measures and evaluations: weight, height. Evaluation of the nutritional profile based on standards of the World Health Organization; evaluation of the dietary intake by the dietary frequency questionnaire.

Statistical Analysis: frequency, measures and X^2; analysis preformed by SPSS® Software.

Results: The average age of the group is 2.53 years (+1.38), with 49.3% of girls and 50.7% of boys. The percentage of preschool children with overweight risk was 23.2% and the unhealthy food with the highest frequency intake by the children was: fruit yogurt, which in 50.1% consumes two to four times per week, and biscuits without filling are consumed by 50.5% two to four times per week. The amount of hours spent in front of the TV was 2.07 hours (+2.13).

At the analysis of the groups the intake of meat and chicken cheeseburger (one time per week, p=0,05); fermented milk (two to four times per week, p=0,001); sausages (two to four times per week, p=0,002) were more frequent in risk and excess groups than in eutrophic groups.

Conclusions: The prevalence of overweight risk in preschool children was 23.2%.

The unhealthy foods most consumed by preschool children with overweight risk were fruit yogurt and biscuit without filling.

The intake of cheeseburger, fermented milk and sausages were significantly higher in groups of children with excess and overweight risk than in eutrophic children.

Keywords: weight excess, pre- schools, unhealthy habits

Background and objectives: Inflammation may influence the cardio-metabolic profile which relates with the risk of chronic diseases. Thus, the objectives are: to assess the inflammatory status by metabolic health/body mass index (BMI) category and to assess how inflammation can predict the cardio-metabolic profile in European adolescents, considering BMI.

Methods: 659 adolescents (295 boys) from a cross-sectional European study were included. Adolescents were classified by metabolic health based on age- and sex-specific cut-off points for glucose, blood pressure, triglycerides, high density cholesterol and BMI. C-reactive protein (CRP), tumor necrosis factor alpha (TNF-α), interleukin (IL-6), complement factors (C3, C4) and cell adhesion molecules were assessed.

Results: Metabolically abnormal (MA) adolescents had higher values of C3 (p<0.001) and C4 (p=0.032) compared to those metabolically healthy (MH). C3 concentrations significantly increased with the deterioration of the metabolic health and BMI (p<0.001). Adolescents with higher values of CRP had higher probability of being in the overweight/obese-MH group than those allocated in

other categories. Finally, high C3 and C4 concentrations increased the probability of having an unfavorable metabolic/BMI status.

Conclusions: Metabolic/BMI status and inflammatory biomarkers are associated, being the CRP, C3 and C4 the most related inflammatory markers with this condition. C3 and C4 were associated with the cardio-metabolic health consistently.

Keywords: Inflammation, metabolic health, metabolic syndrome, inflammatory biomarkers, adolescents.

COMMUNITY-BASED DISTRIBUTION OF IRON-FOLIC ACID SUPPLEMENTATION: A REVIEW OF EVIDENCE AND PROGRAM IMPLICATIONS FOR ANEMIA PROGRAMMING FOR WOMEN AND GIRLS

[1]Kavle, Justine; [2]Landry, Megan; [3]Gottwalt, Allison.

[1]PhD. Senior Nutrition Advisor. Maternal Newborn Child Health and Nutrition Division. Maternal and Child Survival Program (MCSP)/ PATH. USA.; [2]PhD. Consultant and Adjunct Faculty. Department of Prevention and Community Health, Milken Institute of Public Health. George Washington University. USA.; [3]MPH. Program Assistant. Maternal Newborn Child Health and Nutrition Division. Maternal and Child Survival Program/ PATH. USA.

Background and objectives: Globally, anemia affects 29% of pregnant women and 38% of non-pregnant women. Anemia puts women at greater risk of mortality, morbidity, postpartum hemorrhage, and poor birth outcomes, including preterm births and low birth weight. The World Health Organization (WHO) recommends daily iron-folic acid (IFA) supplementation (30-60 mg iron, 0.4g folic-acid) initiated as early as possible and continued throughout pregnancy for all adolescent and adult women to prevent anemia and poor birth outcomes. Despite the benefits of maternal IFA supplementation, many low- and middle-income countries continue to face high anemia rates. Unfortunately, low coverage of these programs remains a problem due to lack of supplies, late or no attendance to antenatal care (ANC) and demand-side issues. Community-based distribution (CBD) of IFA may aid with supply and/or access issues. A literature review of CBD of IFA in low and middle income (LMIC) countries was conducted to understand how to improve coverage and utilization for pregnant women and young girls at the community level.

Methods: An extensive review of peer-reviewed and grey literature of CBD of IFA supplementation for pregnant women, girls and women of reproductive age in low and middle income countries was conducted. Authors reviewed and screened titles and abstracts. A final pool of 26 articles was included in this review. Components of program implementation including cadre of health worker, supply and demand issues, and coverage were reviewed.

Results: CBD programs had moderate success with midwives, and community health workers who counseled on health benefits and compliance with IFA supplementation. CHWs were more likely to identify and reach a greater number of women earlier in pregnancy, as women presented late to ANC. CBD channels had greater consistency in terms of adequate supplies of IFA in comparison to clinics and vendors, who faced stock-outs. Targeting women of reproductive age through school and community settings showed high compliance and demonstrated reductions in anemia.

Conclusions: CBD of IFA can be a valuable platform for increasing access and coverage of IFA supplementation.

Keywords: anemia, iron folic-acid supplementation, community distribution, pregnant women, girls

TIMING OF INITIATION OF BREASTFEEDING AND EARLY-NEWBORN SEPSIS: EVIDENCE FROM RURAL BANGLADESH

Background and objectives: In Bangladesh, neonatal deaths decreased by 46% during 1990-2014. However, it remains high (28.0/1000 live-births), with early-neonatal deaths (19.3/1000) contributing over 65% of neonatal deaths. Neonatal sepsis is the cause of 24% neonatal deaths, while only 36% women start to breastfeed their newborn within 1st hour of birth. Early initiation of breastfeeding has a positive impact on neonatal health.

We aim to explore the effect of timing of breastfeeding initiation on early-newborn sepsis in rural Bangladesh.

Methods: We used data from a large community based trial in Bangladesh where pregnant women were enrolled from 2013-2015 covering 30,646 newborns. Sepsis was defined using neonatal danger signs reported by "The Young-Infants Clinical Science Study Group". Timing of initiation of breastfeeding was categorized as within 1hr, 1-24 hr,24-48hr, and more than 48hr of birth. Analysis includes descriptive statistics, risk attribution and binomial logistic-regression while adjusting for clustering effects of the trial design, and other maternal and infant characteristics.

Results: 29,172 live-births had information on initiation of breastfeeding. Of these, 4,121(14.1%) neonates had signs of sepsis till 7th day after birth. Two-thirds of the newborns [68.3%,(n=19,913)] had breastfeeding initiated within 1hr of birth. Mean time to initiation was 3.8hrs and by the end of 48hrs all but 3.5% neonates were breastfed. Breastfeeding within first hour was lower among women who delivered through caesarean section [46.5% vs 72.8%,(p<0.05)]. The incidence of sepsis increased as initiation of breastfeeding was delayed from 1hr (12.0%), 24hrs (15.7%), 48 hrs (27.7%) to more than 48hrs (36.7%) after birth. Overall, initiation after 1hr, 24hrs and 48hrs were associated with 6.8%, 20.4% and 23.4% higher attributable risk of having sepsis compared to those who initiated within 1hr, 24hrs and 48hrs respectively. Initiating breastfeeding after 1st hour significantly increases risk of having signs of sepsis during the first 7 days [1-24hr: OR=1.37(95%,CI:1.25-1.50); 24-48hr: OR=2.84(95%,CI:2.29-3.50); ≥48hr: OR=4.21(95%,CI:3.55-5.00)].

Conclusions: Findings indicate that timing of initiation of breastfeeding, especially within the first hour of birth, has significant protective effect on early-newborn sepsis. Tailored community-based intervention to promote initiation of breastfeeding within first hour of birth will help to reduce neonatal sepsis leading to neonatal deaths.

Keywords: Early breastfeeding, neonatal sepsis, maternal characteristics, infant, live-birth

DIETARY CONSUMPTION AND IRON DEFICIENCY ANEMIA IN INFANTS AGED 18-24 MONTHS

[1]Bouchenak, Malika; [2]Hadj Kadi, Amira; [3]Dida, Nawal; [2]Benadouda, Soraya; [2]Hamous, Amina; [4]Saadelhachemi, Houria; [5]Ghomari, Hanane; [4]Hachelaf, Wahiba; [6]Boureghda, Imad; [7]Bouziane Nedjadi, Karim.

[1]PhD. Laboratoire de Nutrition Clinique et Métabolique. Algeria.; [2]MSc. Laboratoire de Nutrition Clinique et Métabolique. Université d'Oran1 Ahmed Ben Bella. Algeria; [3]PhD. Laboratoire de Nutrition Clinique et Métabolique. Université d'Oran1 Ahmed Ben Bella. Algeria; [4]MSc. Clinique A. Cabral. CHU Oran. Algeria.; [5]MD. Laboratoire de Nutrition Clinique et Métabolique. Université d'Oran1 Ahmed Ben Bella. Algeria; [6]MD. Danone Nutricia ELN, Alger.; [7]PhD. Clinique A. Cabral. CHU Oran. Algeria.

Background and objectives: Iron deficiency (ID) is one of the most widespread nutritional disorders in both developing and industrialized countries, making it a global public health concern.1 ID and iron deficiency anemia (IDA), during the first years of life, are associated with impaired cognitive function and decreased motor activity.2 The major cause of micronutrient malnutrition is a diet consisting mainly of staple foods and lacking in animal sources. The aim of this study was to evaluate dietary consumption in infants with IDA or not

Methods: Infants (n=130, B/G: 72/58), aged 21±5 months, were recruited in three pediatric consultation and immunization centers of Oran. Dietary consumption, by the "24H recall" followed by 3 days record, was evaluated. Fresh blood count, plasma ferritin, and soluble receptors of transferrin (RsTf) were measured.

Results: Body mass index was 17±3 in infants, with 14% underweight, 25% overweight, and 15% obesity. Iron deficiency was defined according to several models: 22% met model criteria of ferritin<12μg/L and 73% with low ferritin or high RsTf or low mean corpuscular volume (MCV). IDA (Hb<11g/dL) was present in 48% of Infants (B/G: 35/27) with low MCV (<70μ3) compared to infants

without IDA (p<0.001). There was no significant difference in dietary consumption between infants with IDA or not. Total energy intake (TEI) represented 909±230 vs 961±273Kcal/d) but differed to recommended values (900Kcal/d).3 Intakes of proteins (12%) and carbohydrates (57%) were high, while that of lipids (31%) was decreased, compared to recommendations. 4 Qualitatively, animal proteins (74%), simple carbohydrates (49%) and saturated fatty acids (SFA) (51%) were high, compared to recommendations. Dietary iron consumption (5.6±3mg) was reduced compared to recommended value (7mg), showing that 81% of infants were deficient.

Conclusions: Dietary imbalance is probably at the origin of some micronutrients deficiencies, in particular iron leading anemia in half of infants. It is necessary to sensitize mothers to well monitoring and diversifying feeding of their infants, thus ensuring dietary balance for their growth and development.

INITIATION OF BREASTFEEDING AND MORTALITY RISK FOR NEWBORN IN RURAL BANGLADESH

[1]Rahman, Mohammad Masudur; [2]Raihana, Shahreen; [3]Tahsina, Tazeen; [4]Rahman, Qazi Sadeq-ur; [5]Islam, Sajia; [6]Huda, Tanvir Mahmudul; [7]Arifeen, Shams El; [8]Dibley, Michael.

[1]Senior Research Investigator.MBBS.MHE.MPS. Maternal and Child Health Division. International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b). Bangladesh; [2]Research Investigator. MPhrm. MPH. Maternal and Child Health Division. International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b). Bangladesh; [3]Senior Research Investigator. Maternal and Child Health Division. International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b). Bangladesh; [4]Senior IT Development Specialist. Maternal and Child Health Division. International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b). Bangladesh; [5]Research Investigator. MPH. Maternal and Child Health Division. International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b). Bangladesh; [6]Research Associate and PhD Candidate. Sydney School of Public Health. Sydney Medical School. The University Of Sydney. Australia; [7]PhD. Senior Director and Senior Scientist. Maternal and Child Health Division. International Centre for Diarrhoeal Disease Research, Bangladesh (icddr,b). Bangladesh; [8]Professor in Global Public Health Nutrition. Sydney School of Public Health. Sydney Medical School, The University Of Sydney. Australia.

Background and objectives: The average annual rate of reduction of neonatal mortality is 2.6% and neonatal mortality contributes about 61% of under-five mortality in Bangladesh. Evidence has shown that early initiation of breastfeeding has a positive impact on neonatal health and survival. Although, the majority of Bangladeshi mothers breastfeed their infants till 23 months of life, initiation of breastfeeding in the 1st hour of life is only 36%.

We aim to explore the effect of timing of initiation of breastfeeding on cause specific neonatal mortality in rural Bangladesh.

Methods: We collected data from a large community based trial in Bangladesh during July 2013 till March 2015, which covered 30,646 live births. Primary outcome is the number of breastfed neonates. Neonates who died within 48 hours of birth were excluded from analysis to reduce reverse causality. Timing of initiation of breastfeeding is categorized as- within 1hr, 1-24 hr, 24-48hr, and more than 48hr of birth. Our analysis includes descriptive statistics and binomial logistic regression while adjusting for clustering effect of the trial design. Verbal autopsies were used to ascertain cause of death.

Results: 244 newborns died between 2-28 days of birth giving a mortality rate of 8.5/1,000 live-births. We excluded 501 neonates who died before day 2, as they may have been too sick for early initiation of breastfeeding. More than half of the infants [68.3%,(n=19,805)] started breastfeeding within 1hr of birth. Neonatal deaths were higher among children for whom breastfeeding was initiated after an hour of birth (10.1 vs 7.6/1000 livebirths, p<0.05). Compared with those fed within the first hour after birth, risk of mortality was 1.0 [(95%,CI: 0.69 to 1.45)], and 2.37 [(95%,CI: 1.26 to 4.45)] times higher among newborns first breast-fed within 24hrs and 48hrs of birth respectively. Newborns who initiated breastfeeding within 24-48hrs had a higher risk of death (RR=2.37 (95%,CI:1.26 to 4.45), after adjusting for birthweight, gestational age and parity compared to newborns who were breastfeed within 1hr.

Conclusions: Our findings highlight the importance of breastfeeding for reduction of neonatal mortality. Promoting need for early initiation of breastfeeding through community-based interventions may have potential to significantly reduce neonatal mortality.

Sri Lanka.; [7]BSc. MPP. PhD. Senior Lecturer. Menzies Centre for Health Policy. School of Public Health. University of Sydney. Sydney. Australia.

Background and objectives: Infant and young child feeding (IYCF) practices play a critical role in growth and development of children. A favourable environment supported by appropriate policies and positive contributions from all stakeholders are prerequisites for achieving optimal IYCF practices. As Sri Lanka has identified childhood malnutrition as a priority issue, this study aimed to assess the IYCF-related policy environment in Sri Lanka. This would help to identify opportunities to strengthen the policy environment to better support appropriate IYCF and reduce childhood malnutrition.

Methods: The research team mapped national level policy-related documents on IYCF across four selected domains of best-practice interventions. Mind mapping and causal analysis was used to identify relevant policy sectors and types. Documents were identified by searching government archives and websites, and through officials from Ministry of Health and other relevant Ministries. A matrix was designed to capture data from IYCF policy-related documents using a thematic approach, and a narrative synthesis of data from different documents was conducted.

Results: Twenty four policies and policy related documents were identified containing provisions in the areas of global recommendations for best-practice IYCF, marketing of breast milk substitutes, strengthening health and non-health systems, maternity benefits, inter-sectoral collaboration, capacity building, health education and supplementation. Twenty of them belonged to the health sector. Significant policy support for IYCF was evident across the four domains studied, i.e. general policy support, dissemination of evidence based information, capacity building of healthcare workers and enabling mothers/caregivers to engage with best-practice interventions.

On the other hand, there is no separate, written policy on IYCF in Sri Lanka, and it is not specifically mentioned in high level policy documents that demonstrates political will and strategic direction.

Conclusions: Globally accepted major evidence-based recommendations are covered in the policies and policy documents studied. This is in line with the findings of Gupta et al. (2013) of an assessment conducted in 40 countries, that Sri Lanka generally had good policy support for IYCF programmes.

In order to further improve, advocacy should be targeted towards strategic support for IYCF in high-level policy documents, and enhanced involvement of non-health sectors need to be explored.

NO DIFFERENCES BETWEEN THE INTAKES OF MACRO AND MICRONUTRIENTS IN PRESCHOOL CHILDREN, WITH AND WITHOUT EXCESS WEIGHT, CARED AT HEALTH SCHOOL CENTER BUTANTÃ/COLLEGE OF MEDICINE UNIVERSITY OF SÃO PAULO

[1]Tomaz Cabral Ribas Martins, Bruna; [1]Prado de Lima Ramos, Bianca; [1]Guimarães de Angelis, Karina; [1]Kupper Lima, Victoria; [2]Harumi Miranda Omori, Luciana; [3]Bechere Fernandes, Maria Teresa.

[1]Student. Nutritionist. Faculdade de Saúde Pública da Universidade de São Paulo. Brazil.; [2]MD. Faculdade de Medicina da Universidade de São Paulo. Brazil.; [3]PhD. MD. Faculdade de Medicina da Universidade de São Paulo.Brazil.

Background and objectives: A deficit of micronutrients normally is associated with unhealthy dietary behaviors.

1. Check the food consumption profile of the preschool children cared at Pediatric nutrition clinic in the Health School Center Butantã,

2. Compare the dietary frequency consume (micro and macronutrients) of the preschool children with the risk for overweight, weight excess and eutrophic children.

Methods: Studied Population: Preschool children attended at pediatric service care at Health School Center Butantã in which mothers accepted the participation of the attendance at the Pediatric nutrition clinic (N=69).

Measures and evaluations: weight, height. Evaluation of the nutritional profile based on standards of the World Health Organization; evaluation of the dietary intake by the dietary frequency questionnaire.

Statistical Analysis: Averages and T student Test for independent samples; analysis preformed by SPSS® Software and AVANUTRI®.

Results: The average age of the group is 2.53 years (+1.38), with 49.3% of girls and 50.7% of boys. At the analysis of groups

it is not possible to observe significant differences between the consumption of the studied macro and micronutrients. An average intake of proteins and sodium were revealed high, in the two groups regarding to the references (IDRs, 2002). The intake of protein and sodium, respectively, on the excess and overweight risk group=79.4g/day(+38.4), 1,8g/day(+0.93) and eutrophic group=73.4g/day(+41.5), 2.06g/day (+1.02). Still, the average intake of calcium was low in the two groups regarding the reference above. The intake of calcium on the excess and overweight risk group was 979.8mg/day(+814.2) and in the eutrophic group it was 759,6mg/day(+377.4).

Conclusions: The groups of risk, excess weight and eutrophic children exhibited similar macro and micronutrient consumption. The protein and sodium intake are higher than the references, and the calcium intake are discreetly lower at the preschool population, revealing the needing of orientation about healthy eating behaviors to the children.

LIPIDOMIC ANALYSIS REVEALS THE SIGNIFICANT INCREASE OF DIACYLGLYCEROPHOSPHOCHOLINES IN UMBILICAL CORD BLOOD FROM PREGNANT WOMEN WITH GESTATIONAL HYPERCHOLESTEROLEMIA

Yu, Huanling; Zhang, Ran; Zhou, Qi; Cai, Xueping; Dong, Shan; Le, Zhiyin; Cai, Xiaxia; Xiao, Rong.

School of Public Health, Beijing Key Laboratory of Environmental Toxicology, Capital Medical University. Beijing. China.

Background and objectives: Gestational hypercholesterolemia has been recognized as risk factors of some pregnancy complications. We supposed that maternal hypercholesterolemia modified the lipid profile of fetus.

Methods: Thirty hypercholesterolemic pregnant women and matched controls were recruited and cord blood was sampled. Lipidomic analysis was used to evaluate the lipid profile change between the two groups.

Results: The results showed that content of diacylglycerophosphocholines (PC) were significantly affected. PC (16:0/20:4) and PC (18:0/20:4) were selected as the most important lipid spices in cord plasma which positive related to total cholesterol (TC) and high density lipoprotein cholesterol (HDL) levels in cord blood. The contents of these two PCs were significantly high in hyperchplesterolemic group than that in control group.

Conclusions: These results suggested that gestational hypercholesterolemia might program the phospholipide metabolism in offspring.

Keywords: Lipidomic, cord blood, gestational hypercholesterima, glycerophosphocholines

DESIGNING A LARGE MULTI-SECTOR PROGRAMME TO REDUCE STUNTING IN BANGLADESH. LESSONS FROM SUCHANA

[1]*Schofield, Lilly;* [2]*Seal, Ayan Shankar;* [3]*Tanvir, Ahmed;* [4]*Self, Vanessa;* [5]*Roschnik, Natalie;* [6]*Hasan, Sajedul.*

[1]MSc. Nutrition Advisor. Save the Children. UK.; [2]MSc.Nutrition Advisor. Save the Children. Bangladesh; [3]PhD. Monitoring and Evaluation Advisor; [4]MSc. Senior Food Security Advisor. Save the Children. UK; [5]MSc. Senior Nutrition Advisor. Save the Children. UK; [6]MSc. Team Lead Suchana. Save the Children. Bangladesh.

Background and objectives: Bangladesh has made significant progress in addressing chronic malnutrition with national stunting rates falling from 51% to 36% between 2004 and 2014. Progress has not been uniform across the whole country however and in Sylhet, stunting rates have remained at 50%. The Suchana programme was developed over 4 years using an iterative and collaborative process to design a programme to address the multi-faceted causes of malnutrition.

Methods: A series of studies were undertaken between 2012 and 2015 to understand the context of under nutrition in Sylhet Division and design a programme tailored to that context. These included a political economy analysis, governance study, food security and nutrition survey, Household Economy Analysis (HEA), Cost of Diet (CotD) assessment, ormative research, multi-hazard risk analysis, social protection and child poverty assessment, food security and nutrition scoping study, value chain study and health and nutrition services mapping, and review of learning from similar programmes.

Results: Five core programme pillars were identified: 1) Improved nutrition governance; 2) improved access to and utilization of nutrition specific and nutrition sensitive services; 2) better nutrition through improved economic status; 4) Community mobilisation for optimal IYCF and Maternal Child Health and Nutrition (MCHN) behaviour and practices; and 5) robust evidence of impact generated for scale up. It targets 250,000 vulnerable households in Moulvibazar and Sylhet districts and is delivered through a coalition technical and implementing partners, working across 8 Ministries, in a phased approach over 6 years. The first year learning phase has just been completed generating valuable learning and recommendations to further improve the approach.

Conclusions: Suchana is unique yet challenging because it uses systems based, multi-sector and multi-pronged approach to addressing the underlying causes of malnutrition. It was designed with a strong evidence base and highly iterative process which is equally rare.

Keywords: Stunting, food security, systems, multi-sector, Bangladesh

DIETARY PATTERNS AND CHANGES IN FRAILTY STATUS - THE ROTTERDAM STUDY

[1]Schoufour, Josje; [2]de Haas, Sandra; [2]de Jonge, Ester; [2]Voortman, Trudy; [2]Steenweg-de Graaff, Jolien; [2]Kiefte-de Jong, Jessica; [2]Franco, Oscar; [2]Ikram, Arfan; [2]Schoufour, Josje.

[1]PhD. Nutritionist. Department of Epidemiology. Erasmus MC, Rotterdam. The Netherlands; [2]Department of Epidemiology. Erasmus MC. Rotterdam. The Netherlands.

Background and objectives: The frailty index, developed by Mitnitski and Rockwood, appraises frailty as the accumulation of health-related and age-related deficits. The included deficits cover a broad range of health aspects including cognition, disabilities, laboratory abnormalities, and comorbidities. To provide more insight into how diet quality is associated with the frailty index and changes in frailty status over time we aim to: (1) examine the cross-sectional association between adherence to national dietary guidelines (a priori defined dietary pattern) and population-specific (a posteriori derived) dietary patterns and the frailty index in middle-aged and elderly populations and (2) examine if these a priori and a posteriori defined dietary patterns are associated with changes in frailty over a four year follow-up period.

Methods: Cross-sectional and longitudinal analysis embedded in the population-based Rotterdam Study (n=2,632 aged 45 years. Diet was assessed at baseline (year 2006) using food-frequency questionnaires. Dietary patterns were defined a priori using an existing index reflecting adherence to national dietary guidelines and a posteriori using principal component analysis. A frailty index was composed of 38 health deficits and measured at baseline and follow-up (4 years later). Linear regression analyses were performed using adherence to each of the dietary patterns as exposure and the frailty index as outcome (all in Z-scores).

Results: Adherence to the national dietary guidelines was associated with lower frailty at baseline (β -0.05, 95%CI -0.08, -0.02). Additionally, high adherence was associated with lower frailty scores over time (β -0.08, 95% CI -0.12, -0.04). The PCA revealed three dietary patterns that we named a "Traditional" pattern, high in legumes, eggs and savoury snacks; a "Carnivore" pattern, high in meat and poultry; and a "Health Conscious" pattern, high in whole grain products, vegetables and fruit. In the cross-sectional analyses adherence to these patterns was not associated with frailty. However, adherence to the "Traditional" pattern was associated with less frailty over time (β -0.09, 95%CI -0.14, -0.05).

Conclusions: Even in a population that is relatively young and healthy, adherence to dietary guidelines could help to prevent or delay frailty.

Keywords: Dietary patterns, diet quality, elderly, frailty, frailty index

EXCESS WEIGHT AND INADEQUACY OF MACRO AND MICRONUTRIENT ADOLESCENT INTAKE IN A TOWN OF BRAZILIAN NORTH EAST

[1]Oliveira, Halsia Stefane; [2]Martins da Silva, Háquila Andrea; [3]da Silva Neves, Sherida; [4]Vale do Carmo, Amanda; [4]Rodrigues Queiroz, Iara Saionaria; [4]Patrício Rebouças, Nathalia.

[1]MSc. Nutritionist. Federal Institute of Education Science and Technology of Ceará campus Crato. Crato. Brazil; [2]MSc. Nutritionist. Federal University of Ceará. Fortaleza. Brazil; [3]MSc. Nutritionist. University of Fortaleza. Fortaleza. Brazil; [4]Student of Nutrition. University of Fortaleza. Fortaleza. Brazil.

Background and objectives: Adolescence is a stage of intense body modification. The eating habits during this period are associated with increased risk of obesity and other chronic non-communicable diseases. The objective was to correlate excess weight with macronutrient intake and inadequate micronutrient intake of adolescents in a town of brazilian northeastern.

Methods: Adolescents students at public school answered three 24-hour dietary recall. The intake of energy and nutrients was estimated based on the Brazilian Food Composition Table. The inadequacy prevalences were estimated using the Estimated Average Requirement method as a cut-off point, the macronutrients were analized by Acceptable Macronutrient Distribution Range. Weight and height measurements were performed for BMI calculation and nutritional status classification as recommended by the WHO. The descriptive analysis of the data and the analytical test of the chi-square. The analyses were stratified according sexes.

Results: The analysis of nutritional status by sex showed that the girls had higher frequency of adequade weight (62.2%) and overweight (33.3%), compared to boys, who were respectively 47.2% and 13.9%. On the other hand, obesity was higher in boys, being 38.8% compared to 4.4% in girls. The mean energy consumption of male participants was higher (2352.5 kcal) than female (2200.7 kcal), however with no statistically significant difference. The percentage contribution of carbohydrates, proteins and lipids to total energy intake was similar among the different sexes and nutritional status. The consumption was out of the range in 6.3% for carbohydrates, 28.4% for proteins and 36.8% for lipids. Micronutrients that had the highest prevalence of inadequacy were calcium (92.6%), vitamin A (78.7%) and vitamin C (52.6%). Adequate iron consumption is present in the most subjects (87.2%). There were also no statistically significant differences in micronutrient intake by sex or nutritional status. The ERICA study in Brazil found either the highest prevalence of inadequacy with calcium and vitamin A, similar results among sexes. However, inadequate iron intake was higher among females.

Conclusions: There were no relation between sexes, nutritional status and inadequacy of micronutrients or high intake of macronutrients. There were a high prevalence of weight excess and inadequacy of calcium, vitamin A and vitamin C.

SNACKING BEHAVIOR IN ADOLESCENT GIRLS LIVING IN URBAN CITIES IN JAVA, INDONESIA

[1]Blum, Lauren; [2]Mellisa, Ayu; [3]Kurnia Sari, Eny; [4]Novitasari Yusadiredja, Isma; [5]Tumilowicz, Alison; [6]van Liere, Marti; [7]Shulman, Susan; [8]Menon, Ravi.

[1]Global Alliance for Improved Nutrition. USA.; [2]BA. PT Kadence International. Jakarta. Indonesia.; [3]BSc. Global Alliance for Improved Nutrition. Jakarta. Indonesia.; [4]MD. Consultant. Global Alliance for Improved Nutrition. Jakarta. Indonesia.; [5]PhD.Global Alliance for Improved Nutrition. Geneva. Switzerland.; [6]PhD. Global Alliance for Improved Nutrition, Geneva, Switzerland.; [7]Consultant. Global Alliance for Improved Nutrition. Geneva. Switzerland.; [8]MSc. Global Alliance for Improved Nutrition. Jakarta. Indonesia.

Background and objectives: Adolescence is a critical period in the lifecycle characterized by physical, social and developmental changes that impact on health and eating behavior. Indonesia is experiencing dramatic economic and infrastructural changes, causing greater access to the global food industry and media. This transition is influencing modifications in food intake, leading to new nutritional challenges in adolescent girls. Social science research was conducted to examine factors affecting eating and snacking behaviors in adolescent girls between 16-19 years of age. An overall aim was to inform the development of a communication strategy to improve snacking behavior.

Methods: Qualitative research was conducted between November 2016 and January 2017 in five urban sites in Java, Indonesia. Methods: **Results:** Freelisting results identified over 200 snack foods, with the most salient being packaged foods such as chips and cookies or fried foods available from street vendors or fast food restaurants, with little mention of fruits or vegetables. Respondents typically snacked multiple times daily, either with friends or while alone, with girls commonly storing snacks in their bedroom. Triggers for snacking included boredom, cravings, the desire to replace a heavy meal, and the need for a "companion" while studying, watching movies, or browsing social media, a regular activity of adolescent girls. Snack food selection is guided by taste, price, and accessibility, while health is not considered. Factors influencing snacking included its central role while socializing with friends, parental provision of snack foods and pocket money, the ubiquitous availability of snacks and their low price, and media advertisements, as well as a limited understanding of food content, nutritional needs and the adverse effects of poor food consumption.

Conclusions: Routine consumption of low quality snack foods high in sugar, salt and fat will likely have long-term implications on the nutritional status and health of Indonesian adolescent girls. This in-depth study provided context-specific information for the development of a social media campaign designed to motivate girls to modify snacking practices.

Nutrition Specialist Kenya Nutrition and Health Programme Plus. Kenya.

Background and objectives: Background: In Kenya, 39% of mothers deliver at home and those discharged from hospital require continuity of care hence Baby Friendly Hospital Initiative does not reach some women. Baby-Friendly-Community-Initiative (BFCI) could fill this gap.

Objective: To describe community based approach and tools used in implementation of BFCI to improve maternal infant and young child feeding practices.

Methods: Method: Participatory research on community engagement in BFCI, desk review, country case studies and exchange study to Cambodia. A package of BFCI implementation was developed which includes BFCI implementation guidelines, training package, orientation package, communication and advocacy materials. Eighty (8) step point plan and 11 key interventions/activities were determined in the implementation package. Monitoring and assessment tools were developed which includes mentorship and supervision tool, community self-assessment tools, individual child feeding and growth monitoring forms and external assessment tools. Two levels of community support groups were defined in the policy documents and integrated in the established community health strategy system; the community mother support groups (CMSGs) and mother to mother support groups (M2MSGs). Community health volunteer (CHV) were identified as implementers with supervision from the community health extension worker (CHEW). Income generating activities were encouraged as a form of incentives for CHVs.

Results: BFCI has been integrated successfully within the community health strategy structures. Training of over 200 TOTs and roll out of trainings to over 50% of the counties and successful

integration of nutrition sensitive programmes has been achieved. BFCI has led to successful achievement of the following; Improved exclusive breastfeeding rates upto over 80% and 65% at 3 and 6 months respectively, referral and reporting rates from 41% to 80% (MOH reports), 4 ANC attendance upto over 60% and scaling up of ART services to over 90% lower level facilities in a pilot site.

Conclusion: BFCI is can be effectively integrated into already existing community structures to improve feeding practices. A structured way of enhancing capacity of communities to providing services to improve infant feeding is key for success.

FOOD FORTIFICATION GLOBAL MAPPING STUDY: HIGHLIGHTING DONOR ENGAGEMENT AND ADVANCING UNDERSTANDING OF CHALLENGES AND OPPORTUNITIES TO REDUCE MICRONUTRIENT DEFICIENCIES

[1]Luthringer, Corey L.; [2]Hoogendoorn, Annemarie; [3]Parvanta, Ibrahim; [4]Garrett, Greg S.; [5]Declercq, Bruno.

[1]MPH. Non-Key Expert. Food Fortification Advisory Services. European Commission/Technical assistance for strengthening capacities in food fortification. USA.; [2]MSc. Key Expert. Food Fortification Advisory Services. European Commission/Technical assistance for strengthening capacities in food fortification. The Netherlands.; [3]MS. Key Expert. Food Fortification Advisory Services. European Commission/Technical assistance for strengthening capacities in food fortification. USA.; [4]MSc. Non-Key Expert. Food Fortification Advisory Services. European Commission/Technical assistance for strengthening capacities in food fortification. Switzerland.; [5]DEVCO C1: Rural Development, Food Security, and Nutrition. European Commission. Belgium.

Background and objectives: Food fortification is a component of interventions aimed at tackling "hidden hunger" and an area in which the European Commission is increasing its support to building, improving, and sustaining programmes in low- and middle-income countries, in alignment with the priorities of the Commission's Action Plan on Nutrition. A Global Mapping of food fortification was conducted by the Food Fortification Advisory Services to advance understanding on food fortification and biofortification, including key strategic and operational challenges, coverage and consumption trends, and impact on reducing micronutrient deficiencies. The mapping leverages the recommendations from the Global Summit on Food Fortification, held in September 2015 in Arusha, Tanzania.

Methods: The Global Mapping was conducted via a desk review of documentation from peer reviewed and grey literature sources in combination with a survey sent to a limited number of key stakeholders working in fortification. An analysis of the overall global status, results, and key learnings accompanies cues for future programming.

Results: Six key findings are articulated in the Mapping: 1) Fortification can make a significant contribution to improving public health outcomes if properly implemented; 2) A comparative advantage of fortification is it's delivery through national food systems; 3) Fortification can significantly improve the micronutrient content of existing diets of populations; 4) Sustainable and transparent public-private partnerships in nutrition form the basis for fortification programmes; 5) Inappropriate programme planning and poor compliance with standards are major challenges in achieving expected impact of fortification in some settings; and 6) Monitoring and surveillance of national fortification programmes are often inadequate and should be strengthened at national and global levels.

Conclusions: The Global Mapping report is a resource for enhancing mobilisation and political commitment for nutrition, scaling-up actions at country level, and contributing to the generation of knowledge and evidence on nutrition and food fortification. It represents an example of donor engagement in the scientific, programmatic, and policy spaces of nutrition. It has the potential to contribute towards food and nutrition program coordination by the Commission, partner countries and international donor and implementing agencies. This will help ensure fortification programmes achieve public health objectives and support relevant sustainable development goals.

SARCOPENIA, FRAILTY AND NUTRITIONAL STATUS IN VERY OLD WOMEN LIVING IN A NURSING HOME

[1]Velázquez, María Consuelo; [2]Irigoyen-Camacho, Maria Esther; [2]Lazarevich, Irina; [2]Marco, Zepeda.

[1]Msc. Full Time Professor. Health Attention Department. Metropolitan Autonomous University. Mexico; [2]Full Time Professor. Health Attention Department. Metropolitan Autonomous University. Mexico.

Background and objectives: Sarcopenia is a geriatric syndrome characterized by loss of mass, strength and skeletal muscle function. When sarcopenia is associated with frailty and malnutrition; it contributes to dependence, physical disability, morbidity and mortality.

OBJECTIVE: To estimate the prevalence of sarcopenia, frailty and malnutrition in elderly women (aged 65 year and over) living in a nursing home in Mexico City.

Methods: A cross-sectional study. To identify sarcopenia, the criteria of Consensus of the European Working Group on Sarcopenia in Older People (EWGSOP) was applied. The gait speed was measured in meters/second (≤ 0.8 m/s = low value) the handgrip strength was measured using a dynamometer (< 20 kg = low value).

To estimate muscle mass, two methods were used: 1. Calf circumference (CP) (<31 cm, low value) and 2. bioelectrical impedance analysis (BIA) (applying Janssen's formula). Fried L. criteria were used to detect frailty. To evaluate nutritional status, the Mini-Nutritional Assessment tool (MNA) was applied.

Results: A total of 114 elderly women, with an average age of 85 years, were studied. The prevalence of sarcopenia using BIA was 61.1% and using CP 30.7%. 50.9% of the old women had pre-frailty and 45.6% frailty. Undernutrition was detected in 3.5% and risk of malnutrition in 29.8%. Sarcopenia identified by BIA, it was associated with frailty and we observed that 46.0% of the elderly women were pre-frailty and 27.8% frailty. When sarcopenia it was identified by CP, we observed 32.1% with frailty and 62.9% with pre-frailty. The percentage of frailty was lower in those without sarcopenia (16.35%). While sarcopenia diagnosed across BIA, it was associated with nutritional status: 30.1% of the sarcopenic women presented risk of malnutrition, and 4.7% undernutrition. Using CP: 11.4% presented risk of undernutrition and 45.7% malnutrition

Conclusions: The prevalence of sarcopenia in very old women differs according to the method used to estimate skeletal muscle mass. The prevalence of malnutrition increases when there is fragility. The very old women living in a home car, requires intervention programs for prevent and receive an opportune therapeutic management for sarcopenia, fragility and malnutrition.

formations, genetic syndromes, studied intrauterine infections or cerebral palsy were excluded.

Instruments: Growth chart and outcomes on the rings subtest (RSubt) of the ENFEN. This subtest assesses executive functions, especially those related to planning and problem solving.

Statistical analysis: RSubt performance scores were divided in 2 categories: 1-4 and 5-10. Low RSubt score was defined as a score less than 4. Normal RSubt score was defined as a score >=5. Categorical data was analyzed using Chi2 or Fisher test. Significance level was set at $p<0.05$.

Results: 92 born preterm children (10-12 y/o) were studied. 31.52 % were SGA (n=29) and 68.47 % AGA (n=63). There were 68.96% of girls in SGA group and 52.38% in the AGA group. Mean+/-SD of BW and GA by group are shown in table 1. Table 2 shows the Chi2 results of the RSubt scores (<4 and >=5) for each group (SGA and AGA) and for each growth z score group at 1 and 2 years of life. There were no statistically significant differences between AGA children. However, the Chi2 test resulted significant for those in the SGA group ($p<0.05$).

Conclusions: Preterm SGA children are at special risk for cognitive impairment. We found that SGA in preterm (<1500g) children was associated with growth restriction at 1 and 2 years of life and lower scores in the RSubt of the ENFEN ($p<0.05$).

[1]Psicopedagoga. Educational Psychology in Ramón Sarda Maternity Hospital. Argentina.; [2]Medical doctor. Ramón Sarda Maternity. Argentina; [3]Phonoaudiologist. Ramón Sarda Maternity Hospital. Argentina.

Background and objectives: Several studies on preterm-born children have identified birth weight (BW) as a potent predictor of later cognitive functioning and academic success, with poorer outcomes in those born SGA (small for gestational age) compared with those born appropriate for GA (AGA).

The objective of the study was to compare SGA and AGA born preterm (<=1500g) children between 10-12 years old (y/o) on growth at 1 and 2 years of life and on the outcomes of the rings subtest (RSubt) of the ENFEN (Evaluación Neuropsicológica de las Funciones Ejecutivas en Niños.

Methods: 92 born preterm (<1500g) children between 10-12 y/o (53 girls, 39 boys) were studied. Children with congenital mal-

Ontario Child Health Support Unit. The Hospital for Sick Children. Canada.

Background and objectives: Infant linear growth faltering is a significant public health problem in South Asia. Low length-for-age z-scores (LAZ) are associated with adverse physical and neurocognitive outcomes in childhood. Linear growth faltering often begins early in infancy, suggesting that prenatal factors have a significant impact on postnatal growth. Vitamin D regulates bone mineral homoeostasis and growth plate activity and is, therefore, a key candidate nutrient involved in fetal and infant linear growth.

Methods: In a randomized controlled dose-ranging maternal vitamin D supplementation trial in Dhaka, Bangladesh, 1300 women were enrolled in mid-pregnancy (17-24 weeks gestation) and allocated into on of five treatment arms, receiving 1) placebo, 2) 4,200 IU/week, 3) 16,800 IU/week, or 4) 28,000 IU/week vitamin D in the prenatal period and placebo in the postpartum period, or, 5) 28,000 IU/week vitamin D in the prenatal and 28,000 IU/week vitamin D in the postpartum period. Infants underwent weekly morbidity evaluation until 6 months of age and anthropometric and clinical evaluation at 3-month intervals until 1 year of age. Laboratory analyses were performed at enrollment, 30-weeks gestation, delivery, and 3 and 6 months of age. The primary outcome was mean lenght-for-age Z score (LAZ) at 1 year of age. Secondary outcomes included pregnancy/birth outcomes and infant morbidity.

Results: Of 1300 women enrolled, 64% were vitamin D deficient (25-hydroxyvitamin D<30 nmol/L) at baseline. There were 20 stillbirths, 29 infant deaths, and 86 other losses to follow-up, such that 1165 (90%) infants completed anthropometric follow-up at 1 year of age. The effects of maternal vitamin D supplementation during pregnancy and lactation on infant LAZ, other anthropometric indices, and various clinical outcomes will be presented.

Conclusions: The impact of the current findings on maternal vitamin D supplementation on infant length and maternal and infant health outcomes in Bangladesh will be discussed. The significance of the findings for current maternal vitamin D supplementation guidelines will be discussed.

FREQUENCY OF VITAMIN D DEFICIENCY IN OUR OBESE PATIENTS

Vera, Matilde Elizabeth.

MSc. Nutrition. Argentina.

Background and objectives: The objective of the present study is to determine the frequency of vitamin D deficiency in obese patients

Methods: Methodology: A cross-sectional observational, descriptive study with an analytical component, performed in 40 patients of the Integral Management Unit of the Obese Patient of the Hospital de Clínicas from June 2015 to May 2016. Variables: socio-demographic, clinical data, 25- Hydroxy-Vitamin D and relation between them. The data collected were loaded in Microsoft Excel ® version 2007 and analyzed using Epiinfo 7 version February 2011

Results: The mean age was 40 ± 11 years (19-59), mostly women (88%), who work Office (30%), residents of the Central area (68%). The medical diagnosis was predominantly Hypertension (62%) and Type 2 Diabetes (29%), with predominance of obese type II and III with 40% and 38%, respectively. 40% have vitamin D deficiency (≤20ng / ml) and 40% deficiency (21-29 ng / ml) and 20% adequate. The environment, 9 miles, being higher in women. The most frequent risk factor was 55% of the non-exposed subjects with the lowest vitamin D value (μ18 ± 9). Of those with deficiency, 50% had grade II obesity and in those with good results, 75% were grade III.

Conclusions: Almost half of the obese studied had vitamin D deficiency, more affecting those with type II obesity

Keywords: obesity, vitamin D, vitamin D deficiency, Paraguay.

WHO GUIDELINES ON FEEDING COMPLEMENTARY FOODS TO 6-24 MONTH OLD CHILDREN: DEMOGRAPHIC & HEALTH SURVEY (DHS) DATA FROM CAMEROON, EGYPT, INDONESIA AND THE PHILIPPINES

[1]Marriott, Bernadette P.; [2]Nasarre, Patrick; [3]Lee, Fu-Shing; [4]Poole, Ann; [5]Boan, Andrea D.; [6]Wallingford, John C.

[1]PhD. Director. Nutriton Section. Division of Gastroenterology. Department of Medicine. Medical University of South Carolina. Charleston. SC. USA.; [2]PhD. Medical University of South Carolina. Charleston. SC. USA; [3]PhD. Statistician. Nutrition Section. Department of Medicine. Medical University of South Carolina. Charleston. SC. USA.; [4]MSc. Nutrition Section. Department of Medicine. Medical University of South Carolina. Charleston. SC. USA; [5]PhD. Department of Pediatrics. Medical University of South Carolina. Charleston. SC. USA; [6]PhD. Nutrition Scientist. Prsident. Nutrispectives Inc. Seattle. WA. USA.

Background and objectives: The World Health Organization (WHO) recommends complementary foods with sufficient diversity to meet nutritional needs that are measured by four solid food feeding indicators (FI). Earlier studies have reported associations between meeting the FI and economic status or maternal education. Our purpose was to determine if meeting the WHO FI was associated with country economic status measured by Gross Domestic Product (GDP).

Methods: We assessed complementary feeding practices of children 6-24 months of age and their family socio-demographics and lifestyle factors using comparable Demographic and Health Survey (DHS) data and the WHO FI, among four countries of dissimilar economic status: Egypt, Indonesia, Philippines, and Cameroon (World Bank: GDP= 6,600; 5,200; 4,700; 2,400 USD/capita, respectively).

Results: The percent of children meeting the WHO guidelines did not parallel GDP. Cameroon had significantly fewer children meeting all four of the solid food FI (p<0.01) than the other countries, yet children in Cameroon were significantly more likely to be fed with meat, vitamin A rich foods, and fruits than children in Egypt (p<0.01). While Philippines had a lower GDP than Egypt and Indonesia, it had a higher percentage of children meeting all four FI's (p<0.01) and mothers completing secondary school or higher education. In terms of food groups overall, more than 80% of the children in all 4 countries received grain-based foods with between 45% and 70% of children having been fed with fruit. Higher maternal education was a significant predictor of meeting the FI specifically for food diversity in Egypt, Indonesia and Cameroon, while working outside the home was a significant predictor of meeting this FI only for women in the Philippines and Indonesia (p<0.01). Overall, a higher family asset index was associated with meeting the FI for food diversity alone among all countries (p<0.01).

Conclusions: Among these four countries, maternal educational achievement appears to be a better predictor of general complementary feeding practices than country GDP.

ENERGETIC CONTRIBUTION OF ULTRA-PROCESSED PRODUCTS TO THE FOOD LISTFROM DE DIET OF ADULTS IN NORTHEAST OF BRAZIL

[1]de Oliveira Lyra, Clélia; [2]de Lima Motta, Virginia Williane; [3]Vale, Diôgo; [4]Pereira Santos, Camila Dayze; [3]Freitas Da Silva Pereira, Ingrid; [2]Garcia Germoglio, Rebecca; [3]De Araujo Cabral, Natalia Louise; [3]Freire Pequeno, Nila Patrícia; [5]Viana Bagni, Ursula; [5]Vieira Cunha Lima, Severina Carla.

[1]PhD Professor. Nutrition Departament. Federal University of Rio Grande do Norte. Brazil; [2]BSc. Post-Graduation Program of Nutrition. Federal University of Rio Grande do Norte. Natal. Brazil.; [3]MSc. Post-Graduation Program of Public Health. Federal University of Rio Grande do Norte. Natal. Brazil.; [4]BSc. Post-Graduation Program of Public Health. Federal University of Rio Grande do Norte. Natal. Brazil.; [5]PhD. Professor. Nutrition Department. Federal University of Rio Grande do Norte. Natal. Brazil.

Background and objectives: The ultra-processed products are formulations of industrial sources of dietary energy and nutrients, likefree sugars and salt, saturated fat or trans fats, plus additives including those designed to intensify sensory impact. They typically contain little or even no intact food. Recent studies have shown significant associations between the food consumption of ultra-processed food products with non-communicable diseases (NCDs), in all ages.

The aim of this study was to verify the energetic contribution of ultra-processed food products on a food list in adults, in Northeast of Brazil.

Methods: The food list was obtained by food records using data from a nationwide survey, the Pesquisa de Orçamentos Familiares 2008-2009 (POF), in a population sample of Northeast of Brazil in age between 20 and 59 years. Data on pregnant and lactating women have not been included. To construct the list was opted for the methodology of relative percentage of contribution of each food item from Block et al. The foods classifications based on the extent and purpose of their processing, was used the NOVA system of food classification.

Results: The list was constituted by 97 foods that contributed up to 90% of the energy consumption. Ultra-processed (n=30) food products contributed together with 11,4% of the energy from the list of food consumed. The food that most contributed to energy was margarine (n = 15;% = 1,23), followed by the crackers (n = 19;% = 1,03%). Were part of the contributions, foods like cookies and stuffed, soft drinks and fast foods.

Conclusions: The ultra-processed food products have an important contribution in the energetic consumption of adults in the northeast of Brazil. This results demonstrated the need for public policies aimed at the promotion of healthy eating. For these public policies aimed at the promotion of healthy eatingbe successful, it is important to recognise the conflict of interests between the ultra-processed products food market and public health. To tackle the NCDsit is necessary that there should be a strengthening of the regulatory capacity of the State in the production and marketing of food.

BIOLOGICAL AND SOCIAL DETERMINANTS OF OVERWEIGHT IN CHILDREN AT ENTERING PRIMARY SCHOOL. RESULTS OF MINISALTEN STUDY

[1]Zonis, Luciana Noemi; [2]Indart Rougier, Paula; [2]Favieri, Andrea Lorena; [3]De Gregorio, Maria Jose; [4]Rausch Herscovici, Cecile; [5]Kovalskys, Irina.

[1]BSc. Nutritionist. Nutrition and Health Area. ILSI Argentina (International Life Sciences Institute). Argentina.; [2]BSc. Nutritionist. Nutrition and Health Area. ILSI Argentina (International Life Sciences Institute). Buenos Aires. Argentina.; [3]BSc. Sociologist. Department of Anthropological Sciences. University of Buenos Aires. Argentina; [4]PhD. Nutrition and Health Area. ILSI Argentina (International Life Sciences Institute). Buenos Aires. Argentina.; [5]MD. Nutrition and Health Area. ILSI Argentina (International Life Sciences Institute). Buenos Aires. Argentina.

Background and objectives: Overweight (OW) at early ages is a vulnerable condition due to the effect of tracking adiposity during infancy and adolescence. The goal of this study was to identify the main determinants in a sample of first grade children attending at public schools in Buenos Aires.

Methods: This analysis includes the baseline assessment of the MiniSALTEN Study (obesity prevention program developed in 12 Public Schools in Bs As, Argentina). Data was collected from June to November 2015. All first grade children and their mothers were invited to participate. Data of intake was collected face to face with a 24 h recall for both mother and child, for the last one, the information was completed by the research team, at school. Weight and Height was measured and BMI calculated. Socio demographic information, including socioeconomic level (SEL) was collected. Time of sleep (in hours) was collected during one week. Intake data was analyzed with a software (NDS-R, Nutrition Data System). All analyses were performed with SPSS for Windows. Multivariate logistic regression model was used to find the most predictive variables associated with overweight and obesity. The final models are reported using odds ratios (ORs) and their 95% confidence intervals (CI) and p-value.

Results: Final sample was composed by 205 dyads. Children's mean age was 6.68 y. The prevalence of overweight was 26,3 % and obesity 22 %. Significant factors associated with overweight and obesity were Mother's BMI (OR: 1.09, CI 1.03-1.153, p-value: 0.003) and low SEL (OR: 2.279, CI: 1.224-4.242, p-value: 0.009). Were also analyzed energy (OR:1.00, CI: 1.00-1.001, p-value: 0.160), added sugars (OR: 0.983, CI: 0.95-1.018, p-value: 0.345), average daily time of sleep (OR: 1.071, CI: 0.7-1.639, p-value: 0.752), birth weight (OR: 1.183, CI: 0.712-1.965, p-value: 0.517) and exclusive breastfeeding up to 6 months (OR: 1.319, CI:0.730-2.385, p-value:0.359). Non of them shawed association with children's BMI.

Conclusions: Argentina is a developing country with one of the highest prevalences of children's overweight in Latin America. Both mother's adiposity and poverty (main determinants) are environmental preventable conditions to tackle obesity at early ages.

Keywords: Childhood obesity, Diet, Risk factors, Multivariate analysis.

Conflict of Interest Disclosure: The source of funding for the research is the Coca-Cola Foundation. The authors declare that they have no competing interests. The funding source had no role in study design, data collection and analysis, decision to publish, or preparation of manuscripts.

PRENATAL NUTRITIONAL CARE IMPROVED PERINATAL OUTCOME OF PREGNANT WOMEN IN THE CONTEXT OF PRIMARY HEALTH CARE IN MANGUINHOS, RIO DE JANEIRO, BRAZIL

[1]Della Líbera, Beatriz; [2]Baião, Mirian; [3]Barros, Denise; [2]Santos, Marta; [4]Araújo, Roberta; [5]Saunders, Cláudia.

[1]PhD. Nutritionist. Curso de graduação em Nutrição. Faculdade Redentor. Brazil.; [2]PhD. Nutritionist. Departamento de Nutrição Social e Aplicada. Universidade Federal do Rio de Janeiro. Brazil.; [3]PhD. Nutritionist. Escola Nacional de SaúdePública. Fundação Oswaldo Cruz. Brazil.; [4]MSc. Nutritionist. Escola Nacional de Saúde Pública. Fundação Oswaldo Cruz. Brazil.; [5]PhD. Nutritionist. Departamento de Nutrição e Dietética. Universidade Federal do Rio de Janeiro. Brazil.

Background and objectives: Maternal morbidity is strongly associated with neonatal mortality. Adequate prenatal care, with early detection and intervention during risk situations, as well as good quality care during labour, are key health indicators related to mother and child, with the potential to further reduce the effects of the main causes of maternal and neonatal mortality. The aim of the study was to assess the impact of a prenatal nutritional care programme on perinatal outcome in the context of primary health care.

Methods: That's a non-randomized controlled clinical trial developed in a unit care in Rio de Janeiro, Brazil. 284 pregnant women were allocated into one of two groups: an intervention group (IG; n = 122), comprising pregnant women who received the intervention of nutritional care through collective consultations with a nutritionist, and a control group (CG, n = 162) consisting of pregnant women who did not receive the intervention.

Results: There was a higher proportion of pregnancy complications (p=0.000) and abnormal total gestational weight gain (p=0.031) in the CG. In the final model, it was found that belonging to the CG (adjusted OR=4.721; CI 95%=1.009-22.090) and living with four or more people in the household (adjusted OR=2.692; CI 95%=1.021-7.101) were predictors of pregnancy complications, while belonging to the CG (adjusted OR=2.354; CI 95%=1.063-5.213) and starting prenatal care after 16 weeks (adjusted OR =8.509; CI 95%=1.023-70.784) were determinants of abnormal pregnancy weight gain.

Conclusions: These findings reinforce that the prenatal nutritional care programme contributed to improving the health of pregnant women.

Keywords: Pregnancy. Nutrition programmes. Prenatal nutrition.

EXPERIENCING A PROPOSAL OF NUTRITIONAL ANTENATAL CARE AMONG PREGNANT WOMEN ATTENDED IN A FAMILY CLINIC IN RIO DE JANEIRO, BRAZIL

(1)Della Líbera, Beatriz; (2)Saunders, Cláudia; (3)Barros, Denise; (4)Santos, Marta; (5)Araújo, Roberta; (4)Baião, Mirian.

(1)PhD. Nutritionist. Curso de graduação em Nutrição. Faculdade Redentor. Brazil.; (2)PhD. Nutritionist. Departamento de Nutrição e Dietética. Universidade Federal do Rio de Janeiro. Brazil.; (3)PhD. Nutritionist. Escola Nacional de SaúdePública. Fundação Oswaldo Cruz. Brazil.; (4)PhD. Nutritionist. Departamento de Nutrição Social e Aplicada. Universidade Federal do Rio de Janeiro. Brazil.; (5)MSc. Nutritionist. Escola Nacional de Saúde Pública. Fundação Oswaldo Cruz. Brazil.

Background and objectives: Scientific evidence suggests the effectiveness of prenatal and nutritional care on the improvement of perinatal outcomes. The research aimed at analyzing the meanings attributed by mothers to prenatal nutritional care developed in a family clinic in the city of Rio de Janeiro, using Depth Hermeneutics as the methodological framework.

Methods: Pregnant women received nutritional care offered in three collective appointments during the prenatal, characterized as "conversation circles" (CC), structured as follows: evaluation of medical records; nutritional assessment; development of educational activities related to health and nutrition; delivery of educational material. Nutritional assessment and medical records provided subsidies for the development of nutritional care developed at CC, in which we applied the nutritional and dietary counselling techniques, taking into account what the woman thinks, how she lives, her daily life, her social representations of "being pregnant" and her eating habits. Participant observations and 15 semi-structured interviews were performed with mothers who participated in the conversation circles (CC).

Results: It is possible that pregnant women have realized the CC as a form of emotional support for their concerns, when they could display their behaviours, as well as get information and guidance concerning their new status as pregnant. CC were considered as an opportunity for sharing experiences among pregnant women and professionals, and a significant involvement of both parties in the care production process was observed. It was also recognized as a welcoming environment for enabling dialogue, allowing free expression of doubts, feelings, and expectations, strengthening the bond between the team and the pregnant woman and among pregnant women.

Conclusions: The CC represented an important strategy for promoting health in the period of pregnancy, being an environment of humanization, citizenship and social inclusion.

SOCIAL DISPARITIES AND THE NUTRITIONAL STATUS OF CHILDREN UNDER FIVE AND CHILD BEARING WOMEN IN PERU

(1)Curi Quinto, Katherine; (2)López de Romaña, Daniel.

(1)MSc. Nutritionist. National Institute of Public Health. Mexico.; (2)PhD. Technical Advisor. Micronutrient Initiative. Canada.

Background and objectives: Social disparities are the root of inequalities in health for both communicable and chronic diseases. Understanding the social determinants of nutritional status in Peru can contribute to promote broader and structural interventions. This work examines associations between socioeconomic status (SES), education and ethnicity with overweight (OW), stunting and anemia in children under 5 y and women of 20-49 y.

Methods: We analyzed the Peruvian 2015 National Demographic and Family Health Survey. We used multivariate log-binomial regression model to obtained the prevalence ratio (PR) and assess the independent associations between (SES), education and ethnicity with stunting in children and with overweight and obesity combined (OW) and anemia in both children and women. Low levels of SES, education and non-indigenous were used as reference of prevalence comparison. We used a confidence level of 95%.

Results: The prevalence of OW, stunting and anemia in children was 9.1% (8.5-9.8), 14.1% (13.4-14.9) and 32% (31.0- 33.0), respectively. Independently and compared with their respective reference, it was found that the prevalence of stunting and anemia was higher in indigenous children [PR=1.35 (1.21-1.50)]; [PR=1.29 (1.2-1.4)], and lower in children with high SES [PR=0.25 (0.21-0.31)]; [RP=0.64 (0.58-0.70)]. Children with high mother education had less prevalence of stunting [PR=0.4 (0.3-0.5)]. For OW only SES was independently associated, its prevalence was higher in high SES children [PR=3.1 (2.5-3.9)]. In women the prevalence of OW and anemia was 65.2% (64.3-66.2) and 21.7 (20.8-22.6) respectively. The prevalence of OW was higher in high SES women [PR=1.27 (1.2-1.3)] and less in indigenous and high educated women [PR=0.64 (0.6-0.7)]; [PR=0.84 (0.8-0.9)]. For anemia, only being indigenous was independently associated; indigenous had more prevalence than non-indigenous [PR=1.18 (1.0-1.3)].

Conclusions: Social disparities were associated to the nutritional status of children and women. In general, undernutrition is negatively associated to SES, education and being indigenous, whereas OW is positively associated to SES.

Keywords: Social disparities, children and women nutritional status.

Division of Nutritional Sciences. Cornell University. USA.; [6]PhD. Associate Professor. Department of Food Science and Nutrition. SNDT Women's University. India.; [7]PhD. Emeritus Professor. Division of Nutritional Sciences. Cornell University. USA.; [8]MBBS. ScD. Associate Professor. Division of Nutritional Sciences. Cornell University. USA.

Background and objectives: The efficacy of biofortification, which is a promising strategy to tackle widespread micronutrient malnutrition, has not been demonstrated in the first 1,000 days. We are conducting the first randomized efficacy trial of biofortified iron- and zinc-enriched pearl millet in children under two years of age residing in urban slums of Mumbai, India. The objective of this analysis was to examine the pre-intervention nutritional status (including micronutrient biomarkers, anthropometric measures, and body composition) of mothers and their children in the community to inform the potential to benefit and the design and implementation of this randomized intervention trial.

Methods: Children (6-24 months) were recruited from urban slums in Mumbai, India after obtaining informed parental consent. Anthropometric measurements were assessed in children and a subset of mothers, including length/height, weight, body circumferences, and skinfold thicknesses using standardized methods and calibrated instruments. Z-scores for length-for-age (LAZ), weight-for-length (WLZ), and weight-for-age (WAZ) were calculated using the World Health Organization Child Growth Standards. Percent fat mass was calculated using the Slaughter equation. Hemoglobin (Hb), serum ferritin, serum zinc, and C-reactive protein (CRP) concentrations were evaluated in children at baseline.

Results: The median age of children was 12.1 (10.0-13.2) months and 48% of participants were female. A total of 29% of children were stunted (LAZ<-2); the prevalence of stunting and underweight (WAZ <-2) was higher in boys compared to girls [36% vs. 21% (p<0.05), and 34% vs. 17% (p<0.05), respectively]. Median fat mass was 15.9% (13.7-18.7). In analyses among mothers, 26% were underweight, 54% were of normal weight, and 20% were overweight or obese, based on standard BMI cutoffs. 51% of mothers were less than 150 centimeters tall. A total of 75% of children were anemic (Hb <110 g/L). Approximately 74% of children were iron deficient (serum ferritin <15 μg/L), and 54% were zinc deficient (serum zinc <70.0 μg/dL).

Conclusions: Findings demonstrate a high burden of malnutrition, particularly iron and zinc deficiency, in children in the urban slums of Mumbai and indicate the suitability of this population as the target for the biofortified crops-based intervention (ClinicalTrials.gov ID: NCT02233764).

Keywords: Stunting, iron, biofortification, children, India

Conflict of Interest Disclosure: Saurabh Mehta is an unpaid board member for a diagnostic start-up company focused on developing point-of-care assays for nutritional status, informed by his research as a faculty member at Cornell University. All other authors report no conflict of interest.

KNOWLEDGE OF HYDRATION PRACTICES OF AMATEUR RUNNERS FROM THE CITY OF SÃO PAULO

[1]Guizellini, Gloria Maria; [2]Perim, Pedro; [3]Barrella, Ana Beatriz; [3]Rodrigues, Tânia; [4]Rossi, Luciana.

[1]Nutrition Student. Universit Center of São Camilo. Sao Paulo. Brazil; [2]Nutrition Student. University Centre of Sao Camilo. Sao Paulo. Brazil; [3]RG Nutri Nutrition Consulting. Sao Paulo. Brazil; [4]Faculty of Pharmaceutical Sciences. University of Sao Paulo. USP. Sao Paulo. Brazil.

Background and objectives: Street racing is a sport of easy execution that has great health benefits. Thermoregulation is a physiological process in modalities that require physical effort as in street races. This process can affect the hydration of the runner, as increased body temperature will result in excessive production of sweat assisting in dehydration.

Methods: A total of 18 male (n = 4) and female (n = 14) between the ages of 31 to 53 years old belonging to a race office in the city of São Paulo were evaluated. The methodology used was of the exploratory type, through a descriptive research using a questionnaire composed of 12 objective self-management questions. The study was approved by ethics committee number 97/06.

Results: The results indicated that individuals didn't adequately perform hydration procedures, since the most consumed solution was water and they practice more than 90 minutes of physical exercise. It was also found that there is a greater concern of the runners in hydrating only during and after training and competitions, neglecting hydration before exercise. The main symptoms associated with dehydration were: pallor, sensation of loss of strength and headache.

Conclusions: It is concluded that individuals have prior knowledge about the importance of hydration. However, they didn't perform correctly, requiring more specific guidelines to reduce the effects of dehydration on the performance and health of runners.

Keywords: Hydration; Runners; dehydration; Performance.

PROMOTING NUTRITION AND HYGIENE FOR ORPHANS AND VULNERABLE CHILDREN IN THROUGHOUT CHILDHOOD IN NIGERIA

(1)Cunningham, Andrew; (2)Granger, Kristina; (3)Mburu-de-wagt, Anne; (4)Rogers, Bridget; (5)Koniz-Booher, Peggy.

(1)MPH. SBCC Project Officer. SPRING Project. JSI. United States.; (2)MPH. SBCC Manager. SPRING Project. Manoff Group. United States.; (3)PhD. Independent consultant. India.; (4)MPH. Senior Project Officer. SPRING Project. JSI. United States.; (5)MPS. SBCC Team Lead. SPRING Project. JSI. United States.

Background and objectives: Out of Nigeria's 69 million children, an estimated 17.5 million are considered orphans and vulnerable children (OVCs), of which 7.3 million are orphaned by HIV/AIDS. Communities often face challenges when trying to feed and care for these children and meet particular needs due to their OVC status. In 2015, The USAID-funded Strengthening Partnerships, Results: **Methods:** SPRING conducted a landscape analysis to identify priority nutrition practices, existing nutrition materials and curricula, and other interventions across Nigeria for the early childhood (2-5), middle childhood (6-11), and adolescent (13-17) age groups. Data were collected via a combination of desk review and surveys conducted with 63 civil society organizations (CSOs) working with OVCs. SPRING used the findings to design a training package with key nutrition information for use by CSOs associated with Kids' Clubs and early child development (ECD) centers. SPRING concept tested selected activities from the package in four communities in the Federal Capital Territory with teachers and children from each age group.

Results: The resulting training package builds the nutrition capacity of CSO staff and volunteers working with OVCs. It includes four modules that use highly engaging and participatory activities for all three age groups and colorful graphic training aids to highlight nutrition concepts. In September 2016, SPRING conducted a training of trainers (implementing partners and donors) to build a pool of 26 master trainers. Each of the five OVC partners is now able to cascade the trainings across CSOs and communities in which they work; one partner has already adopted this package for use in northern Nigeria.

Conclusions: This package incorporates developmentally appropriate lessons about food and nutrition using language, concepts, and instruction techniques tailored to each age group. In addition to OVC partners in Nigeria who are cascading this curriculum for their communities, Ministry of Education representatives were specifically included in the TOT to facilitate the incorporation of activities from this package into their existing curricula.

USA.; (4)Lead Investigator. Institute of Investigation in Nutrition. Lima. Peru; (5)Nutrition Consultant. Tegucigalpa. Honduras.

Background and objectives: Given its benefits, exclusive breastfeeding (EBF) remains low in many countries. Studies in three in countries in Africa, Asia, and the Middle East were conducted to determine coverage of EBF in the first 6 months and the reasons for non-EBF.

Methods: In-depth interviews (IDIs) about breastfeeding were conducted with mothers of children<2 years in Lao People's Democratic Republic (PDR) in 2001 (67 mothers), Malawi in 2009 (100 mothers), and in Yemen in 2013-14 (32 mothers). Breastfeeding practices also were observed in homes. IDIs with key informants (KIs) (fathers, grandmothers, health workers) also identified barriers to EBF.

Results: In Yemen, only one child<2 years had been exclusively breastfed. In Malawi, nearly half of babies<6 months were exclusively breastfed while in Lao PDR, one-third of babies had been exclusively breastfed until 4-6 months. EBF varied by region and ethnic group only in Lao PDR.

The major reasons for non-EBF, reported by mothers and KIs, was that breastmilk was insufficient or mothers had to return to work. While there was knowledge about the benefits of EBF in all countries, there was less knowledge about (and fewer observations of) optimal breastfeeding practices. The perception about breastmilk insufficiency, triggered by babies crying after breastfeeding or too much, led to the introduction of breastmilk substitutes and/or food. Inadequate practices co-existed with perceptions of insufficiency and included late initiation of breastfeeding; giving pre-lacteal feeds; withholding colostrum; incorrect positioning; breastfeeding for short durations or infrequently; breastfeeding from only one breast per feed; mothers returning to work; and lack of knowledge about how to increase breastmilk production. A few mothers and key informants said the cause of insufficiency was that mothers' diets were inadequate.

Conclusions: To successfully breastfeed in the first six months, nutrition programs need to get back to basics and give mothers adequate information about and support and time to breastfeed. Detailed information is needed by mothers and their families about all the practices required to ensure optimal breastfeeding. Agricultural and income-generating programs need to be nutrition-sensitive by giving mothers the time and support to breastfeed.

Keywords: breastfeeding, breastmilk, practices, barriers, education

IDENTIFICATION OF FACTORS ASSOCIATED WITH NUTRITIONAL RISK AND MALNUTRITION FOR USE IN COMPREHENSIVE GERIATRIC ASSESSMENT – CGA BY CORRESPONDENCE ANALYSIS

[1]Marques de Sousa, Mariana Izabel; [2]de Aquino, Rita de Cássia; [2]Nogueira Previdelli, Agatha; [3]Império de Freitas, Tatiana; [4]de Jesus dos Santos, Amanda.

[1]MSc. Nutritionist. Faculdade de Ciências Biológicas e da Saúde. Universidade São Judas Tadeu. São Paulo. Brazil.; [2]PhD. Professor. Faculdade de Ciências Biológicas e da Saúde. Universidade São Judas Tadeu. São Paulo. Brazil.; [3]MSc. Professor. Universidade Cruzeiro do Sul. São Paulo. Brazil.; [4]MSc Student. Nutritionist. Faculdade de Ciências Biológicas e da Saúde. Universidade São Judas Tadeu. São Paulo. Brazil.

Background and objectives: Background: Comprehensive Geriatric Assessment (CGA) is a tool used to early identify health problems (medical, psychosocial, and functional limitations) of a frail older person. Nutritional screening is an important component of the CGA that can provides an indication of a patient's nutritional risk. Objective: The study aimed to identify the factors associated with nutritional risk and malnutrition, using the Comprehensive Geriatric Assessment.

Methods: This is a cross-sectional study with systematic random sample. A total of 233 older adults patients (aged 60 years or older) attending the Rehabilitation Screening of the Center for the Elderly Reference in the north area of São Paulo (CRI-Norte) (Centro de Referência do Idoso da Zona Norte). Initially, Chi-square and Fisher's exact tests were performed to identify variables associated with nutritional risk and malnutrition, treated as a single variable. For these analysis, it was adopted a level of significance of 5%. Multiple Correspondence Analysis (MCA) were used to identify the association between nutritional risk and malnutrition and the co-variables of the study: weight loss, altered appetite, decrease intake, physical difficulty to buy food, self-health assessment and nutritional self-assessment. MCA is a technique used to analyze the pattern of relationships of several categorical dependent variables, aiming to reduce large sets of variables into smaller sets of components that summarize the information contained in the data.

Results: Based on the Multiple Correspondence Analysis, nutritional risk and malnutrition were correlated with unintentional weight loss, decrease appetite, decrease food intake, receiving physical help for to buy food, poor and regular self-health assessment, and nutritional self-assessment low-weight.

Conclusion: Through the joint relationship between nutritional risk and malnutrition and the identified variables, it is suggested the development and validation of a nutritional screening tool for the early identification of risks. This instrument will be important for the optimization of the time and appropriate referral of the elderly to the nutritional attention essential for the recovery and maintenance of the health and quality of life of this population.

Keywords: nutritional risks, aging, malnutrition, nutrition-assessment.

Johns Hopkins Bloomberg School of Public Health. USA.; [4]Ministry of Health. Government of Bhutan. Bhutan.; [5]MBBS. MPH. Chief Health Nutrition and WASH section. UNICEF Bhutan. Bhutan.; [6]Director. Research, Learning, and Evaluation. Helen Keller International. Bangladesh.; [7]Vice President. Asia-Pacific. Helen Keller International. Cambodia.; [8]DrPH. Professor. International Health. Johns Hopkins Bloomberg School of Public Health. USA.

Background and objectives: In Bhutan, anemia has declined but remains a public health concern. Globally, causes include iron or other micronutrient deficiencies, helminths or genetic disorders. We estimated prevalence and identify risk factors of anemia in children, adolescent girls and women in Bhutan.

Methods: In a 2015 national survey, hemoglobin was measured in 1,083 children 6-59 months, 1,103 adolescent girls 10-19 years, 118 gravida and 3,234 non-pregnant women 15-49 years. We calculated anemia prevalence adjusted for altitude and survey design using life-stage-specific cutoffs. Predictors of hemoglobin and anemia were evaluated in unadjusted and survey-adjusted multivariable regression models.

Results: Anemia affected 42%, 32%, 36% and 28% in children, adolescents, non-pregnant and pregnant women, respectively. Children 24-59 mo were at lower risk [OR (95% CI): 0.4 (0.3-0.7)] than 6-11 mo olds, as were girls [0.7 (0.5-0.9)] versus boys. Stunted and overweight children were at higher risk [1.5 (1.1-2.1) and 3.7 (1.4-9.5), respectively] than normal height/weight children. Child feeding practices were not associated with anemia. Adolescent and adult women's risk was lower in the East [0.7 (0.5-1.0) and 0.7 (0.5-0.8)] than West region. Older adolescents (15-19 yrs) were at higher risk than 10-14 yr olds [1.5 (1.1-2.2)]. A protective odds was observed for adolescents in households consuming animal foods 1-6 versus zero, but also, paradoxically, ≥7 times per week. Among non-pregnant women, risk was higher at 30-39 and 40-49 years [1.2 (1.0-1.6) and 1.4 (1.0-1.8), respectively], versus 20-29 yrs. Primary versus no schooling was protective [0.7 (0.6-0.9)], as was being married [0.4 (0.3-0.6)] versus unmarried and having a child <5 yr [0.8 (0.6-1.0)] versus not. Beginning antenatal care (ANC) in the first trimester may have put pregnant women at lower risk [0.4 (0.1-1.1)]. In survey design-adjusted regressions, point estimates were unchanged but most CIs contained 1.

Conclusions: Age, region, socioeconomic status and possibly diet pose diverse risk associations with anemia in Bhutanese children and women. National ANC coverage including IFA supplementation may have reduced anemia among pregnant wom-

en; scaling supplementation for other demographic groups may reduce anemia further, though other potential causes (e.g., thalassemias) should also be investigated.

Maternal and Child Health and Nutrition. PATH. USA.; [9]PhD. Technical Officer. Maternal and Child Health and Nutrition Global program. PATH. USA.

Background and objectives: Kenya has a high burden of neonatal deaths (22/1,000 live births). Breastfeeding is among the most effective interventions for reducing infant mortality but some babies lack access to breastmilk due to mother's sickness, unavailability, or death. World Health Organization recommends Donor Human Milk (DHM) as the best alternative, for vulnerable infants without access to mother's own milk (MOM). However, Kenya has not implemented the best practice of providing safe DHM from Human Milk Banks (HMB), for children without access to MOM. This study aims to establish the perceptions and acceptability of donating and using DHM and the perceived barriers and facilitators in establishing HMBs.

Methods: The study was conducted in Nairobi.Quantitative interviews were conducted in three health facilities with 980 mothers of children under 3 years. Qualitative interviews included 17 focus group discussions, 29 key informant interviews and 25 in-depth interviews, with mothers, fathers, and other community members, health professionals and policy makers. Descriptive analysis of quantitative data was done in STATA 13 software while qualitative interviews were transcribed verbatim, coded using NVIVO and analyzed thematically.

Results: HMBs and use of DHM were new concepts to over 70% of the mothers. Majority of the participants had a positive attitude towards donating breastmilk to a HMB (80%) and feeding children on DHM (87%). At a personal level, participants were more willing to donate their milk to HMBs (78%) than using DHM on their own children (56%). The main concerns on donating and use of DHM were personal dislike, fear of diseases including HIV, hygiene concerns and cultural beliefs.Testing DHM for contamination, Ster-

ilizing DHM and the processing equipment, enhancing personal hygiene were recommended to ensure DHM safety. Community education and involvement in the establishment of HMBs, multidisciplinary approach and assurance on the safety and quality of the DHM were proposed as important ways of enhancing the acceptability and successful establishment of the HMBs.

Conclusions: The Findings show potential feasibility of establishing HMBs in Kenya, and are useful in HMB's guidelines development and informing future actions towards establishment of HMB in Kenya, as a strategy to promote optimal child health and nutrition.

NUTRITIONAL STATUS, EATING HABITS AND INDICATORS OF SALUGENIC ENVIRONMENT IN RURAL ADOLESCENTS OF TUCUMÁN

[1]Sal, Francisco; [2]Salazar Burgos, Ramiro; [3]Lacunza, Betina; [4]Fernandez, Noelia; [5]Caballero, Valeria; [6]Filgueira, Josefina; [7]Diaz, Yanina; [7]Ale, Marcelo.

[1]Nutricionist. Saint Tomas of Aquino University of North. Argentina; [2]Nutritionist. Conicet. National University of Tucumán. Argentina.; [3]PhD. Psychology. Conicet. National University of Tucumán. Argentina; [4]Nutritionist. Saint Thomas of Aquino University of North. Argentina; [5]Psychology. National University of Tucumán. Argentina; [6]Nutritionist. Si.Pro.Sa. (Sistema Provincial de Salud). Argentina.; [7]Psychology. Saint Thomas of Aquino University of North. Argentina.

Background and objectives: Literature indicates that socioeconomic disparities affect health, due to a reduced presence of physical, ecological and psychosocial protective resources.

The objective was to evaluate the relationship between nutritional status, eating habits and salugenic environment indicators in rural Tucuman adolescents.

Methods: Anthropometric Measurements (Weight, Height, BMI) according to WHO criteria.

Structured questionnaire of Food Habits with descriptive rating scale of 5 categories (designed for this study).

Structured questionnaire of salugenic environment indicators (presence of tap water, waste collection and presence of sewers). The environment was considered salugenic when the respondent had at least one of these indicators.

Sample: 167 adolescents students of low and medium socioeconomic level between 11 and 18 years (57% were women), from rural schools of the province of Tucumán. It was stratified into 2 subgroups: Clinical group (over weight) and Control group (regular weight). There is no incidental type probabilistic.

Results: The clinical group presented a greater absence of salugenic environmental indicators than the control group (24% vs. 21%).

Comparing the clinical and control groups with eating habits, the control group represented a higher consumption in the categories of "always and always" protective foods (fruits, vegetables, dairy products and eggs) and hypercaloric (sweets, ice cream, chocolates). The clinical group had a lower consumption of protective foods.

Relating eating habits and indicators of the salugenic environment, it was found that in the categories "never and almost never" the consumption of healthy foods (beef, fish, eggs, fruits, vegetables and dairy products) the percentages were higher in people who did not present Indicators of salugenic environment than in their peers who responded to have at least one indicator (Fish 39% vs. 29%, vegetables 31% vs. 11% and milk 54% vs. 28%).

Regarding the consumption of hypercaloric foods (sweets, ice cream, chocolates and soft drinks), a greater proportion of "always / almost always" responses were observed among adolescents with not salugenic environment indicators in this food group (81% Vs. 45%, 50% vs. 28%, 61% vs. 35%).

Conclusions: Rural adolescents belonging to less salugenic environments reported higher consumption of hypercaloric foods. These data are relevant for the design of interdisplinary intervention strategies focused on food and surrounding ecological contexts.

Keywords: Nutritional status, eating habits indicators of salugenic environment

Nutrition Unit. World Food Programme. Cambodia.; [6]MPH. Nutritionist. Programme Unit. World Food Programme. Uganda.; [7]MPH. Nutritionist. Analysis Trends and Innovation Unit. World Food Programme. Kenya.; [8]MPH. Nutritionist. World Food Programme. Guatemala.; [9]MPH. Office of Nutrition. World Good Programme. Italy.; [10]MPH. Office of Nutrition. World Good Programme. USA.

Background and objectives: Addressing the nutritional needs of adolescent girls is a key step towards achieving SDG 2, Target 2.2, ending malnutrition by 2030. This formative study provides a landscape analysis of adolescent programming in four high priority countries (Kenya, Uganda, Cambodia and Guatemala) and presents new empirical data on perceptions and experiences of adolescents regarding nutrition and engagement platforms particularly aimed at reaching the most vulnerable.

Methods: The collaborative study was conducted in three phases. First, a country landscape analysis of adolescent programming categorized the focus, timeframe and location of interventions, target group (age, ethnicity, gender), modes of engagement, and key programme implementer(s). Second, formative qualitative research using participatory creative methodologies elicited perspectives, experiences and suggestions from adolescents and their communities. Third, data was synthesized to provide evidence to improve the design of nutrition-specific and nutrition-sensitive interventions for adolescents across different contexts. Adolescents participated from a range of communities including food insecure pastoralists, rural agriculturalists, settled refugees, remote ethnic minorities, and urban and slum communities.

Results: Final results will be available by June. Initial stakeholder mapping indicated a wide range of government, non-governmental and private sector engagement with adolescents, with different policy and operational environments influencing the focus of interventions and modes of engagement. Preliminary analysis highlighted that the concept of 'adolescence' is varied, that nutrition is one of several key areas of intervention alongside education, sexual reproductive health, gender-based violence and employment opportunities. Thematic synthesis across the four countries will identify points of convergence and divergence in engaging with adolescents in different contexts and operational environments.

Conclusions: Increasing the visibility, priority and engagement of adolescents is critical. Evidence can be operationalized to develop adolescent friendly, context specific interventions and appropriate modes of engagement that can positively influence health- and nutrition-related behavior, and encourage the timely utilization of services by adolescents.

VALUATION OF NUTRITIONAL STATUS BY AN-THROPOMETRIC METHODS AND BIOELECTRIC IMPEDANCE IN SCHOOLSCHILDREN'S AND ADOLESCENTS OF PUBLIC AND PRIVATE SCHOOLS IN THE CENTRAL DEPARTMENT

(1)Torres Giménez, María Elida; (2)Sanabria, Marta; (3)Meza Miranda, Eliana.

(1)Nutritionist. Paraguay.; (2)MSc. Doctor. Cathedra and Pediatric service. Faculty of Medical Sciences. National University of Asuncion. Paraguay; (3)PhD. Nutritionist. Teaching researcher. Multidiciplinary Center for Technological Research. National University of Asuncion. Paraguay.

Background and objectives: The nutritional status allows to focus groups of risk that present deficiencies and excesses. Child malnutrition is a public health problem in Paraguay. There are few national publications on body composition therefore a descriptive observational research with analytical component was designed to determine the nutritional status and body composition in school-children and adolescents attending Public and Private Educational Institutions of the Central Department.

Methods: A Sampling probabilistic, stratified, random study was conducted on 494 school children and adolescents between 6 to 17 years old attended public and private educational institutions in the Central Department during 2016. Anthropometric indicators were evaluated according to the current WHO growth curves.

Results: 50% of the sample was male. It was found 22.3% of Overweight malnutrition and 13.2 % of overweight and obesity, 88% of normal height. There is a positive correlation between BMI and waist circumference (WC). As for the muscular area of the arm, 21% of the female population is with low protein reserve, 60% with normal protein reserve and 19% with high protein reserve. On the other hand, in the men, 32.4% had low protein reserves, 44.1% had normal protein reserves and 23.5% had high protein reserves. In reference to the women fat area, 90.6% showed a normal energy reserve, while 9% showed a high energy reserve. As for males, 74.5% showed a normal energy reserve and 25.1% high energy reserve.

Conclusions: Overweigh malnutrition is high among school-children in the Central Department. The percentage of fat mass measured by impedanciometry does not exceed the limit that is 25% for men and 30% for women. There is a positive correlation between BMI and WC.

Instituto de Inmunología Genética y Metabolismo (INIGEM) CONICET-UBA. Argentina.; (3)PhD. Medicine. Laboratorio de Enfermedades Metabólicas Óseas. Instituto de Inmunología Genética y Metabolismo (INIGEM) CONICET-UBA. Argentina.; (4)PhD. Nutritionist. Escuela de Nutrición. Universidad de Buenos Aires. Argentina.

Background and objectives: Both nutritional status and bone health influence elderly's health and quality of life. The aim of this study was to evaluate: the relationship between the nutritional status of vitamin D (VD) and biochemical markers of bone turnover; the relationship between the intake of Calcium (Ca), protein, VD and vitamin K (VK) and bone formation and resorption markers; the relationship between total osteocalcin (OC) and undercarboxylated osteocalcin (ucOC) to VK intake and bone remodeling parameters.

Methods: 102 healthy women were evaluated, with age: (X±SD) 71±5 years, BMI 28.7±3.8 kg/m2. A validated food frequency questionnaire was used to asses' dietary intake. Serum 25 hydroxyvitamin D (25OHD), crosslaps (sCTX), bone alkaline phosphatase (BAP), calcium (sCas), phosphorus (sP), OC y unOC were determined in blood samples and calcium/creatinine ratio (uCa/uCr) in 24-hour urine samples.

Data were analyzed applying descriptive statistics, Kolmogorov-Smirnov, Mann-Whitney and Pearson or Spearman correlation. Linear regression models were used to analyze the relationship between numerical variables.

Results: Calcium, VK and VD intakes were lower than the recommended doses 79%, 33.7% and 100% of population respectively. Median protein intake was 1.03 g/kg body weight/d, with 100% reporting intakes higher than the recommended. Vitamin D insufficiency affected 32.7% of women and deficiency 55.9%, higher levels of sCTX were observed in those women with lower 25OHD levels. There were significant ($p<0.02$) correlations between 25OHD and sCa, sP, uCa/uCr and Ca intake. OC correlated directly with the bone resorption marker: sCTX ($p<0.0001$), but not with the formation parameters. In contrast, the unOC showed an inverse cor-

relation with BAP, no correlation with sCTX and was related with VK intake (p<0.0001). OC levels were lower in the deficiency and insufficient VD groups and were related to sCTX levels (p<0.0001).

Conclusions: The intake pattern was high in protein, and deficient in calcium, VD and VK. Poor vitamin D status affected 93% of women, with an increase in bone remodeling observed in severe deficiency. The ucOC was related to VK intake, so it could be considered an adequate indicator of its nutritional status, while OC and its relation to sCTX would reflect the increase in bone remodeling.

Keywords: Elderly, bone health, intake, nutritional status

A BABY FRIENDLY COMMUNITY INITIATIVE IN KENYA: HARNESSING THE POTENTIAL OF THE COMMUNITY HEALTH STRATEGY IN ENHANCING MATERNAL AND CHILD NUTRITIONAL AND HEALTH STATUS IN RURAL KENYA

[1]Gatheru, Peter; [2]Kimani-Murage, Elizabeth; [3]Kimiywe, Judith; [4]Wekesah, Frederick; [5]Muhia, Nelson; [6]Wanjohi, Milka; [7]Samburu, Betty.

[1]BA. Research Officer. Health Challenges and Systems. African Population and Health Research Center. Kenya.; [2]PhD. Research Scientist. Health Program. African Population and Health Research Center. Kenya.; [3]PhD. Nutrition. Assistant Professor. Department of Food, Nutrition and Dietetics. Kenyatta University. Kenya.; [4]MSc. Epidemiologist. Health Challenges and Systems Program. African Population & Health Research Center. Kenya.; [5]BA. Economist. Health Challenges and Systems Program. African Population & Health Research Center. Kenya.; [6]BSc. Research Officer. Health Challenges and Systems Program. African Population and Health Research Center. Kenya.; [7]MSc. Program Manager. Maternal Infant and Young Child Nutrition. Nutrition and Dietetics Unit. Ministry of Health. Kenya.

Background and objectives: Background:The Baby Friendly Community Initiative (BFCI) is a multifaceted program for the promotion of optimal breastfeeding and maternal, infant and young child nutrition practices in the community. BFCI extends the care provided at the health facility through the Baby Friendly Hospital Initiative (BFHI) to the community, while providing the mothers and their babies a comprehensive support system to improve breastfeeding practices and other maternal, infant and young child nutrition practices at the community level thereby bridging the gap between health facilities and the community.

Objectives: We present the design and implementation of the BFCI in rural Kenya, while highlighting its contribution to the improvement of maternal and child nutritional and health status. BFCI leverages on the community health strategy, a program established by the government of Kenya in 2007, and one that uses the vast network of community health volunteers to promote health care at the community level.

Methods: The BFCI is implemented within the community health strategy. The community units, which includes the community health volunteers (CHVs) and the community health committees (CHC) are sensitized on appropriate and optimal maternal, infant and young child nutrition practices. The CHVs are empowered and facilitated by knowledge and materials to provide home based counselling to pregnant women and breastfeeding mothers on maternal, infant and young child nutrition practices.

Results: The BFCI program in the rural community in Koibatek sub County, Baringo County engages about 260 CHVs, in 13 community units. From August 2015 to December 2016, CHVs have been actively involved in home visits and counselling of pregnant and breastfeeding women and their families in the community. BFCI also includes introduction of sustainable income generating activities, formation of community mother support groups which includes men and other community members as they influence feeding practices at household level.

Conclusions: Ultimately, we hope that the BFCI will: (i) strengthen the capacity for CHVs and the community members regarding MIYCN at community level; (ii) improve nutrition, health and survival of children substantially; and (iii) inform the design and implementation of ongoing and future interventions while advancing knowledge among the research community locally and internationally.

Keywords: Baby Friendly Community Initiative, breastfeeding

RELATIONSHIP BETWEEN CHOLINE METABOLITES AND DEVELOPMENTAL OUTCOMES IN HEALTHY TODDLERS AT 24 MONTHS-OF-AGE

[1]Wiedeman, Alejandra Wiedeman; [2]Chau, Cecil; [3]Grunau, Ruth; [4]McCarthy, Deanna; [5]Yurko-Mauro, Karin; [3]Innis, Sheila; [3]Devlin, Angela M.

[1]PhD candidate. Department of Pediatrics. University of British Columbia and BC Children's Hospital Research Institute. Vancouver. Canada.; [2]MSc. Department of Pediatrics. University of British Columbia and BC Children's Hospital Research Institute. Vancouver. Canada.; [3]PhD. Department of Pediatrics. University of British Columbia and BC Children's Hospital Research Institute. Vancouver. Canada.; [4]RD. DSM Nutritional Products. Columbia. MD. USA.; [5]PhD. DSM Nutritional Products. Columbia. MD. USA.

Background and objectives: Choline is an essential nutrient that plays an important role in growth and development and is the precursor of acetylcholine, phosphatidylcholine, and the methyl donor betaine. There is limited data on choline status of infants and toddlers and the potential relationship to neurodevelopmental outcomes. The objective of this study was to assess choline status in healthy toddlers at 12 and 24 months-of-age and to determine relationships to neurodevelopment.

Methods: Participants were part of a prospective longitudinal double blind controlled study of arachidonic acid (ARA) and docosahexaenoic acid (DHA) supplementation of toddlers between 12 and 24 months-of-age (24 months). Plasma free cho-

line, betaine, and dimethylglycine concentrations were quantified by liquid chromatography tandem mass spectrometry at baseline (13.4±0.9 months-of-age; mean±SD) and 24 months; developmental outcomes were assessed by the Bayley Scales of Infant and Toddler Development 3rd Ed (Bayley-III) Cognitive and Language composites, and Beery-Buktenica Developmental Test of Visual–Motor Integration (5th Edition) (Beery) at 24 months. Relationships between choline metabolites and developmental outcomes at 24 months were determined by separate general linear models adjusted for sex, supplement group, maternal nonverbal intelligence (TONI-3), and baseline concentrations.

Results: At baseline (n=122) plasma free choline, betaine, and dimethylglycine concentrations [median (IQR)] were 9.8 (8.1-12.3), 36.2 (30.8-47.7), and 3.7 (2.9-2.8) μmol/L, respectively. Plasma free choline, betaine, and dimethylglycine concentrations at 24 months (n=103) were 8.1 (6.9-9.5), 37.5 (31.2-45.0), and 2.9 (2.3-3.6) μmol/L, respectively. The DHA/ARA supplement had no effect on plasma choline metabolites at 24 months but plasma free choline and dimethylglycine concentrations were lower (P<0.001) at 24 months compared to baseline. Plasma betaine concentrations were positively associated with Bayley III Language composite scores (B=59.4, P=0.002) at 24 months but no relationships were found with the Bayley III Cognitive or Beery scores. No associations between plasma free choline or dimethylglycine and neurodevelopment tests were observed.

Conclusions: This finding suggests a positive relationship between plasma betaine concentrations and language development in healthy toddlers at 24 months-of-age. Additional work is required to investigate this relationship further and to delineate choline metabolism in toddlers and its role in neurodevelopment.

FACTORS ASSOCIATED WITH PARENT'S UNDERESTIMATION OF CHILD'S WEIGHT STATUS: A STUDY IN BRAZIL

[1]Amaral Mais, Laís; [2]Warkentin, Sarah; [3]Dias de Oliveira Latorre, Maria do Rosário; [4]Carnell, Susan; [5]de Aguiar Carrazedo Taddei, José Augusto.

[1]MSc. Nutritionist. Discipline of Nutrology. Department of Pediatrics. Federal University of São Paulo. Brazil; [2]MSc. Nutritionist. Discipline of Nutrology. Department of Pediatrics. Federal University of São Paulo. Brazil.; [3]PhD. Statistician. School of Public Health. Department of Epidemiology. University of São Paulo. Brazil.; [4]PhD. Psychologist. Division of Child & Adolescent Psychiatry. Department of Psychiatry and Behavioral Sciences. Johns Hopkins University School of Medicine. United States of America.; [5]PhD. Epidemiologist. Discipline of Nutrology. Federal University of São Paulo (UNIFESP). Department of Pediatrics. Brazil.

Background and objectives: Childhood overweight is a recognized public health problem, including in Brazil. Early intervention is critical in the prevention and treatment of overweight and obesity, as dietary patterns and eating habits are often formed in childhood, and persist through adolescence into adulthood. Parents can be seen as 'agents of change' in the recognition and treatment of childhood obesity. However, they usually fail to recognize their child excessive weight. The aim of this study was to examine the prevalence of parental misperception of child weight status, and identify socioeconomic, anthropometric, behavioral and dietary factors associated to underestimation.

Methods: Cross-sectional study. Data was collected in 14 Brazilian private schools. Parents of two-to-eight-year-old children (n=976) completed a self-reported questionnaire about their perception of child weight status, and sociodemographic, anthropometric, behavioral and dietary information. To measure the agreement between parental perception about child weight status and actual child weight status, we estimated the Kappa coefficient, and to investigate associations between parental underestimation and independent variables, we calculated chi-square tests, followed by multiple logistic regression model, considering p≤0.05 for statistical significance.

Results: Overall, 48.05% of the parents incorrectly classified their child's weight; more particularly, 45.08% underestimated their child's weight status. Logistic regression demonstrated that children with higher body mass index (OR=2.03; p<0.001) and boys (OR=1.70; p<0.001) were more likely to have their weight status underestimated by parents. The poor agreement of parent's perception and child's weight status was also confirmed by the Kappa coefficient (0.038).

Conclusions: Clinical practitioners should focus their interventions on these children to assist parents to correctly evaluate their child weight status. The awareness of parents about a weight problem in children is essential towards the prevention and treatment of childhood obesity, and healthy lifestyles.

STRENGTHENING OF THE ESSENTIAL NUTRITION ACTIONS (ENA), AT THE PRIMARY LEVEL HEALTH SERVICES ON 30 MUNICIPALITIES OF THE WESTERN HIGHLANDS FROM GUATEMALA

[1]Alfaro, Norma; [2]Corado, Ana; [2]Arroyo, Gustavo; [3]Perez, Wilton.

[1]MSc. Department of Development of Human Resources. Institute of Nutrition of Central America and Panama. Guatemala.; [2]Nutritionist. Department of Development of Human Resources. Institute of Nutrition of Central America and Panama. Guatemala.; [3]PhD. Department of Monitoring and Evaluation. Institute of Nutrition of Central America and Panama. Guatemala.

Background and objectives: Guatemala is ranked as the sixth country worldwide and the first in Latin America with the highest prevalence of stunting in children less than five years old. Data shows a national prevalence of 46.5% in 2014-2015, mostly focused on the population located at the western highlands of the country. In order to contribute to the Government´s efforts to battle this

problem a project based on interventions to address mother-child health and nutrition during the first 1,000-day window of opportunity, which efficacy has been widely recognized, and also based on the Normative Framework of the Ministry of Health (MOH) for the primary level of attention was promoted. This study aims to strengthen the capabilities of the primary level health workers at 30 municipalities of the western highlands from Guatemala, to provide nutrition actions to reduce stunting in Guatemala.

Methods: A project based on the analysis of needs and conditions of the environment was generated, which started with the collaborative work among the international cooperation, INCAP and the MOH on its different levels of organization and implementation, afterwards the curricula of the program supported by the MOH and the methodology of implementation were designed, including the training addressed to trainers. The topics included were: nutrition of the pregnant woman, breastfeeding, complementary feeding and feeding of a sick child, water, hygiene and sanitation, growth monitoring and promotion and effective counseling. The topic of self-esteem was included in order to promote the appreciation of the human resource as an agent of change. A process of monitoring and evaluation was applied.

Results: The model was carried out in two cohorts, which trained 97 trainers, 1,163 health workers. An 18% of increase on knowledge acquired was reached. Educational printed and multimedia materials were created. The collaborative work at all levels, favored the positioning of the topic related to the first 1,000-day window of opportunity at the MOH and the transference of the program.

Conclusions: The feasibility, realignment and interinstitutional coordination were essential for the achievement of results and will be key for sustainability.

Keywords: Forming and training, stunting, 1,000-day window of opportunity, essential nutrition actions.

HEIGHT TRAJECTORIES AND WAIST CIRCUMFERENCE IN LATE CHILDHOOD OF MEXICAN CHILDREN

[(1)]Barrios, Pamela L.; [(2)]Rivera, Juan; [(3)]Garcia-Feregrino, Raquel; [(4)]Barraza-Villarreal, Albino; [(4)]Romieu, Isabelle; [(5)]Gonzalez-Casanova, Ines; [(5)]Stein, Aryeh.; [(5)]Ramakrishnan, Usha; [(6)]Hoffman, Daniel J.

[(1)]Msc. Department of Nutritional Sciences. New Jersey Institute for Food, Nutrition, and Health. Rutgers University. United States.; [(2)]PhD. Health and Nutrition Research Center. National Institute of Public Health. Mexico.; [(3)]MSc. Health and Nutrition Research Center. National Institute of Public Health. Mexico.; [(4)]Population Health Research Center. National Institute of Public Health. Mexico.; [(5)]PhD. Hubert Department of Global Health. Rollins School of Public Health. Emory University. United States.; [(6)]PhD. Department of Nutritional Sciences. New Jersey Institute for Food, Nutrition, and Health. Rutgers University. United States.

Background and objectives: The relationship between fast early growth and adiposity has been of particular interest in the literature. While accurately assessing adiposity can be expensive and invasive, waist circumference (WC) adjusted for total body weight is a cost-effective and useful maker of body fat distribution. The aim of this study was to determine the association between height trajectories during the preschool years and WC in late childhood.

Methods: Study participants were a sub-sample that participated in the 8-10 y follow-up of the POSGRAD study, a double-blind, randomized, placebo-controlled trial of prenatal DHA supplementation. Sex-specific height latent class trajectories were derived from 11 measures of height from birth to 5 years of age. MPlus version 7.3 was used in the derivation of trajectories using latent class growth analysis. At ages 8-10, WC (to the nearest 1 mm) was measured at the smallest horizontal circumference between the costal margin and the iliac crests. Multivariable linear regression models were used to determine the relationship between growth trajectory classes and WC in late childhood. Covariates included in the analysis were current body weight (kg), SES (low, medium and high), parity and maternal schooling. Regression analyses were conducted using STATA 14.

Results: We included 281 boys and 255 girls. Two height classes were determined for girls [low (58%), high (42%)] and three for boys [low (17%), medium (51%) and high (32%)]. In boys, relative to the intermediate growth class, the high trajectory class had lower waist circumference in late childhood β = -1.15 cm 95% CI (-2.27 – -0.03) after controlling for covariates, while no significant associations were found the low trajectory class. For girls, the high class had lower waist circumference relative to the low class, β= -1.06 cm, 95%CI (-1.93 - -0.20).

Conclusions: In this study, children who followed the higher growth trajectory through 5 years of age, had lower waist circumference in late childhood. This suggests that children with shorter stature during the first 5 years of life are at a higher risk of becoming overweight or obese.

Keywords: child nutrition, latent class growth analysis, height, waist circumference, BIA, Anthropometry

EFFECTS OF TWO FORMS OF DAILY PREVENTIVE ZINC AND THERAPEUTIC ZINC SUPPLEMENTATION FOR DIARRHEA ON GROWTH AND ACQUISITION OF DEVELOPMENTAL MILESTONES IN RURAL LAOTIAN CHILDREN: A RANDOMIZED TRIAL

[1]Barffour, Maxwell A; [2]Hinnouho, Guy-Marino; [3]Kounnavong, Sengchanh; [1]Wessells, K. Ryan; [3]Ratsavong, Kethmany; [3]Bounheuang, Bangone; [3]Chanhthavong, Bigphone; [4]Arnold, Charles D.; [5]Brown, Ken; [1]Hess, Sonja.

[1]PhD. Program in International and Community Nutrition. Department of Nutrition. University of California. Davis. CA. USA; [2]MD-PhD. Program in International and Community Nutrition. Department of Nutrition. University of California. Davis. CA. USA; [3]MD. National Institute of Public Health. Vientiane. Lao People's Democratic Republic (PDR); [4]M.S. Program in International and Community Nutrition. Department of Nutrition. University of California. Davis. CA. USA; [5]MD. Program in International and Community Nutrition. Department of Nutrition. University of California. Davis. CA. USA and Bill & Melinda Gates Foundation. Seattle. WA. USA.

Background and objectives: Evidence is needed on the optimal strategy for delivering zinc to improve growth and other zinc-related functional health outcomes in children. In this double-blind, placebo-controlled, randomized trial, we determined the impact of providing daily preventive zinc tablets (7 mg/d), daily multiple micronutrient powder sachets (containing 10 mg zinc, 6 mg iron and 13 other micronutrients), therapeutic zinc supplements for diarrhea treatment (20 mg/d for 10 days) or daily placebo powder, on growth and acquisition of motor and language developmental milestones in young children in rural Lao PDR.

Methods: 3433 children 6-23 months old at enrollment were randomized to one of four intervention groups and followed weekly for ~9 months. Weight and length were assessed at baseline and endline, 32-40 weeks later. Motor milestones (crawling, sitting without support, standing with assistance, standing alone, walking with assistance, walking alone, running, eating, drinking and waving) and language acquisition were assessed weekly by caregiver report and monthly by observation. We compared final height-for-age, weight-for-age, and weight-for-height z-scores, and stunting, underweight and wasting prevalence, and age of acquisition of developmental milestones among the 4 groups using linear or logistic regression (anthropometric outcomes) and cox proportional hazard models (milestone acquisition), controlling for age and baseline values. Intervention groups are still masked.

Results: Groups were comparable regarding age, anthropometric scores and attained milestones at baseline. Mean age at baseline was 14.2 ± 5.1 mo; and there was a high prevalence of stunting (37.9%), underweight (26.0%) and wasting (7.9%). We observed a marginally significant treatment effect on the prevalence of final stunting (34.8-41.2% across the groups), wasting (3.8-6.6%) and underweight (22.3-24.9%). There were no between-group differences in final anthropometric indices. We observed a significant treatment effect on reported or observed onset of crawling, sitting without support, standing with assistance, standing alone and walking with assistance but not on other milestones.

Conclusions: Endline stunting, wasting and underweight were marginally different and onset of crawling, sitting without support, standing with assistance, standing alone, and walking with assistance differed significantly by treatment group after ~9 months of supplementation. Specific pairwise differences will be identified when codes are revealed.

Keywords: Zinc supplementation strategy, growth, developmental milestones

Conflict of Interest Disclosur: KHB works for the Bill & Melinda Gates Foundation, which provided part of the financial support. The spouse of SYH works for the Bill & Melinda Gates Foundation. KRW and SYH received non-monetary support from Nutriset SAS. None of the other authors have a conflict of interest to declare.

TIMELY COUNSELLING AS A STRATEGY TO IMROVE AGE APPROPRIATE INFANT AND YOUNG CHILD FEEDING (IYCF) PRACTICES AMONG MOTHERS FROM URBAN SLUMS OF VADODARA

[1]Chandorkar, Suneeta; [2]Patil, Priyanka.

[1]PhD. Nutritionist. Department of Foods and Nutrition. The Maharaja Sayjirao University of Baroda. Vadodara; [2]MSc. Department of Foods and Nutrition. The Maharaja Sayajirao University of Baroda. Vadodara.

Background and objectives: Good nutrition during first 1000 days of life can give a good head start to a child to achieve his/her physical and cognitive potential. Therefore, the present study aimed at capacity building of health functionaries to improve Infant and Young Child Feeding (IYCF) practices among mothers of urban slums of Vadodara.

Methods: Counselling regarding age appropriate IYCF practices was provided to pregnant women in last trimester and lactating mothers (N=57) by Anganwadi Workers (AWWs; service provider under ICDS government nutrition health program), doctors and nurses for 3 months once every month. The pregnant women formed the intervention group 1, younger lactating women (4-6 months) formed the intervention group 2 and older lactating women (7-9 months) formed the intervention group 3. Perceptions and practices of mothers were assessed at baseline and post intervention.

Results: Sixty five percent of the mothers in intervention group 1 initiated breastfeeding within 1 hour after birth and 96% fed colostrum to the child. Intervention group 2- Exclusive breastfeeding practices were good and majority of the mothers knew about correct age of introduction of complementary foods but percep-

tions regarding quality, quantity and frequency of feeding complementary foods were poor. Post intervention 85% of the mothers fed solid, semi solid or mushy foods along with breast milk. Intervention group 3- The rates of feeding appropriate quality, quantity and frequency of complementary foods were average at baseline in children 7-9 months. Forty three percent of the mothers fed 3 or more food groups at baseline while the same increased to 86% at the end of intervention. Forty three percent of the mothers started feeding adequate quantity of food after intervention. Knowledge and attendance of mothers at mamta day and annaprashan day (nutrition days celebrated under ICDS) were poor at baseline and marginal improvement was observed after intervention.

Conclusions: Counselling by AWWs and doctors was found to bring about improvement in age appropriate IYCF practices in intervention group 2 and 3. Timely counselling on age appropriate feeding practices can bring about significant improvement in adoption of age appropriate IYCF practices.

Keywords: 1000 days, age appropriate IYCF practices, complementary feeding

EFFECT OF MULTIPLE MICRONUTRIENT SUPPLEMENTATION IN LACTATING WOMEN ON INFANT GROWTH AND MORBIDITY: A DOUBLE-BLIND RANDOMIZED CONTROLLED TRIAL IN RURAL BURKINA FASO

[1]Bouckaert, Kimberley; [2]Lanou, Hermann Bienou; [3]Roberfroid, Dominique; [1]Kolsteren, Patrick; [4]Kouanda, Seni; [5]Huybregts, Lieven.

[1]PhD. Department of Food Safety and Food Quality. Ghent University. Belgium.; [2]MD. Département Biomédical et Santé Publique. Institut de Recherche en Sciences de la Santé. Burkina Faso.; [3]PhD. Belgian Health Care Knowledge Centre. Belgium.; [4]PhD. Département Biomédical et Santé Publique. Institut de Recherche en Sciences de la Santé. Burkina Faso.; [5]PhD. Poverty, Health and Nutrition Division. International Food Policy Research Institute. USA.

Background and objectives: Micronutrient deficiencies contribute to the vicious cycle of growth restriction in low and middle-income countries. Lactating women and their infants are at risk of inadequate intakes and deficiencies in multiple micronutrients due to the imbalance between their high requirements and a typical low intake of micronutrient-dense foods. Infants born small-for-gestational age (SGA) or preterm may be particularly vulnerable. However, there currently is no evidence on the effect of multiple micronutrient supplementation in lactating women on infant growth and morbidity. The objective of this study is to test the efficacy of supplementation with the UNICEF/WHO/UNU International Multiple Micronutrient Preparation (UNIMMAP) compared to iron and folic acid (IFA) on growth and morbidity of infants, and particularly those born SGA or preterm.

Methods: In a randomized controlled trial in rural Burkina Faso, 1426 pregnancies were allocated to daily supplementation with either UNIMMAP (intervention) or IFA (control) for three months after delivery. In total, 1296 mothers with live births were enrolled in the study. Daily tablet intake was directly observed by trained community workers. Anthropometry, morbidity and hemoglobin concentration of infants were measured monthly until the first birthday.

Results: Infant linear growth and relative weight gain remained suboptimal despite supplementation of lactating mothers. The linear growth rate of infants in the UNIMMAP group increased compared to IFA (Beta coef = 0.0117 length-for-age Z-score/month; 95% CI: -0.0022 - 0.0256; P interaction = 0.099). Infants who were born SGA had significantly higher linear growth rates (Beta coef = 0.0217 length-for-age Z-score/month; 95% CI: -0.0012 - 0.0447; P interaction = 0.063), but did not show significant reductions in stunting. Preterm infants had increased hemoglobin concentration rates (Beta coef = 0.1569 g/dL/month; 95% CI: - 0.0208 - 0.3346; P interaction = 0.084). Infants in the UNIMMAP group had a reduced relative weight gain rate (Beta coef = -0.0179 weigth-for-length Z-score/month; 95% CI: -0.0355 - 0.0002; P interaction = 0.047).

Conclusions: Supplementing UNIMMAP instead of IFA during the first three months of lactation promotes overall infant linear growth, and shows a larger effect in those born SGA. However, UNIMMAP reduced ponderal growth compared to IFA.

EARLY LIFE HEIGHT TRAJECTORIES AND LATE CHILDHOOD ADIPOSITY IN MEXICAN CHILDREN

[1]Barrios, Pamela L.; [2]Rivera, Juan; [3]Garcia-Feregrino, Raquel; [4]Barraza-Villarreal, Albino; [5]Romieu, Isabelle; [6]Gonzalez-Casanova, Ines; [6]Stein, Aryeh.; [6]Ramakrishnan, Usha; [7]Hoffman, Daniel J.

[1]MSc. Department of Nutritional Sciences. New Jersey Institute for Food, Nutrition, and Health. Rutgers University. United States.; [2]Health and Nutrition Research Center. National Institute of Public Health. Mexico.; [3]MSc. Health and Nutrition Research Center. National Institute of Public Health. Mexico.; [4]PhD. Population Health Research Center. National Institute of Public Health. Mexico.; [5]Population Health Research Center. National Institute of Public Health. Mexico.; [6]PhD. Hubert Department of Global Health. Rollins School of Public Health. Emory University. United States.; [7]PhD. Department of Nutritional Sciences. New Jersey Institute for Food, Nutrition, and Health. Rutgers University. United States.

Background and objectives: In Mexico, childhood obesity is a major public health concern, with a current prevalence of 34.4 % in school-aged children classified as overweight or obese. Previous research suggests that poor growth during early childhood may increase the risk of obesity, but others have reported that the rate of growth is more important than size at birth or early nutritional status. Therefore, the objective of this study was to determine if distinct trajectories of growth are associated with body fat mass (FM) in late childhood.

Methods: Study participants were a sub-sample that participated in the 8-10 y follow up of the POSGRAD study, a double-blind, randomized, placebo-controlled trial of prenatal DHA supplementation. Sex-specific height latent class trajectories were derived from 11 measures of height from birth to 5 years of age using MPlus v.7.3. Body composition and anthropometric measures were obtained between ages 8-10 years. Body composition was estimated using validated equations for Mexican children based on the measures from a tetrapolar bioimpedance analyzer (Impedimed DF50). Multivariate linear regression was used to determine the relationship between growth trajectory classes and FM (kg) in late childhood, controlling for current body weight (kg), SES (low, med and high), parity and maternal education. All statistical analyses were conducted with STATA 14.

Results: 255 girls and 281 boys and were included. Two height latent classes were identified in girls [low (58%) and high (42%)] and three classes in boys [low (17%), medium (51%) and high (32%)]. Mean FM in girls (high and low) and boys (high, medium, low) per class were 12.66 kg and 8.99 kg and 10.76 kg, 8.97 kg and 8.39 kg, respectively. In girls, there were no significant associations between classes and FM. In boys, relative to the intermediate growth class, the low class had higher FM $\beta = 0.69$ kg, 95% CI (0.26 - 1.11) and the high class had lower FM in late childhood $\beta = -0.40$ kg, (-0.76 - -0.05).

Conclusions: Among boys, more rapid growth in early childhood is associated with lower adiposity in late childhood compared to children who grew slower.

Keywords: child nutrition, latent class growth analysis, height, fat mass, BIA

Background and objectives: Maternal diet and nutritional status are powerful determinants of development in utero and the first years of life. Women from disadvantaged groups tend to have the poorest quality diets which are translated into their offspring.

We aimed to investigate the long-term influence of maternal obesity and gestational diabetes (GD) during pregnancy on their children diet up to 6 years of life.

Methods: 119 children participating in the PREOBE study, born to overweight (n=16), obese (n=15), GD (n=35), and healthy normal weight pregnant women (n=53) were included in the present analysis. Children dietary intake was recorded using three days 24h dietary record (2 working days and 1 weekend day). Quantification of nutrient intake by each child was performed by using the DIAL nutritional software. MANCOVA were performed using SPSS version 23.0, and the results were adjusted for confounding factors (maternal age, weight gain during pregnancy, maternal education and family status). Bonferroni corrected post hoc comparisons were used to identify significant group differences.

Results: Children born to GD mothers showed higher levels of fatty acids and trans- fatty acids intake than those born to normal weight (p=0,013 and p=0,006;respectively) and overweight mothers (p=0,026 and p=0,008;respectively). Children born to GD mothers showed higher levels of monounsaturated fatty acids (MUFA)-cis than those born to normal weight (p=0,034) and MUFA-trans respect to those born to normal weight and overweight mothers (p=0,031 and p=0,013;respectively). The intake of polyunsaturated fatty acids-trans were higher inchildren born to GD mothers than in those born to normal weight or overweight mothers (p=0,005 and p=0,002;respectively).

Conclusions: At 6 years of age, children born to mothers who developed GD show an inadequate dietary intake of trans fatty acids from manufactured foods. Diabetic pregnant women are included by routine in medical and nutritional programs to prevent undesirable problems during pregnancy and on their offspring, and furthermore after this intervention, an improvement of their eating habits isusually expected. However, the present results reflect the turn back to poor eating habits in the diabetic mothers which are translated into their offspring up to school age. The consequences of this fact are unknown. Behavioural programs are needed to maintain healthy eating habits in the mothers and children.

MAIN SOURCES OF INFORMATION ON INFANT FEEDING, AND THEIR APPRAISAL, AMONG SOMALI AND IRAQI MOTHERS RESIDING IN NORWAY – A MIXED-METHODS STUDY

(1)Grewal, Navnit Kaur; (1)Terragni, Laura; (2)Torheim, Liv Elin.

(1)PhD. Department of Health, Nutrition and Management. Faculty of Health Sciences. Oslo and Akershus University College of Applied Sciences. Norway.; (2)PhD. Professor. Department of Health, Nutrition and Management. Faculty of Health Sciences. Oslo and Akershus University College of Applied Sciences. Norway.

Background and objectives: Child health centers have a unique opportunity to support infant nutrition. However, studies suggest there can be communication barriers between health centers and immigrant mothers. The objective of the present study was to describe the main sources of information regarding infant nutrition, and how they have been evaluated, among Somali and Iraqi mothers residing in Norway.

Methods: Two rounds of surveys and qualitative interviews were carried out in the Oslo region in 2013-2014 among Somali and Iraqi mothers with infants aged 6 and 12 months. At infant's age 6 month, 187 mothers participated in the questionnaire-based survey and 29 in qualitative, in-depth interviews. At age 12 months, 166 mothers participated in the survey and 30 in qualitative interviews.

Results: Both in the 6- and 12-month surveys, the main source of information on infant nutrition was the child health center, received by more than 90% of the mothers. At infant's age 6 months, more Somali (97%) than Iraqi mothers (86%) evaluated the information received at the health center as useful. Information received from family members was the second most important source of information, at both 6 and 12 months. At 12 months, slightly more mothers (83%) rated the information from the family as useful, as compared with information received from the health station (80%). Qualitative interviews revealed that the mothers trusted the public health nurses. Some found it challenging to balance the information from the different sources. The mothers missed information that was adapted to their language and culture. Around 60% of the mothers wanted more information on infant and child nutrition.

Conclusions: The child health center is the main source for information on infant nutrition among Somali and Iraqi mothers in Norway. The information should be culturally adapted and more informative about feeding of toddlers.

Keywords: Infant feeding, nutrition information, immigrants, Norway

MATERNAL DIET WITH ELEVATED FOLIC ACID AND LOW VITAMIN B12 CONCENTRATIONS INCREASES THE METABOLIC RISK IN MICE (C57BL/6)

Castaño, Erika; Ronco, Ana María.

Professor. Institute of Nutrition and Food Technology Doctor Fernando Monckeberg Barros. INTA. University of Chile. Chile.

Background and objectives: Folates and vitamin B12 (B12) are essential during pregnancy to ensure adequate fetal and placental development. Several countries have implemented public policies of food fortification and supplementation with folic acid (FA), but not with B12. Potential side effects for the mother and offspring of high FA/ low B12 consumption during pregnancy are unknown. The aim of this work was to determinate whether maternal diets containing high levels of FA and low B12 increase oxidative stress markers in maternal livers and placentas.

Methods: Female mice (C57BL / 6, age 8 weeks) were fed with diets containing high FA (8mg/Kg) and low B12 (0.5mg/Kg) diet (T) and with normal diet (C) 60 days before, during (20 days) and 21 days after pregnancy. A group (n=13) was scheduled for caesarean and another group (n=8) grew up until 60 days of age with same prenatal diet. Oxidative stress was assessed measuring TBARS in maternal livers and in placentas. Offspring weight was registered after weaning (21 days of age) and fasting glycemia was determined at 60 days of age.

Results: TBARS (MDA equivalents µM/mg protein) in T were higher in both, livers (10.5±2.4 vs 6.38±1.3, p=0.0082) and placentas (20.2±5.2 vs 14.2±2.4; p=0.0275) compared to C. Offspring weight at weaning was higher in T compared to C, in both, males (13±3 vs 8±1, p=0.0188) and females (12±2 vs 9±2, p=0.0227). Fasting blood glucose levels (mg/dL) at 60 days of age were higher in T vs. C only in males (153 ± 23 vs 116 ±30).

Conclusions: Maternal diets containing high levels of FA and low B12 before, during and after gestation may increase the risk of metabolic alterations in mothers and their offspring, in the short and long term; as evidenced by an increase in oxidative stress in the liver and placenta, in weaning weight, and in fasting blood glucose levels at 60 days of age.

Keywords: Folic acid, vitamin b12, oxidative stress, placenta, fetal programming.

SNDT Women's University. India.; [3]PhD. Associate Professor. Department of Food Science and Nutrition. SNDT Women's University. India.; [4]BSc. Doctoral Candidate. Division of Nutritional Sciences. Cornell University. United States.; [5]BS. Research Assistant. Division of Nutritional Sciences. Cornell University. United States.; [6]ScD. Assistant Professor. Division of Nutritional Sciences. Cornell University. United States.; [7]PhD. Emeritus Professor. Division of Nutritional Sciences. Cornell University. United States.; [8]MBBS. ScD. Associate Professor. Division of Nutritional Sciences. Cornell University. United States.

Background and objectives: This cross-sectional study was conducted in preparation for a randomized controlled feeding trial assessing the efficacy of iron-biofortified pearl millet based complementary foods in improving child health outcomes. The main objective of the present study was to characterize dietary intake and their appropriateness based on the Indian recommended dietary allowances (RDAs) in urban slums of Mumbai, India.

Methods: Study participants were children aged eight to 22 months (n=106). Children's dietary data was collected using 24-hour dietary recall (administered to mothers). Nutrient intakes were calculated using CS Dietary System and compared with the Indian RDAs per day for children.

Results: Mean intake of complementary foods was 260 ± 231 g per day. Daily energy intake was less than the RDA for complementary foods in 53% (6 to 12 months, RDA=276 kcal/d) and 89% (12 to 24 months, RDA=714 kcal/d) of children. Protein intake from complementary foods accounted for 81% (6-12 months, RDA=14 g/d) and 88% (12-24 months, RDA=16 g/d) of the total RDA. Iron, zinc, vitamin B-12, and vitamin A intakes were inadequate in more than 90% of children. Dietary iron intake from complementary foods was 24% (6 to 12 months, RDA=5 g/d) and 17% (12 to 24 months, RDA=9g/d) of the Indian RDA. Zinc intake from complementary foods contributed to 10% of the RDA (12 to 24 months, RDA=5 g/d). Vitamin B-12 intake contributed to only 1 % of the total RDA (12 to 24 months, RDA=0.2-1 g/d). Vitamin A intake provided 4% and 5% of RDA in the children from both the age groups. Seventy-two percent (n=76) of children consumed animal source foods including whole milk, eggs, yogurt, and chicken.

Conclusions: Our results demonstrate the widespread prevalence of inadequate energy and nutrient intake from complementary foods among children in Mumbai. Implementation of effective and sustainable nutritional interventions is essential to ameliorate nutritional deficiencies in such vulnerable populations (ClinicalTrials.gov ID: NCT02233764).

Keywords: Energy intake, complementary foods, nutritional status, iron, zinc

United States; [7]Faculdade de Saúde Pública. Universidade de São Paulo. São Paulo. Brazil.

Background and objectives: Weight gain during pregnancy is a prognostic factor for maternal and child health and its inadequacy is associated with undesirable outcomes for both. The present study aims to evaluate the relation between gestational weight gain and anemia, vitamin A insufficiency, and blood pressure in the third trimester of pregnancy.

Methods: Prospective study in the urban area of Cruzeiro do Sul, Acre state, Western Brazilian Amazon. Women up to 20 weeks of pregnancy (by last menstrual period) attending primary health care units were enrolled in this study (n = 457). Weight gain between the second and third trimesters was classified as insufficient, adequate and excessive according to pre-pregnancy body mass index, using the guidelines of Institute of Medicine (2009). Outcomes of interest in the third gestational trimester were: anemia (Hb <110 g/dL), vitamin A insufficiency (retinol <1.05 μmol/L) and blood pressure levels (continuous variable, in mmHg). Multiple Poisson regression models with robust variance adjusted for age, schooling and use of micronutrient supplements were performed using Stata software 14.0, p <0.05.

Results: Prevalence ratios (PR, 95% CI) for anemia among pregnant women with insufficient (n=85) weight gain was 0.41 (0.18, 0.93) when compared to those with adequate weight gain (n=102). For vitamin A insufficiency, PR was higher among pregnant women with insufficient weight gain (2.85, 95% CI: 1.55, 5.24) and excessive (1.53; 95% CI: 0.84, 2.74) when compared to those with adequate weight gain. Pregnant women with excessive weight gain presented higher mean systolic blood pressure (111.1, 95% CI: 109.9, 112.2) than those with insufficient weight gain (107.5, 95% CI: 105.4, 109.6) and adequate weight gain (106.2; 95% CI: 104.3, 108.2).

Conclusions: This is the first study in the Western Brazilian Amazon to evaluate the association between inadequate gestational weight gain and nutritional status and blood pressure levels during pregnancy. Insufficient gestational weight gain was associated with poorer vitamin A nutritional status, while excessive weight gain was associated with higher blood pressure levels. Findings highlight the importance of promoting adequate gestational weight to improve maternal nutritional status and maintain blood pressure in appropriate levels.

WOMEN'S EMPOWERMENT: PATHWAYS TOWARDS MATERNAL AND CHILD NUTRITIONAL OUTCOMES

[1]*Jones, Rebecca;* [2]*Ramakrishnan, Usha;* [3]*Yount, Kathryn M.;* [4]*Miedema, Stephanie;* [5]*Haardoerfer, Regine;* [2]*Webb Girard, Aimee.*

[1]MSPH. Doctoral Student. Nutrition and Health Sciences. Emory University. USA.; [2]PhD. Nutritionist. Hubert Department of Global Health. Emory University. USA..; [3]PhD. Sociologist. Hubert Department of Global Health. USA; [4]MA. Doctoral Student. Department of Sociology. Emory University. USA.; [5]PhD. Statistician. Department of Behavioral Sciences and Health Education. Emory University. USA.

Background and objectives: Women's empowerment (WE) is a key determinant of nutritional status of women and children. In this paper we examine the role of several domains of WE and the pathways by which they influence child nutritional status (CNS).

Methods: We used nationally representative data from the Demographic and Health Survey (2011-2015) for married women with children under five in East Africa (Ethiopia, Kenya, Rwanda, Tanzania, and Uganda) (n=42,721). Our key outcome, CNS was operationalized through anemia, height-for-age-z score (HAZ), and body mass index (BMI). Based on our previous work, we used three domains of WE as our primary exposure variable: human/social assets, justification of wife-beating, and household decision-making. We used measured variable path analysis to estimate the strength of a priori hypothesized biological and behavioral pathways from WE to CNS. For the biological pathway, the mediating variable was women's nutritional status (WNS) including anemia, underweight, and BMI. The behavioral pathway included infant and young child feeding (IYCF) practices measured by breastfeeding and timely introduction of complementary foods. Analysis reported with standardized coefficients and was further adjusted for maternal and household characteristics. .

Results: In Ethiopia, the direct association of WE and CNS was significant for the household decision-making domain, with higher empowerment being positively associated with better CNS (beta=0.64; p<0.001). For the biological pathway, higher WE was positively related to WNS for each domain of empowerment (assets: beta=0.40; p<0.005; beatings: beta=0.12; p<0.001; decision-making: beta=0.38; p<0.001). Improved WNS was related to improved CNS (beta=0.54; p<0.001). Along the behavioral pathway, the assets domain was related to appropriate IYCF practices (beta=0.09; p<0.005). Improved IYCF was related to CNS (beta=0.10; p<0.005). Further examination of these relationships and pathways including analysis of data from the other four countries is ongoing.

Conclusions: These findings indicate that the direct and biological pathways are more strongly associated with CNS than the behavioral pathway in Ethiopia. Further analysis will help determine if these observations are generalizable across East Africa. Based on the relative contribution of the specific components of WE and pathways by which they influence CNS, appropriate interventions and programs that improve WE could be developed to improve CNS.

National Institute of Public Health. Mexico.; [5]MD. Population Health Research Center. National Institute of Public Health. Mexico.; [6]PhD. Hubert Department of Global Health, Rollins School of Public Health. Emory University. United States.; [7]PhD. Department of Nutritional Sciences, New Jersey Institute for Food, Nutrition, and Health, Rutgers University. United States.

Background and objectives: Growth during infancy is important for future health and overall well-being and rapid weight

gain during childhood has been associated with adverse health effects in adulthood. Latent class growth analysis (LCGA) identifies heterogeneity of growth patterns in cohort subgroups whereas other modeling techniques assume a single underlying trajectory per population. In LCGA, similar individuals are grouped together on the basis of their growth characteristics. The aim of this study was to derive height and weight growth trajectories from birth to 5 years of age in Mexican children.

Methods: Study participants were a sub-sample that participated in the 8-10 y follow-up of the POSGRAD study, a double-blind, randomized, placebo-controlled trial designed to assess the effect of prenatal supplementation with DHA on offspring growth and development (281 boys, 255 girls). Sex-specific height and weight latent class trajectories were derived from 11 measures of height and weight from birth to 5 years of age. Analyses were conducted by using MPlus version 7.3 (Muthen &Muthen). Tests of class membership association between the latent classes formed by sex were carried out using Pearson's Chi Squared in STATA 14 and p<0.05 was considered significant.

Results: Two weight and height latent classes were identified in girls [height: low (58%) and high (42%), weight: low (67%) and high (33%)] and three classes in boys [height: low (17%), medium (51%) and high (32%), weight: low (30%), medium (52%) and high (19%)]. The 2-class models for girls and the 3-class models for boys had the highest entropy (sign of successful convergence), they were all above 0.79. Classes also had the highest posterior probabilities of candidate models suggesting high class separation, all above ~0.92. For both sexes, height latent class membership was associated to weight latent class membership (p<0.000).

Conclusions: Based on these results, distinct height and weight trajectories separate within the first months of life, suggesting that early life factors may play a role in this separation. There is also a high correlation of latent class membership in height and weight trajectories.

Population, Poverty, and Policy University of Southampton. Southampton. UK; [10]Professor. International Health Institute. Brown University. Providence. Rhode Island. USA.

Background and objectives: Interventions promoting optimal infant and young child nutrition could prevent a fifth of under five deaths in countries with high mortality. Effective strategies to improve infant and young child feeding practices are needed. This study aims to pilot implementation of the baby friendly community initiative (BFCI), a global initiative recommended by the WHO that is aimed at promoting optimal infant and young child feeding practices, to determine its feasibility and effectiveness with regards to exclusive breastfeeding in a rural setting in Kenya.

Methods: The study, employing a cluster-randomized trial design, was conducted in rural Kenya between 2014 and 2016. A total of 13 clusters, constituting community units within the government's community health strategy were randomized with six allocated to the intervention and seven to the control arm. A total of ~800 pregnant women and their respective children were recruited into the study. The mother-child pairs were followed up until the child was at least six months. The intervention involved regular counseling and support of mothers by trained community health volunteers and health professionals on maternal, infant and young child nutrition. Regular quantitative assessment of knowledge, attitudes, and practices on maternal, infant and young child nutrition was done. A qualitative exploration of the effect of the intervention was also done. The analysis involves assessment of the effectiveness of the intervention on the primary outcome (exclusive breastfeeding for six months).

Results: Preliminary results indicate potential effectiveness of the intervention on exclusive breastfeeding. Narratives indicate that the counseling of women enhanced their skills and competencies in breastfeeding including with regards to breast positioning and attachment which led to better breastfeeding practices. The analysis is ongoing.

Conclusions: The study indicates potential effectiveness of the Baby Friendly Community Initiative in promoting exclusive breastfeeding in a rural setting. Findings from the study will inform feasibility and effectiveness of a community-based intervention aimed at promoting optimal breastfeeding and other infant feeding practices. The study will inform policy and practice in Kenya and similar settings.

ANTHROPOMETRIC, CLINICAL AND INFLAMMATORY PROFILE OF CHILDREN AND ADOLESCENTS WITH WEIGHT EXCESS BEFORE AND AFTER NUTRITIONAL INTERVENTION WITH OATMEAL

[1]Rodrigues, Lúcia; [2]Oliveira, Mitsu.

[1]PhD. University Teacher of Nutrition. Federal University of Rio de Janeiro State. Brazil; [2]Nutritionist. Federal University of Rio de Janeiro State. Brazil.

Background and objectives: Several studies have demonstrated the presence of healthy risk factors in children with weight excess. Interventions strategies may be used to treat this population and the nutritional guidelines are considerate essential part of this process, not only in the period of treatment, but at whole life, equipping this population to do healthier food choices. The aim of this study was to evaluate the anthropometric, inflammatory, insulin and clinical profile of children and adolescents with weight excess before and after nutritional intervention with oatmeal.

Methods: This research consisted in an open randomized clinical pragmatic trial with duration of six weeks, with children and adolescents, recruited by a clinic of nutrition in a University Hospital. After the selection, the patients were allocated in two groups: control (G0) with diet based on lipid stratification and intervention (G1) with diet and 51g of oatmeal. The anthropometric profile analyzed was: weight, height (H), BMI/Age, waist circumference (WC) and abdominal circumference (WA), waist/height (WC/H), C reactive protein (CRP), blood pressure (BP) and HOMA-IR. The database was constructed in SPSS 17.0, in which the descriptive and inferential statistics (paired t test and independent samples with normal distribution and Mann Whitney Test and Wilcoxon non-normal distribution by the Kolmogorov-Smirnov normality test) were analyzed. It was also performed the chi square test. The significance level was 0,05. The study was approved by the Ethics Committee.

Results: The sample consisted of 151 patients, 77 by G0 and 74 by G1. The groups were homogeneous at the beginning of the study. The age was 10.1±2.8 years. After nutritional intervention there was a significant reduction in weight, WC, WA, WC/H, CC/ AND HOMA-IR, SBP and DBP in both groups. In relation to CPR, there was a significant reduction of 0.56±0,69mg/dL to 0.37±0.66

in the G0.. The same did not occur with the G1 that initially showed a value of 0.26 ± 0.25/dL and after 6 weeks, 0.34±0,58mg/dL. However, this change was not significant.

Conclusions: Both the G0 and G1 showed a reduction of weight, circumferences, BP and HOMA-IR, however there was no significant difference by type of diet instituted (with or without oatmeal).

DETERMINANTS OF ENERGY AND NUTRIENT INTAKES AMONG PREGNANT WOMEN IN ACCRA, GHANA

[1]Koryo-Dabrah, Alice.; [2]Berko Nartey, Eunice.

[1]MPhil.Dietetics. Department of Nutrition and Dietetics. University of Health and Allied Sciences. Ho. Ghana; [2]MPhil Dietetics. Department of Nuttrition and Dietetics. University of Health and Allied Sciences. Ho. Ghana.

Background and objectives: During pregnancy nutrition plays a vital role in the well-being of both the mother and the developing fetus, and further influences health during childhood and adulthood. Nutrition is of major concern for maternal health and optimal fetal development since pregnancy is a time of increased nutritional requirement. The study is focused on identifying factors influencing energy and nutrient intakes in pregnancy.

Methods: A cross-sectional survey using systematic random sampling was employed in selecting 279 pregnant women from the Korle-Bu Teaching Hospital and Osu Maternity Home. Data obtained include dietary practices and demographic information. Dietary data was obtained using the 24-hour recall and analysed with the Esha Fpro software for nutrient analysis.

Results: The study showed that almost 73% of the women did not meet the RDA for energy, 40% were below the RDA for protein and almost (99.6%) all were short of the RDA for folate. Again 83.5%, 87.8%, 73.5% and 73.5% were below the RDA for vitamin B12, zinc, riboflavin and iron respectively. Also, income level of the pregnant woman, the educational level of the pregnant women as well as the frequency of meals consumed during pregnancy influenced protein and zinc intakes. Household size significantly influenced the intakes of energy and nutrients. However, dietary practices observed during pregnancy (pica practice, food craving and food avoidance) did not influence energy and nutrient intakes.

Conclusions: Maternal educational level, maternal income, household size and frequency of meal consumption were predictors of nutrient intake in pregnancy in this study. Dietary practices observed in pregnancy were not worrying since it did not influence nutrient intakes. Nevertheless interventions targeted at improving nutrient intake in pregnancy should be intensified.

THE ASSOCIATION BETWEEN ACTIVE TOBACCO USE DURING PREGNANCY AND GROWTH OUTCOMES OF CHILDREN UNDER FIVE YEARS: A SYSTEMATIC REVIEW AND META-ANALYSIS

(1)Quelhas, Diana; (2)Kompala, Chytanya; (3)Wittenbrink, Brittney; (4)Han, Zhen; (5)Downs, Shauna; (6)Shapiro, Myra; (7)Parker, Megan; (3)Kreis, Katharine; (8)Kraemer, Klaus; (9)Fanzo, Jessica.

(1)BSc. MPH. PhD. Nutrition Innovation. PATH. USA.; (2)BSc. MSPH. Nutrition Innovation. PATH. USA.; (3)BSc. MPH. Nutrition Innovation. PATH. USA.; (4)BSc. PhD. Nutrition Innovation. PATH. USA.; (5)BSc. MSc. PhD. Berman Institute of Bioethics. Johns Hopkins Bloomberg School of Public Health. USA.; (6)BA. MHS. PhD. Center for Human Nutrition. Department of International Health. Johns Hopkins Bloomberg School of Public Health. USA.; (7)BScH. MSc. PhD. Nutrition Innovation. PATH. USA.; (8)BSc. PhD. Johns Hopkins Bloomberg School of Public Health. USA. Sight and Life. Switzerland.; (9)BSc. PhD. Berman Institute of Bioethics. Johns Hopkins Bloomberg School of Public Health. USA.

Background and objectives: Current research on infant and young child growth faltering, manifesting in the form of stunting, primarily focuses on nutrition-specific risk factors. However, less is known about the nutrition-sensitive risk factors of growth faltering, including exposures to harmful substances, such as tobacco use during pregnancy. The objective of the study is to investigate the relationship between active tobacco use among pregnant women and growth outcomes of children under five years globally through a systematic review and meta-analysis.

Methods: CABI Global Health, CINAHL, Embase, Global Index Medicus, PubMed, and Web of Science databases were searched to identify studies from 1980 to present on the association between active tobacco use during pregnancy and child growth. Studies that collected data on active tobacco use as either a binary measure, quantity, or frequency at any time during pregnancy based on self-reporting or biomarker assessment were included in the review. At least one of the following child growth outcomes was considered: small for gestational age (SGA), length/height, and head circumference. A meta-analysis using a random effects model was conducted for the association between active tobacco use and SGA.

Results: Of the 13,189 citations identified by the search strategy, 406 studies were included in the full text review and 213 studies were eligible for inclusion in the analysis: 42 cross-sectional, 77 prospective cohort, 41 retrospective cohort, 29 case-control, and 24 unclear study design. In total, 25,168,224 mother-child pairs were included measuring for SGA (121 studies), length/height (84 studies), and head circumference (75 studies). These studies were conducted in 43 countries, including low-, middle-, and high-income countries. Most commonly, tobacco use was defined by cigarette smoking measured by self reporting and/or cotinine levels. Active tobacco use during pregnancy is associated with significantly higher rates of SGA (pooled adjusted OR=1.96; 95% CI 1.71 to 2.23).

Conclusions: Active tobacco use during pregnancy is associated with impaired child growth among certain outcomes. Nutrition-sensitive risk factors such as tobacco use during pregnancy should be considered when implementing interventions to reduce child stunting.

Keywords: tobacco, pregnancy, stunting, growth, nutrition-sensitive

THE NEED OF FOOD SUBSIDY PROGRAMS TO FULFILL NUTRIENT ADEQUACIES: THE CASE OF INDONESIA

(1)Usfar, Avita; (2)Catharina, Maria.

(1)Dr. Avita A. Usfar. Nutritionist. Sakanti Consulting. Jakarta. Indonesia.; (2)Maria Catharina, MSc. Nutritionist. Sakanti Consulting. Jakarta. Indonesia.

Background and objectives: The Indonesian family-based conditional cash transfer (CCT) program or locally known as PKH/Program Keluarga Harapan) started in 2007, which target the bottom poorest 10 percent households. The program demanded pregnant and lactating mothers, as well as children under the age of five years attend health check-ups and school age children go to school. In addition, these families are entitled to a cash or 15 kg rice subsidy monthly. However, the two programs have had less effect on the improvement of the quantity and quality of food consumed.

Methods: The authors exercised calculation on the potential macronutrient adequacy of the cash received from both programs, which is amounting to approximately USD 12.00 per month.

Results: Assuming all the money is used to purchase rice, the money is not enough to provide 100% adequacy of energy and protein for pregnant and lactating women. There is still a gap of 6% for energy and 26% for protein for a pregnant woman or equivalent to one small plate of rice and two eggs daily. The gap for a lactating mother and her child age 7 to 11 month is 23% for energy and 40% for protein or equivalent to 2.5 plate rice and three eggs daily. The money, however, should be enough to provide food for a child age 4 to 6 years. The amount of money or food equivalent given to a family with a pregnant woman should be USD 13.00 monthly and for a lactating mother and her child USD 19.00.

Conclusions: Improvement of the programs should be made to guarantee nutritional need for the important first 1000-days-period.

Keywords: conditional cash transfer, nutrient adequacy, food subsidy, Indonesia

INTAKE OF DAIRY PRODUCTS REPORTED BY ELDERLY PEOPLE AND SOCIODEMOGRAPHIC AND CULTURAL VARIABLES - SABE SURVEY: HEALTH, WELLBEING AND AGING

[1]Souza, Cláudia; [2]Marucci, Maria De Fátima; [3]Roediger, Manuela; [3]França, Ana Paula; [4]Duarte, Yeda.

[1]MSc. Department of Nutrition. School of Public Health. University of São Paulo. Brazil.; [2]PhD.Department of Nutrition. School of Public Health. University of São Paulo. Brazil.; [3]PhD. Department of Nutrition. School of Public Health. University of São Paulo. Brazil; [4]PhD. Department of Nursing Medical-Surgical. School of Nursing. University of São Paulo. Brazil.

Background and objectives: The feeding behavior may be related to sociodemographic and cultural variables. The elderly intake of dairy products has been considered unsatisfactory by some researchers and this behavior may be related to the living conditions influenced by sociodemographic and cultural variables. The aim of this study was verify the association among elderly intake of dairy products and sociodemographic and cultural variables.

Methods: Cross-sectional study with elderly people (≥60 years), of both sex, from the SABE Survey: Health, Wellbeing and Aging, performed in 2000, in São Paulo/SP city. The variables were self-reported: intake of dairy products (<1x/day); sociodemographic: schooling by years (zero, 1-4, >4), sex (male or female), age group (60-74 or ≥75 years), marital status (married, single, divorced or widower) and company at home (accompanied and living alone); cultural (life in rural area during childhood or adolescence-yes/no); nationality (brazilian or foreign); religion (catholic, evangelical, others). It was used univariate logistic regression, Rao & Scott test (CI=95%;p<0,05) and Stata Version10.1 program.

Results: This research studied 2142 elderly people; 82% reported intake of dairy products ≥1x/day (60% female sex). It was verified positive association between the intake of dairy products <1x/day and: schooling = zero (OR=2,85;CI=1,85-4,40;p=0,000), schooling = 1-4 (OR=1,76;CI=1,17-2,66;p=0,007), life in rural area (OR=1,76;CI=1,27-2,44;p=0,001), male sex (OR=1,50;CI=1,16-1,93;p=0,002) and negative association with: age group ≥75 years (OR=0,63;CI=0,50-0,79;p=0,000) and foreign nationality (OR=0,35;CI=0,19-0,66;p=0,002).

Conclusions: The intake of dairy products was associated with sociodemographic and cultural variables such as schooling, life in rural area, sex, age group and nationality in this brazilian elderly population.

Keywords: Dairy products, feeding behavior, aged, aging

EFFECT OF MATERNAL VITAMIN D SUPPLEMENTATION ON VITAMIN D METABOLITES AND MARKERS OF IMMUNE FUNCTION IN UMBILICAL CORD SERUM

[1]Best, Cora; [2]Mehta, Saur; [3]Pressman, Eva; [3]Queenan, Ruth Anne; [4]Cooper, Elizabeth; [5]O'Brien, Kimberly.

[1]MHS. PhD Candidate. Division of Nutritional Sciences. Cornell University. USA.; [2]MBBS. ScD. Division of Nutritional Sciences. Cornell University. USA.; [3]MD. Department of Obstetrics and Gynecology. University of Rochester School of Medicine. USA.; [4]CNM. EdD. Department of Obstetrics and Gynecology. University of Rochester School of Medicine. USA.; [5]PhD. Division of Nutritional Sciences. Cornell University. USA.

Background and objectives: Low maternal vitamin D status has been associated with increased risk for asthma and autoimmune disease in the offspring. The hormone 1,25-dihydroxyvitamin D (1,25(OH)2D) regulates many inflammatory processes, but the pathways by which insufficient vitamin D during gestation may impact the developing immune system have not been elucidated. The aim of this study was to test the effects of maternal vitamin D supplementation on concentrations of vitamin D metabolites, inflammatory cytokines, and IgE in umbilical cord serum (UCS).

Methods: Pregnant adolescents (n=79) living in Rochester, NY received 200 IU or 2,000 IU of vitamin D3 daily (in addition to a standard prenatal supplement with 400 IU of vitamin D3) from (mean ± SD) 18 ± 5 weeks of gestation until delivery. Maternal serum and UCS were analyzed for 25(OH)D, 1,25(OH)2D, and 24,25(OH)2D using LC-MS/MS. UCS cytokines (IL-2, IL-4, IL-6, IL-10, IL-17, IFN-γ, TGF-β1, and TNF-α), IgE, and IgA (the negative control) were measured by immunoassays. Linear regression was used to test the effect of supplement group assignment on UCS vitamin D metabolites, cytokines, and IgE.

Results: The mothers were 17 ± 1 yrs of age at study entry. The majority (60%) identified as Black race, and 35% had serum 25(OH)D <20 ng/mL at delivery. UCS was obtained from 56 neonates at birth (39.5 ± 1.7 wks' gestation). The prevalence of UCS 25(OH)D <12 ng/mL was 39%. The 2,000 IU group had greater mean UCS 25(OH)D (β=4.6; p=0.02) and 24,25(OH)2D (β=0.42; p<0.01), but there was no effect of treatment group on UCS 1,25(OH)2D. Cytokines and IgE have been measured in 34 UCS samples. IL-6, IL-10, TGF-β1, TNF-α and IgE were detectable in the majority of UCS samples. The mean concentrations of these cytokines and IgE in UCS did not differ by supplement group.

Conclusions: Risk of vitamin D deficiency was prevalent in term neonates born to adolescents living at latitude 43°N. Daily supplementation with 2,000 IU compared with 200 IU of vitamin D3 increased UCS 25(OH)D and 24,25(OH)2D but had no effect on either UCS 1,25(OH)2D or (based on data available to date) select markers of immune function.

Keywords: perinatal nutrition, vitamin D, developmental origins, asthma, allergy

MOTHERS' VIEW ON BREASTFEEDING OF NEWBORNS ON A NEONATAL INTENSIVE CARE UNIT (NICU) AT A HOSPITAL IN CURITIBA, BRAZIL

[1]Gebara, Telma; [2]Delfino, Bianca; [3]Tarzia, Andréa; [4]Mastella, Paula; [5]Santos, Silvana; [2]Thomaz, Ana Cláudia.

[1]BSc. Nutritionist. Department of Biological and Health Sciences. Tuiuti University of Parana. Brazil.; [2]BSc. Nutritionist. Department of Biological and Health Sciences. Tuiuti University of Parana. Brazil.; [3]PhD. Nutritionist. Department of Biological and Health Sciences. Tuiuti University of Parana. Brazil.; [4]PhD. Department of Biological and Health Sciences. Tuiuti University of Parana. Brazil.; [5]MSc. Nutritionist. Department of Biological and Health Sciences. Tuiuti University of Parana. Brazil.

Background and objectives: Breastfeeding is the best natural strategy for bonding, affection, protection and nutrition for a child, as well as an important intervention to reduce infant morbidity and mortality. Exclusive breastfeeding is recommended by World Health Organization up to 6 months of age, with continued breastfeeding along with appropriate complementary foods up to two years of age or beyond. Some of the benefits that make breastfeeding feasible are the families engagement to support the mother during the breastfeeding period, the low cost, and the quality of life for mothers and their babies. Nevertheless, many mothers are not knowledgeable on the benefits of breastfeeding. The aim of this research was to analyze the perception of mothers regarding breastfeeding of inpatient newborns on a neonatal intensive care unit (NICU) in the city of Curitiba, Brazil.

Methods: A cross-sectional study (descriptive and observational) was conducted on a group of 10 mothers of newborns, during the months of August and September 2016. A questionnaire was applied and answered individually by each mother, without interference. Furthermore, the research project was approved by the Ethics Research Committee.

Results: Average age of mothers was 31.7 (± 4.71) years, and 60% were graduate or post-graduated. All the mothers (100%) answered that they received information about maternal education through various media, nurses and doctors, as well as family and friends. Half of them (50%) answered that mother can offer the milk to the baby in the first hour postpartum. Cultural level of the mothers is related to breastfeeding in a positive way, breastfeeding in the first hour after the birth of the baby is important for effective breastfeeding, in addition to providing the strengthening of the affective bonds between mothers and their babies.

Conclusions: It is important to recognize that knowledge building about the importance of exclusive breastfeeding is the result of a collective struggle, where quality health professionals should, besides providing adequate guidance, give greater safety to the mothers during breastfeeding.

Keywords: breastfeeding, nursing, breastfeeding promotion.

POSTINFANCY GROWTH AND COGNITIVE PERFORMANCE IN EARLY ADOLESCENCE IN FOUR LOW AND MIDDLE INCOME COUNTRIES: YOUNG LIVES

[1]Kowalski, Alysse; [2]Georgiadis, Andreas; [3]Stein, Aryeh.

[1]PhD Student. Laney Graduate School. Emory University. Atlanta. USA.; [2]PhD. Brunel Business School. College of Business, Arts and Social Sciences. Brunel University London. London. UK.; [3]PhD. Hubert Department of Global Health. Rollins School of Public Health. Emory University. Atlanta. USA.

Background and objectives: Linear growth failure in the first 1000 days is associated with impaired child cognitive development. Using longitudinal data from four low and middle income countries we examined the strength of the pathways by which growth throughout childhood is associated with measures of cognitive performance.

Methods: Data come from the Young Lives study in Ethiopia (N=1275), India (N=1350), Peru (N=1402), and Vietnam (N=1594). Height was measured at participant age 1, 5, 8, and 12 y; height-for-age z-scores (HAZ) were calculated. Cognitive performance was assessed at age 12 y by the Peabody Picture Vocabulary Test and a mathematics test, which were adapted and standardized in each country. We used path analysis to examine associations between HAZ at each age and each test. We adjusted for covariates at the child, parent, household, and community levels.

Results: In all four countries, the total effect of HAZ at each age was positively associated with cognitive performance; 12 of 16 and 10 of 16 associations were statistically significant for vocabulary and mathematics scores, respectively. Collectively, total effects of HAZ explained modest proportions of the total variation in test scores; across countries, partial r2 ranged from 1.8% to 4.0% for vocabulary and 1.1% to 2.5% for mathematics. Across countries, the total effect of HAZ 1 y explained 0.1% to 1.3% and 0.1% to 0.9% of the total variation in vocabulary and mathematics scores, respectively, while HAZ 5, 8, and 12 y combined explained 1.0% to 3.9% and 0.9% to 2.0%, respectively. The relative magnitude of the HAZ associations with cognitive performance were comparable to those of maternal and paternal education, household expenditures, and ethnicity. The proportion of the total effect of HAZ at 1 y mediated through HAZ at older ages ranged from 55% to 100% across countries for vocabulary and 42% to 100% for mathematics.

Conclusions: HAZ was associated with increased cognitive performance at age 12 y, but the proportion of the total variation in test scores explained was modest. While the primary drivers of cognitive performance may not be mediated through growth, increased child growth may confer modest benefits for cognitive performance.

Keywords: growth, height-for-age, cognitive development

MALNUTRITION AND INFANT/YOUNG CHILD FEEDING PRACTICES AMONG PENAN COMMUNITY IN SARAWAK, MALAYSIA

[1]Noor, Mohd Ismail; [2]Bong, Mee Wan; [3]A Karim, Norimah.

[1]Wife. Malaysia.; [2]BSc. Nutritionist. Nutrition Section. Sarawak State Health Department. Kuching. Sarawak. Malaysia; [3]PhD. Nutritionist. Nutritional Sciences Programme. Faculty of Health Sciences. Universiti Kebangsaan Malaysia. Kuala Lumpur. Malaysia.

Background and objectives: The tribal Penan estimated around 16,000 largely settled in rural and remote areas of Sarawak. The objective of this study was to determine the nutritional status and infant young child feeding (IYCF) practices in Penan children, using indicators of minimum dietary diversity (MDD), minimum meal frequency (MMF) and minimum acceptable diet (MAD).

Methods: Data collection was carried out in 14 Penan villages in Sarawak from August to December 2016. Subjects consisted of 71 young children, aged below 24 months. Malnutrition was assessed using anthropometric measurements of children and categorized according to WHO Growth Standards (2006). Mothers were interviewed using a pre-tested questionnaire based on WHO IYCF Indicators.

Results: Majority (88.7%) of mothers interviewed were below 35 years, with 29.6% having attended primary school and 15.5% secondary school with a household income of less than MYR600 (USD 135) per month. The prevalence of underweight was 33.8%; stunting 49.3% and wasting 9.8%. Prevalence of exclusive breastfeeding under 6 months was 50% while continued breastfeeding up to 1 year was 72.2% and 41.2% at 2 years. Proportion of children aged between 6 to 23 months achieving MDD was 83.1%. Among children of different age groups, MDD achievement was low (71.4%) for those aged 6 to 11 months. For those achieving MDD, 71.2% of children received food from 4 to 5 food groups whilst 11.9% received food from 6 to 7 food groups. Majority of children received food from grain, roots and tubers group (96.6%). Other food groups given were flesh foods and Vitamin-A rich fruits and vegetables. Almost half (49.2%) of the children consumed dairy products and eggs; and MMF achieved was 83.1%. The study also revealed only 59.3% of children aged 6 to 23 months achieved minimum acceptable diet. Overall, the compliance to minimum acceptable diet indicator was low. Consumption of iron-rich foods was satisfactory at 79.7%, however only 57.1% was achieved amongst infants aged 6 to 11 months.

Conclusions: Effort to ensure that appropriate IYCF key messages reach Penan mothers should be strengthened, to further improve the overall nutritional status and feeding practices of this vulnerable group.

Keywords: nutritional status, infant young child feeding, Penan

NUTRITION RECOMMENDATIONS FOR IMPROVING ADOLESCENT GIRLS' HEALTH AND WELLBEING

[1]Koniz-Booher, Peggy; [2]Ramage, Abigail Kaplan; [3]Rayco-Solon, Pura; [4]Alvey, Jeniece; [5]Lamstein, Sascha; [6]Grey, Elaine S.; [7]Lutter, Chessa; [8]Cunningham, Sarah.

[1]MPS. SPRING/USAID Project. JSI Research & Training Institute Inc. USA.; [2]MS. MA. Independent Nutrition Consultant. United Kingdom.; [3]MD. MSc. PhD. Evidence and Programme Guidance Unit. Department of Nutrition for Health and Development. World Health Organization. Switzerland.; [4]MPH. IBCLC. Global Health Fellows Program II/USAID. Public Health Institute. USA.; [5]PhD. SPRING/USAID Project. JSI Research & Training Institute, Inc. USA.; [6]MS. MPH. Global Health Fellows Program II/USAID. Public Health Institute. USA.; [7]PhD. Visiting Research Professor. School of Public Health. University of Maryland. United States.; [8]BS. SPRING/USAID Project. JSI Research and Training Institute, Inc. USA.

Background and objectives: Over half a billion adolescent girls between the ages of 10 and 19 live in low- and middle-income countries (LMIC), making up nearly ten percent of their populations (UNDESA 2008). The challenge of developing appropriate policies, social and behavior change strategies, effective nutrition education programs, and targeted communication tools to reach adolescent girls is complicated by the lack of specific nutrition guidance for this critical population. While guidelines exist for some adolescent interventions, adolescent girls might also benefit from nutrition interventions that target wider age groups, such as iron supplementation for women of reproductive age. In many cases, however, these interventions have not been prioritized or adapted for adolescent programming. To help provide better guidance, the USAID Strengthening Partnerships, Results:
Methods: Building on recommendations from the 2015 technical expert meeting on adolescent and women's nutrition, co-hosted by PAHO/WHO and SPRING/USAID, a framework reflecting the determinants of and interventions for adolescent girls' nutrition, health and wellbeing was developed through a consultative, interagency process. This framework guided the selection of relevant evidence-informed recommendations from existing WHO guidelines for inclusion in the document.
Results: This product – Nutrition Recommendations for Improving Adolescent Girls' Health and Wellbeing – will provide global guidance for achieving optimal adolescent girls' nutrition in a user-friendly format. It organizes key interventions and related recommendations under categories, including healthy diets;

---

micronutrient deficiencies; undernutrition management; antenatal nutrition; water, hygiene and sanitation; physical activity; and sexual and reproductive health.

Conclusions: Global guidance focused on improved adolescent girls' nutrition is needed to protect gains made in child survival and early childhood development, with a focus on the adolescent period as a "second window of opportunity". This WHO product will provide Member States, donors and implementing partners with recommended evidence-informed guidance for adolescent girls' nutrition interventions and programming. It aims to catalyze and focus future investments for prioritization and development of policies, strategies, programs, and tools.

CORRELATION BETWEEN CHRONOTYPE AND THE QUALITY OF DIET IN PREGNANT WOMEN

[1]Cabral, Bruna; [2]Gontijo, Cristiana Araújo; [3]Castro, Isabella; [2]Balieiro, Laura; [4]Fahmy, Walid; [5]Maia, Yara; [5]Crispim, Cibele.

[1]Nutritionist. Brazil.; [2]Nutritionist. MSc. Medical Faculty. Federal University of Uberlandia. Brazil.; [3]Undergraduate student. Nutrition Course. Medical Faculty. Federal University of Uberlandia. Brazil.; [4]Physician. MSc. Prefeitura Municipal de Uberlandia. Brazil.; [5]UBERLANDIA. Brazil.

Background and objectives: The literature shows that chronotype can influence food consumption and individuals with an evening chronotype may consume a lower quality of diet. However, this issue is an unexplored among pregnant women. In this sense, the focus of this study was to correlate chronotype with the quality of diet in pregnant women in the first trimester.

Methods: We evaluated 100 pregnant women, with up to 12 gestational weeks, aged 18 to 40 years, attended at the public health service in Uberlandia city, Minas Gerais, Brazil. Properly trained nutritionists collected information about food consumption by means of three 24HR on non-consecutive days, including one day of the weekend, in order to better reflect the eating habits of the participants. The qualitative dietary assessment was performed using the Brazilian Healthy Eating Index Revised (BHEI-R), from the following components and, or food groups: Total Fruits; Whole Fruits; Total Vegetables; Vegetables Dark Green and Orange Vegetables and Legume; Total Grains; Whole Grains; Milk and Dairy Products; Meat, Eggs and Beans; Oils; Saturated Fat; Sodium; and SoFAAS. Chronotype was derived from the time of mid sleep time on free days at the weekend (MSF), with a further correction for calculated sleep debt – calculated as the difference between average sleep duration at the weekends and weekdays correlation was used and p <0.05 with significant statistic. The data were analyzed using the SPSS.21.0. To evaluate correlations between variables, Spearman's correlation coefficients, adjusted for confounders were used. Correlations were considered weak if r <0.30, moderate if r was 0.30–0.70 and strong if r >0.70. Statistical tests with p < 0.05 were accepted as significant.

Results: We found a significant correlation between the BHEI-R score for the total Fruit components (r=-0.239; p=0.017), Whole Fruits (r=-0.214; p=0.032) and Saturated Fat (r=-0.211; p=0.035) with chronotype.

Conclusions: Our data suggest that pregnant women with an evening chronotype may be more likely to a diet with less fruit and higher saturated fat. Longitudinal studies should be developed to better understand this issue.

Keywords: chronotype, food consumption, pregnance, Quality Of Diet

CONSUMPTION OF NON-ALCOHOLIC SWEETENED BEVERAGES IN YOUNG ADULTS IN URUGUAY

[1]Elichalt, Marta; [2]Puig, Silvia; [1]Girona, Alejandra; [3]Della Santa, Ana Paula; [1]Britz, Monica; [4]Perdomo, Guillermo.

[1]MSc. Nutritionist. Nutrition School. Republic University. Uruguay.; [2]Nutritionist. Nutrition School. Republic University. Uruguay; [3]Nutritionist. Nutrition School. Republic University. Uruguay.; [4]MSc. Biological Sciences. Nutrition School. Republic University. Uruguay.

Background and objectives: Sweetened drinks are one of the ultraprocessed foods that have had the greatest increase in consumption in recent years in Uruguay. A descriptive quantitative study was carried out to determine the consumption of sugar drinks in young adults aged 18 to 35 years and to compare the average amount of sugar from this consumption with the maximum amount of intake recommended by WHO free sugar in the framework of healthy eating (10% of energy needs per day).

Methods: The sample was non-probabilistic, a Google form was applied where it was collected: socio-demographic information, types of beverages consumed, frequency and total quantity for different types. To know the association between variables the chi square test p <0.05 was applied.

Results: Respond 440 young people, 75% between 18 to 29 years and 75% were women, just over half reside in the capital and have university education; 44% study and work. In relation to the frequency of consumption, tea, coffee and soft drinks predominate with a minimum frequency of 5 times per week. More than 70% exceeds the average consumption / day of 200 mL. 34% exceeds 10% of energy from free sugars only with the intake of beverages. There are no significant differences in the sugar energy intake of the drinks between sexes, ages, places of residence, or types of activity (p <0.05).

Conclusions: It is concluded that the habit of young adults to consume tea and coffee with sugar added and the intake of soft drinks, fruit juices and flavored waters contribute to the excessive contribution of free sugars in the study population as a risk factor for the development of diseases prevalent in Uruguay.

Keywords: sugar; drinks, intake

IMPROVING COMPLEMENTARY FEEDING IN RURAL BANGLADESH WITH LOCAL FOOD-BASED RECOMMENDATIONS

[1]Wendt, Amanda; [2]Waid, Jillian; [3]Ali, Masum; [4]Gabrysch, Sabine.

[1]Postdoctoral Fellow. Institute of Public Health. University of Heidelberg. Germany.; [2]Director of Research, Learning, and Evaluation. Helen Keller International. Dhaka. Bangladesh.; [3]Researcher. Helen Keller International. Dhaka. Bangladesh.; [4]Unit Head, Deputy Institute Head. Unit of Epidemiology and Biostatistics. Institute of Public Health. University of Heidelberg. Germany.

Background and objectives: Poor infant and child feeding practices can lead to adverse growth and development outcomes. This is of particular concern in low- and middle- income countries. Nutrition-sensitive agricultural interventions are uniquely positioned to improve child feeding practices through improved household access to nutrient-dense foods as well as providing a platform for nutrition counseling activities.

Our objectives were to describe current food patterns of 6-23 month old children in the Food and Agriculture Approaches to Reduce Malnutrition (FAARM) trial population, identify problem nutrients which are not being fulfilled with normal dietary patterns, and create local food-based recommendations to address these deficiencies.

Methods: Food consumption patterns were measured as part of the FAARM cluster-randomized trial in Sylhet, Bangladesh. A 24-hour recall was conducted in 864 households (Children 6-8m: n=43; 9-11m: n=59; 12-23m: n=255) from September 2015 to August 2016, with replication in one-third of the sample. Complementary feeding patterns and food-based recommendations were evaluated using WHO Optifood linear programming software, which evaluated 10 micronutrients: calcium, vitamin C, thiamine, riboflavin, niacin, vitamin B6, folate, vitamin A, iron, and zinc.

Results: In all age groups, calcium, riboflavin, folate, iron, and zinc were identified as 'problem nutrients,' defined as not meeting 100% of recommended intake levels with an optimized diet. Thiamine was also identified as a 'problem nutrient' for children 12-23 months of age. Key local foods rich in these micronutrients were identified and included dark green, leafy vegetables (e.g. red amaranth, buffalo spinach), small dried or fermented fish, pulses, and eggs. For 9-11m and 12-23m age groups, increasing dark green, leafy vegetable consumption to two meals per day and consuming fish with eggs or pulses once per day ensured dietary adequacy of 5 and 7 of the 10 nutrients evaluated, respectively. For children 6-8m of age, diets remained inadequate.

Conclusions: Promotion of key foods which are locally available and acceptable is an important to step for effective nutrition counseling of complementary feeding. Methods: **Keywords:** Infant and young child feeding

METABOLIC SYNDROME AND DIETARY PATTERNS OF OLDER ADULTS FROM THE HEALTH, WELL-BEING AND AGING SURVEY (SABE)- BRAZIL

[1]Quintiliano Scarpelli Dourado, Daiana; [2]Roediger, Manuela; [3]Marucci, Maria de Fátima.

[1]PhD. Nutritionist. Public Health School. University of Sao Paulo; [2]Post Doctoral Student. Nutritionist. Public Health School. University of Sao Paulo. Sao Paulo. Brazil; [3]PhD. Profesor. Public Health School. University of Sao Paulo. Sao Paulo. Brazil.

Background and objectives: Metabolic syndrome (MS) is common in elderly people. The feeding influences its prevalence constituting one of the modifiable risk factor with positive impact on disease control.

To investigate the association between MS and dietary patterns of older adults from São Paulo city.

Methods: Cross-sectional study that used data from the SABE survey: epidemiological, cohort based and home-dwelling. The study population included elderlies ($\geq$ 60 years old), both sexes, selected by probability sampling, belonging to three cohorts A/2000 (n = 630), B/2006 (n = 214) and C/2010 (n = 311). The study variables were: gender, age, education, alcohol consumption, smoking, physical activity, number of chronic noncommunicable diseases; MS, identified according to the criteria of the National Cholesterol Education Program-Adult Treatment Panel III. The feeding data were obtained by one food frequency questionnaire with 18 food groups. Dietary patterns were determined by exploratory factor analysis of principal components. Rao & Scott and multiple logistic regression for complex sample were used, with 5% significance level. The statistical software STATA 13.1 was used.

Results: 1155 subjects were studied. The prevalence of MS was 57.9%. Four dietary patterns were identified: pattern 1, composed by fried foods, sausages, canned foods, sweets, tubers, spices/sauces and processed eggs, called inappropriated; pattern 2, composed by low-fat dairy products, whole grain cereals and breads, and light, diet or zero food, called modified; pattern 3, composed by vegetable oils, rice, refined cereals and white bread, meat and legumes, called Brazilian traditional pattern; and pattern 4, fruits, vegetables and tubers, called beneficial. The modified pattern was positively associated to MS. 4th quartile modified pattern older adults had increased in 60% the risk of MS. The beneficial pattern was negatively associated to MS, in the older individuals ($\geq$ 70 y, cohort A). The inappropriated and Brazilian traditional patterns were not significantly associated to MS.

Conclusions: The modified and beneficial dietary patterns were associated to MS. Modified individuals pattern showed in-

creased risk of MS. Beneficial pattern reduced the risk to the oldest older individuals. The modified pattern could be due to dietary changes implemented in the older adults daily life after diagnosis of metabolic abnormalities.

Keywords: metabolic syndrome; aging; food intake; factorial analysis.

ABDOMINAL OBESITY ASSOCIATED WITH IN-SUFFICIENT PHYSICAL ACTIVITY IN CLIMAC-TERIC WOMEN OF THE CITY OF SÃO PAULO, SP, BRAZIL

[1]França, Ana Paula; [2]Marucci, Maria de Fátima; [2]Roediger, Manuela; [3]de Souza, Claudia Sebba Tosta.

[1]PhD. Nutritionist. University of São Paulo. Faculdade das Américas. São Paulo. Brazil.; [2]PhD. Departament of Nutrition. School of Public Health. University of São Paulo. Brazil.; [3]MSc. Departament of Nutrition. School of Public Health. University of São Paulo. Brazil.

Background and objectives: To investigate the association between abdominal obesity and demographic, clinical and behavioral variables, a cross-sectional study with 469 women (45-65 years) was conducted in two outpatient public clinics in São Paulo, Brazil.

Methods: The dependent variables were: abdominal obesity according to waist hip ratio (WHR) and obesity according to waist circumference (WC); the main explanatory variable was: climacteric stage (pre- or post-menopause) and the control variables were age; level of education; parity; use of hormone therapy; physical activity and smoking habit. Was performed multiple regression analysis "glm" (general linear model) using Stata 9.2 software for analysis.

Results: According to WHR, abdominal obesity was positively associated with age (PR=1,02; 95% CI = 1,00-1,05), and negatively associated with level of education (PR = 0,76; 95%CI = 0,64-0,92) and physical activity (PR = 0,70; 95% CI = 0,61-0,82). As indicated by WC, abdominal obesity was positively associated with age (PR = 1,02; 95% CI = 1,01-1,03) and parity (PR = 1,21; 95% CI =1,02-1,45) and negatively with physical activity (PR = 0,70; 95% CI = 0,61-0,82).

Conclusions: While physical activity was a protective factor, age, level of education and parity were established as risk factors for the prevalence of abdominal obesity in women of this study group.

Keywords: abdominal obesity; parity; physical activity, climacteric; menopause.

STUDY OF THE RELATIONSHIP BETWEEN FATTY ACID INTAKE AND COGNITIVE DEVELOPMENT IN CHILDREN FROM AN ECUADOR SCHOOL

[1]Guerendiain, Marcela; [2]Monzón Rodríguez, Allyson Natalie; [3]Cando Pilatuña, Rosario Isabel; [4]Mayorga Mazón, Clara de las Mercedes; [2]Ligerini Vázquez, Lorena Johana; [2]Menendez Blanco, Cintya Yanella.

[1]PhD. Nutritionist. School of Medicine. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.; [2]Nutritionist. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.; [3]MSc. Psychologist. School of Clinical Psychology. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.; [4]MSc. Nutritionist. School of Nursing. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.

Background and objectives: There is evidence that the polyunsaturated fatty acids may play a key role in brain development, but the studies on monounsaturated and saturated fatty acids are limited. Therefore, the objective of this research was to explore the relationship between fatty acid intake and cognitive development in schoolchildren.

Methods: It was studied seventy-three children, from 5 to 11 years old, of the EVANES project, in this case, from San Juan school, Ecuador, located at 3240 meters above sea level. To identify levels of verbal comprehension (VC), perceptual reasoning (PR), working memory (WM), processing speed (PS) and full-scale intelligence quotient (FSIQ) the schoolchildren were evaluated using the Wechsler Intelligence Scale for Children four edition (WISC IV). In the target population, a survey was conducted in order to know the total daily consumption of food, and the fatty acids were calculated. The data were analyzed using general linear model, corrected by Bonferroni, and linear regression tests, both adjusted for age, sex and standard deviation (SD) of height. Inside the cognitive development, the sample was divided in normal ($\geq$80 points) and low (<80 points).

Results: The mean and the SD for VC, PR, WM, PS and FSIQ were 79,62 $\pm$ 14.33, 81.30 $\pm$ 13.90, 86.53 $\pm$ 13.73, 89.49 $\pm$ 14.90 and 78.66 $\pm$ 12.11 points, respectively; for intake of saturated, monounsaturated and polyunsaturated fatty acids were 29.82 $\pm$ 18.56, 19.93 $\pm$ 9.88 and 7.19 $\pm$ 3.03 grams per day, respectively. It was found that children with a low VC had a higher intake of saturated and monounsaturated fatty acids. Besides, it was identified a relationship between lower PS and higher saturated fatty acid consumption, and, when we adjusted the model, the association became stronger.

Conclusions: An inverse relationship between the consumption of saturated and monounsaturated fatty acids, and verbal comprehension and processing speed was observed in schoolchildren of Ecuador.

Keywords: Cognitive development; fatty acids; monounsaturated fatty acids; saturated fatty acids.

THE INFLUENCE THAT A LOCAL GOVERN-MENT-LED MODEL WALKING PROGRAM GIVES FOR THE CHANGE OF PHYSICAL STRENGTH AND THE FIGURE

[1]Nagaoka, Tatsuki; [2]Omori, Akane; [1]Cho, Chuhwa; [3]Okubo, Mion; [4]Koizumi, Kayo.

[1]Japan Woman's College of Physical Education Graduate School. Japan.; [2]M.S. Abiko Nikaido High School. Japan.; [3]Japan Woman's College of Physical Education. Japan.; [4]Ph.D. Japan Woman's College of Physical Education. Japan.

Background and objectives: The purpose of this study to compare the numerical value of the figure with the physical fitness test before and after the business of this time by the generation and examine an effect to physical training according to the generatio.

Methods: Participants included 74 individuals ≥60years old-(n=58), ≥70(n=16) that participated in "10,000 steps of walking" in residents. The intervention combined a program to improve a physical function program to prevent declines in cognitive function. This intervention was conducted 9 times for 5 months from September 2014 to January 2017. All participants were measured their body composition, body size, physical fitness tests and steps were made at baseline and after 5 months later, and results were than compered. Body composition were measured by a whole-body bioelectric impedance analysis system (MC-780, Tanita Co.Ltd,Tokyo,Japan).And the International Society for the Advancement of Kinanthropometory(ISAK) protocol was used for measuring 5 body parts as follows ; three skinfolds(abdominals and medial calf) and 3 girths (waist, gluteal and mid-calf) on the right side of the objects'body. The statistical difference was determined by two-sided Student's t test, Difference with P<0.05 was considered significant.

Results: As for the steps of 5 months, a man in 70s was 11889±4700 steps of most, 5406±4022 steps of the 70s woman, that there was the least. No significant difference was found for all measurements between 60s and 70s. The long seat body ante flexion, the walking speed significantly increased the man and woman in its 60s, the woman in her 70s in approximately a program, but, as for the man in 70s, a meaningful change was not recognized. A meaningful change was not accepted for the grips between sex generations.

Conclusions: This study indicated that necessity of program not just walking, but to improve physical strength and increase of the quantity of muscle for 60s also.

Keywords: 10,000 steps of walking, elderly person,physical fitness

ARE THERE CHANGES IN THE FATTY ACID PRO-FILE IN BREAST MILK WITH SUPPLEMENTATION OF OMEGA 3 SOURCES? A SYSTEMATIC REVIEW

[1]Amaral, Yasmin; [2]Marano, Daniele; [3]Silva, Leila; [3]Guimarães, Aline; [4]Moreira, Maria Elisabeth.

[1]Msc. Nutritionist. InstitutoFernandes Figueira/ Fiocruz. Brazil.; [2]Dr. Nutritionist. Instituto Fernandes Figueira/ Fiocruz. Brazil.; [3]Nutritionist. Instituto Fernandes Figueira/ Fiocruz. Brazil.; [4]Dr. Neonatologist. Instituto Fernandes Figueira/ Fiocruz. Brazil.

Background and objectives: Due to the controversies between the studies, as well as to the importance of the theme for the health of the newborn, this systematic review aims to evaluate the studies that verified the effects of Omega 3 supplementation during pregnancy and/or puerperium on the composition of LH. The bibliographical survey with this theme aims to assist the maternal and child population as well as health professionals, in order to establish the importance of supplementation as well as offering subsidies for its practice. Objective: To evaluate the effect of supplementation of Omega 3 sources on the fatty acid composition of human milk.

Methods: The review consisted of the search for articles published in PubMed, Virtual Health Library and Web of Science databases using the following keywords: "Fatty acids, Omega-3, Human milk and Supplementation"., for which we have used the PRISMA checklist. The following selection criteria were used: articles published in English, Portuguese, Spanish or Italian, published between 2000 and 2015 and carried out in humans, according to the established strategy, resulting in 710 articles.

Results: All studies found a positive relationship between the consumption of Omega-3 sources and their concentration in human milk. The differences in the findings are due to the different methods used such as,for example, the specific moment of Omega-3 supplementation, the type of Omega-3 source offered, as well as sample size.

Conclusions: Although the studies were different in several methodological aspects, it was possible to observe the importance of Omega-3 supplementation in gestation and/or puerperium.

Keywords: Pregnant women; Breastfeeding; Human milk; Omega-3 Fatty Acids; Systematic review.

COMPARISON OF TOTAL LIPID AND FATTY ACID INTAKE ACCORDING TO THEIR DAILY DISTRIBUTION: RELATIONSHIP WITH STUNTING IN CHILDREN FROM ECUADOR

(1)Guerendiain, Marcela; (2)Ligerini Vázquez, Lorena Johana; (3)Mayorga Mazón, Clara de las Mercedes; (2)Monzón Rodríguez, Allyson Natalie; (2)Menendez Blanco, Cintya Yanella.

(1)PhD. Nutritionist. School of Medicine. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.; (2)Nutritionist. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.; (3)MSc. Nutritionist. School of Nursing. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.

Background and objectives: It must be considered that, in childhood, the contribution of fats is essential for correct growth, vigorous physical activity and optimum intellectual development, and therefore it is necessary to maintain an adequate contribution. Our objective was to compare the daily lipid intake in the different meal times and to link the fatty acids consumption with stunting in schoolchildren of Andean region.

Methods: The study included 100 middle-aged children, 7.8 ± 2.17 years old, from a rural community school in Chimborazo, Ecuador. A nutritional survey was used for the registration of the food intake. The dietary consumption was evaluated, in each food time, and was calculated from the corresponding standard portion size. The total lipid and fatty acid (FA) consumption was determined transforming these data into food volume/weight (gr or ml), as appropriate, and through the latest available information in food-composition tables from Ecuador. The standard deviation score of height, applying the Child Growth Standards of Word Heath Organization (2006 and 2007) and Anthroplus, was used for nutritional status evaluation. Children were classified in stunting (height for age <-2 SD) and normal (height for age ≥-2 SD). The daily intake was analysed using the general linear model, corrected by Bonferroni, which was adjusted for sex, age and body mass index. The children were divided into two groups, stunting and normal stature.

Results: The contribution of fats at breakfast was higher than the other mealtimes, except lunch. The intake of total lipids in the collation at mid-morning (provide by government of Ecuador at school) was greater than middle afternoon, while in the evening collation was lower compared with all meal times. Children also presented a higher contribution of saturated FA in breakfast compared to collation. Regarding nutritional status, the saturated FA intake was higher in schoolchildren who had normal height than these who had stunting.

Conclusions: In schoolchildren from rural communities of Chimborazo, the main lipid intake comes from breakfast. Stunting children have a lower contribution of saturated fatty acids in relation to those with normal stature.

Keywords: fatty acids; mealtimes; saturated fatty acids; children.

PERCEPTION OF HEALTHY EATING AND DAILY DIETARY INTAKE IN CHILDREN AND ADOLESCENTS OF FACATATIVÁ, COLOMBIA

(1)Rojas Infante, Diana Milena; (2)Guerendiain Margni, Marcela Esther.

(1)Nutritionist. Pontificia Universidad Javeriana. Bogotá. Colombia.; (2)PhD. Nutritionist. School of Medicine. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.

Background and objectives: The perception of healthy eating is a useful tool to identify beliefs, ideas and concepts about this term. In childhood, these factors contribute to eating behaviours and patterns. For this reason, it was analysed the differences in dietary intake according to the perception of healthy eating in children and adolescents.

Methods: It was included 33 children and adolescents (8-14 years old) of Facatativá, Colombia. The perception of healthy eating was obtained through a semi-structured questionnaire, based on the model used in previous studies. The narrative responses were codified and grouped into 6 categories "eating fruits and vegetables", "eating all food groups", "foods that help us grow healthy", "foods that give vitamins", "eating vegetables and proteins", "do not eat sweets or junk food". To determine the daily dietary intake, a food frequency questionnaire with 33 item was used.

Results: The mean of age of population was 9.8 ± 1.7 years, and for fish, milk and gran intake was 8.24 ± 11.77, 244.67 ± 192.65 and 16.01 ± 16.15 grams, respectively. The participants who reported, as healthy eating, "eating fruits and vegetables" had a lower grain consumption than "do not eat sweets or junk food" group (p=0.032). The daily fish and milk intake was higher in children who responded, "do not eat sweets or junk food" than those who said, "foods that help us grow healthy" (p=0.037) and "eating fruits and vegetables" (p=0.003), respectively.

Conclusions: Children and adolescents who consider a healthy eating as "do not eat sweets or junk food" present a higher intake of fish, milk and grain. This suggest that the perception of healthy eating may affect the dietary patterns in these stages of life.

Keywords: Perception of healthy eating; daily dietary intake; fish intake; milk intake; grain intake.

NUTRITIONAL STATUS AND CHILD DEVELOPMENT OF PRE-SCHOOL CHILDREN IN BHUTAN

(1)Kang, Yunhee; (2)Aguayo, Victor; (3)Campbell, Rebecca; (4)Dzed, Laigden; (5)Joshi, Vandana; (6)Waid, Jillian; (7)Haselow, Nancy; (8)West, Jr., Keith.

Department of International Health. Johns Hopkins School of Public Health. USA.; (4)PhD. Sr.Program officer. Ministry of Health. Royal Government of Bhutan.Thimphu. Bhutan.; (5)PhD. Nutrition Specialist. UNICEF Bhutan. Thimphu. Bhutan.; (6)PhD. Helen Keller International New York. USA.; (7)PhD. Vice President for Asia-Pacific. Helen Keller International. USA.; (8)DrPh. Professor. Department of International Health. Johns Hopkins School of Public Health. USA.

Background and objectives: Few nationally representative studies exist reporting on the nutrition and development of Bhutanese pre-school children. Using the National Nutrition Survey (NNS) 2015 and Multiple Indicator Cluster Survey 2010 (MICS-4), we evaluated household-, maternal-, and child-level risk factors for undernutrition among children aged 6 to 59 mo (n=1,506) and examined associations between early development indicators and nutritional status among children aged 36 to 59 mo (n=2,038).

Methods: Prevalences of stunting, wasting, underweight (height-for-age, weight-for-height, weight-for-age Z-scores, respectively,<-2) and overweight (weight-for-height Z-score>2) were estimated adjusting for survey design. Ten-item early child development index (ECDI) scores were created using UNICEF guidelines to assess four domains: literacy and numeracy, learning, physical, and socio-emotional. ECDI was defined as "on track" for children with satisfactory scores in 3 or 4 domains. Logistic regression, adjusting for sampling design, was conducted to identify predictors of undernutrition and its association with development indicators.

Results: The prevalence of stunting, wasting, underweight and overweight were 21.2%, 2.5%, 7.3% and 2.6%, respectively. In multivariable regressions, risk of stunting increased with age: 5.2% at <6 mo (referent), 17.1% at 6-23 mo (OR=3.59; 95%CI: 0.74, 17.4) and 24.9% at 24-59 mo (OR=6.12; 95%CI: 1.40, 26.9) and was lower among children of university-educated (OR=0.05; 95%CI: 0.00, 0.89) compared to uneducated mothers. No examined variables were significantly associated with wasting or overweight. Percentages of children who met literacy and numeracy, learning, physical, and socio-emotional were 25.5%, 99.6%, 61.4%, and 93.2%, respectively; 66.1% children were found "on track". Literacy and numeracy was negatively associated with stunting (OR=0.64; 95%CI: 0.48, 0.86), severe stunting (OR=0.55; 95%CI: 0.36, 0.83), and severe wasting (OR=0.17; 95%CI: 0.03, 1.08) providing a clear linkage between these aspects of development and chronic undernutrition. ECDI was negatively associated with severe stunting (OR=0.66; 95%CI: 0.47, 0.93). No other associations were found between nutritional status and developmental outcomes.

Conclusions: Whereas weight-for-height is superimposed on the WHO referent distribution, one-fifth of Bhutanese preschoolers are stunted, a condition that is negatively associated with children's literacy and numeracy achievement and maternal education. Severely stunted children require remedial care, both nutritionally and to promote catch-up in aspects of their development.

Keywords: stunting; risk factors; early child development index; literacy and numeracy; Bhutan

ANALYSIS OF THE ASSOCIATION BETWEEN NUTRITIONAL STATUS AND DIETARY INTAKE IN CHILDREN AND ADOLESCENTS OF FACATATIVÁ, COLOMBIA

(1)Rojas Infante, Diana Milena; (2)Guerendiain Margni, Marcela Esther.

(1)Nutritionist. Pontificia Universidad Javeriana. Bogotá. Colombia.; (2)PhD. Nutritionist. School of Medicine. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.

Background and objectives: The food intake is one of the most important factors that determines the nutrition and health in childhood. For this reason, it was analysed the relationship between the nutritional status and daily dietary intake in children and adolescents of Facatativá, Colombia.

Methods: A descriptive cross-sectional study was conducted, involving 33 children and adolescents (9.8 ± 1.7 years old). The nutritional status was defined according to the standard deviation score of height and body mass index (BMI), using the Child Growth Standards of Word Heath Organization, 2006 and 2007, adapted for the Colombian population in 2016. Taking into account the BMI-for-age, children and adolescents were classified in: thinness (< -2 SD), risk of thinness (≥-2 to <-1 SD), normal (≥-1 to ≤+1 SD), overweight (>+1 to ≤+2 SD) and obesity (>+2 SD). Considering the height, they were divided in: stunting (height-for-age <-2 SD), risk (height-for-age >-2 to <-1 SD) and normal (height-for-age ≥-1 SD). The daily dietary intake was assessed using a food frequency questionnaire with 33 item.

Results: The mean of weight was 32.9 ± 9.5 kg and for height 1.3 ± 0.1 m. The 39.4% of children had risk of stunting and 48.5% normal height; the 63.6% presented a normal BMI and 21.2% excess weight. It was found relationship between the standard deviation score of height-for-age and the butter intake (-0.482, p=0.005). The daily intake of tomato had an inverse association with the weight (p=0.043) and positive with the standard deviation score of height-for-age (p=0.032). The BMI presented a negative relationship with daily carrot consumption (p=0.038), and the intake of sugar was positively associated with the height.

Conclusions: As expected, it has been found relationship between food intake and nutritional status. Tomato and carrot consumption, could have beneficial effects on the nutritional status

of children and adolescents in rural Colombia. Further studies on sugar and butter intake are required to support our results.

Keywords: Perception of healthy eating, daily dietary intake, fish intake, milk intake, gran intake.

MANIPULATIVE AND TOTAL INTELLECTUAL QUOTIENT IN ECUADORIAN SCHOOLCHILDREN AND THEIR RELATIONSHIP WITH HEMATOCRIT AND HEMOGLOBIN

[1]Robalino Flores, Ximena del Rocío; [1]Balladares Saltos, Aida Mercedes; [2]Cando Pilatuña, Rosario Isabel; [3]Guerendiain Margni, Marcela Esther.

[1]MSc. Laboratory Technician. School of Clinical Laboratory. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.; [2]MSc. Psychologist. School of Clinical Psychology. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.; [3]PhD. Nutritionist. School of Medicine. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.

Background and objectives: It is well known that the presence of anemia may affect the development in childhood, including the cognitive functions. However, the evidences on inhabitants of the Andean region are scarce or null. Hence, we studied the association between hematological parameters and cognitive development in children of Ecuador highlands.

Methods: Forty-three preschool children, from 5 to 6 years old, of the EVANES study, were recruited. To evaluate verbal, manipulative and full-scale intelligence quotient (IQ), the Wechsler Preschool and Primary Scale of Intelligence (WPPSI) was used. The scores were classified according to the following criteria: extremely low (<70), borderline (70-79), low average (80-89), average (90-109), high average (>110) and superior (>120). Also, the IQ was grouped in low (<80) and normal (≥80). Blood samples were extracted by venipuncture, and hemoglobin and hematocrit concentrations were determined. Children were divided in anemic (hemoglobin <11.5 g/dL) and non-anemic. The data were analyzed using SPSS statistical software, and General linear model, with Bonferroni correction, and Spearman tests were applied.

Results: The hematocrit concentration was 43.14 ± 2.73% and the hemoglobin level 14.49 ± 0.94 g/dL. The means of verbal, manipulative and full-scale IQ were 86.46 ± 11.55, 96.39 ± 9.96 and 89.25 ± 10.43 points, respectively. No differences were found in subscales and full-scale IQ between anemic and non-anemic children, nor in hemoglobin and hematocrit concentration between normal and low IQ groups. However, it was observed positive correlation of tertiles of hematocrit level with the classification of manipulative IQ (extremely low, borderline, low average, etc.). In addition, the manipulative and full-scale IQ were directly related to hemoglobin concentration tertiles.

Conclusions: A higher hemoglobin and hematocrit concentration is related to an elevated cognitive performance, in preschool children of Andean region of Ecuador.

Keywords: Cognitive development; intelligence quotient; hemoglobin; hematocrit; anemia.

SOCIAL AND ECONOMIC CORRELATES OF BMI AND HFA Z-SCORES AMONG FILIPINO ADOLESCENTS

[1]Padilla, Lowela; [2]Melse-Boonstra, Alida; [3]Ferrer, Eldridge; [4]Barba, Corazon; [5]Feskens, Edith.

[1]MSc. PhD Candidate. Division of Human Nutrition and Health. Wageningen University & Research. The Netherlands.; [2]PhD. Assistant Professor. Division of Human Nutrition and Health. Wageningen University & Research. The Netherlands; [3]MSc. Science Research Specialist. Food and Nutrition Research Institute. Philippines.; [4]PhD. Professor Emeritus. Institute of Human Nutrition and Food. University of the Philippines Los Banos. Philippines.; [5]PhD. Professor. Division of Human Nutrition and Health. Wageningen University & Research. The Netherlands.

Background and objectives: Adolescence is a period that provides an opportunity to address problems from early life. Yet, available information on adolescents are scarce, usually limited to sexual & reproductive health and often not disaggregated by sex, age, and other factors. This study aimed to establish the association of BMI and HFA Z-scores among male and non-pregnant, non-lactating female Filipino adolescents. Additionally, to characterize the pattern of growth of male and non-pregnant, non-lactating female Filipino adolescents.

Methods: This research is a cross-sectional secondary data analysis of the adolescent (10.0-19.0 years; n=33,404) data from the 2011 Updating of Nutritional Status of Filipino Children and other Population Groups conducted by the Food and Nutrition Research Institute (FNRI). Selection of social, economic factors in the dataset for inclusion in the analysis was determined a priori based on empirical data as well as those found associated with HFA and BMI Z-scores during bivariate correlations. Associations with Z-scores were determined through multiple linear regression.

Results: Among male and non-pregnant, non-lactating female Filipino adolescents, stunting rates decreased from pre-pubertal to pubertal stage and reverted back to even higher levels before puberty (M:38.5%-36.0%-39.1%; F:35.3%-30.4%-35.0%). An overall decreasing trend was observed for thinness (M:13.5%-9.7%-6.5%; F:15.0%-16.4%-12.6%) and overweight (M:7.2%-5.9%-6.8%; F:9.1%-5.8%-5.0%) as the Filipino adolescent grew older. Wealth index had the highest correlation with HAZ (r=.305, p<.01) as residence locality is for BAZ (r=.125, p<.01) according to bivariate correlations. After controlling for covariates in multiple linear re-

gression, household size showed consistently negative association with z-scores in both physiologic categories. Other strong predictors of z-scores were belonging to the richest quintile and being a widow/widower. Apart from educational attainment of household head and wealth index, there were no other clear trends observed in the associations of the different parameters to the z-scores.

Conclusions: The results of this study underscores the need to improve nutritional status prior to the onset of puberty to maximize vertical growth. On the other hand, interventions focused on sustaining nutritional gains during the post-pubertal stage should be similarly implemented without compromising BMI. Providing interventions that lead to improvement in wealth is a good place to begin with.

Keywords: Adolescent Nutrition, Filipinos, HAZ, BAZ

ASSESSMENT OF MALNUTRITION RISK AND NUTRITIONAL STATUS OF OLDER PEOPLE AT HOSPITAL ADMISSION

[1]Núñez, Iliana; [1]Gómez, Milagros; [2]Rios, Israel.

[1]Nutritionist. Nutrition and Dietetic Department. Medicine School. University of Panama. Panama city. Panama.; [2]MSc. Nutritionists. Nutrition and Dietetic Department. Medicine School. University of Panama. Panama city. Panama.

Background and objectives: Introduction: Malnutrition in the elderly is of multicausal origin even in hospitals. Objective is to evaluate the nutritional status and risk factors of older adults admitted to the geriatric acute ward of Irma De Lourdes Tzanetatos Hospital (ILTH).

Methods: Methodology: Observational, analytical and transverse study in 94 patients admitted to the geriatric ward of Irma De Lourdes Tzanetatos Hospital. Data were collected from January to March 2016. Included anthropometric measurements, nutritional risk screening according to Mini Nutritional Assessment (MNA), clinical and hospital data, Barthel Index and Charlson Comorbidity (CC); Biochemical data and sociodemographic information. Multivariate logistic regression was used to determine risk factors associated with malnutrition.

Results: Of the 94 patients, 51 (54%) were female, mean age 77.9 ± 8.2 years; 39.4% had cardiovascular disease admission diagnosis, 35.1% presented severe functional disability, 95.8% severe lean mass, according to the arm muscle area (AMA). According to MNA, 50.0% were malnourished; according to BMI, 54.2% were in the low weight category; And according to the CC, 45.7% with high comorbidity. Barthel's index, schooling, triceps skin fold (TSFmm) and arm circumference (ACcm) were significantly associated (R2 = 0.61) with an increased risk of malnutrition according to MNA (OR = 46.5, p = 0.001, OR = 13.8, p = 0.009, OR = 0.78, p = 0.005, OR = 0.73, p = 0.046, respectively). For nutritional status according to BMI, Barthel's index and pre-albumin were significantly associated (R2 = 0.43) with low weight (BMI <23kg / m2), (OR = 14.3, p = 0.003 and OR = 0, 91, p = 0.024, respectively).

A second model to determine low-weight risk according to BMI showed a significant association (R2 = 69) with TSFmm, ACcm, pre-albumin and number of drugs in use (OR = 0.78, p = 0.010, OR = 0.51, P = 0.000, OR = 0.92, p = 0.043, OR = 0.65, p = 0.045, respectively).

Conclusion: Barthel's Index, schooling level, triceps skin fold and arm circumference were associated with an increased risk of malnutrition. Barthel's index, prealbumin, skin fold of the triceps, arm circumference and number of drugs are associated with low weight according to BMI.

Keywords: Older adults, malnutrition, MNA, anthropometry.

Magister in Clinical Nutrition. Faculty of Medical Sciences. University Catholic of Santiago of Guayaquil. Ecuador.; [5]Nutritionist. Faculty of Medical Sciences. University Catholic of Santiago of Guayaquil. Ecuador.; [6]Biologist. Institute of Biomedicine. University Catholic of Santiago of Guayaquil. Ecuador.; [7]Nutritionist. Faculty of Medical Sciences. University Catholic of Santiago of Guayaquil. Ecuador.

Background and objectives: Obesity is a major health problem shown to be associated with a pro-inflammatory state. Adipocyte dysfunction results in the expression of pro-inflammatory mediators which, in turn, contribute to the development of chronic inflammation states. We documented the serum levels of leptin and their association with markers of systemic inflammation in obese children.

Methods: Cross-sectional study of 46 scholar children (Boys: 45,7%). BMI, waist circumference and body fat percentages were obtained by means of anthropometric and bioimpedance techniques. Leptin, fibrinogen and C-reactive protein measurements were made by recommended analytical protocols in fasting blood samples.

Results: Average BMI was 23,28 ± 4,39 kg/m2. Only 6.5% of the children had elevated CPR values. In sharp contrast with this finding, leptin values were increased in 93,5% of them.

Conclusions: Obesity is associated with increased leptin values. This finding confirms the presence of a state of insulin resistance resulting from adipocyte dysfunction. The increase in leptin values precedes the rise of inflammation markers that will eventu-

---

ally lead to endothelitis and atherosclerosis. Obese children are at high risk of cardiovascular disease.

THE VARIETY AND DIVERSITY OF THE DIET OF BREASTFED INFANTS AND YOUNG CHILDREN FROM THE PROVINCE OF BAJA VERAPAZ IN GUATEMALA IS LOW

[1]*Montenegro-Bethancourt, Gabriela;* [2]*Garcia-Meza, Rosario;* [3]*Gonzalez, Wendy;* [4]*Vossenaar, Marieke;* [5]*Solomons, Noel W.*

[1]PhD. Researcher. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala; [2]MA. Researcher. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.; [3]PhD. Monitoring, Learning and Research. Global Alliance for Improved Nutrition (GAIN). Switzerland.; [4]PhD. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.; [5]MD. Director. Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala.

Background and objectives: The WHO recommends exclusive breastfeeding for 6 months, followed by the progressive introduction of safe, nutritious and appropriate complementary foods (CF). Qualitative research in the province of Baja Verapaz indicates both premature and delayed introduction of CF. We aimed to assess the dietary variety and diversity of CF offered to infants and young children (IYC) aged 6 to 23 months old in this setting.

Methods: Convenience samples of IYC aged 6-8 months (n=6), 9-11 months (n=9) and 12-23 months (n=13) were derived from distinct sites and ethnicities across the province of Baja Verapaz. We aim to increase the sample size to 100 in the near future. IYC diets were assessed by means of previous-day dietary recalls collected from mothers. Dietary diversity among breastfed infants was computed using the WHO food groups which include: (i) grains, roots and tubers, (ii) legumes and nuts, (iii) dairy products (milk, yogurt, cheese), (iv) flesh foods (meat, fish, poultry and liver/organ meats), (v) eggs, (vi) vitamin-A rich fruits and vegetables and (vii) other fruits and vegetables. Dietary variety was calculated by adding all food items mentioned within these food groups; non-nutritive beverages and food were not included.

Results: Most IYC had been breastfed the day of the interview (n=23, 82%) and all breasted infants were receiving CF. The most commonly consumed foods were corn-dough tortilla (consumed by 19), banana (n=9), rice (n=8), sweet bread (n=7) and Incaparina® gruel (n=7). IYC consumed a median of 5 food and beverage items, and dietary variety ranged between 2 and 9. Median dietary diversity was 3, and ranged between 1 and 6 food groups. Median dietary diversity was 2, 3 and 3 at for IYC aged 6-8, 9-11 and 12-23 months, respectively. Only 4(14%) of breastfed IYC consumed a minimum dietary diversity, as recommended by the WHO.

Conclusions: No instance of protracted EBF was documented in the 6-8 month period. However, the variety and diversity of CF offered to IYC in Baja Verapaz is alarmingly low and unlikely to be nutritionally adequate. Further investigation into the quality of the diet of IYC is merited.

Keywords: infant and young child feeding, minimum dietary diversity, dietary variety, human milk, Guatemala

BREASTFEEDING AND PRESCHOOL CHILDREN INTELLIGENCE QUOTIENT IN RURAL HIGHLANDS IN ECUADOR

[1]*Díaz Silva, Alicia Virginia;* [2]*Cando Pilatuña, Rosario Isabel;* [3]*Guerendiain Margni, Marcela Esther.*

[1]Psychologist. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.; [2]MSc. Psychologist. School of Clinical Psychology. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.; [3]PhD. Nutritionist. School of Medicine. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.

Background and objectives: The nutrition during the early stages of life, is essential for an adequate neurological development. Beneficial effects of breast milk were reported even in preterm infants. Thus, our objective was to analyse the relationship between breastfeeding and intelligence quotient in children from a rural school in Chimborazo.

Methods: The study included 37 children, belonging to EV-ANES project, aged 5 to 6 years, from San Juan primary school, in Chimborazo, Ecuador. They were assessed using the Wechsler Preschool and Primary Scale of Intelligence (WPPSI™). A survey to parents was applied to identify the duration of exclusive breastfeeding and age of weaning. The breastfeeding parameters were divided into quartiles (Q1: ≤5, Q2: 6-6; Q3: 7-9 and Q4: >10 months, for exclusive breastfeeding, and Q1: ≤12, Q2: 13-18; Q3: 19-24 and Q4: >25, for weaning age). The verbal, manipulative and total intelligence quotient (IQ) was classified as extremely low (<70), borderline (70-79), low average (80-89), average (90-109), high average (>110) and superior (>120). Data analysis was performed by applying Chi-square test. Differences were considered significant at $p < 0.05$. This study was conducted in accordance to the ethical rules of the Declaration of Helsinki and was approved by the Ethic Committee of the San Francisco de Quito University.

Results: The means of total, verbal and manipulative IQ scores were 89.25 ± 10.43, 86.46 ± 11.55 and 96.39 ± 9.96, respectively. Likewise, the value of duration of exclusive breastfeeding

was 7.61 ± 4.34 months and the age of weaning was 17.89 ± 6.28 months. The manipulative IQ registered three levels, low average, average and high average, and there were no extremely low, borderline and superior scores. When we compared the quartiles of duration of exclusive breastfeeding according to the classification of intelligence quotient, it was observed that the average manipulative IQ was more frequent in the higher quartiles, and the low average level in Q1 (p=0.039). Although, no differences for weaning age were found.

Conclusions: The duration of exclusive breastfeeding may be a key factor in cognitive development of preschool children. However, further studies are required since other environmental factors could be influencing the results.

Keywords: Breastfeeding; cognitive development; intelligence quotient; preschool children; highlands.

ASSOCIATION BETWEEN HOUSEHOLD FOOD SECURITY AND INFANT FEEDING PRACTICES IN URBAN INFORMAL SETTLEMENTS IN, KENYA

[1]Njoki, Teresia; [2]Ochola, Sophie; [3]Mutua, Martin; [4]Kimani-Murage, Elizabeth.

[1]BSc. Research Officer. Health Program. African Population and Health Research Center. Kenya.; [2]PhD. Senior Lecturer and Chairman. Foods Nutrition and Dietetics department. Kenyatta University. Kenya.; [3]Msc. Data Analyst. Health Program. African Population and Health Research Center. Kenya.; [4]PhD. Research Scientist. Health Program. African Population and Health Research Center. Kenya.

Background and objectives: Studies in the urban informal settlements show widespread inappropriate infant and young child feeding (IYCF) practices and high rates of food insecurity. These together with unique challenges with regards to child survival in these settings has led to widespread and persistent under-nutrition rates. Globally, few studies have explored the linkage between food security and infant feeding practices. This study assessed the association between household food security and IYCF practices in two urban informal settlements in Nairobi, Kenya.

Methods: The study adopted a longitudinal study design that involved a census sample of 1110 children less than 12 months of age and their mothers aged between 12-49 years. A researcher-administered questionnaire was used to collect information on infant and young child feeding practices (initiation of complementary foods, dietary diversity, frequency of feeding and minimum acceptable diet); household food security; maternal demographic and socio-economic characteristics. Logistic regression was used to determine the association between food insecurity and IYFC practices having controlled for maternal demographic and socio-economic characteristics as these may influence IYFC practices.

Results: The findings showed high household food insecurity as only 17.4% of the households were food secure. Infant feeding practices were inappropriate; 41% of the children attained a minimum dietary diversity; only 27% attained minimum acceptable diet and 76% attained minimum meal frequency. With the exception of the minimum meal frequency, adjusted logistic regression findings showed that infants living in food secure households were significantly more likely to achieve appropriate infant feeding practices than those in food insecure households: minimum meal frequency (AOR 1.26, p= 0.530); minimum dietary diversity (AOR 1.84, p= 0.046) and minimum acceptable diet (AOR 2.35, p= 0.008).

Conclusions: The present study adds to the body of knowledge by showing how household food security relates to infant feeding practices in low-income settings. The findings imply that interventions aimed at improving infant feeding practices and ultimately nutritional status need to also focus on improving household food security.

Keywords: Infant feeding practices, household food security, urban informal settlements, complementary feeding

Background and objectives: Iron-deficiency is the most common nutritional deficiency globally. Due to the high iron requirements, it is highly prevalent and severe in pregnant women. Our objective was to evaluate if iron-folic acid supplementation starting in the first trimester of pregnancy and sustained throughout pregnancy reduces neonatal mortality.

Methods: We conducted a community based, cluster randomized controlled trial in five districts in Dhaka Division, Bangladesh with a combined population of >10 million. In the intervention clusters trained BRAC village volunteers identified pregnant women and provide consenting women with capsules (Eskayef Bangladesh Ltd) containing 60 mg of elemental iron and 400μg of folic acid. We measured ground water iron levels in all study households using a validated test kit [±0.1 mg/L, HACH Iron Test kit, Model IR-18B]. We compared the neonatal mortality rates and their 95% confidence intervals adjusted for clustering in each ground water iron-level group. We used Cox proportional hazards mixed models for mortality outcomes and include ground water iron level as an interaction term in the mortality model.

Results: We recruited a total number of 36,532 pregnant women. Overall the enhanced distribution of iron/folic acid did not reduce neonatal mortality (HR 0.94, 0.78 to 0.1.12, P=0.521). However in sub-population with low ground water iron levels, iron/folic acid significantly reduced risk of neonatal mortality by 42% (HR 0.58, 0.37 to 0.90, P=0.015). Neonatal mortality was not reduced in sub-populations with medium (HR 1.05, 0.83 to 1.32…., P=0.671) or with high ground water iron levels (HR 1.01, 0.74 to 1.38, P=0.940).

Conclusions: In rural populations in Bangladesh where the ground water iron level is less than 0.5 mg iron/L, early antenatal supplementation with iron/folic acid approximately halved neonatal mortality compared with the usual program. This effect was removed with ground water iron levels of >0.5 mg iron/L. Our results indicate a causal role of iron in reducing neonatal mortality in deficient populations. Overall pregnant women in developing countries need sufficient doses of iron in nutrient supplements to maximize reductions in neonatal mortality.

Keywords: iron-folic acid, first trimester , pregnancy, neonatal mortality, ground-water iron

Background and objectives: High intake of added sugar (AS) is a public health concern due to its association to many diseases. The present study aims to identify the amount and main sources of AS in the Argentine population

Methods: Data were obtained from 1266 Argentines participating in Latin American Health and Nutrition Study (ELANS), a multicenter study of a nationally representative randomized sample of urban population of eight LA countries between November 2014 and July 2015. Data from two face to face 24-hour recall (separated by 5 days) were used to identify the intake of the major foods and beverages containing AS. The weighed-proportions formula developed by Block et al (1985) in which the relative contribution (RC) of a given food item/food group is defined as: RC=(Total AS grams from a food item x 100)/Total AS grams from all food items was used, and performed by age, gender, socioeconomic level (SEL) .Descriptive statistical data analysis was performed with SPSS 20.

Results: Median consumption of AS was 80,6 g /day, 15% of total energy (TE). The Sugar Sweetened Beverages (SSB) grouped were the highest contribution of AS intake (76.3%). The foods contributed with 23.7%. Soft drinks (SD) (34.5 %) infusions (27.8%) juice dry mix (7.9%) juice RTD (4.7%), other beverage (1.4 %). In women 32% of the AS was added to the infusions and 28.7% was in SD, while in men, less AS was added to Infusions 24.2% but brings in SD 39.4%. The AS from infusions, increased by age in women (23.8% in 15 to 19y until in 36.7% in 50-65y) in adolescents SD provided 37.2% (41.1% in men and 28.1% in women). In low SEL women, the infusions provided 37.2% of the AS and mainly based on mate (30%) while in men of high SEL the SD raise up to 48.5%.

Conclusions: In Argentina, the consumption of Added Sugars comprised 15% of TE and the main sources are SSBs. In men, main source of AS are soft drinks and the infusions are in women. A local consideration is the proportion of AS coming in mate (19.5%).

Nutritionist. Nutrition and Health Area. International Life Science Institute (ILSI). Buenos Aires. Argentina.

Background and objectives: High fat diets, especially saturated fat is associated with cardiovascular disease. The present study aims to identify the consumption and main food sources of fats in the Argentine's diet.

Methods: Data were obtained from 1266 Argentines participating in the Latin American Health and Nutrition Study (ELANS), a multicenter study of a nationally representative randomized sample of urban population of eight LA countries between November 2014 and July 2015. Data from two face to face 24-hour recall were used to identify the intake of the major foods containing fats. The weighed-proportions formula developed by Block et al (1985) in which the relative contribution (RC) of a given food item/food group is defined as: RC=(Total fat grams from a food item x 100)/Total fat grams from all food items was used, and performed by age, gender, socioeconomic level (SEL). Descriptive statistical data analysis was performed with SPSS 20

Results: The median of energy intake (EI) was 2154 kcal/day (2434 kcal/day in men and 1911 kcal/day in women). Median fat intake was 78.8 g/day representing a 33% of the daily EI, while saturated fats was 27.4 g/day (11.4 % of the EI). Five food groups were identified as major sources of fats: the oils and fats (O&F) (30.4%), meats (27.2%), bakery products (13.6%), dairy (13.3%) and pizza (7.1%). Meats as a source of fats increased with age from 23% (15-19y) to 30.9% (50-65y), becoming the first source in men of 50-65 y. Inversely, the percentage of total fats from dairy and O&F is slightly higher in women than in men. Differences in the source of fats are found comparing low with high SEL: more proportion of fat from meat (27.5% and 21.6% respectively) and O&F (31.5 and 21.6% respectively) in low SEL and higher fats from pizza in high SEL compared to low (16.4 and 8.7 % respectively). No differences were found by BMI.

Conclusions: Argentine identity includes high proportion of fats coming from meats & animal fats, oils, bakery products, and/ or pizza. Public health interventions reinforcing other cultural options based on drivers of food choice could be beneficial.

Keywords: Fats intake, sources of fats, Argentine population

University of São Paulo. Brazil.

Background and objectives: Scientific evidence shows relationship of chronic inflammation, elevated cardiometabolic biomarker levels and quality of life (QoL). This study verified associate of elevated inflammatory and cardiometabolic biomarker levels, in older adults with impaired quality of life, in different domains.

Methods: Cross-sectional population-based study (SABE Study), including older adults (≥ 60 years-old). The inflammatory and cardiometabolic biomarkers used were uric acid, fibrinogen, C-reactive protein serum levels e glycated hemoglobin, fasting blood glucose, triglycerides and cholesterol, respectively, determined using sensitive regular immunoassays (ELISA). QoL was assessed using the SF12 questionnaire. Socio-demographic information and health conditions used as control variables were: sex, age and educational level; number of non-communicable diseases, self-reported conditions (chronic pains, hypertension, diabetes and cardiovascular disease), functional capacity, body mass index and waist circumference, respectively, determined using specific questionnaire. Multiple logistic regression was used to analyze this association.

Results: From the 1.344 older adults, 1255 were eligible to be part of this study. There was no association of uric acid, fibrinogen, fasting blood glucose, triglycerides and cholesterol with QoL. Older adults with one or more chronic diseases (OR =1.75, p = 0,000), hypertension (OR =2.35; p = 0,000), BMI higher than 30kg/m2 (OR =2.25, p = 0,000), high levels of CRP (OR =2.85, p = 0,000) and glycated hemoglobin (OR =1.31, p = 0,000), were associated with low values in the physical domain of SF12.

Conclusions: The joint associations elevated inflammatory and cardiometabolic biomarker levels have a significant and negative effect on physical domain of quality of life in older adults, demonstrating the importance of control of these biomarkers for better physical well-being.

Keywords: quality of life; chronic inflammation; older adults; cardiometabolic biomarker.

MOTHERS AND CHILDREN: ARE THEIR DIET'S RELATED? RESULTS OF MINISALTEN STUDY

[1]Zonis, Luciana Noemi; [2]De Gregorio, Maria Jose; [3]Indart Rougier, Paula; [3]Favieri, Andrea Lorena; [4]Rausch Herscovici, Cecile; [5]Kovalskys, Irina.

[1]BSc. Nutritionist. Nutrition and Health Area. ILSI Argentina (International Life Sciences Institute). Buenos Aires. Argentina.; [2]BSc. Sociologist. Department of Anthropological Sciences. University of Buenos Aires. Argentina.; [3]BSc. Nutritionist. Nutrition & Health Area. ILSI Argentina (International Life Sciences Institute). Buenos Aires. Argentina.; [4]PhD. Nutrition & Health Area. ILSI Argentina (International Life Sciences Institute). Buenos Aires. Argentina.; [5]MD. Nutrition & Health Area. ILSI Argentina (International Life Sciences Institute). Buenos Aires. Argentina.

Background and objectives: Children's diet composition could be influenced by many factors and It is supposed that mothers have a crucial role during the first years of life. The aim of this study was to determine the relationship between mother's diet and their first grade children.

Methods: The present analysis comprises the baseline assessment (June to November 2015) of the MiniSALTEN Study (an obesity prevention program). All children attending first grade of 12 Buenos Aires Public schools and their mothers were invited to participate. For both mothers (M) and children (CH) were measured: weight and height. A 24 hour recall was collected in a face to face interview with mothers to assess their diet and her kid's. Children's intake was completed with observational information at school. Intake data were entered and analyzed with NDS-R, Nutrition Data System. BMI Z score calculated (WHO 2007). Descriptive statistical data analysis was performed with SPSS 14.0 for Windows. Pearson correlation was calculated between M and children's intake.

Results: Final sample was composed by 188 dyads. Children's mean age was 6.68 y. Prevalence of overweight was 26,3 % and obesity 22 %. Pearson correlations between M and children´s diets were the following: Saturated fats r = 0.481, Total fat r= 0.471, Monounsaturated r= 0.448, Polyunsaturated r= 0.416 and Energy r= 0.359. Both diets were well balanced in macronutrients distribution. M: 52%, 16% and 32% of total energy and CH: 54%, 15% and 31% of total energy. Median total kcals a day were 1682.3 kcals/d (SD 656.3) and 1797 kcals/d (SD 591.7) M and CH respectively. In both cases, saturated fats were 12% of the total energy but more added sugars were part of children diets: 18.4 % and 14.4 % respectively. Additionally, fiber was much more present in mother's diets than in their children (22.4 g and 12 g/d respectively).

Conclusions: Although significant correlations were found between both diets in saturated, total fat and monounsaturated fats, children's diet is higher in added sugars, total energy and lower in fiber than their mothers.

Keywords: Children's intake, Mother's diet, Fats, Total calories, Added sugars

ENERGY, PROTEIN AND CARBOHYDRATE INTAKE IN RELATION TO ANTHROPOMETRIC PARAMETERS AT DIFFERENT MEALTIMES IN CHILDREN OF EVANES STUDY

[1]Mayorga Mazón, Clara de las Mercedes; [2]Monzón Rodríguez, Allyson Natalie; [2]Ligerini Vázquez, Lorena Johana; [2]Menendez Blanco, Cintya Yanella; [3]Guerendiain Margni, Marcela Esther.

[1]MSc. Nutritionist. School of Nursing. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.; [2]Nutritionist. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.; [3]PhD. Nutritionist. School of Medicine. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.

Background and objectives: Indigenous communities, especially in rural regions, are more vulnerable to malnutrition. In rural schools of Ecuador, a fortified collation is provided to children, consisting of biscuit and colada, a typical drink, which is prepared using a flour mixture (quinoa, bean, peas and corn). Hence, our objective was to compare the association between anthropometric parameters and energy, protein and carbohydrate intake at different mealtimes in children from a rural school in Andean region.

Methods: It was included 100 schoolchildren (7.8±2.17 years) from San Juan (indigenous community), Chimborazo, Ecuador, belonging to EVANES study. Dietary intake was evaluated at each mealtime (breakfast, mid-morning collation, lunch, mid-afternoon collation and dinner) using a nutritional survey. Energy, protein and carbohydrate consumption was determined from the corresponding standard portion size, transforming the data into gr or ml, and using food-composition tables from Ecuador. Weight and height were measured in duplicate, and body mass index [BMI, weight (Kg)/height (m)2] was calculated. Standard deviation score of height and BMI were determined, applying the AnthroPlus software, which is based on Child Growth Standards of Word Heath Organization (2007). Data analysis was performed using SPSS, version 20.0, considering statistical significant differences at p<0.05.

Results: No statistically significant relationship were found between anthropometric parameters and energy, protein and carbohydrate intake at breakfast, lunch and mid-afternoon collation. The most important results were observed at the mid-morning collation, which is provided at the school, where the colada is made with fortified flour. At this mealtime, the energy, protein, and carbohydrate intake was inversely related to weight, BMI and standard deviation score of BMI (p<0.05). On the contrary, a positive association was found between weight and caloric and protein consumption (p=0.033) at dinner.

Conclusions: The energy and nutrient intake is related to anthropometric parameters only at school collation and dinner. Our findings prove that, at school, the children who have lower weight and BMI receive more energy, protein and carbohydrates than those with better nutritional status. But, at home, specifically at dinner, the children who intake more energy and protein are the ones with the higher body weight.

Keywords: Energy intake; nutrient intake; anthropometric parameters; mealtimes; children.

WOMEN'S DIETARY DIVERSITY IN BANGLADESH: COMMUNITY-LEVEL PATHWAYS THROUGH WOMEN'S EMPOWERMENT

[1]Sinharoy, Sheela; [2]Waid, Jillian; [3]Gabrysch, Sabine; [4]Yount, Kathryn M.; [5]Haardoerfer, Regine.

[1]MPH. PhD Candidate. Nutrition and Health Sciences Program. Emory University. USA.; [2]MSW. Director of Research, Learning, and Evaluation. Helen Keller International. Bangladesh.; [3]PhD. Unit Head, Epidemiology and Biostatistics. Institute of Public Health. Heidelberg University. Germany.; [4]PhD. Professor. Hubert Department of Global Health. Rollins School of Public Health. Emory University. USA.; [5]PhD. Assistant Professor. Department of Behavioral Sciences and Health Education. Rollins School of Public Health. Emory University. USA.

Background and objectives: A majority of women in Bangladesh consume inadequately diverse diets, but the influence of aggregate-level, contextual factors on women's diets is unknown. We examined whether community-level factors, including measures of women's empowerment, influenced women's dietary diversity through direct and indirect pathways.

Methods: We collected panel data in three rounds from urban and rural samples in Bangladesh between February 2015 and October 2016. We collected data on diet, women's empowerment, years of schooling, and household wealth and other demographics from 422 urban and 698 rural households. The urban sample was representative of the poorest three deciles of neighborhoods in Dhaka City Corporations, and the rural sample comprised the control arm of a cluster-randomized controlled trial in Habiganj District. We used exploratory factor analysis, confirmatory factor analysis, and multilevel structural equation modeling to examine relationships between socio-demographic characteristics, measures of women's empowerment, and dietary diversity at the community level.

Results: In our sample, 79% of urban women and 85% of rural women consumed inadequately diverse diets. Factor analysis resulted in three latent variables for women's decision-making, voice with

husband, and freedom of movement. We observed a strong positive association between schooling and dietary diversity at the individual level (β=0.224, p<0.001) but no association at the community level. Schooling was not associated with the community-level latent variables for decision-making, voice with husband, and freedom of movement. However, the disparity in years between a husband's and wife's completed grades of schooling was significantly associated with women's decision-making (β=0.18, p=.002), voice with husband (β=0.12, p=.008), and freedom of movement (β=0.41, p=.033) at the community level. None of these latent variables were associated with dietary diversity at the community level.

Conclusions: This is the first use of multilevel structural equation modeling to examine community-level pathways related to nutrition. The disparity between women's schooling and that of their husbands was associated with all three measures of women's empowerment, suggesting that important relationships may exist at the community level. Further research is needed to better understand the contextual factors influencing women's diets in urban and rural Bangladesh.

Keywords: community-level, contextual, multilevel, women's nutrition, diet

SERUM PROTEINS AND NUTRITIONAL STATUS IN SCHOOLCHILDREN FROM A RURAL SCHOOL IN YARUQUÍES, CHIMBORAZO

[1]Miño Orbe, Patricia Azucena; [2]Robalino Flores, Ximena del Rocío; [2]Balladares Saltos, Aida Mercedes; [3]Guerendiain Margni, Marcela Esther.

[1]MSc. Pharmaceutical Chemistry. School of Clinical Laboratory. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.; [2]MSc. Laboratory Technician. School of Clinical Laboratory. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.; [3]PhD. Nutritionist. School of Medicine. Metabolism and Nutrition Disorders research group. Faculty of Health Sciences. National University of Chimborazo. Riobamba. Ecuador.

Background and objectives: The malnutrition is one of the most prevalent problems in underdeveloped countries, which is associated with poverty. Chimborazo is the poorest province in Ecuador, mainly, in rural communities, which are often indigenous. Those populations, are highly vulnerable from a socioeconomic and nutritional point of view. Thus, our objective was to evaluate the nutritional status of children from a rural school, and to explore the association with serum proteins.

Methods: A cross-sectional descriptive study was conducted in ninety-five children (EVANES project), from a rural school in Yaruquíes, Chimborazo. The anthropometric evaluation was performed using standard deviation score of height and BMI, according to Child Growth Standards of Word Heath Organization

(WHO, 2006 and 2007). It was applied the WHO Anthro and AnthroPlus software. Weight and height were measured in duplicate, and body mass index [BMI, weight (Kg)/height (m)2] was calculated. Blood samples were collected by venipuncture. Concentration of total proteins, globulins and albumin was determined. The serum proteins were divided into tertiles. Data analysis was carried out using SPSS software, version 22.0. Statistical significant differences were considered at p<0.05. To stablish the relationship between ordinal variables, the Spearman test was applied, and, to determine differences in quantitative parameters, the one-way ANOVA, corrected by Bonferroni, was used.

Results: The mean of age was 8.36±2.45 years. Only 1.1% of children were undernutrition, 9.5% overweight and 2.1 obesity. On the other hand, the 47.4% of them were stunting. The tertiles of globulins were inversely related to nutritional status determined from the BMI for age, but not to height for age. When the anthropometric parameters were compared according to tertiles of serum proteins, it was observed that the weight and height were lower in tertil 3 of globulins than tertil 2. Also, the standard deviation score of height was higher in tertil 2 compared to tertil 1 of the same protein. No statistically significant differences were found with the other parameters.

Conclusions: The main problem detected in Yaruquíes, a rural community in Chimborazo, was stunting. Only globulins were related to anthropometric parameters. Further studies are required to identify causes and consequences of nutritional status.

Keywords: Serum proteins; nutritional status; children

IMPACT OF SMS TEXT MESSAGES TO IMPROVE EXCLUSIVE BREASTFEEDING AND REDUCE OTHER ADVERSE INFANT FEEDING PRACTICES IN YANGON, MYANMAR: A RANDOMIZED CONTROLLED TRIAL

[1]Hmone, Myat Pan; [2]Li, Mu; [3]Agho, Kingsley; [4]Dibley, Michael.

[1]School of Public Health. Sydney Medical School. Univesity of Sydney. Australia; [2]Professor,Sydney School of Public Health. University of Sydney. NSW 2006. Australia.; [3]Senior Lecturer ,School of Science and Health. Western Sydney University. NSW 2571. Australia.; [4]Professor in Global Public Health Nutrition. Sydney School of Public Health. Sydney Medical School. The University of Sydney. Australia.

Background and objectives: Myanmar has a low exclusive breastfeeding (EBF) rate at 24% and 15% for children under six and at six months. Objective is to implement and evaluate the impact of a SMS intervention on the breastfeeding practices as a first time in Myanmar.

Methods: A two-arm parallel randomized controlled trial with monthly follow-up phone calls between 1-6 months post-delivery was conducted in January-December 2015 at Central Women's Hospital, Yangon, Myanmar. A total of 353 pregnant women, who were 24-38 weeks of gestation with singleton uncomplicated pregnancy, literate and owned a mobile phone, were recruited and randomly as-

signed to intervention or control groups. The intervention group received breastfeeding promotion SMS and the control group received other maternal and child health care SMS from recruitment to six months postpartum. We hypothesized that the EBF rate in the intervention infants would be double that of the control infants at six months. We defined EBF as giving only breastmilk, not even water except medicines. Data was analyzed by intention to treat principle. Poisson regression analysis with generalized estimation equations (GEE) was used to adjust for within person correlation and the effect of time, group and group by time interaction as covariates.

Results: The intervention significantly improved the EBF rate (43% vs 15%; Relative Risk (RR), 2.83; 95% confidence interval (CI), 1.85,4.33), current breastfeeding rate (RR 1.17; CI, 1.08-1.26) and reduced bottle feeding (RR 0.30; CI, 0.17,0.54) and complementary feeding (RR 0.72; CI, 0.52-0.99) among infants at six months and predominant breastfeeding (RR 0.90; CI, 0.60,1.36) at four months. For the overall follow-up period, the SMS intervention significantly reduced acute lower respiratory illness (RR 0.95; 95% CI, 0.91,0.98; P<0.005) and diarrhea (RR 0.95; 95% CI, 0.91,0.99; P<0.008) compared to the control group. Subgroup analysis showed the intervention had a higher effect on women with low breastfeeding knowledge, low self-efficacy to breastfeed and no intention to EBF at recruitment.

Conclusions: Use of SMS text messages was effective in promoting EBF and reducing other adverse infant feeding practices in Myanmar. Further research is recommended to assess this intervention model in other settings including rural areas.

VITAMIN A STATUS IN THE THIRD TRIMESTER OF PREGNANCY IN BRAZILIAN AMAZON

(1)Ribeiro Neves, Paulo Augusto; (2)Alzineth Campos, Chiara; (3)Barreto Malta, Maíra; (4)Hatzlhoffer Lourenço, Bárbara; (5)de Castro, Marcia; (6)Augusto Cardoso, Marly; (7)MINA-Brazil Working Group.

(1)PhD candidate. Nutritionist. Department of Nutrition. School of Public Health. University of Sao Paulo. Brazil.; (2)Master in Science candidate. Nutritionist. Department of Nutrition. School of Public Health. University of Sao Paulo. Brazil.; (3)Postdoc fellow. Nutritionist. Department of Nutrition. School of Public Health. University of Sao Paulo. Brazil; (4)Adjunct Professor. Nutritionist. Department of Preventive Medicine. Federal University of Sao Paulo. Brazil; (5)Associate Professor. Demographer. Department of Global Health and Population. Harvard T.H. Chan School of Public Health. USA. ; (6)Full Professor. Nutritionist. Department of Nutrition. School of Public Health. University of Sao Paulo. Brazil.;(7)Department of Nutrition. School of Public Health. University of Sao Paulo. Brazil.

Background and objectives: Vitamin A status during pregnancy has been associated with maternal and child outcomes worldwide, including birth weight, lung function and bone mineralization. The present study describes the predictors of vitamin A status in the third trimester of pregnancy in Brazilian Amazon.

Methods: Prospective study in the urban area of Cruzeiro do Sul, Western Brazilian Amazon. A total of 445 pregnant women, with up to 20 weeks of pregnancy, and who were attending pre-natal care at primary health centers were enrolled in the study. Demographic, socioeconomic, environmental, and clinical characteristics, as well as obstetric history, anthropometric, dietary, and biochemical data were gathered at second trimester of pregnancy (gestational age week: 20.03 ± 2.91). Serum retinol measured by HPLC at third trimester of pregnancy (gestational age week: 27.76 ± 1.61) was the outcome of interest. Multiple linear regression models with hierarchical selection of independent variables were used to evaluate associations with serum retinol. The analysis were adjusted for gestational age at the outcome assessment. Data analysis was performed in Stata 14.0 with $p < 0.05$.

Results: Overall, the following variables explained serum retinol levels at third trimester of pregnancy in the adjusted model (R2-adj=11.22%): menarche age (β: 0.000; 95% CI: 0.000, 0.002), weekly gestational weight gain (β: 0.055; 95% CI: 0.003, 0.141), seasonality (rainy season from November to April: β: 0.018; 95% CI: 0.004, 0.043), weekly consumption of Amazonian carotenoid-source fruits (such as buriti and pupunha) (β: 0.010; 95%CI: 0.000, 0.004), and retinol levels at 16-20 weeks of pregnancy (β: 0.013; 95%CI: 0.001, 0.004) were positively associated; having a smoker at home was negatively associated with the outcome (β: -0.007; 95%CI: -0.027, -0.0001).

Conclusions: In this study, the menarche age, weekly gestational weight gain, the Amazon rainy season and vitamin A status in the mid-pregnancy were predictors of serum retinol levels in the third trimester. Consumption of locally available Amazonian fruits should be encouraged in this population for improving vitamin A status. The passive smoking may play a role on decreasing vitamin A levels as a proxy of smoking exposure in pregnant women.

Keywords: vitamin A; pregnancy; epidemiologic factors; cohort studies; nutritional status.

ASSESSMENTS OF SARCOPENIA AND ITS ASSOCIATED FACTORS IN COMMUNITY-DWELLING MALAYSIAN CHINESE MIDDLE-AGED ADULTS AND ELDERLY

(1)Foo, Leng Huat; (2)Wen, Yin Siew; (3)Abdul Kadir, Azidah.

(1)Universiti Sains Malaysia. Malaysia.; (2)School of Health Sciences, Universiti Sains Malaysia, Health Campus, Kubang Kerian 16150, Kelantan. Malaysia.; (3)School of Medical Sciences, Universiti Sains Malaysia, Health Campus, Kubang Kerian 16150, Kelantan. Malaysia.

Background and objectives: Sarcopenia is considered as an emerging public health problems and challenges worldwide, including in Malaysia, but very limited information concerning the influence of lifestyle factors and blood inflammation levels on

sarcopenia among community-dwelling older populations in Asia. The aim of the present study was to assess the prevalence of sarcopenia and its associated risk factors of body composition, dietary and lifestyle practices and blood inflammation markers in older adults.

Methods: A total of 232 apparently healthy Chinese older adults aged 50 years and above were included in the study. Validated questionnaires were used to assess dietary and lifestyle practices, whereas pro-inflammatory cytokine status was assessed by blood interleukin-6 concentrations (IL-6). Sarcopenia was assessed by diagnostic criteria of the Asian Working Group for Sarcopenia (AWGS).

Results: The prevalence of sarcopenia was 12.5% among these apparently healthy community-dwelling Chinese older adults. A similar pattern of sarcopenia was found between males and females. Multivariate logistic regression analysis showed that older age and higher concentrations of pro-inflammatory cytokine levels of IL-6 were significantly associated with greater risk of sarcopenia, after adjustments of age, gender and body composition levels.

Conclusions: The present findings indicate that older adults aged 70 years and above and higher inflammation levels had significantly greater sarcopenia risk. Hence, effective dietary and lifestyle intervention strategies should emphasize to reduce the inflammation associated with aging in order to prevent the rapid loss of muscle mass and strength that can lead to sarcopenia. Moreover, prospective studies with large sample size are required to further elucidate the natural progression and predisposing modifiable dietary and lifestyle factors associated with rapid loss of muscle mass and strength that consequently leading to sarcopenia.

Keywords: Sarcopenia, inflammatory, interleukin-6, dietary, elderly

SELF-PERCEPTION OF LACTOSE INTOLERANCE AND ITS INFLUENCE ON MILK CONSUMPTION

[1]Murphy, Marcela; [2]Gonzalez, Marcelo; [3]Roldán, Guadalupe; [4]López, Mariela Victoria.

[1]Bachelor of Biological Sciences. Instituto Nacional de Tecnología Industrial, Lácteos. Argentina.; [2]Chemical technician. Instituto Nacional de Tecnología Industrial. INTI-Lácteos. Argentina.; [3]Bachelor in Psychology. Instituto Nacional de Tecnología Industrial. INTI-Lácteos. Argentina.; [4]Bachelor in Nutrition. Instituto Nacional de Tecnología Industrial. INTI-Lácteos. Argentina.

Background and objectives: Lactose intolerance is not a disease; it is a normal physiological condition. However, the strategy of avoiding milk consumption may lead to an unnecessary nutritional risk. The purpose of this study was to evaluate lactose intolerance self-perception and its influence on milk consumption.

Methods: A population of 2170 individuals between 18-83 years old performed an online survey to gather information on frequency of consumption of dairy products and a preliminary self-report on lactose intolerance. Moreover, participants were asked whether they have been diagnosed as lactose intolerant.

Results: 81.5% of the participants reported a frequent consumption of milk, at least 1 glass per day (200 ml). The main reasons given by the participants who do not consume any milk was dislike for the taste of milk (38.5%) or suffering of intestinal discomfort (28%). 9.3% of the population considers that they are lactose intolerant; however most of them (81.0%) have not been diagnosed. Of this group, 24.0% has permanently ceased to consume milk. 5% of the people in this study choose to consume lactose-free milk. Of this percentage, 79% of people who consume it are those who perceive themselves as lactose intolerant without being diagnosed and those who refer that they don´t like regular milk because they suffer intestinal discomfort after consumption without perceiving themselves as intolerant.

Conclusions: People that are diagnosed as lactose intolerant turned out to be the group with the least consumption of lactose-free milk. This leads to an interesting observation regarding the real market of this product that requires further research. Moreover, there is a group that has permanently ceased to include milk in their diets due to a self-perception of being lactose intolerant or a lack of medical diagnosis. This could be a psychological factor that could expose them to an unnecessary nutritional risk.

Keywords: auto-percepción, self-perception, lactose intolerance, milk consumption.

Iran.; [7]PhD student in Food & Nutrition Policy. Department of Community Nutrition. National Nutrition and Food Technology Research Institute. Faculty of Nutrition Sciences and Food Technology. Shahid Beheshti University of Medical Sciences. Tehran. Iran.

Background and objectives: Food choice is a vital and common practice in everyday life that all the people deal with it. In Iran, as a country that experiencing nutrition transition, identifying the aspects, thought and contexts of food choice are necessary to design and investigate trends in the quantity and quality of food consumption. This study aimed to understand the causal process of food choice in Iranian adults.

Methods: a qualitative study was carried out using Grounded Theory approach with thirty-three adults aged 30-64 years who were chosen using purposive sampling with maximum diversity (in terms of age, place of residence and socioeconomic status). An in-depth semi-structured interview was conducted with each subject based on Life course approach to explore participants' current and past eating habits from childhood to adulthood and dietary change at different life courses. Data were analyzed by constant comparative analysis. Interview transcriptions were reviewed and imported into the qualitative software, MAXQDA 11, for open and axial coding. Main themes emerged by integrating the categories which explored from axial coding.

Results: The finding revealed that determinants of food choice in Iranian 30-64-year old adults can be categorized into five main themes:

1) Individual mood, traits and habitus (sub-themes: biological traits, childhood habits, mood, food tendency and physical activity level)

2) Ecologic and environmental characteristics (sub-themes: seasonal and environmental conditions, place of living)

3) socio-cultural determinants (sub-themes: Cultural context and patterns, Social Structure and Norms, Household and Family structure, Information Resources and Media, Transition in Nutrition)

4) Perceived desirability (as core variable with sub-themes: economic possibility, meeting needs and satisfaction of children, health),

5) Food characters and features (sub-themes: sensory aspects of food, food safety, food contents)

Conclusions: Different experiences and periods in people lives, including childhood, adolescence, adulthood, parenthood, work, military service, pregnancy, and marriage could be effective in their food selection(s). Some of these determinants might adjust during the lifespan and affect their personal and social contexts.

RECOMMENDED AND INAPPROPRIATE BEVERAGE INTAKE IN MEXICAN INFANTS AND TODDLERS

[1]Afeiche Zehil, Myriam; [2]Eldridge, Alison; [3]Fries, Lisa R.; [4]Reidy, Kathleen; [5]Villalpando, Salvador.

[1]PhD. Institute of Nutritional Science. Nestlé Research Center. Switzerland.; [2]Institute of Nutritional Science. Nestlé Research Center. Switzerland.; [3]PhD. Institute of Material Science. Nestlé Research Center. Switzerland.; [4]PhD. Nutrition and Regulatory Affairs. Nestlé Nutrition Florham Park. New Jersey. United States of America.; [5]MD. Children's Hospital of Mexico. National Institute of Health. Nestlé Infant Nutrition. Mexico City. Mexico.

Background and objectives: While 94% of Mexican infants receive breastmilk before 6 months, only 14% are exclusively breastfed, and inappropriate beverages are often concurrently given. Recent research among 6-11m shows that 34% are fed sugar-sweetened beverages (SSBs) and cow's milk is introduced to approximately one-third of infants before 12 months of age. The objectives of this study were to examine the consumption of age-appropriate beverages among 0 to 2 years of age Mexicans and to evaluate whether SSBs or inappropriate milks were substituting for age-appropriate milks.

Methods: Dietary intake data were collected via one proxy-reported 24-hr recall in the 2012 Mexican National Health and Nutrition survey among 0-5m (n=182), 6-11m (n=229), and 12-23m (n=538) old. Beverages were classified as breast milk, infant formula, cow's milk, water, 100% fruit juice and SSBs. These categories were then grouped as age-appropriate or age-inappropriate beverages based on national and international feeding recommendations.

Results: While 66% of 0-5m olds exclusively consumed breastmilk and/or infant formula, 30% were concurrently fed water (mean=56g) and/or other age-inappropriate beverages (mean=127g) such as 100% fruit juice, cow's milk, and SSBs.

Among infants 6-11 months, recommended beverages include breastmilk and infant formula, along with the introduction of water and 100% fruit juice. Only 45% of met recommended beverage guidelines. Compared to 0-5m olds, a higher percentage of 6-11m old were fed water (36%), but a large percentage also consumed age-inappropriate beverages, including cow's milk (29%) and SSBs (34%). Infants 6-11m consumed 2.7 times more cow's milk compared to water and nearly the same amount of SSBs compared to water. After 1 year of age, the World Health Organization and the Mexican Norm on Nutrition recommend the consumption of water ad libidum, introduction of cow's milk, a limited amount of 100% fruit juice and SSBs. Among 12-23m olds, 54% consumed milk, 62% consumed SSBs and 45% consumed water.

Conclusions: Many infants and young children are not compliant with Mexican and international complementary feeding recommendations. Communication about the guidelines and parental education on age-appropriate beverage feeding could be improved.

Keywords: complementary feeding, infants, milks, beverages, Mexico

THE MEDIA INFLUENCE ON BODY IMAGE OF BRAZILIAN TEACHERS

[1]Gori, Mariana; [2]Furlan Viebig, Renata.

[1]Master's degree in pediatric. Nutritionist. Centro Universitário São Camilo. Brazil.; [2]PhD in Science. Nutritionist. São Camilo University Center. Brazil.

Background and objectives: Sociocultural influences can influence individuals of all ages, especially women, to desire a slimmer body and they can feel unsatisfied with their bodies. The difference between the actual body and a body which is considered "ideal", can provoke low self-esteem, thus triggering several eating disorders. OBJECTIVE: To evaluate how satisfied teachers in infants and primary private schools of Sao Paulo are with their own body image and analyse their possible messages given to students about health, weight and eating habits.

Methods: It was a transversal study about infant and primary teachers in 4 schools in the city of Sao Paulo. Teachers were submitted to an anthropometric evaluation: weight, height, Body Mass Index (BMI) and body fat percentage. To evaluate the corporal image the Figure Rating Scales by Kakeshita (2009) was translated and validated. The sociocultural attitude questionnaire was applied to check how media can influence the individual's appearance (SATAQ-3) (Amaral, 2011). The present study followed ethical values and was approved by the ethic, research committee at the Centro Universitário São Camilo.

Results: Fifty-five teachers with mean age of 37,49 years old took part in the study. The mean BMI was 26,6Kg/m2 and the average percentage of body fat was 41,9%. Eighty-nine percent of the teachers showed dissatisfaction with their body image, mostly the older ones and with children. Teachers who were more influ-

enced by the media were older, had a higher socioeconomically status and a higher percentage of body fat. It was discovered that the longer the professional period the lower the SATAQ (p=0,030) score.

Conclusions: The results showed a high level of body dissatisfaction of schoolteachers with great influence on social media. It is possible that teachers reveal their dissatisfaction to their students in the classes, as they are behaviour models to them, triggering eating disorders.

Keywords: Teachers. Body image. Eating disorders. Social Media.

Pontificia Universidad Católica de Chile. Chile.; [3]MSc. Department of Public Health. School of Medicine. Pontificia Universidad Católica de Chile. Chile.; [4]MD. PhD. Institute of Nutrition and Food Technology. Chile University. Department of Neonatology. Division of Pediatrics. School of Medicine. Pontificia Universidad Católica de Chile. Chile.; [5]MSc. PhD. Department of Neonatology. Division of Pediatrics. School of Medicine. Biochemist. Pontificia Universidad Católica de Chile. Chile.; [6]Paola Casanello Toledo. MSc. PhD. Department of Neonatology. Division of Pediatrics. Division of Obstetrics and Gynecology. School of Medicine. Pontificia Universidad Católica de Chile. Chile.; [7]José Castro Rodríguez. MD. Division of Pediatrics. School of Medicine. Pontificia Universidad Católica de Chile. Chile.

Background and objectives: The effects of maternal obesity on the metabolic and inflammatory state of their offspring at birth remains to be fully defined. The aim of this study was to compare cord blood levels of insulin, leptin, adiponectin and cytokines in offspring from normal weight and obese mothers, and relate these to maternal and neonatal biological characteristics.

Methods: A group of healthy pregnant women, with BMI >30 kg/m2 (obese) and BMI between 18.5- 24.9 kg/m2(normal weight) at the first trimester of pregnancy and their healthy neonates were recruited at the time of delivery (36 - 41 wks) after signing an informed consent. Umbilical cord blood samples were obtained at birth. The concentration of insulin, leptin, cytokines (Milliplex® Human Cytokine/Chemokine and Human Adipokine, Merck Millipore, Billerica, MA, USA), and adiponectin (ELISA, HMW & Total Adiponectin ELISA. ALPCO, USA) were determined in umbilical cord plasma. Distribution of variables was assessed with Shapiro-Wilk test. The comparison between groups

was done using t-student and Chi2 tests. Multiple linear regression models were used to examine the association between the neonatal outcomes and maternal BMI. p-value <0,05 was considered statistically significant. A power of >80% for leptin and adiponectin was calculated.

Results: Offspring from obese mothers had higher birth weight (3585 g vs. 3446 g) and ponderal index (2.92 vs. 2.78). When comparing the gender of the neonates from obese mothers, boys exhibit higher birth weight (g) (3726 vs. 3423) and height (cm) (50.3 vs. 48.9) Neonates from obese mothers had higher concentrations of leptin (ng/mL) (57.0 vs. 36.6), adiponectin (ug/mL) (33.9 vs. 29.0) and IL-12p40 (pg/mL) (117.3 vs. 98.3). Girls from obese mothers had higher leptin than girls from normal weight mothers (71.8 vs. 47.6) and boys from obese mothers (71.8 vs. 44.1). Boys from obese mothers had higher adiponectin than boys from normal weight mothers (34.6 vs. 28.5). Cytokines did not exhibit a significant differential pattern among groups.

Conclusions: Offspring from early gestation obese mothers had higher leptin and adiponectin. Maternal obesity affects principally the metabolism in girls and the size at birth in boys.

TRENDS ON BREASTFEEDING INDICATORS IN BRAZIL IN THREE DECADES

[1]de Moraes Mello Boccolini, Patricia; [2]Boccolini, Cristiano Siqueira Boccolini; [3]Regina Justo Giugliani, Elsa; [4]Isoyama Venâncio, Sônia; [5]Ramos Monteiro, Fernanda.

[1]PhD. Petrópolis Medicine School. Brazil; [2]PhD. Institute of Scientific and Technological Information and Communication in Health. Fiocruz. Brazil.; [3]PhD. School of Medicine. UFRGS. Brazil.; [4]PhD. Heath Institute of São Paulo. Brazil.; [5]MSc. Health Ministry of Brazil. Brazil.

Background and objectives: Objective: we aim to study the breastfeeding indicators trends in the last 3 decades, using informations recently obtained from the 2013 National Health Survey (Pesquisa Nacional de Saúde, in Portuguese).

Methods: this is a time series study with secondary data obtained from 4 national surveys with breastfeeding information (from years 1986, 1996, 2006 e 2013). The following WHO standardised indicators were studied: prevalence of exclusive breastfeeding in children under 6 months of life (EB6mo); prevalence of breastfeeding in children under 2 years old (BFtotal); continued breastfeeding at 1 year (BF1y); and continued breastfeeding at 2 years (BF2y).

Results: prevalences of EBF6mo, BFtotal and BF1y had an increasing trend until 2006 (from 4.7%, 37.4% and 25.5% in 1986 to 37.1%, 56.3% and 47.2% in 2006, respectively), followed by a rel-

ative stabilization in 2013 (36.6%, 52.1% and 45.4%, respectively). The BF2y indicator had a relatively stable prevalence from 1986 to 2006 (around 25%) followed by a subsequent increase, reaching 31.8% in 2013.

Conclusions: The time series of breastfeeding in Brazil had an increasing trend from 1986 to 2006, with stabilization in 2013 of three out of four indicators studied. These results can be considered an alert sign to stakeholders, indicating the need of reevaluation and strengthening of existing breastfeeding promotion, protection and support policies and programs. New strategies should be considered to retake the breastfeeding uptrend seen in the previous decades.

Keywords: breastfeeding, time series studies, population surveys, epidemiology.

FASTING DURING THE SUCKLING-WEANING TRANSIENT PERIOD IN RATS INDUCES METABOLIC ABNORMALITIES IN ADULTHOOD

[1]Honma, Kazue; [2]Ikeda, Misa; [2]Mawatari, Riko; [3]Mochizuki, Kazuki; [4]Goda, Toshinao.

[1]PhD. Japan.; [2]Nutritionist. Japan.; [3]Ph.D. Japan.; [4]Ph.D. School of Food and Nutritional Sciences. The University of Shizuoka. Japan.

Background and objectives: Nutritional status during developmental stages could be associated with subsequent development of metabolic abnormalities. This theory is known as the Developmental Origins of Health and Disease (DOHaD). Many studies have reported the relationship between nutritional deficiency during developmental stages and metabolic abnormalities in animal models including intrauterine calorie restriction (IUCR) in their mothers in the last week of rat pregnancy. In this study, we have examined whether malnutrition by fasting for 3 days in the weaning period alters glucose tolerance in adulthood.

Methods: Male Sprague-Dawley rats were fasted from 18 to 21 days after birth, and subsequently they are fed a high-fat, high-sucrose (HF) or low-fat, high-starch (LF) diet for 14 weeks from 17wk of age. The mRNA levels of inflammation-related genes in the peripheral leukocytes were measured at 0 h and 2 h after oral glucose load at 30 wk of age. Serum monocyte chemoattractant protein-1 (MCP-1) concentration and the mRNA levels of inflammatory cytokine and related genes were assessed in mesenteric adipose tissues were at 31 wk of age. Furthermore, the mRNA levels of the genes related to lipid and sugar metabolism related genes were assessed in the liver.

Results: At 16 wk of age, body weight and glucose tolerance in rats fasted for 3 days in the weaning period were similar to those in control rats. At 31 wk of age, the animals fasted in the weaning period showed a higher MCP-1 protein concentration when they were fed a LF diet but not when they were fed a HF diet. HF diet-induced increase in the mRNA levels of tumor necrosis factor-α, interleukin-1β and S100 proteins in peripheral leukocytes

at 2 h after glucose load was greater in rats fasted in the weaning period than controls. In the animals fasted in the weaning period, liver triglyceride contents were enhanced in adulthood when they were fed a HF diet, and the expression of gluconeogenesis-related genes were enhanced in adulthood when they were fed a LF diet.

Conclusions: These results suggest that malnutrition in the weaning period induces an enhanced inflammation and impaired glucose tolerance in adulthood.

ASSOCIATION BETWEEN PROTEIN INTAKE AND FRAILTY IN THE KOREAN ELDERLY OF KFACS

[1]*Park, Yongsoon;* [2]*Lee, Yeonjoo.*

[1]PhD. Professor. Department of Food and Nutrition, Hanyang University. South Korea.; [2]PhD. Research Professor. Hanyang Unviersity. South Korea.

Background and objectives: With a rapidly aging population, frailty defined as geriatric syndrome that increases the risk of falls, disability, hospitalization and mortality, is a major health concern. Malnutrition, which is very prevalent in geriatric populations, is one of the main risk factors for the onset of frailty. Previous studies suggest that protein supplementation is an effective dietary strategy to decrease frailty by positively influence aspects of sarcopenia in elderly. However, protein intake for preventing or delaying development of frailty is still a controversial issue. The present study was investigated to evaluate the association between protein intake and frailty in the elderly.

Methods: This study was approved by the Institutional Review Board of Hanyang University (HYI-15-228). A total of 265 free-living elderly aged between 70 and 85 years were recruited at three senior citizen welfare centers in Seoul, Korea. The inclusion criteria were ability to communicate independently, and no medical conditions affecting protein intake, such as chronic kidney or liver disease. The frailty status was assessed with the Cardiovascular Health Study (CHS) frailty criteria (weight loss, exhaustion, low physical activity, slowness and low handgrip strength), and three day of 24-hr dietary recall and the Mini Nutritional Assessment (MNA) were evaluated.

Results: Elderly participants were categorized into 4 groups: non-frail (n=82), frailty score 1 (n=90), 2 (n=58) and 3-4 (n=35). The daily intakes of energy and protein, protein intake per bodyweight, physical activity, grip strength and gait speed were negatively associated with frailty score. Protein intake was significantly lowered in frailty stage 3-4 than frailty state 1 and non-frail group after adjusting for energy intake. There was significantly less well-nourished elderly (MNA score ≥24) in frail or pre-frail elderly. Intakes of energy, protein, protein per bodyweight, body mass index, frailty score and physical activity were significantly higher in well-nourished elderly than malnourished elderly.

Conclusions: Protein intake was significantly inversely associated with frailty and MNA score in Korean elderly, suggesting that protein intake may play an important role for prevention of frailty.

EVALUATION OF METAPHORS (LIFE AND SELF) OF OBESE & OVERWEIGHT PEOPLE IN COMPARISON WITH THE PEOPLE WITH NORMAL WEIGHT

[1]*Ajami, Marjan;* [2]*Alimoradi, Mohammad;* [3]*Abdollahi, Morteza;* [3]*Vazirijavid, Roya;* [4]*Pazoki Toroudi, Hamidreza;* [5]*Ghanati, Kiandokht.*

[1]Assistant Prof. Dept. of Food & Nutrition Policy. Planning Research. National Nutrition & Food Technology's Research Institute. Faculty of Nutrition & Food Technology. Shahid Beheshti University of Medical Sciences. Tehran. Iran.; [2]National Nutrition & Food Technology's Research Institute. Faculty of Nutrition Sciences & Food Technology. Shahid Beheshti University of Medical Sciences. Tehran. Iran .; [3]Dept. of Nutrition Research. National Nutrition & Food Technology Research Institute. Faculty of Nutrition Sciences & Food Technology. Social Determinants of Health Research Center. Shahid Beheshti University of Medical Sciences. Tehran. Iran.; [4]Physiology Research Center. Iran University of Medical Sciences. Tehran. Iran.; [5]Research Department of The International affairs of Shahid Beheshti University of Medical Sciences & Health Services. Iran.

Background and objectives: Overweight and obesity have become an epidemic and a community health problem . In Iran, the prevalence of obesity is increasing dramatically. While the cost for obesity treatment on health is increasing, accordingly, the presence & nature of the relationship between obesity & mental health is less obvious. Metaphors are found in everyday human thoughts & action; they reflect the person's thinking process& ultimately, affect the performance . In this study the relationship between the severity of obesity and healthy behaviors and beliefs was studied.

Methods: 120 women randomly selected from nutrition and diet therapy clinics in North of Tehran. All patients who fulfilled the selection criteria divided in to 3 groups (obese, overweight and normal weight). Demographic questionnaires were completed by volunteers. Osgood semantic differential test questionnaire and GHQ mental health questionnaire were completed by the interviewer for each participant. After completing the questionnaires, quality control was re-examined and in case of a problem questionnaires were completed again.

Results: On this basis, women with obesity have more negative "self metaphor" than the general population (56.3% vs 42.3%) and

this women have more negative "life metaphor" (62.5% vs 38.5%) than the general population. 37.5% of obese individuals used negative emotional concept metaphors to describe themselves. Most codes with more negative metaphorical content have more repeat in obese subjects than normal weight subjects that psychological condition is very different in obese people.

Conclusions: The findings of this study show that overweight and obese individuals have more negative perceptions of their conditions of life,and the intensity of the negative perceptions increase along their weight increase. Negative and closed concepts of the metaphors suggest lack of freedom and mastery in individuals' lives. Their unpleasant subjective sensation of living and feeling stuck are clearly reflected in metaphors.In all groups there is a direct relationship between their attitude to life and to themselves(-self) and overweight and obesity, and the more negative their attitude is, the weight control is more difficult. Other studies have confirmed these results.

NUTRITION THROUGH LIFE COURSE - NUTRITION DURING PREGNANCY (TIME OF CONCEPTION TO DELIVERY) - A CASE STUDY IN TESHIE, A SUBURB OF ACCRA

Akita, Morkor C.

PhD. Sociologist. FAO. Ghana.

Background and objectives: The "Life Course Perspective" proposes that environmental exposures, including biological, physical, social, and behavioral factors, as well as life experiences, throughout the entire life span, influence health outcomes in current and future generations. Nutrition, from preconception to adulthood, encompasses all of these factors and has the potential to positively or negatively shape the individual or population health trajectories and their intergenerational differences. A well-balanced diet is important for adequate nutrition to address common nutrient deficiencies among pregnant women that include iodine, iron, vitamin A and zinc.

Methods: The research sought to gain a better understanding of the importance of nutrition during pregnancy. The study adopted a phenomenological case study approach. The voices of pregnant women were used in a form of narratives. The experiences of these women, during pregnancy forms the basis of this study.Twenty-five (25) participants were purposively sampled for the study, aged between 18 and 45. Both primary and secondary data were used. The study was conducted through one-on-one interviews using semi-structured interviews and women's focus group discussion in Teshie, a suburb of Accra in the Greater Accra region of Ghana.

Results: The research findings revealed different foods eaten by these pregnant women during pregnancy. Almost 75 percent of women between the ages of 18 – 25 years were eating what they were able to buy, whilst the remaining 25 percent were following the prescribed menu from the antenatal clinics. This confirms what Right (2014) said about poverty contributing to the kind of diets people eat. Other findings were the social-cultural practices in that community.

Conclusions: Adults should consume a balanced diet to maintain a healthy and active lifestyle. This is essential for preventing various diet-related non-communicable diseases such as diabetes, hypertension, and cardiovascular diseases. Taking a life course perspective, consuming a balanced diet has great potential for improving the health and nutritional well-being of the population. While nutrition education remains important, a balanced diet can only be achieved if healthy alternatives are available, accessible, might meet the nutritional needs as well as be affordable for all at all times.

Keywords: Nutrition, deficiency, balanced diet, life cycle and environmental exposures

LEVELS OF VITAMIN B12 AT EARLY PREGNANCY AND THE RISK OF EXCESS WEIGHT AT BIRTH

[1]*Arija, Victoria;* [2]*Aranda, Nuria;* [3]*Miralles, Bernat;* [4]*Abajo, Susana;* [4]*March, Gemma;* [5]*Fargas, Francesc;* [6]*Aparicio, Estefania;* [7]*Iglesias, Lucia.*

[1]Rovira i virgili University. Spain. ; [2]PhD. Pharmacology. Nutrition and Public Health Unit. Rovira i Virgili University. Reus. Spain. ; [3]MS. Nutritionist. Nutrition and Public Health Unit. Rovira i Virgili University. Reus. Spain.; [4]Midwife. Sexual and reproductive health service. Institut Català de la Salut. Spain.; [5]PhD. Gynecologist. Sexual and reproductive health service. Institut Català de la Salut. Spain.; [6]PhD. Nutritionist. Nutrition and Public Health Unit. Rovira i Virgili University. Reus. Spain.; [7]Biology. Nutrition and Public Health Unit. Rovira i Virgili University. Reus. Spain.

Background and objectives: Vitamin B12 (VitB12) during pregnancy plays a key role in the development of the newborn. There is some controversy about the effect of VitB12 levels on newborn weight. Recently, some authors observed that VitB12 deficiency is related to excess birth weight (Sukumar et al., 2016). Objective: To describe the prevalence of VitB12 deficiency in the first trimester of gestation and its association with the weight of the newborn in the Mediterranean population.

Methods: Prospective study in healthy pregnant women from week 12 of gestation until delivery. Mother data collected: clinical history, anthropometry, socioeconomic level, parity, ethnicity, age, smoking and alcoholic habits and food consumption.) At week 12, VitB12 was determined by electrochemiluminescence and was classified as optimal levels (>220pmol/L) and deficiency (marginal (150-220pmol /L) and low levels (<150pmol /L)) (Allen, 2009; de Benoist, 2008). Newborn data collected: sex, gestational age (GA) and birth weight. Birth weight was classified as: macrosomia (>4000g) or low birth weight (<2500g); and large-for-GA (>P90) or small-for-GA (<P10) according to the reference tables (AEP, 2008; DGSP, 2008).

Results: 301 pregnant women of age 30.8+/-4.9, 80.1% Caucasian, 58% medium-high educational level, 20.6% smokers and 7.1% alcoholics and with a BMI 24.9+/-4.3kg/m2 were enrolled. The intake of VitB12 was 4.7+/-1.7µg/day. At week 12, the 65.2% had optimal VitB12level (a mean of 298.5+/-64.7 pmol /L; the 29.1% marginal-levels (192.8+/-19.2pmol/L) and the 5.7% low levels (122+/-25.0pmol/L). The percentage of VitB12 supplementation was 15.5%, 12.8% and 5.9% respectively. According to VitB12 levels, the risk of macrosomia was: a 4.7% in optimal level group, a 10.5% in marginal group and a 17.6% in low level group; and the risk of a large-for-GA was 11.1%, 7.3% and 29.4% respectively. In logistic regressions adjusted, vitB12 deficiency (marginal+low levels) were associated with an increased risk of macrosomia (B=1,833; p=0.01) and large-for-GA (B=1.508;p=0.004) in newborn.

Conclusions: The prevalence of vitB12 deficiency in the first trimester of pregnancy affects 34.8% of the women in a Mediterranean country. This deficiency is related to a lower supplementation of this vitamin and a higher risk of macrosomia and large-for-GA in the newborn.

Keywords: Vitamin B12, pregnancy, birth weight

Rovira i Virgili University. Reus. Spain.

Background and objectives: Breastfeeding (BF) confers numerous benefits on the developing infant in both the short and the long term including psychological development, but there are multiple other factors that must be taken into account when these relationships are studied. To analyse how breastfeeding during the first 4 months of life affects infant cognitive development (CD) at 6 and 12 months in a group of healthy infants from a Mediterranean Spanish city considering many important potential confounds.

Methods: Prospective longitudinal study. A total of 154 healthy infants were evaluated by Hospital Paediatric Unit in Spain.

Data collection: at birth, at 6 and 12 months of age.

Were assessed: Clinical history and sociodemographic data (Hollingshead index) of mothers. Obstetrical and perinatal data (Infant gender, gestational age at birth). Newborn data: Type of feeding (months of breastfeeding and/or infant formula), anthropometry (weight, height and cranial perimeter), iron status (haemoglobin by Coulter, serum Ferritin by turbidimetric immunoassay) and Mental Development Index (MDI) and Psychomotor (PID) by Bayley Scale of Infant Development.

Student's t-test, one-way ANOVA post-hoc test (Scheffé) were used; and also Multiple Linear Regression Models were applied adjusting for prenatal, perinatal and postnatal confounds potential Maternal age, maternal education and socioeconomic status, prenatal nicotine exposure, infant gender, mode of delivery, gestational age at birth, anthropometric measurements, iron status).

Results: 46% of whom were boys. At 4 months, 24% of infants received BF, 50% infant formula and 26% mixed feeding (MF). At 6 moths, exclusive BF during the first 4 months of life increased PDI by 7.712 points (p=0.019), while MF increased PDI by 6.393 points (p=0.039).

At 12 months, exclusive BF during the first 4 months of life increased PDI by 7.223 points (p=0.033). We also observed that high haemoglobin levels at 6 months increased PDI (p=0.015). BF did not affect MDI at 6 nor 12 months.

Conclusions: In conclusion, after the adjustment of important potential confounds, BF during at least four months and adequate infant iron status are related to better psychomotor development during the first year. No associations were found between BF and mental development.

Abbott Nutrition. Spain.

Background and objectives: The gut microbiome has been associated with a wide range of chronic diseases including obesity, diabetes and cardiovascular disease, inflammatory and neurological diseases. Early colonisation of the infant gut may be key to the development of gut microbiome in later life but our understanding of the factors which determine the colonisation process and how that links to later/adult health is still incomplete. Many studies have suggested that the human milk microbiome contributes significantly but it is unclear how the bacteria detected in breastmilk are derived and if they survive in the infant gut. We explored the evidence in a systematic review.

Methods: A systematic review was carried out to answer 'What evidence exists with regards to early colonization of the infant gut by bacteria coming from breast milk?'

Search terms included: (("Microbiota"[Mesh] OR "Metagenome"[Mesh] OR "Dysbiosis"[Mesh]) AND "Anti-Bacterial Agents"[Mesh]) AND ("Infant"[Mesh] OR "Infant, Extremely Premature"[Mesh] OR "Infant, Extremely Low Birth Weight"[Mesh] OR "Infant, Low Birth Weight"[Mesh] OR "Infant, Very Low Birth Weight"[Mesh] OR "Infant, Small for Gestational Age"[Mesh] OR "Infant, Premature"[Mesh] OR "Infant, Postmature"[Mesh] OR "Infant, Newborn"[Mesh] OR "Infant, Premature, Diseases"[Mesh])and (microbiota OR bacteria OR microflora OR microbes) AND (dysbiosis) AND (infant OR neonate OR baby) AND (health) AND (disease) AND (birth OR parturition) AND (breastmilk OR breast milk OR human milk) AND (breastfeeding OR breast feeding OR breastfed) AND (formula fed OR infant formula OR bottle fed OR bottle feed) AND (lactation). Searches were carried out using PUBMED, OVID, LILACS and PROQUEST.

Results: After initial removal of duplicates and not-relevant papers, 66 papers remained for detailed review. This was carried out independently by three authors before final evaluation of the evidence. Papers were considered for information on sample collection, avoidance of contamination procedures, specified bacterial analysis methods and kits used, and if they discussed maternal and infant events that may influence colonisation including mastitis and antibiotic use.

Conclusions: Many studies reported a range of different bacteria in breastmilk. There remains a need to understand the breastmilk microbiome and the modifiable factors which influence this to support health promoting microbial development in the offspring.

Keywords: gut microbiome, breastmilk, bacteria, breastfeeding, infant

BINGE EATING DISORDER IN ADULT WOMEN

(1)Rossi, María Laura; (1)Belen, Lorena; (2)Alebuena, Daiana; (2)Andrada, Javier; (2)Larronda, Eugenia; (2)Saporiti, Daniela; (3)Torresani, María Elena.

(1)MSc. Nutritionist. School of Nutrition. Faculty of Medicine. University of Buenos Aires. Argentina.; (2)BSc. Nutrionist. School of Nutrition. Faculty of Medicine. University of Buenos Aires. Argentina.; (3)PhD. Nutritionist. School of Nutrition. Faculty of Medicine. University of Buenos Aires. Argentina.

Background and objectives: Binge Eating Disorder (BED) is a psychological disturbance characterized by recurrent episodes of eating large quantities of food, feeling loss of control during the binge; experiencing shame, distress or guilt afterwards and not regularly using unhealthy compensatory measures. It is associated with severe obesity, psychiatric morbidity, and increased risk for cardiovascular diseases. The aim was to determinate the proportion of BED on a sample of women residing in Buenos Aires.

Methods: Observational cross-sectional study achieved by a voluntary self-administered survey among women between 30 - 65 years old in a community-based site during july – august 2016. It was evaluated BED by Binge Eating Scale (BES), biological stage (pre and postmenopause) by self-reference, body mass index (BMI) (being altered when $\geq$ 25 kg/m2), cardiometabolic risk according to waist circumference (WC) (very high risk when > 88 cm), regular physical activity according to WHO recommendation, BED frequency and favorite kind of food and mood perceived during the binge. Data was describe by mean (SD) or percentage and comparisons were made by X2 and Fisher test (α= 0,05) by statistical software SPSS 19.0.

Results: The sample (n=101) had a mean age of 43,3 ± 11,1 years old and a mean BMI of 25,3 ± 5,27 kg/m2. The 41% were in post menopause and the 15,8% presented moderated BED. The 48,5% presented overweight and 49,5% high cardiovascular risk by WC. The 37,5% had binges occasionally. The 71,3% did not practice regular physical activity. The most chosen foods were baked food and deli-meat/cheeses. It was found statistically significant association between BED and biological stage (p=0,013) and between BED and anxiety (p=0,03), but not with the rest of the variables studied.

Conclusions: Perimenopause indeed may be a vulnerable period for the development of an eating disorder. Nutritional education and psychotherapy should be considered to minimize the associated risks.

Keywords: binge eating disorder, women, perimenopause, anxiety, overweight.

Instituto PENSI/Hospital INfantil Sabará/Fundação José Luiz Egydio Setúbal. Brazil.

Background and objectives: Background: Delays in gross motor development, sensory processing issues, organic and behavioral problems are known to interfere in the development of feeding skills; and – therefore - in the success of the whole process of feeding a child. Children with feeding difficulties (FD) commonly present inadequacy of feeding skills. Objectives: Assessment of five feeding skills (FS) in Brazilian children with Feeding Difficulties (FD), and search of possible associations with different types of FD.

Methods: Cross-sectional study with 70 children below 10 years old. Data was obtained from medical records: age, gender, age at texture transitions, feeding phase (breastfeeding, weaning to solids or full solids) at first complaint; characteristics of the meal (duration, environment and shared meals with adults), self-feeding practices, use of feeding equipment and bottle, mouthing, feeding position and type of FD. Skills were categorized according to standards for age. Chi-Square, Anova Test (or non-parametric

equivalent) and Multinomial logistic regression tests were used, with a significance level of 5%.

Results: There was no difference in FS (p>0,05) or in the number of FS inadequateness (p=0,84) according to FD diagnosis. The majority (94%) of children presented at least one delayed development of FS; and 1/3 presented delays in more than half of the FS evaluated. Feeding complaints first appeared at 10,9m ± 11,4, and picky eating was the most prevalent type of FD (37,1%). Most children were fed in inadequate environments (55,2%), in inappropriate feeding positions (78%), without the company of adults (78%); did not practice self-feeding (97,7%), although used proper feeding equipment (65,2%); used prolonged bottle feeding (56,9%). Transition to solid foods occurred at 16m ± 5,6. Multinomial logistic regression showed no difference in likelihood of presenting any type of FD compared to picky eating, according to FS. Age at texture transition both from breastfeeding to complementary feeding (p=0,95), and from complementary feeding to solid foods (p=0,43) to did not vary according to FD diagnosis.

Conclusions: Feeding skills development or number of FS inadequateness did not vary according to FD diagnosis. Identification of these inadequacies could help the discussion for multi-professional treatment of patients with FD.

São Paulo. Brazil.

Background and objectives: Early life feeding practices can directly affect nutritional status, growth, development, and child survival. The prevalence of exclusive breastfeeding up to 6 months of age is fundamental for monitoring actions to promote, protect and support breastfeeding. The present study aims to investigate the prevalence of exclusive breastfeeding in the first month of life in Cruzeiro do Sul, Acre.

Methods: Cross-sectional analysis of data from the MINA-BRAZIL birth cohort study in the urban area of Cruzeiro do Sul, Acre state, Western Brazilian Amazon. Mothers of babies born from July 1, 2015 to June 30, 2016 at the only maternity hospital in the region were enrolled in this study (n=1,328). Women were interviewed soon after giving birth and by telephone at 30-45 days postpartum. For this analysis, the outcome of interest was exclusive breastfeeding in the first month, classified according to the World Health Organization guidelines when the baby receives only breast milk, including milk expressed or from a wet nurse, without other liquids or solids, except for drops or syrups containing vitamins, oral rehydration salts, mineral supplements or medicines. Information on breastfeeding practices was used to calculate the prevalence of exclusive breastfeeding, using Stata software 14.0.

Results: Data on breastfeeding practices in the first month were obtained from 964 mothers and their babies (72.6% of eligible participants). Reasons for the 344 losses of follow-up were: six dropouts (0.45%), 11 without telephone (0.82%), 327 the call was not answered (24.6%), three children (0.22%) and one mother (0.07%) died, two moved out of the municipality (0.15%), and 15 moved to the rural area (1.12%). Although 97.7% (n=942) of the study babies were breastfed at the first month of life, the prevalence of exclusive breastfeeding was 33.1% (n=319), predominant breastfeeding (breastmilk with water, pounded cassava, juice or tea) was 32.6% (n=314), and 32% (n=309) were receiving breastmilk and other type of milk.

Conclusions: The exclusive breastfeeding rate in the first month of life in Cruzeiro do Sul was considerably below the World Health Organization recommendations. These preliminary findings highlight the need of intensive actions for promotion, support and protection of breastfeeding before the first month of life.

SUSTAINABLE UNDERNUTRITION REDUCTION IN ETHIOPIA (SURE) PROGRAMME EVALUATION (2016-2019): CROSS-SECTIONAL BASELINE SURVEY

Background and objectives: Sustainable Undernutrition Reduction in Ethiopia (SURE) program is the first Government-led multi-sectoral integrated health and agriculture sector program for nutrition outcomes. The program will deliver an enhanced Community-Based Nutrition (CBN) program. The objective was to establish baseline characteristics at the outset of the program and assess the comparability in intervention and comparison districts.

Methods: A cross-sectional survey was carried out in four agrarian regions of Ethiopia from April to July 2016. The survey used multistage cluster sampling at the village and household levels. The sample size calculations for the survey was based on detecting a change at end line in nutritional status and key IYCF practices that can be attributed to the SURE intervention. A total of 4980 children 0-47 months old in 4299 households were involved in the survey. The survey covered 36 intervention and 36 comparison districts, a total of 72 districts.

Results: The prevalence of stunting among children 6-23 months old was 31.3% and 27.9%; whereas underweight prevalence was 19% and 16.5% and wasting was 9% and 8% in the intervention and comparison districts, respectively. Among children 24-47 months old, stunting prevalence was 46.9% and 40.5%, underweight was 23.7% and 21.6% and wasting was 4% in the intervention and comparison districts, respectively.

Breastfeeding was nearly universal in both groups. Over 60% of children initiated breastfeeding within an hour of birth and nearly 80% of children in both arms were exclusively breastfed. About three-quarters of all children initiated complementary feeding between 6 to 9 months of age but 4.5% and 7.8% of all children had access to the minimum diversified diet in the intervention and comparison districts, respectively. About 41% and 45% of all households were food insecure in the intervention and comparison districts, respectively. About 5% in intervention and 8% in comparison districts of all mothers interviewed had access to minimum diversified diet.

Conclusions: The intervention and comparison districts are comparable in most of the demographic and socio-economic characteristics. The prevalence of undernutrition, child feeding practices, food insecurity and women dietary diversity practices are more or less comparable between the two groups.

FOOD CONSUMPTION SOURCE EVALUATION OF CALCIUM, IRON AND OMEGA 3 DURING PREGNANCY IN MOTHERS IN LABOR INTERNED IN SANATORIO DE LA TRINIDAD

[1]Garcia, Stella Maris; [2]Perri, Noemi; [2]Rodriguez Fanlo, Eugenia; [3]Leal, Marcela.

[1]PhD. Nutritionist. Service of Nutrition. Sanatorio de la Trinidad. Argentina.; [2]BSc. Nutritionist. Maimonides University. Argentina.; [3]MSc. Faculty of Health Sciences. Maimonides University. Argentina.

Background and objectives: Women's nutrition during pregnancy is vital for her and the baby in gestation; an inappropriate nutritional status, both preconception and pregnancy, will impact negatively on the ability to carry out that pregnancy and also the health of the mother and the child.

This study aims to determine the percentage of adequacy for calcium, iron, and Omega 3 and determine if it covers requirements for the biological moment, in mothers in labor interned in Sanatorio de la Trinidad.

Methods: Quantitative, descriptive, observational, cross-sectional, retrospective; sample non probabilistic of 328 women in labor interned in Sanatorio de la Trinidad. The information was collected through a structured questionnaire of consumption frequency of foods source in calcium, iron and Omega 3.

Results: 75% of the sample does not cover the calcium requirements with an average consumption of 666,56 mg (±16, 6), mean percentage of adequacy of 55.5%. The total sample does not cov-

er the recommendation for iron, noticing that 96% of the sample does not reach 50% of adequacy. Only 2.4% of the sample covers the requirements for Omega-3, and 31.1% refers not to consume it at all.

Conclusions: A well qualitatively and quantitatively fed mother, is capable of providing sufficient energy reserves, micro and macronutrients for protection and normal development of the fetus. Prior and during pregnancy nutritional assessment and relevant food education should be routine practices incorporated obstetric consultation and also to the education of the population in general, to improve the conditions of pregnancy and puerperium of the mother as well as to achieve optimum embryo development.

Keywords: Pregnancy, Requirements, Calcium, Iron, Omega 3.

MODIFIABLE RISK FACTORS PRESENT FROM CONCEPTION TO AGE 2 YEARS AND THEIR ASSOCIATION WITH OBESITY AT 5 YEARS OLD

[1]Bove, Maria Isabel; [2]Zelmonovich, Caren; [3]Bia, Daniel; [4]Iturralde, Adriana; [4]Ghiachetto, Gustavo; [2]Klaps, Leticia; [2]Guillermo, Valentina.

[1]PhD Health and Welfare Institute. Catholic University Uruguay. Uruguay; [2]MSc. Nutritionist. Health and Welfare Institute. Catholic University Uruguay. Uruguay; [3]PhD. MD. Medicine Physiology Chair. Republic University Uruguay. Uruguay.; [4]MD. Medicine Pediatric C Chair. Republic University Uruguay. Uruguay.

Background and objectives: The origins of childhood obesity can be found as early as the "first 1,000 days". The main goal of this investigation is to study some modifiable risk factors present from conception to age 2 years and their association with obesity at 5 years old.

Methods: Multistage stratified random sampling was used for the selection of children. Public kindergartens of Montevideo-Uruguay were randomly selected and then, a group randomly selected from each school. Trained team measured weight using an electronic scale(SECA) and height non-elastic measuring tape(SECA). From health services, we registered maternal gestational weight, birthweight and weight and height at the age of 6,12,18,24 and 36 months. Dependent variable was current obesity BMI/Age≥2SD(WHO). Analyses were adjusted by high maternal pre-pregnancy BMI(≥25kg/m2), prenatal tobacco exposure, maternal excess gestational weight gain(IOM criteria), high infant birthweight(≥4000 g), short breastfeeding(<9 month), introduction of solid food intake(<4 months) and accelerated infant weight gain(Z-score-change greater than 0.67 in Weight/Age since birth to 24 months).

Results: We studied 452 children, 5.9±0.3 years old, approximately half was boys (51.8%). We observed high prevalence of obesity 17.5%(13.6-20.6). Obesity was significantly higher for children which mothers had high pre-pregnancy BMI 24.4%(14.9-33.9), excess gestational weight gain 21.2%(14.2-28.1) and smok-

ing during pregnancy 28.0%(13.3-30.6); those born with high birthweight 20.0%(14.2-28.1) and introduced solid food intake before 4 months 26.3%(14.5-48.1). Obesity wasn't significantly higher in children breastfed less than 9 months.

Accelerated weight gain was the higher obesity risk. Children who upward weight percentile change since birth to 24 months had between 2.6 and 10 times higher likelihood obesity than their non-accelerated weight gain counterparts OR:5.1(IC 95% 2.6-10.1)p<0.001. On other hand, early introduction of solid food intake OR:3.5(IC 95% 1.05-11.92)p=0.041; prenatal tobacco exposure OR:2.5(IC 95% 1.2-5.0) p=0.014 and high maternal pre-pregnancy OR:2.3(IC 95%1.1-4.6)p=0.022 also were significant childhood obesity risk.

Conclusions: The present results indicate that accelerate weight gain during the first 1,000 days is the main risk for obesity at 5 years old. It´s necessary to prevent accelerated weight gain by good infant feeding practices and to optimize maternal diet and composition before and during pregnancy.

HIGH RISK PREGNANCY: EVIDENCE FOR THE NUTRITIONAL APPROACH

[1]*Carmo Rodrigues Barbosa, Míriam;* [2]*Cantão dos Santos, Hully;* [2]*Carlos da Silva, Lauriete;* [2]*Nascimento Norete, Diésse;* [1]*Perim de Faria, Carolina.*

[1]PhD. Nutritionist. Federal University of Espirito Santo (UFES). Health Sciences Center of the UFES. Brazil.; [2]BSc. Nutritionist. Federal University of Espirito Santo (UFES). Health Sciences Center of the UFES. Brazil.

Background and objectives: Pregnancy is characterized by changes in the standards physiological and metabolic, may reflect in the nutritional status (NS). This natural process can be surrounded by pathological outcomes associated with the NS.

The present study aimed investigating the alterations in the NS along the pregnancy in women assisted in a reference prenatal care service.

Methods: Cross section study accomplished in a reference prenatal care service, in the Espirito Santo (Brazil), in which 122 pregnant women participated. For the classification of the body mass index before-pregnant (BMIBP) and BMI pregnant (BMIP) was used the proposed by Atalah (1997). For the statistical analysis was used the program SPSS version 21.0. Significance was set at p<0.05. This study was approved by the local Ethics Committee (CEP – CCS/ UFES; CAAE 45328215.4.0000.5060).

Results: Pregnant women had age between 13 and 44. Among these 25,4% were adolescents and 74,6% were adult. It was observed that the average weight gain gestational was higher among pregnant women who started pregnancy with low weight (11,10 ± 5,99). When comparing the BMIBP with BMIP, bivariate analysis showed result significant (p<0,001). It was observed that 18% (22) of pregnant women have changed NS, and half (11) gained weight and the other half lost weight. These 22 pregnant women who have changed of NS, it was observed that 15,6% (19) this change was undesirable. When compared this modification in the NS with the demographic variables, just age obtained result significant (p=0,051).

Conclusions: The results point to the need for monitoring the NS in high risk pregnancy. It is also necessary to establish specifics nutritional care protocols in this prenatal care service, in order to contributing for reduce unfavorable outcomes in this group.

AGREEMENT OF EXCLUSIVE BREASTFEEDING DURING THE FIRST 6 MO BY MOTHER'S RECALL VERSUS THE DOSE-TO-MOTHER ISOTOPE DILUTION METHOD

[1]*Pongcharoen, Tippawan;* [1]*Winichagoon, Pattanee;* [2]*Karim, Norimah A.;* [3]*Hettiarachchi, Manjula;* [4]*Yameen, Ayesha.*

[1]PhD. Institute of Nutrition. Mahidol University. Thailand.; [2]PhD. Nutritional Sciences & Dietetics Programme. School of Healthcare Sciences. Universiti Kebangsaan. Malaysia.; [3]PhD. Medicine Unit. Faculty of Medicine. University of Ruhuna. Sri Lanka.; [4]PhD. Pakistan Institute of Nuclear Science and Technology. Pakistan Atomic Energy Commission. Pakistan.

Background and objectives: Exclusive breastfeeding (EBF) for the first six months is promoted worldwide for infant feeding, especially in developing countries. WHO/UNICEF used mother's recall of whether their infants were exclusively breastfed or not. Evidence from small scale studies showed inconsistent finding when using the deuterium oxide dose-to-mother (DTM) method. The objective of this study was to investigate the agreement between the reported EBF and EBF by the DTM method.

Methods: Lactating women who reported that they were EBF at 3 months were recruited in 8 participating countries. Mothers reported whether they were EBF using a questionnaire. The EBF was verified using the (DTM) technique. Ninety-one mother-infant pairs from 4 countries were included in the present analysis. Breast milk intakes and non-milk water (NMW) were calculated using the Bayesian approach. The cutoffs used to define EBF were <25 g according to IAEA recommendation, or 82.6 g from the unpublished study using DTM and home observation (Houghton, et al).

Results: The result showed that at 3 month, from 91 mother-infant-pairs, only 12.1% and 58.2% were confirmed as EBF using the DTM technique at cutoffs <25 and <82.6 g NMW. At 6 months, 54 mothers recalled they were EBF, and only 5.6 and 18.5%, by respective cutoffs were confirmed as EBF.

Conclusions: There was very low agreement in mother's recall of EBF and that by the DTM method, both at 3 and 6 months. This has an important implication to monitoring and program evaluation of breastfeeding promotion.

ESTIMATION OF THE DIETARY REQUIREMENT FOR VITAMIN D IN PREGNANCY: A DOSE-RESPONSE, DOUBLE-BLIND, RANDOMIZED PLACEBO-CONTROLLED TRIAL

[1]O' Callaghan, Karen; [2]Hennessy, Áine; [3]Dowling, Kirsten G.; [2]Hull, George; [4]Kenny, Louise C.; [5]Cashman, Kevin D.; [6]Kiely, Mairéad E.

[1]BSc. Research Nutritionist. Cork Centre for Vitamin D and Nutrition Research. University College Cork. Republic of Ireland.; [2]PhD. Research Nutritionist. Cork Centre for Vitamin D and Nutrition Research. University College Cork. Republic of Ireland.; [3]MSc. Research Nutritionist. Cork Centre for Vitamin D and Nutrition Research. University College Cork. Republic of Ireland.; [4]Professor of Obstetrics and Consultant Obstetrician and Gynaecologist. Irish Centre for Fetal and Neonatal Translational Research. University College Cork. Republic of Ireland.; [5]Professor of Food and Health. Cork Centre for Vitamin D and Nutrition Research. University College Cork. Republic of Ireland.; [6]Professor of Human Nutrition. Cork Centre for Vitamin D and Nutrition Research. University College Cork. Republic of Ireland.

Background and objectives: Pregnancy-specific dietary recommendations for vitamin D have not been established to date, owing to a lack of sufficient experimental evidence to confirm whether an increased vitamin D intake is required during pregnancy. Given the high prevalence of vitamin D deficiency reported among gravidae and neonates worldwide, estimation of the dietary requirement to prevent maternal and neonatal deficiency is a research priority. The aim of this study was to provide the experimental evidence to determine the nutritional requirement for vitamin D during pregnancy and the early neonatal period.

Methods: The DMAT Study (Nutritional Requirements for vitamin D in Pregnant Women, NCT02506439) was a three-arm, parallel, dose-response, double-blind, randomized trial of vitamin D3 versus placebo. One-hundred and forty-four healthy pregnant women were randomly assigned to receive either 10 or 20 μg vitamin D3/d or placebo from ≤18 weeks' gestation until late gestation. Vitamin D metabolites in maternal sera at a mean gestational age of 14, 24 and 36 weeks' gestation and in cord sera were quantified by liquid-chromatography-tandem mass spectrometry. A curvilinear regression model was used to predict the total vitamin D intake required to maintain serum 25-hydroxyvitamin D (25(OH)D) above a range of predefined thresholds (25, 30 and 50 nmol/L).

Results: Mean baseline serum 25(OH)D was 54.9 ± 10.7 nmol/L. Serum 25(OH)D increased in all groups from the first to the final visit, and mean ± SD maternal concentrations at 36 weeks' gestation were 24.3 ± 5.8 and 29.2 ± 5.6 nmol/L higher in the 10 and 20 μg/d groups, respectively, than in the placebo group (P < 0.001). The estimated vitamin D intakes required to maintain serum 25(OH)D > 25, 30 and > 50 nmol/L in 97.5% of gravidae were 12.4, 15.1 and 29.5 μg/d, respectively. At a minimum maternal threshold of 44 – 55 nmol/L, neonatal circulating 25(OH)D concentrations did not fall < 25 – 30 nmol/L.

Conclusions: A vitamin D intake of at least 29.5 μg/d is sufficient to maintain serum 25(OH)D concentrations ≥ 50 nmol/L in 97.5% of women throughout gestation, which in turn will prevent neonatal deficiency at the 25 – 30 nmol/L threshold.

MATERNAL PROTEIN RESTRICTION INDUCES SALT SENSITIVITY AND ALTERS RENAL DNA METHYLATION OF THE PTGER1 GENE IN SHRSP OFFSPRING

[1]Miyoshi, Moe; [2]Sato, Masayuki; [2]Saito, Kenji; [2]Otani, Lila; [2]Jia, Huijuan; [3]Kato, Hisanori.

[1]Ph.D. student. Graduate School of Agricultural and Life Sciences. The University of Tokyo. Tokyo. Japan; [2]Researcher. Food for Life.The University of Tokyo. Tokyo. Japan; [3]Professor. Food for Life.The University of Tokyo. Tokyo. Japan

Background and objectives: We have previously reported that maternal protein restriction during pregnancy increases the salt sensitivity in stroke-prone spontaneously hypertensive rat (SHRSP) offspring. By a genome-wide methylation analysis in the offspring's kidney, we have revealed that the highly methylated regions were located in the gene of prostaglandin E2 receptor (ptger1), which is known to be associated with hypertension. This study evaluated DNA methylation in the ptger1 gene region by bisulphite sequencing and expression of the ptger1-related genes.

Methods: Female SHRSP rats during pregnancy were fed a 20% casein diet (CN group) or a 9% casein diet (LP group). After birth, male pups were reared on a commercial diet and water ad libitum. They were given water (W group) or 1% saline solution as drinking water (S group) from 10 weeks of age. Kidneys were collected after 12 weeks from birth, which were used for mRNA expression analysis by RT-PCR and DNA methylation analysis of ptger1 (+1315-1614 region) by bisulphite sequencing.

Results: In response to saline drinking, the blood pressure of pups in LP-S was significantly elevated compared to that in CN-S. There was no significant difference in the blood pressure between CN-W and LP-W. The expression of ptger1 in LP-S and LP-W were significantly increased compared to that in CN-S and CN-W, respectively. DNA methylation of the Ptger1 of LP-S and LP-W showed markedly hyper-methylated state compared with CN-S and CN-W,

respectively. Moreover, in LP-S the expression of enacα (epithelial sodium channel α, ENaC α), which encodes a sodium channel, was significantly decreased compared to that in CN-S.

Conclusions: These results indicate that maternal protein restriction during pregnancy may alter renal DNA methylation of the ptger1 in SHRSP offspring. Our findings also suggest that the DNA methylation changes in the ptger1 might be associated with the regulation of ptger1 gene expression. In addition, a Ptger1-mediated down-regulation of ENaC α may be involved in the enhancement of salt sensitivity.

Keywords: hypertension, maternal protein restriction, DNA methylation

ASSESSMENT OF PERCEIVED SOCIAL SUPPORT, FOOD INSECURITY AND NUTRITIONAL STATUS OF THE ELDERLY IN THE SAGNARIGU DISTRICT OF THE NORTHERN REGION, GHANA

[1]Adam, Patrick Wumpini; [2]Colecraft, Esi; [3]Otoo, Gloria; [4]Dwamena, Francesca.

[1]MPhil. Nutrition. Department of Nutrition and Food Science. University of Ghana. Ghana; [2]DrPH. Faculty. Department of Nutrition and Food Science. University of Ghana. Ghana; [3]PhD. Faculty. Department of Nutrition and Food Science. University of Ghana. Ghana; [4]MD. Professor and Chair. Department of Medicine. Michigan State University. USA.

Background and objectives: Despite a growing elderly population, there is a paucity of information on the living conditions of elderly persons in Ghana. With limited institutional social support services and declining extended family support systems, elderly Ghanaians may be vulnerable to food insecurity and malnutrition. We assessed social support, food security and nutritional status of elderly persons in the Sagnarigu District of Northern Ghana.

Methods: Cross-sectional survey with a randomly selected sample of 120 elderly persons categorized as young-old (60-64y), middle-old (65-70y) and old-old (>70y) from 3 communities in the Sagnarigu District. Structured questionnaires were used to interview participants about their socio-demographic characteristics, food security situation (using USDA household food security module-short form) and perceived social support. Additionally, participant's weights and heights (or armspan) were measured and BMI or BMA computed and participants categorized as being

Underweight (BMI or MBA< 18.5kg/m2), normal weight (BMI or BMA 18.5-24.9kg/m2) or overweight/obese (BMI or BMA >25kg/m2). Descriptive statistics, bivariate associations and logistic regression for predictors of food insecurity and nutritional status were used to summarize the data.

Results: Mean age of participants was 69.5 ± 7.7yrs, 38% were young-old (60-64y), 24.2% middle-old (65-70y) and 37.5% old-old (70y+). There were more females (56.7%) than males (43.3%) and the majority (55.9%) were married. Although a majority (58%) of participants perceived themselves as having strong social support, fewer females than males had strong perceived social

support (48.6% vs. 51.4%; χ2=4.48; P=0.03). Prevalence of food insecurity was 61.7%. Mean BMI and BMA were 22.3 ± 4.8kg/m2 and 20.0 ± 4.2kg/m2, respectively: Approximately 18.3% of participants were underweight and 24.2% were overweight or obese. Prevalence of underweight was significantly (P=0.006) higher among the old-old participants while women (58.6%) were more likely than men (41.4%) to be overweight or obese (P=0.005). Current income above 250 Ghana cedis but not social support was protective against food insecurity (OR=-1.4: P= 0.029).

Conclusions: Cash transfers to elderly persons may help curb the prevalence of food insecurity among the elderly persons in this district. Overweight and obesity was more prevalent than underweight in this elderly population.

Keywords: nutritional status, elderly, food security, perceived social support, Ghana

CHALLENGES AND OPPORTUNITIES IN DESIGNING WEEKLY IRON AND FOLIC ACID SUPPLEMENTATION PROGRAMS FOR ADOLESCENT GIRLS IN AND OUT OF SCHOOL IN 3 AFRICAN COUNTRIES

[1]Roche, Marion; [2]Mekuria Lewetie, Ermias; [3]Tidiane Niang, Cheikh; [4]Murage, Lucy; [5]Holte-McKenzie, Merydth; [6]Aziz Adish, Abdul; [7]De Regil Velez, Luz Maria.

[1]PhD. Senior Technical Advisor. Research & Evaluation Unit. Nutrition International. Canada.; [2]MPH. Senior Project Officer. Nutrition International. Ethiopia.; [3]MD. Senior Project Officer. Nutrition International. Senegal.; [4]MPH. Senior Project Officer. Nutrition International. Kenya.; [5]MCH. Technical Advisor. Research & Evaluation Unit. Nutrition International. Canada.; [6]PhD. Deputy Regional Director. Africa Regional Office. Nutrition International. Kenya.; [7]Nutrition International. Canada.

Background and objectives: The 600 million adolescent girls living in developing countries have to become a focus of anemia reduction efforts to reach the WHA target of a 50-percent reduction in anemia by 2025. Despite the 2011 WHO recommendation for weekly iron folic acid supplementation (WIFAS), national policies and operational guidelines are lacking and national programs are not being implemented in most African countries. Our objective was to design demonstration programs informed by context specific formative research, to assess feasibility of delivery platforms that could inform national scale up to reach adolescent girls in and out of school system in Ethiopia, Kenya, and Senegal.

Methods: Formative research protocols were adapted for each country and studies were implemented with local partners in 2016 and 2017 to identify contextual opportunities for reaching adolescent girls with WIFAS and factors that could influence coverage and adherence. Purposive sampling guided the selection of adolescents, teachers, health workers, decision makers and influencers. Methods included focus group discussions (FGDs) and in-depth interviews (IDIs): Ethiopia–30 FGDs and 85 IDIs; Kenya– 45 FGDs and 36 IDIs; and Senegal–83 FGDs and 301 IDIs.

Results: As adolescent girls have low access of the health system for preventative services, the delivery of WIFAS through the school system was the most efficient platform for greatest reach in all settings. Engagement of teachers and school attendance have the greatest influencers on coverage and adherence. Attendance is often much lower than enrollment due to family and community pressures and a lack of basic amenities, such as female-friendly latrines and safe water. Reaching disperse out-of-school girls with health extension workers will be more resource and time intensive. Awareness of anemia is high, yet misconceptions are common. WIFAS benefits that motivate adolescent girls are related to current school performance, strength and health, rather than future reproductive potential; yet, distinct segments exist within adolescent girls.

Conclusions: Reaching adolescent girls with WIFAS requires multi-sector collaboration between health and education. Impact of these anemia reduction efforts requires overcoming gendered barriers to school attendance and youth-specific barriers to the health system, while recognizing the specific motivators of diverse adolescents in each country.

PRENATAL NUTRITION, STIMULATION, AND EXPOSURE TO PUNISHMENT ARE ASSOCIATED WITH EARLY CHILD MOTOR, COGNITIVE, AND SOCIOEMOTIONAL DEVELOPMENT IN DAR ES SALAAM, TANZANIA

[1]Pitchik, Helen; [2]Fawzi, Wafaie; [3]McCoy, Dana Charles; [4]Darling, Anne Marie; [5]Abioye, Ajibola I.; [6]Tesha, Florence; [7]Smith, Emily R.; [8]Musgui, Ferdinand; [7]Sudfeld, Christopher R.

[1]MSc. Division of Epidemiology. School of Public Health. University of California. Berkeley. Berkeley. CA. USA.; [2]MBBS DrPH. Department of Global Health and Population. Harvard T.H. Chan School of Public Health. Boston. MA. USA; [3]PhD. Harvard Graduate School of Education. Cambridge. MA. USA.; [4]MSc. Department of Global Health and Population. Harvard T.H. Chan School of Public Health. Boston. MA. USA.; [5]MBBS. MPH. Department of Global Health and Population. Harvard T.H. Chan School of Public Health. Boston. MA. USA.; [6]Department of Global Health and Population. Harvard T.H. Chan School of Public Health. Boston. MA. USA.; [7]ScD. Department of Global Health and Population. Harvard T.H. Chan School of Public Health. Boston. MA. USA.; [8]MD. Department of Internal Medicine. Muhimbili University of Health and Allied Sciences. Dar es Salaam. Tanzania.

Background and objectives: Despite growing evidence that early life experiences and exposures can impact child development, there is limited research on prenatal determinants in resource-limited settings. This study examines the association between prenatal factors, birth outcomes, and early life stimulation with motor, cognitive/language and socioemotional development in Tanzania.

Methods: We assessed motor, cognitive/language and socioemotional development among a cohort of 198 children aged 18-39 months in Dar es Salaam, Tanzania, whose mothers were previously enrolled in a randomized, placebo-controlled trial of prenatal vitamin A and zinc supplementation. Linear regression models were used to assess standardized mean differences in child development scores for randomized prenatal regimen and pregnancy, delivery, and early childhood factors.

Results: Children born to mothers randomized to prenatal vitamin A had significantly lower motor scores in minimally adjusted and multivariate analyses (-0.28 SD; 95% CI: -0.53- -0.03; p=0.03) as compared to children whose mothers did not receive vitamin A. There was no significant effect of randomized prenatal zinc on child development. In terms of observational factors, greater caregiver-child stimulation was associated with better cognitive/language scores (p<0.01), while children who experienced both verbal and physical punishment were reported as 0.29 SD (95% CI -0.53- -0.06; p=0.02) lower in socioemotional development than their peers who did not experience both verbal and physical punishment. Further, children of mothers who were <155cm tall had 0.27SD (95% CI -0.54- -0.01; P=0.05) lower scores on the cognitive/language subscale when compared with children of mothers who were ≥155cm tall.

Conclusions: Prenatal vitamin A supplements in a setting with low levels of vitamin A deficiency may not provide child development benefits. However, integrated environmental, educational, parenting, and stimulation interventions may have positive implications across child development domains in resource-limited settings.

CHARACTERIZATION OF UNDERNUTRITION AND ASSOCIATED FACTORS AMONG CHILDREN AGED 6 TO 24 MONTHS IN RURAL MALAWI

[1]Kang, Yunhee; [2]Hurley, Kristen; [3]Ruel-Bergeron, Julie; [3]Oemcke, Rachel; [4]Monclus, Assumpta; [3]Wu, Lee Shu; [3]Mitra, Maithilee; [5]Phuka, John; [6]Klemm, Rolf; [7]West, Jr., Keith.

[1]PhD. Postdoctoral fellow. Department of International Health. Johns Hopkins School of Public Health. USA.; [2]PhD. Assistant Professor. Department of International Health. Johns Hopkins School of Public Health. USA.; [3]MSc. Department of International Health. Johns Hopkins School of Public Health. USA.; [4]MD. Department of International Health. Johns Hopkins School of Public Health. USA.; [5]MD. Senior Lecturer. University of Malawi. Zomba. Malawi.; [6]DrPh. Helen Keller International. USA.; [7]DrPh. Professor. Department of International Health. Johns Hopkins School of Public Health. USA.

Background and objectives: Given the high prevalence of child undernutrition in Malawi, this study aimed to examine the burden and risk factors of stunting and wasting using data from an impact evaluation study collected at baseline.

Methods: Using a cross-sectional dataset for 2,364 children, multivariable logistic regression analysis was conducted to identify risk factors of stunting and wasting at household, maternal, and child level separately among infants (6-<12 mo; n=778) and children (12-23 mo; n=1586). In all 42 risk factors were examined.

Results: The prevalence of stunting (LAZ<-2) was 45.3% and 56.4%, and wasting (WLZ<-2) was 1.6% and 3.0% among infants and children (12-23 mo), respectively. Among infants, stunting was positively associated with male sex (OR=1.66), age (OR=1.12), having no toilet (OR=1.65), and inappropriate hand washing (OR=1.32) [all 95%lower limit (LL)>1.0] and negatively associated with mother's age≥25 y and <35 y (OR=0.62; referent: age<25 y) [all 95%upper limit (UL)<1.0]. These variables were found also to be risk factors, except for having no toilet, among children (12-23mo): male sex (OR=1.58), age (OR=1.06), inappropriate hand washing (OR=1.30) (all 95%LL>1.0) and mother age≥25 y and <35 y (OR=0.77; referent:<25 y) (95%UL<1.0). Perceived small birth size (OR=1.41), having no TV (OR=2.01), previous child death (OR=1.53), not breastfeeding within 1-hour of life (OR=1.55) (all 95%LL>1.0) and housewife mother (OR=0.65; referent: farming) (95%UL<1.0) were additional risk factors for stunting among children (12-23 mo). Among infants, wasting was positively associated with having no kitchen (OR=7.45) and pre-lacteal feeding (OR=14.89) (all 95%LL>1.0) and negatively related to owning land for producing foods (OR=0.16) (all 95%UL<1.0). Of these variables, having no kitchen (OR=2.31) was only related to wasting among children (95%LL>1.0). Having no mobile phones (OR=2.85), unsafe water source (OR=0.38), having ≤2 rooms (OR=2.16), mother age>35 y (OR=2.27; referent:<25 y), and perceived small birth size (OR=2.02) were additional risk factors for wasting among children (all 95%LL>1.0).

Conclusions: More risk factors for stunting and wasting were found related to socio-economic status, size at birth, and mothers' feeding behaviors among children in their second year of life than in infancy in rural Malawi. Understanding age-specific risks of undernutrition would help refine approaches and interventions for prevention.

Keywords: stunting, wasting, risk factors, children, Malawi

of the age; as the body composition changes (increase of fat mass, decreased lean mass and loss of functionality) next to distinctive pathophysiological factors that are added to the base nutritional status. To recover nutritionally an elderly deteriorated is very difficult, hence the importance of valuing nutritionally this group and detecting early risks to take measures of action.

To assess the risk and nutritional vulnerability and functionality of musculo-skeletal tissue, in elderly hospitalized in Sanatorio La Trinidad during February – March, 2017

Methods: Quantitative research, descriptive, observational and cross-sectional.

Population: Adults ≥ 75 years interned in Sanatorio La Trinidad, excluding patients who had pathologies that by itself altered the base nutritional status.

Sample= 141, non probabilistic.

The selected sample was evaluated by different methods and tools: Mini Nutritional Assessment Questionnaire (MNA), Geriatric Nutritional Risk Index (GNRI), Nutritional Vulnerability Survey and grip force by dynamometry, subsequently data was tabulated and carried out an analysis of the same.

Results: Average age 82 years (SD±6). 61% was female. 74% lived with relatives and/or caregivers at the time of the internment, 25% lived alone and 1% in private geriatrics. The Nutritional Risk obtained by MNA: 43% normal, 45% risk and 12% malnutrition; according GNRI: 50% without risk, 18% under, 20% moderate and 11% high.

Nutritional Vulnerability Degree: 3% didn´t present, 91% mild, 6% moderate.

Grip Force: 41% weak, 38% normal, 21% strong.

Conclusions: Detecting the needs and the difficulties and challenges that the elderly live to procure food; along with the nutritional status evaluation and functionality of muscle-skeletal tissue, is essential for the decision-making during the internment and patient following after hospitalization.

Keywords: Food Vulnerability; Malnutrition; Muscle-skeletal functionality.

OMEGA6:OMEGA3 FATTY ACIDS IN THE DIET: RESULTS FROM A POPULATION-BASED STUDY

[1]Simonian Rodrigues Valente Ghedini, Natália; [2]de Assumpção, Daniela; [3]Berti de Azevedo Barros, Marilisa; [4]Martins Álvares Domene, Semíramis.

[1]Dietitian. Federal University of São Paulo. Baixada Santista Campus. Institute of Health and Society. Graduate Program in Food. Nutrition and Health. Santos. Brazil.; [2]PhD. Dietitian. Department of Collective Health. School of Medical Science. State University of Campinas. Campinas. Brazil.; [3]PhD. Doctor. Department of Collective Health. School of Medical Science. State University of Campinas. Campinas. Brazil.; [4]PhD. Dietitian. Department of Public Policies and Collective Health. Federal University of São Paulo. Santos. Brazil.

Background and objectives: Although the effect of diet on health status is widely recognized, few Brazilian studies have evaluated the profile of fat consumption by the Brazilian population. The imbalance in the consumption of omega-6:omega-3 (n6:n3) fatty acids is related to inflammatory processes that increase the risk of developing non-communicable chronic diseases.

The aim of this study was to analyze the associations between the ratio of n6:n3 fatty acids and sociodemographic variables, health related behaviors and morbidity.

Methods: This is a cross-sectional population-based study, with a sample stratified by clusters and in two stages, conducted between 2008-09, in the city of Campinas, SP, Brazil. Fat intake was estimated using the 24-Hour Recall, and data were entered into the Nutrition Data System for Research software. In the analysis, the means of the n6: n3 ratio were calculated according to the independent variables, using simple and multiple linear regression, with a significance level of 5%. The food records of 3,303 individuals, aged 10 years or more, were analyzed.

Results: Lower values of the n6: n3 ratio were found in the strata of adults and the elderly, in those who ate fruit and milks daily, and in those who were physically active at leisure. The prevalence of inadequate omega 3 in the diet reached 13% of the population, and the omega 6 reached 100% among adult women.

Conclusions: The results reveal that the groups most vulnerable to the inadequate intake of omega-6 and omega-3 fats were adolescents, those who did not eat fruit and milk every day and those who did not practice physical activity at satisfactory levels. These findings show a concomitance of unhealthy behaviors and may contribute to the elaboration of strategies aimed at the adoption of changes in lifestyle.

Keywords: Fatty acid omega 6; fatty acid omega 3; ratio omega6:omega3; sociodemographic profile; dietary surveys.

IMPACT OF ANTIBIOTICS ON MICROBIOME DEVELOPMENT & INSTEAD OF LATER HEALTH

[1]Van Daele, Emmy; [2]Belzer, Clara; [3]Knol, Jan; [4]Vlieger, Arine M.; [5]van Elburg, Ruurd M.; [6]Oosterloo, Neelke.

[1]PhD candidate. Laboratory of Microbiology. Wageningen University. The Netherlands.; [2]PhD. Laboratory of Microbiology. Wageningen University. The Netherlands.; [3]Prof PhD. Laboratory of Microbiology. Wageningen University. The Netherlands.; [4]MD Phd. Department of Pediatrics. St. Antonius Hospital. The Netherlands.; [5]MD Prof PhD. Department of Pediatrics. Academisch Medisch Centrum Universiteit van Amsterdam. The Netherlands; [6]MD. Department of Pediatrics. Academisch Medisch Centrum Universiteit van Amsterdam. The Netherlands.

Background and objectives: Neonatal colonization drives postnatal gut maturation and induces the immune system, thus possibly impacting (long term) health. The exact impact of early life factors on later intestinal microbiota colonization and health remains unclear especially when disruptive factors like antibiotic use come into play. This study aims to provide insights into the development of the early life microbiome, especially for infants that received antibiotic treatments during the first week of life.

Methods: We will investigate the early life microbiome composition with 16S Illumina sequencing within the observational cohort of the INCA study. In this study, stool samples were collected from 450 term infants, of whom 150 had received an antibiotic treatment during their first week of life. Fecal samples and clinical outcomes were followed up until the age of 2 years, including 9 time points. Around the time of birth, the mothers also collected a fecal sample and both parents sampled the skin and oropharynx with a swab. Additional metagenomics studies will be used to study the transmission of micro-organisms from the parents to the infant.

Results: An overview will be made of the microbial development of the gut during the first 2 years of life, especially after short (2-3 days) or long (7 days) antibiotic treatment during the first week of life. A comparison based on the delivery mode (vaginal delivery, primary or secondary caesarean section) and the feeding mode (breastfed or formula fed) will be included.

Conclusions: Possible clinical effects of early life conditions like antibiotic use could be demonstrated with this data set. Such findings could help with the development of pre-, pro- and synbiotics to support an ecological balance in the infant gut microbiota when some life conditions are not optimal. This could resolve disease in later life, especially because of the tight interplay of the gut and immune system's development.

Keywords: Gut microbiota, Early life, Antibiotic use

MATERNAL NUTRITIONAL ADEQUACY AND GESTATIONAL WEIGHT GAIN IN VIETNAMESE PREGNANT WOMEN

[1]Huynh, Dieu Thi Thu; [2]Tran, Nga Thuy; [3]Nguyen, Lam Thi; [4]Berde, Yatin; [5]Low, Yen Ling; [6]Tey, Siew Ling.

[1]MD. PhD. Senior Lead Scientist. Abbott Nutrition Research and Development Asia-Pacific Center. Abbott. Singapore.; [2]MD. PhD. Head of Department. Micronutrient Research and Application. National Institution of Nutrition. Vietnam.; [3]MD. PhD. Deputy Director of National Institution of Nutrition. Clinical Nutrition. National Institution of Nutrition. Vietnam.; [4]MS. Biostatistician. Statistical Services. Cognizant Technologies Solution Pvt. Ltd. India.; [5]PhD. Director. Abbott Nutrition Research and Development Asia-Pacific Center. Abbott. Singapore.; [6]PhD. Senior Clinical Scientist. Abbott Nutrition Research and Development Asia-Pacific Center. Abbott. Singapore.

Background and objectives: Nutritional demands significantly increase during pregnancy to support healthy fetal growth and development. Understanding nutritional adequacy during pregnancy may help to identify appropriate approach to promote optimal nutrition for better pregnancy outcomes. The objective of the present study was to describe maternal nutritional adequacy and gestational weight gain among pregnant women in Vietnam.

Methods: A total of 226 singleton mothers aged 20 to 35 years at 26 to 29 weeks gestation took part in a prospective, multicenter, randomized controlled trial, parallel design with two treatments: (A) daily maternal nutritional supplementation containing macronutrients and a variety of micronutrients starting from 26 to 29 weeks gestation (i.e. baseline) to 12 weeks postpartum and a breastfeeding program (experimental group) or (B) standards of care which is to continue taking iron and folic acid supplementation daily until delivery (control group). Maternal nutritional intake was assessed at baseline using a standardized 24-hour diet recall method. Gestational weight gain during the first and second trimesters was calculated by subtracting pre-pregnancy weight from weight at 26 to 29 weeks.

Results: Ninety-five percent of the pregnant women had concurrent inadequacies for more than five nutrients and approximately one in two (i.e. 44%) pregnant women had concurrent inadequacies for more than ten nutrients at baseline. Almost two-thirds (i.e. 62%) of the pregnant women did not meet the recommended gestational weight gain defined by the Institute of Medicine. Infants in the maternal nutritional supplementation group had significantly higher birth weight, birth weight-for-age z-score, and birth head circumference-for-age z-score, compared with those in the iron and folic acid supplementation group (all P ≤0.049).

Conclusions: Nutrient inadequacies are very common in pregnant women in Vietnam and often occur as concurrent inadequacies across multiple nutrients. The high percentage of women who failed to meet recommended gestational weight gain during pregnancy is of concern. Maternal nutritional supplementation which provides macronutrients and various micronutrients is more effective than the routine iron and folic acid supplementation and can be used as a means to promote maternal nutritional status in order to improve birth outcomes.

Keywords: Pregnancy. Nutritional adequacy. Gestational weight gain. Maternal nutritional supplementation. Birth outcomes.

BODY SELF-IMAGE OF ADOLESCENTS UNDER THE INFLUENCE OF THE MEDIA

[1]Rocha Simonin De Souza, Vagner; [2]Da Silva Daineses, Karen; [3]Nunes Rosa Borges, Graciely.

[1]PhD. Nutritionist. Departament of Nutrition. Redentor Univeristy. Brazil.; [2]Nutritionist student. Redentor University. Brazil.; [3]Nutritionist. Redentor University. Brazil.

Background and objectives: The study aimed to evaluate a body self-image of adolescents under the influence of the media, and how much this influence alters your perception of your body.

Methods: Twelve adolescents between the ages of 15 and 18 participated in the study, at the High School of the Redentor College in Itaperuna, who returned to the Duly signed Free and Informed Consent Form. Two questionnaires were applied: a body self-image test, based on the self-image scale, developed and validated by KAKESHITA et al, 2006. The test was constructed by three self-image scales, each scale being 9 silhouettes, each silhouette corresponding to an average BMI, where the Teenager indicated on the scale 1, the figure that best represented the silhouette of his own body at the moment, and at scale 2, he indicated which silhouette he would like to have. Weight and height of each adolescent were collected to define their BMI, Thus defining the image that represented the real silhouette of the same. Afterwards, a questionnaire containing 29 questions was applied in order to evaluate the influence of the media on the body self-image, developed and validated by AMARAL et al, 2015. Subsequently, Pearson correlation analysis, ANOVA and Tukey, with significance of p < 0.05, between each scale and the questionnaire questions. The three self-image scales, S1, S2 and S3, were also compared for the determination of distortions between them. After the application of the test and questionnaire, an educational lecture was given, where the topics "Fashion Diets" and "Eating Disorders" were discussed.

Results: The TV was defined, according to the results, as an object of greater influence, followed by Magazines, Movies and Movie Stars. As predicted, this influence is stronger in females, but there is a distortion of body self-image in both sexes, suggesting dissatisfaction with body image also in both.

Conclusions: From the results found, it is concluded that the influence of the media in the self-image of adolescents is existing and very significant in both Sexes.

Keywords: body image; media; Teenagers

ANTHROPOMETRY AND BIOIMPEDANCE ANALYSIS: COMPARISON IN PREDICTING INTRA-ABDOMINAL FAT

[1]*Janjetic, Mariana;* [2]*Rossi, María Laura;* [2]*Oliva, María Laura;* [2]*Squillace, Celeste;* [2]*Belen, Lorena;* [2]*Alorda, María Beatriz;* [3]*Maffei, Laura;* [4]*Torresani, María Elena.*

[1]PHD. Nutritionist. Universidad de Buenos Aires. Facultad de Medicina. Escuela de Nutrición. Buenos Aires. Argentina.Consejo Nacional de Investigaciones Científicas y Técnicas. Argentina; [2]MSc. Nutritionist. Escuela de Nutrición. Facultad de Medicina. Universidad de Buenos Aires. Argentina.; [3]MD. Directora Médica de Fundación de Investigación para el Estudio de Enfermedades Endocrino Metabólicas (FIEEM).Buenos Aires. Argentina.; [4]PhD. Nutritionist. Escuela de Nutrición. Facultad de Medicina. Universidad de Buenos Aires. Argentina.

Background and objectives: Abdominal obesity, more specifically increased intra-abdominal adipose tissue, is strongly associated with increased risk of metabolic disease. Bioelectrical impedance analysis (BIA) may provide a better reliability non-invasive measure of visceral fat level (VFL) than anthropometric assessment of waist circumference (WC) considering the possible intra-observer and inter-observer technical errors which can be presented by this latter. The aim of this study was the evaluation of anthropometric measurements in comparison to multifrequency tetrapolar BIA in adult women.

Methods: Cross-sectional study of 406 women, attending a nutritional consultation at the Metabolic and Endocrine Diseases Research Foundation (Buenos Aires City, Argentina). An anthropometric profile was assessed by body mass index (BMI) and WC, considering increased values greater than or equal to 25 kg/m2 and greater than 88 cm, respectively. The VFL analysis was performed in a 3-h fast, by a four-way multifrequency bioelectrical impedance analyzer (model InBody 570). Statistical analysis with SPSS 19.0 using Spearman correlation, Mann Whitney test and chi2 test (p value <0.05).

Results: The mean age was 41.1 (SD = 15.2) years, stratified into two groups: 20-39 years (n = 220) and 40-65 years (n = 186). Mean BMI values for each group were: 25.4 (SD = 4.6) kg/m2 and 27.6 (SD = 4.9) kg/m2, respectively. WC was 81.1 cm (SD = 11.1) and 87.7 cm (DS = 11.0) for each age group, respectively. The prevalence of altered VFL was 50.0% (95% CI, 43.5-56.5%) and 76.9% (95% CI, 70.3-82.3%) respectively (p = 0.000). The greater age range the higher VFL. The correlation between VFL and WC was high positive (r= 0.84, p <0.0001). In the total of the sample 31.8% presented altered WC, while 62.3% presented VFL altered by bioimpedance and both variables were not independent (p <0,001). Stratifying by BMI, neither showed independence (Overweight/obese p=0,02; Normal weight p= 0,01). In overweight or obese women, 53.4% had altered WC, and 94.4% presented VFL altered by bioimpedance. In normal weight women, 4,07% had altered WC, and 18.6% had altered VFL by bioimpedance.

Conclusions: Positive correlation was found between WC and VFL and both variables were not independent beyond the nutritional status.

Keywords: anthropometry, bioelectrical impedance, intra-abdominal fat, women

ADOLESCENT MOTHERS' HEIGHT AND BMI GROWTH VELOCITY IN CHILDHOOD PREDICT NEXT GENERATION'S ANTHROPOMETRICS IN ETHIOPIA, INDIA, PERU AND VIETNAM: A THREE-GENERATIONAL APPROACH

[1]*Schott, Whitney;* [2]*Aurino, Elizabetta;* [3]*Penny, Mary Penny;* [4]*Behrman, Jere.*

[1]BA. MA. PhD. Research Scientist. Population Studies Center. University of Pennsylvania. USA.; [2]BA. MA. PhD. Applied Microeconomist. Centre for Health Economics and Policy Innovation. Imperial College. London. UK.; [3]MA. MBChB. Director and Researcher. Instituto de Investigacion Nutricional. Peru.; [4]BA. PhD. Professor. School of Economics. University of Pennsylvania. USA.

Background and objectives: Previous studies have shown maternal birth weight and childhood growth predicts next-generation birth weight; few have considered adolescent mothers or have examined associations across three-generations, including children, mothers and grandmothers.

Methods: "Young Lives" is a longitudinal study of children growing up in poverty in Ethiopia, India, Peru, and Vietnam. We used data from 285 girls of the older cohort who had been visited at ages 8, 12, 15 and 19 approximately, and had given birth, in order to examine the predictive value of their body size and growth between 8 and 15 years on their infants anthropometrics. We analyzed height-for-age z-scores (HAZ), body-mass-index-for-age-z-scores (BMIZ) and conditional HAZ growth (measured as residuals in regressions of HAZt on HAZt-1, denoted cHAZ) and conditional BMI z-score (BAZ) growth (denoted cBAZ) on their infant's on infant's birth weight, birth weight z-score (BWZ), and conditional growth in weight-for-age-z-score (cWAZ), and HAZ. We also examined the grandmaternal BAZ and HAZ, as predictors of third-generation anthropometrics. We included controls for all three generations.

Results: One standard deviation increase in cHAZ growth between ages 8 and 15 years predicted 128.5g higher third-generation birth weight, 0.30 standard deviation higher BWZ, and 0.41 standard deviation higher cWAZ, but not third-generation HAZ.

Maternal BMI z-score (BAZ) aged 8 was associated with 0.21 higher BWZ (and birth weight, though at p<0.10), but not with third-generation cWAZ or HAZ growth. Maternal cBAZ predicted third-generation cWAZ and HAZ. Grandmaternal BAZ and HAZ did not predict the grandchild anthropometric outcomes that we measured but grandmaternal schooling did predict higher grandchild birth weight and BWZ (p<0.05).

Conclusions: Adolescent mother's size and growth during childhood predicted their offspring's birth weight, BWZ, HAZ and cWAZ. Grandmaternal schooling, but not size, predicted third generation anthropometrics.

Keywords: Adolescent growth, offspring anthropometrics, three generations, "Young Lives" study

OPPOSING PREDICTIONS OF BIRTHWEIGHT AND PRE-PUBERTAL ANTHROPOMETRICS FOR AGE AT MENARCHE IN INDIA, PERU AND VIETNAM, RESULTS FROM THE "YOUNG LIVES" STUDY

[1]Aurino, Elizabetta; [2]Schott, Whitney; [3]Penny, Mary Penny; [4]Behrman, Jere.

[1]BA. MA. PhD. Applied Microeconomist. Centre for Health Economics and Policy Innovation. Imperial College. London. UK.; [2]BA. MA. PhD. Research Scientist. Population Studies Center. University of Pennsylvania. USA.; [3]MA. MBChB. Director and Researcher. Instituto de Investigacion Nutricional. Peru.; [4]BA. PhD. Professor. Department of Economics. School of Arts and Sciences. University of Pennsylvania. USA.

Background and objectives: Evidence on the associations of birthweight and pre-pubertal nutritional status with age at menarche for low- and middle-income countries is limited.

Methods: "Young Lives" is a longitudinal study of children growing up in poverty. We used data from 2001 Indian, Peruvian and Vietnamese girls of the younger cohort, born 2001-2002, who had been visited at approximately ages 1, 5, 8 and 12 years. We investigated the relation between birthweight and pre-pubertal anthropometrics, and age at menarche. Weibull survival models estimated hazards of earlier menarche based on birth weight z-scores (BWZ), and age 8-years BMI-for-age z-scores (BAZ) and height-for-age z-scores (HAZ). Estimates controlled for potential individual-, mother- and household-level confounders, and for changes in anthropometry between 1 and 8 years.

Results: In adjusted models, BWZ predicted later age at menarche (Hazard Ratio, HR=0.90, 95%CI: 0.83 - 0.97). Conversely, HAZ (HR=1.66 95%CI 1.5 - 1.83) and BAZ at 8 years (HR=1.28, 95% CI: 1.18 - 1.38) predicted earlier menarche. Changes in HAZ and BAZ between 1 and 8 years were not associated with earlier menarche. Associations were consistent across the three countries, though with variation in estimated magnitudes. The girl's mother's height and age were associated with later menarche.

Conclusions: This evidence points to consistently robust and opposite associations of birthweight versus pre-pubertal attained height and BMI with age at menarche age in three diverse settings in terms of nutrition, ethnicity and socio-economic status.

Keywords: Birthweight, menarche, nutritional status, prepubertal growth

EFFICACY OF A COGNITIVE BEHAVIORAL TREATMENT VERSUS A TRADITIONAL INTERVENTION TO REDUCE ADIPOSITY WITHIN A NUTRITIONAL INTERVENTION PROGRAM IN OBESE SCHOOL CHILDREN

[1]Salazar Preciado, Laura Leticia; [2]Larrosa Haro, Alfredo; [3]Colunga Rodríguez, Cecilia; [4]Romero Velarde, Enrique; [5]Fernández Castillo, Brenda.

[1]PhD. Nutritionist. Public Health Department. University of Guadalajara. Mexico.; [2]PhD. Gastroenterologist. Human Nutrition Institute. University of Guadalajara. Mexico.; [3]PhD. Psychologist. Medical Research Unit. Mexican Social Security Institute. Guadalajara. Mexico; [4]PhD. Pediatrician. Human Nutrition Institute. University of Guadalajara. Mexico.; [5]Educator. Public Health Department. University of Guadalajara. Mexico.

Background and objectives: Obesity is a major health issue right now. The overwight epidemic worldwide has a fast growth, in rich and poor countries, and among all segments of society for the last decades. There is an urgent need for efficient methods to prevent and treat obesity among children. The aim of this study was to compare the efficacy of a cognitive behavioral treatment [CBT] versus a traditional intervention [TI] trials to reduce the adiposity within a nutritional intervention program in obese children.

Methods: A clinical trial to reduce the adiposity and to modify the dietary and physical activity habits was conducted in 25 obese children attending an elementary school in Guadalajara, Mexico. They were randomly assigned to TI or CBT intervention groups. The outcome variables of this report were measured at times 4, 8 and 12 months of intervention

Results: Most of the differences were found intra-group. Adjusted BMI value with z scores showed a decrease in the intervention group almost at all times (basal vs. 4months p=0.048, vs. 12months p=0.013 and vs. 16months p=0.018) and an increase for the control group at four months (p=0.021). Arm fat index had a significant decrease for the intervention group (basal vs. 12 months p=0.041), and after adjusting the arm anthropometric indicators with z scores, a significant increase of the muscular area (basal vs. 12months p=0.030) was observed along with a decrease in the fat index (basal vs. 16meses p=0.023). The energy adequacy percentage revealed changes mostly in the intervention group with an energy intake decrease at basal vs. 4 months (p=0.013) and vs. 16 months (p=0.013), and the lipids intake (basal vs.4. months p=0.046). The evaluation of PA by the EUROFIT battery test adjusted values with age and sex percentiles showed practically no differences.

Conclusions: The effectiveness of the intervention showed higher intra-group statistical differences in the intervention group

with a decrease of the values of adiposity and energy intake. The inter-group comparison showed practically no statistical difference. The null hypothesis could not be rejected entirely because the differences were mostly intra-group, however, results have clinical relevance due to the decrease of adiposity and energy consumption.

DIETARY HABITS AND LIFE-STYLE FACTORS INFLUENCE THE HEALTH-RELATED QUALITY OF LIFE AND THE LEARNING ATTITUDE IN SCHOOLCHILDREN

[1]Shinohara, Hisae; [2]Okuda, Toyoko; [3]Tanaka, Noriko; [4]Hamaguchi, Ikue.

[1]PhD. Associate professor. Faculty of Education. University of Miyazaki. Japan.; [2]PhD. Professor. Faculty of Human Sciences. Tezukayama Gakuin University. Japan.; [3]PhD. Professor. Faculty of Home Economics. Kobe Women's University. Japan.; [4]PhD. Associate professor. Faculty of Human Sciences. Konan Women's University. Japan.

Background and objectives: Since the Food Education Basic Law "Shokuiku" was enacted to promote childhood nutrition education, nowadays many "Shokuiku" programs are performed in school. Recently, many common health problems such as a decline in physical strength, underweight, or obesity in Japanese children and adolescents are caused by their polarized amount of exercise. The purpose of this study was to elucidate the influence of the dietary habits and life-style factors on quality of life and the learning attitude in schoolchildren.

Methods: From March to May 2015, the survey was conducted in 941 schoolchildren (459 boys and 482 girls aged 9–13 years) from nine schools in Miyazaki. Dietary habits and life-style factors were anonymously assessed through a self-administered questionnaire and brief self-administered diet history questionnaires for 10-year-olds (BDHQ10y) and for 15-year-olds (BDHQ15y). Quality of Life (QOL) were assessed by KidKINDL for children and adolescents. We performed statistical analysis by Chi-square test, factor analysis by the least-square method, and covariance structural analysis. This study has been approved by the research ethics committee of the University of Miyazaki.

Results: QOL of "self-esteem score" and "school score" were lower in 12-13y old groups. By the factor analysis by the least-square method, three factors were extracted and named "interest in cooking", "importance of food" and "enjoyment of sports". According to each category score, the children were divided into high- and low-score groups. Food intake and nutrient intake were mainly better in the high score group of "interest in cooking". QOL total score was higher in the high score group of "importance of food" and "enjoyment of sports". "Interest in cooking" or "importance of

food" had the strong effects directly and indirectly on QOL total score and on improvement of "desire to learn and learning attitude" by covariance structural analysis.

Conclusions: The present analytical results indicated that teachers and parents should work together to develop an "interest in cooking" and "importance of food" as "Shokuiku" program in schoolchildren so as to promote their healthy growth and development.

Keywords: dietary habit, life-style, QOL, schoolchildren, interest in cooking

CODEX: PROTECTING INFANT AND YOUNG CHILD HEALTH OR FACILITATING THE MARKETING OF FOODS FOR INFANTS AND YOUNG CHILDREN?

Sterken, Elisabeth.

International Baby Food Action Network (IBFAN). Canada.

Background and objectives: The UN body, Codex Alimentarius, with parent bodies, World Health Organization (WHO) and Food and Agricultural Organization (FAO) sets standards for food products and food commodities including infant formulas and foods for infants and young children. Codex is mandated to promote fair practices in the trade of food and the protection of public health. However in implementing these two mandates, Codex frequently finds itself facing conflicting priorities in its decision making to set food standards.

Although the participants in the process include government representatives of the UN member states, the parent organizations WHO and FAO and non-governmental organizations (NGOs), it is the latter where large numbers of industry based "NGOs" primarily consisting of food and drinks industries exert extensive influence on Codex standards. In effect outcomes routinely reflect and support the trade and marketing interests of the food and drinks industries.

Methods: The presentation will focus on the standard setting of infant formulas and foods for infants and young children to highlight the conflict of public health protection and, in this case the globe's most vulnerable population, infants and young children and the facilitation of trade in baby foods. The presentation will demonstrate how trade priorities marginalize the protection of health and safety and in the special case of setting standards for formulas and baby foods, the protection of breastfeeding.

Results: Codex Standards are the benchmarks for the World Trade Organization and in effect are mechanisms for harmonizing trade in foods, with resultant loss of national regulatory and policy setting. In the special case of infant formulas and foods for infants and young children, national regulatory loss may result in a government's lack of ability or willingness to implement legislative measures - the International Code of Marketing of Breastmilk Substitutes, the WHA resolutions and other key safety mechanisms to protect breastfeeding and subsequent maternal and child health.

Conclusions: Examples will be presented to demonstrate the impact on measures to protect infants and young child health.

Keywords: Codex. breastfeeding. health. protection. policy.

SUSTAINABLE UNDERNUTRITION REDUCTION IN ETHIOPIA (SURE) PROGRAMME EVALUATION (2016-2019): CROSS-SECTIONAL BASELINE SURVEY

(1)Kuche, Desalegn; (2)Hailu, Tesfaye; (3)Ayana, Girmay; (4)Abera, Andinet; (4)Eshetu, Solomon; (4)Beyene, Yosef; (4)Belay, Adamu; (5)Sisay, Mekonnen.

(1)M.Sc. Nutritionist. Food science and nutrition research directorate. Ethiopian public health institute. Ethiopia.; (2)M.Sc. Nutritionist. Food science and nutrition research directorate. Ethiopian public health institute. Ethiopia.; (3)M.Sc. Nutritionist. M.Sc. Nutritionist. Food science and nutrition research directorate. Ethiopian public health institute. Ethiopia.; (4)M.Sc. Food scientist. Food science and nutrition research directorate. Ethiopian public health institute. Ethiopia.; (5)M.Sc. Nutritionist. University of Gondar. Ethiopia.

Background and objectives: Sustainable Undernutrition Reduction in Ethiopia (SURE) programme is the first Government-led multi-sectoral integrated health and agriculture sector programme for nutrition outcomes. The programme will deliver an enhanced Community-Based Nutrition (CBN) program. The objective was to establish baseline characteristics at the outset of the programme and assess the comparability in intervention and comparison district.

Methods: A cross-sectional survey was carried out in four agrarian regions of Ethiopia from April to July 2016. The survey used multistage cluster sampling at the village and household levels. The sample size calculations for the survey was based on detecting a change at end line in nutritional status and key IYCF practices that can be attributed to the SURE intervention. A total of 4980 children 0-47 months old in 4299 households were involved in the survey. The survey covered 36 intervention and 36 comparison districts, a total of 72 districts.

Results: The prevalence of stunting among children 6-23 months old was 31.3% and 27.9%; whereas underweight was 19% and 16.5% and wasting was 9% and 8% in the intervention and comparison districts, respectively. Among children 24-47 months old, stunting prevalence was 46.9% and 40.5%, underweight was 23.7% and 21.6% and wasting was 4% in the intervention and comparison districts, respectively.

Breastfeeding was nearly universal in both groups. Over 60% of children initiated breastfeeding within an hour of birth and nearly 80% of children in both arms were exclusively breastfed. About three-quarters of all children initiated complementary feeding between 6 to 9 months of age but only 4.5% and 7.8% of all children had access to the minimum diversified diet in the intervention and comparison districts, respectively. About 41% and 45% of all households were food insecure in the intervention and comparison districts, respectively. Only about 5% in intervention and 8% in comparison districts of all mothers interviewed had access to minimum diversified diet.

Conclusions: The intervention and comparison districts are comparable in most of the demographic and socio-economic characteristics. The prevalence of undernutrition, child feeding practices, food insecurity and women dietary diversity are more or less comparable between the two groups.

SOCIOECONOMIC DISPARITIES IN THE CONSUMPTION OF UNPROCESSED FOOD (FRUITS AND VEGETABLES): NATIONAL SURVEY OF THE NUTRITIONAL STATUS IN COLOMBIA, 2010

[1]*Gamboa, Edna;* [2]*Herrán Falla, Oscar Fernando;* [3]*Patiño Benavides, Gonzalo Alberto.*

[1]PhD. Nutritionist. Department of Nutrition. Universidad Industrial de Santander. Colombia; [2]MSc. Nutritionist. Department of Nutrition. Universidad Industrial de Santander. Colombia; [3]PhD. Economist. Department of Economy. Universidad Industrial de Santander. Colombia.

Background and objectives: Establish the prevalence and frequency/day and estimate inequalities in consumption of fruits and vegetables (F&V).

Methods: Design. Multilevel analysis based on cross-sectional data from the National Survey of the Nutritional Situation (EN-SIN-2010)

Setting. Colombia.

Subjects. Adults between 18 and 64 years old (n=5,217) and geodemographic units (n=33).

Results: 88.7% and 72.7% respectively consume fruit juice and cooked vegetables. At the individual level the consumption of whole fruits and juice in women is no different than men; Adjusted prevalence ratio (PR), 0.91 (95% CI; 0.75 to 1.10) and PR=0.91 (95% CI; 0.71 to 1.17), respectively. In women the consumption of raw and cooked vegetables is higher, PR=1.28 (95% CI; 1.05 to 1.56) and PR=1.27 (95% CI; 1.08 to 1.50), respectively. Women reached the highest frequency/day of consumption in fruit juice, 1.02 (95% CI; 0.98 to 1.07), and the smallest man in the consumption of cooked vegetables, 0.31 (95% CI; 0.28 to 0.33). At the ecological level results on consumption they are similar. At the individual level the Gini coefficient for the prevalence was between 0.09 and 0.16 and for frequency/day between 0.51 and 0.62. At the ecological level, the Gini index for the prevalence was between 0.04 and 0.14, for frequency/day between 0.03 and 0.11.

Conclusions: Colombian population does not meet the recommendations of F&V consumption. Men and women prefer drinking fruit juice. Inequality is evident in the consumption of vegetables, to the disadvantage of men. The poorest consume fewer fruits and vegetables. Reducing poverty would increase the frequency/day of consumption.

Keywords: Consumption, Fruits and Vegetables, disparities, unprocessed food.

WAIST-TO-HEIGHT RATIO AND ITS RELATION WITH CARDIOMETABOLIC RISK FACTORS IN CHILDREN FROM BUCARAMANGA, COLOMBIA

[1]*Gamboa, Edna;* [2]*Domínguez, Clara;* [3]*Quintero, Doris.*

[1]PhD. Nutritionist. Department of Nutrition. Universidad Industrial de Santander. Colombia; [2]Nurse. Union temporal CaRDIECOL. Colombia; [3]PhD. Nutritionist. Research Center. Fundación Cardiovascular de Colombia. Colombia.

Background and objectives: Currently, the waist-to-height ratio has emerged as a practical and useful indicator for identifying cardio-metabolic risk in child and adolescent population. Objective: To evaluate the association between the waist-to-height ratio and the cardiometabolic risk factors in a cohort of children in Bucaramanga, Colombia.

Methods: Analytical cross-sectional study. Child population between 6-10 years old from Bucaramanga (n = 1,282). Independent variable: waist-to-height ratio. Dependent variables: hypertension, pre-hypertension, overweight/obesity, impaired glucose, insulin resistance, dyslipidemia. The association between dependent and independent variables was evaluated using logistic regression models. Data analyzed in Stata 12.0.

Results: 9.77% of the children presented a waist-to-height ratio of risk (95% CI: 8.19 to 11.52). After adjustment for age, sex, socioeconomic status and physical activity, the waist-height index of risk was significantly associated with lower HDL levels and higher levels of triglycerides, insulin resistance, hypertension and prehypertension (OR=2.95 IC 95%: 1.82 to 4.79, p=0.000, OR=2.60 IC 95%: 1.59 to 4.26, p=0.000, OR=10.68 IC 95%: 4.88 to 23.36, p=0.000, OR=8.36 IC 95%: 1.99 to 35.15, p=0.004 and OR=2.98 IC 95%: 1.66 to 5.36, p=0.000, respectively).

Conclusions: Children with waist-to-height ratio of risk were more likely to develop high levels of blood pressure and triglycerides, insulin resistance and lower levels of HDL. Interventions are needed for cardio-metabolic risk prevention in children and teenagers.

Keywords: Child. metabolic syndrome x. waist-height ratio.

FOOD SECURITY NUTRITION AND HEALTH: THE PLIGHT OF NEGLETED MAJORITY IN A DEVELOPING COUNTRY

Adeyemo, Remi.

Agricultural Economics.

Background and objectives: The world has more than enough food, yet many are food insecure in sub Saharan Africa, Agriculture plays a key role in providing abundant food and fiber nationally in agricultural based countries and providing food for

all. Food security is in operation when all people at all times have physical, social and economic access to sufficient, safe and nutritious food to meet their dietary need and food preference for an active and healthy life. Food consumption at the household level is often influenced by the amount and varieties of food produced and available, income levels of households and nutritional knowledge of the people in each household. Food insecurity is operating in a number of countries in sub Saharan Africa. Research has shown that lack of access to food has affected the development of and prevention of medical condition and diseases This paper explored the human health risks associated with changing environment and strategies toward sustainable nutritional food.

Methods: The methods used for this study were compilation of secondary data and copious research literature in order to come up with required strategies for sustainable food with good nutritional status that can be adopted in most Saharan Africa

Results: The research revealed that food waste occurred at all stages of production process, post harvesting and preservation. These were evidences that shown that the value chain of food products were under developed There were human health risks associated with environmental issues. These included increased rainfall that multiplied the spread and incidence of vector. Peak flow contributed to widespread malaria.

Conclusions: The paper concluded among others that efforts should be made to promote food value chain in sub Saharan Africa. Producers of food should be encouraged to plant environmental resistant seeds and food essential nutrients should be promoted for consumption

Keywords: Food, Health Nutrition and Environment

DIAGNOSTIC ACCURACY OF WAIST TO HEIGHT RATIO IN SCREENING OF INSULIN RESISTANCE

[1]Quintero Lesmes, Doris Cristina; [2]Domínguez, Clara; [3]Romero, Silvia; [4]Gamboa, Edna.

[1]PhD. MSc. Nutritionist. Fundación Cardiovascular de Colombia. Colombia.; [2]Nurse. Unión Temporal Cardiecol (Conocimiento y acción para reducir la dimensión de la enfermedad cardiovascular en Colombia). Colombia.; [3]M.D. Unión Temporal Cardiecol (Conocimiento y acción para reducir la dimensión de la enfermedad cardiovascular en Colombia). Colombia.; [4]Phd. MSc. Nutritionist. Escuela de Nutrición y Dietética, Universidad Industrial de Santander. UIS. Colombia.

Background and objectives: To explore the sensitivity and specificity of waist to height index as indicator of insulin resistance in pediatric age and to obtain cut-off points to simplify the diagnosis.

Methods: One thousand and two hundred and eighty two child population between 6 and 10 years were analyzed. Anthropometric measures were taken (height, weight, waist circumference and skinfolds thickness), and waist to height ratio (WHR), insulin resistance, body mass index (BMI) and fat percentage were

calculated. ANOVA test was used to evaluate the performance of anthropometric variables during the growth period. ROC curve analysis (Receiver Operating Characteristics) was applied using WHR as test variable and insulin resistance status as criterion variable. The sensitivity and specificity values, areas under the curve (AUC), confidence intervals 95%, and cut-offs points were obtained. The statistical and graphical procedure was performed using Stata® 12.0.

Results: WHR does not vary with age. AUC ranged from 0.7490 (boy) to 0.7515 (girls) indicating that the WHR has a high predictive power to identify the subjects previously classified as insulin resistance using considered criteria.

Conclusions: WHR proved to be an appropriate and acceptable predictor of insulin resistance in children between 6 and 10 years. Cut-offs points of WHR that identify insulin resistance are: 0.46 (AUC=0.7504) in males and 0.46 (AUC=0.6680) in girls.

DIETARY PATTERNS AND BONE MINERAL DENSITY AMONG LONG TERM USERS OF DEPOT MEDROXYPROGESTERONE ACETATE COMPARED TO NON HORMONAL CONTRACEPTIVE USERS, KAMPALA- UGANDA

[1]Matovu, Nicholas; [2]Matovu, Flavia.

[1]MPH (Nutrition). Makere University School of Public Health. Kampala. Uganda.; [2]Principal Investigator. Makerere University-John Hopkins University Research Collaboration. Kampala. Uganda.

Background and objectives: Depot medroxyprogesterone acetate (DMPA) use is greatly associated with decline in bone mineral density (BMD). Although the role of individual nutrients on bone health has been well elucidated, no study among African women has analysed the dietary patterns associated with BMD among DMPA users who are at a higher risk of bone loss especially that of the lumber spine (LS). The aim of this study was to determine whether certain dietary patterns are associated with low BMD of the lumbar spine among DMPA users and non-hormonal contraceptive users in a group of African women.

Methods: We conducted a comparative observational study among 151 women recruited from three family planning clinics in Kampala of whom 100 were long term DMPA users and 51 were non-hormonal contraceptive users. Socio demographic, clinical and dietary intake data were collected using pretested questionnaires. Dietary patterns were derived using principal component analysis (PCA) from a 60-item food frequency questionnaire. Dietary pattern scores for each dietary pattern were computed and categorised into two; low and high. The association between the dietary patterns and LS BMD was investigated using multivariate logistic regression at the 95% Confidence Interval (CI).

Results: LS BMD was classified as low and normal; where low represented osteopenia and osteoporosis. The prevalence of low LS BMD among DMPA users and non-hormonal users was 52.0% and 35.3% respectively. Four dietary patterns were derived: the bread, cereal and milk (BCM) pattern, plant and animal protein pattern, Fruit and vegetable pattern and the traditional Ugandan pattern. After adjustment for potential confounders, low consumption of the BCM pattern was associated with higher odds of low LS BMD among DMPA users (AOR: 10.6, 95%CI: 2.00, 56.73; p=0.006) and not in non-hormonal contraceptive users. We found no significant association between the other dietary patterns and low LS BMD.

Conclusions: Low LS BMD is highly prevalent in DMPA users compared to non-hormonal contraceptive users. However, our findings suggest that increased consumption of bread, cereals and milk could ameliorate the effects of bone loss in the lumbar spine among women who use DMPA.

CREATIVE AND FUN EDUCATION TO IMPROVE KNOWLEDGE OF NUTRITION IN SCHOOL CHILDREN IN BEKASI, INDONESIA

[1]Syah, Muhammad Nur Hasan; [2]Perdana, Silvia Mawarti; [2]Asna, Alfi Fairuz.

[1]M.Kes, Nutritionist. Departement of Nutrition. Mitra Keluarga School of Health Science. Indonesia; [2]MSi. Nutritionist. Departemen of Nutrition. Mitra Keluarga School of Health Science. Indonesia.

Background and objectives: The lack of fruits and vegetables consumption occurs in the entire population of Indonesia, that occurred from children to adults. Lifestyle and growing fast food and lack of knowledge about nutritious foods make dietary changes that are not healthy and nutritious dietary pattern. This study aims to improve the knowledge on elementary school children through nutrition education interesting and creative.

Methods: The study design was cross-sectional. The total sample was 78 in elementary school at Bekasi City. The sample was divided into two groups and given the same education. Before education, student was taking pre-test to determine their prior knowledge. Furthermore, education is given in the form of games and dances. Games and dances was conceptualized so that students can understand the nutrition, particularly of fruits and vegetables. After educating students directly given post-test. The nutritional status of students is determined by measuring the weight, height, and BMI for age and was analyzed by WHO Antro. Differences of knowledge were analyzed with SPSS.

Results: Samples were children aged 8-10 years. Most of the samples were girl (71.8%). Based on BMI for age, 6.4% are obese children, 28.2% are underweight and 11.5% are severe underweight. Research found that proportion of less knowledge (pre-test) in underweight and severe underweight children was 54,5% and 88.9%. The average pre-test score was 63.62 and the average score of post-test 82.43. There are differences in the average value of pre and post test with p <0.05.

Conclusions: The provision of nutrition education by games and dancing can improve children's knowledge. This study suggests needs further evaluation and measuring the children's knowledge on a regular basis to ensure knowledge of nutrition has not disappeared.

IS SALT CONSUMPTION IN LOCAL FOODS A PUBLIC HEALTH CONCERN AMONG MAURITIAN ADULTS?

Sohawon, Hanaa Amiirah.

MSc. Nutritionist. Naturhouse Dietetic Centre. Mauritius.

Background and objectives: Salt is the main source of sodium in the diet. A small amount of salt is important for good health. However, salt consumption has increased nowadays and most of the sodium we eat comes from processed, ready-to-eat foods and this can lead to high blood pressure in sensitive individuals. The main objectives of this study are to investigate whether or not Mauritians are aware of the local recommendations of salt to be consumed per day based upon the World Health Organisation (WHO) recommendations; to know the attitudes of Mauritian adults towards salt consumption and its recommended daily intake; and to evaluate the reported daily consumption of salt among Mauritian adults.

Methods: A cross-sectional study was carried out to evaluate the reported daily consumption and to know the attitudes towards salt consumption and its recommended daily intake. The study was carried out among 300 respondents chosen at random, aged between 30 and 60 years old and consisted of both males and females. A survey-based questionnaire was designed to carry out the investigation, and the results obtained were interpreted and analysed using the Statistical Packages for Social Sciences (SPSS 20.0).

Results: The results obtained showed that 51.3 % of the respondents were aware of the local daily salt intake recommendation, and reported putting 1 teaspoon (5 grams) of salt during their food preparation. 85.7 % of the respondents also found this recommendation adequate. However, another 27.4 % of respondents were neither aware of the fact that 1 teaspoon of salt is the daily recommended amount to be consumed nor did they consume the 5 grams of salt as recommended. Furthermore, the food frequency questionnaire included in the survey revealed that the consumption of highly salted processed foods was quite high among the respondents.

Conclusions: The study demonstrates that nutrition education programmes need to be set up so as to raise awareness on the recommended daily intake for good health as well as on the risks associated with excessive intake of highly salted processed foods given that we have noted that it is the consumption of these foods which is the major culprit.

Keywords: Salt, high blood pressure, highly salted processed foods.

MEAL QUALITY AND SOCIODEMOGRAPHIC CONDITIONS ASSOCIATIONS DIFFERS ACCORDING TO LOCATION OF MEAL PREPARATION

[1]Gorgulho, Bartira; [2]Santos, Roberta O; [2]Teixeira, Juliana A; [3]Pereira, Adélia; [4]Baltar, Valéria T; [5]Marchioni, Dirce.

[1]PhD position. Department of Nutrition. School of Public Health. University of São Paulo. Brazil.; [2]MSc. Department of Nutrition. School of Public Health. University of São Paulo. Brazil; [3]MSc. Department of Nutrition. School of Public Health. University of São Paulo. Brazil.; [4]Professor. Department of Epidemiology and Biostatistics. Institute of Collective Health. Fluminense Federal University. Brazil.; [5]Professor. Department of Nutrition. School of Public Health. University of São Paulo. Brazil.

Background and objectives: The choice of foods that are consumed in the same meal occurs in a very complex way, being modulated by several determinants, such as sociodemographic conditions, gender, age, nutritional status, place of consumption, food preparation, and cultural habits. In this context, the study aims to estimate the association between sociodemographic conditions and nutritional quality of main meals consumed by Brazilian adults, stratifying by the location of meal preparation (home/away from home).

Methods: We used individual food consumption data (food intake record) of 16,096 adults, of both gender, from the National Dietary Survey/Brazilian Household Expenditures Survey. The main meal was defined as the meal with the highest contribution to overall energy intake. In this case, it was lunch, classified by period of consumption (11AM-15PM). To evaluate the meal quality, we applied the Main Meal Quality Index (MMQI), 0 to 100 points, which consists of 10 items of equal weights; the items were the following: fruits (in grams), vegetables (excluding potatoes, in grams), animal protein/total protein ratio, fiber (in grams), carbohydrate (% of energy), total fat (% of energy), saturated fat (% of energy), processed meats (in portions), sugary beverages and desserts (in portions), and energy density. The association between main meal quality and each variable was measured by multiple linear regression models, adjusted by main meal energy.

Results: MMQI was positively associated with males and age; and negatively associated with years of education, family income and meals prepared away from home. Meals prepared at home (58 points) maintained the association with gender, age and family income; while meals prepared away from home (55 points), with years of education.

Conclusions: Main meal prepared away from home had a worse quality. Furthermore, we found different associations between MMQI and sociodemographic conditions between the locations of meal preparation.

Keywords: meal quality; nutrition; eating away-from-home, sociodemographic conditions.

ASSOCIATION BETWEEN BODY MASS INDEX AND INFANT BIRTH WEIGHT AMONG PREGNANT WOMEN FROM A RURAL AREA IN NIGERIA

[1]Oladiran, Sunday A.; [2]Okekunle, Akinkunmi Paul; [3]Fadupin, Grace T.

[1]BSc. MPH. Graduate Student. Department of Human Nutrition. University of Ibadan. Nigeria.; [2]BSc. MPH. Graduate Student. 1. Department of Nutrition and Food Hygiene. Harbin Medical University. China. 2. Department of Human Nutrition. Faculty of Public Health. University of Ibadan. Ibadan Nigeria.; [3]RN. BSc. MSc. PhD. Reader. Department of Human Nutrition. Faculty of Public Health. University of Ibadan. Nigeria.

Background and objectives: Maternal anthropometry is a significant determinant of fetal outcomes. Suboptimal and excessive maternal weight gain (MWG) during pregnancy is a risk factor for poor pregnancy outcomes. For example, suboptimal MWG is reported to be associated with low birth weight (LBW); a risk factor for slow cognitive development, onset of chronic disease in adulthood, neonatal morbidity and mortality. Because the relationship between maternal body mass index (BMI) and fetal outcomes differ by race, we explored the relationship between MWG among pregnant women and infant birth weight (IBW) from a rural setting located Southwestern part of Nigeria.

Methods: 603 singleton pregnant women who attended two ante-natal clinics from 2008-2014; in Ibarapa East local government area of Oyo State Nigeria were systematically sampled, with a retrospective review of case records and retrieval of socio-demographic and obstetric information by trained health professionals, using a pre-defined protocol after due ethical considerations. Pearson's correlation ($p<0.05$) was applied to assess the relationship between MWG, BMI before delivery and IBW.

Results: About 10.4% were adolescent women (ADW) at conception (18.0 ± 1.1 years) and mean age of adult women (ALW) was 27.0 ± 5.0 years at conception. MWG was significantly higher ($t=2.0$, $p=0.04$) among ADW (5.5 ± 3.4kg) compared to ALW (4.8 ± 3.1kg). Contrariwise, mean IBW was significantly lower ($t=-4.1$, $p=0.000$) among infant delivered by ADW (2.9 ± 0.4kg) compared to those of ALW (3.1 ± 0.5 kg). Furthermore, the prevalence of LBW (IBW<2.5kg) was higher ($\chi2=3.5$, $p=0.06$) among infant delivered by ADW (10.0%) compared to those of ALD (4.8%). IBW positively correlated with BMI ($r=0.1$, $p=0.004$) after adjusting for age, parity and MWG.

Conclusions: While Optimal MWG is necessary for optimal fetal outcomes, excessive MWG is also associated with LBW. Further research is necessary to determine the range of MWG suitable for optimal maternal health and fetal outcomes in this setting.

Keywords: Maternal weight gain, Infant birth weight, Rural area, Nigeria.

MORTALITY ATTRIBUTABLE TO OVERWEIGHT AND OBESITY IN PARAGUAY, PERIOD 2010-2014

[1]Fretes Centurión, Gabriela; [2]Sequera, Guillermo; [3]Turnes, Catherine; [4]Santacruz, Ethel; [5]Cañete, Felicia.

[1]MSc. Nutritionist. Ministry of Public Health. Paraguay.; [2]MD. MPH. Epidemiologist. Ministry of Public Health. Paraguay.; [3]Nutritionist. Ministry of Public Health. Paraguay.; [4]Statistics. Ministry of Public Health. Paraguay.; [5]MD. Ministry of Public Health. Paraguay.

Background and objectives: Due to the high prevalence of overweight and obesity currently present in our country, this study aims to describe the mortality attributable to overweight and obesity in people older than 15 years in Paraguay, according to sex and age group, between 2010 and 2014.

Methods: For the purpose, secondary data sources were used: the National Survey of Risk Factors and Non-Communicable Diseases (NSRF) in 2011 and the vital statistics for that period. For the estimation of mortality attributable to overweight and obesity, the prevalence-dependent method was used, based on the calculation of the Population Attributable Fraction (PAF).

Results: The main results indicate that during the study period, 13,359 people died (2672 deaths per year) due to causes attributable to overweight and obesity, which corresponds to 10.0% of the total deaths occurring during the 5 years of study. 7.4% and 13.5% of the deaths attributable to excess weight correspond to men and women respectively. The main cause of death attributable is diabetes, accounting for 74.1% and 73.3% of deaths in males and females respectively. The cause of death coded by ICD-10 as obesity showed a progressive increase from a couple of cases during 2010 to more than 50 cases per year for both sexes in 2014.

Conclusions: This study shows that almost 1 in 10 deaths occurring in the country are associated with being overweight. It is an important data for public health to estimate costs and plan more radical intervention strategies in this area.

Keywords: Mortality, overweight, obesity, non-communicable diseases.

A SOCIO-ECOLOGICAL EXAMINATION OF WEIGHT-RELATED CHARACTERISTICS IN HOME ENVIRONMENTS OF FAMILIES WITH YOUNG CHILDREN

[1]Byrd-Bredbenner, Carol; [2]Quick, Virginia; [2]Martin-Biggers, Jennifer.

[1]Rutgers University New Brunswick. NJ. USA; [2]Nutritional Sciences. Rutgers University. New Brunswick. NJ. USA.

Background and objectives: The prevalence of childhood obesity is a great public health concern. Obesity's pervasiveness is due, in part, to myriad socio-ecological factors (i.e., intrapersonal, interpersonal, and environmental) that are modifiable via public health interventions. The home environment and lifestyle patterns are understudied, yet critical to childhood obesity prevention. Thus, this study aimed to systematically examine the home environment and lifestyle patterns using a socio-ecological framework.

Methods: Parents (n=489; 93% female; 32.3±5.7SD yr) of preschool children completed an online survey that comprehensively assessed weight-related intrapersonal, interpersonal, and environmental factors using valid, reliable instruments.

Results: Healthy intrapersonal dietary behaviors identified in this study population were parent and child intakes of 100% fruit/vegetable juice in amounts congruent with recommendations and low intakes of sugar-sweetened beverages. In contrast, milk intake was low and parent fat intake was high. The home environment's food supply supported healthy intakes of juice and low sugar-sweetened beverage intakes, but also provided little milk and generous amounts of salty/fatty snacks. Physical activity levels, time spent in sedentary activity, and the home's physical activity and media environment were not ideal. Environmental supports for active play inside homes were modest and were slightly better in the yard area outside homes and the neighborhood. Screentime greatly exceeded recommendations likely because homes had abundant media equipment and parents put few limits on children's use of media that promoted sedentary behavior. Most parents met sleep recommendations, whereas children did not. Family interpersonal/social interactions had several positive qualities, including frequent family meals eaten in a positive environment. However, parents were neutral about modeling healthy eating to their children and infrequently modeled physical activity behavior. Parents had considerable self-efficacy with regard to their ability to perform food- and physical activity-related childhood obesity protective practices.

Conclusions: In this study, an array of intrapersonal, interpersonal, and environmental factors in the family home environment placed young children at increased childhood obesity risk. Public health professionals should target these factors in interventions aiming to help parents create home environments and lifestyle practices that promote optimal child development and health while reducing children's risk for obesity.

Keywords: home environment. parent. child. obesity. socio-ecological framework

SEMANTICS OF THE SUSTAINABLE DEVELOPMENT GOALS 2015-2030 FOR NUTRITION: THE CONNOTATION GAINED (OR LOST) IN TRANSLATION FROM ENGLISH TO SPANISH

[1]Garcia-Meza, Rosario; [2]Solomons, Noel W.; [3]Yates-Doerr, Emily.

[1]MA. Nutritionist. Center for Studies in Sensory Impairment, Aging and Metabolism. Guatemala.; [2]Center for Studies of Sensory Impairment, Aging and Metabolism (CeSSIAM). Guatemala City. Guatemala.; [3]PhD. Anthropologist. The University of Amsterdam. Netherlands.

Background and objectives: It is generally recognized that goals 1-6, 12, and 17 of the Sustainable Development Goals 2015-2030 (SDGs) are related to human nutrition. In her introduction to the keynote address of the 2015 SLAN meeting organized by Dr. Francesco Branca on the topic of the SDGs, its president, Dr. María-Nieves, noted that the English word "sustainable" could be translated into Spanish as either "sostenible" or "sustentable", a debate that had not been totally resolved within UN circles. Intrigued by whether this is an important or trivial distinction for the Spanish-speaking world, we sought here to explore and rationalize the contextual semantic connotation and consequences in each translation of "sustainability."

Methods: We undertook to parse the differential meanings of "sostenible," which connotes "persisting-through-time" (enduring) as in "a sustainable monthly payment" and "sustentable," which connotes "supported-by-congruent-reasoning" (coherent) as in "the motion by the defense lawyer is sustained". Connotation will differ profoundly in Spanish semantics depending on the translated format. We performed an inquiry among key-informants from grass-roots-based organizations in western Guatemala to explore the latter connotation in practical and theoretical contexts.

Results: The Mayan-Cosmovision worldview ("Cosmogónico"), which underpins the archetypical intrinsic-spiritual-historic guidance for quotidian life, seeks equilibrium with the environment. As such, the perspective of the informants was generally holistic and emancipatory (from foreign-language discourse), with commentaries favoring a preference for "sustentable" connotation (logically-coherent).

Conclusions: Although likely that SDGs' UN framers saw the word sustainability in terms of repetition of the actions and their benefits in a context that itself allows the environment to endure (sostenible), the ambiguity with the connotation of logically-coherent (sustentable) adds richness and depth to the discussion of the nutrition SDG-interventions across the next decade and a half.

Keywords: Sustainable Development Goals, Spanish semantics

GLOBAL NUTRITION 1995-2015: A SHRINKING HUNGRY, AND EXPANDING FAT WORLD

[1]Berry, Elliot; [2]Peng, Wen.

[1]MD. FRCP. Braun School of Public Health. Hebrew University-Hadassah. Israel; [2]MD. MPH. School of Medicine. Qinghai University. China. Research Center. The Amity Foundation. China.

Background and objectives: Following its publication in 2008, the global nutritional index (GNI) has been updated from 1995-2015 to show the world trends in malnutrition, as it alone penalizes a country for over-nutrition.

Methods: We have re-calculated the GNI according to the methodology of the human development index, using geometric means, based on three indicators of nutritional status: deficits (DALY rates due to nutrition deficiency), food insecurity (FINS) (prevalence of undernourishment) and excess (prevalence of female obesity). GNI (range 0-1) was calculated for 184 countries classified into seven groups according to the World Bank and WHO.

Results: The collective world GNI increased progressively from 0.816 for 1995 to 0.836 for 2015. In all 7 country groups there was a decrease in deficits and FINS, and an increase in obesity. These trends caused a shift from the leading ranking country group in 1995 – high-income countries (0.869, 0.821-0.900) – to European low- and middle-income countries (LMIC) (0.841, 0.823-0.857) in 2005, and South-East Asian LMIC (0.851, 0.822-0.903) in 2015. African LMIC were the lowest ranking groups for GNI in 1995 (0.654, 0.558-0.745) and 2005 (0.716, 0.652-0.778), but were replaced by American LMIC in 2015 (0.741, 0.724-0.772). Among the top 20 ranking countries, the number of LMIC increased from 3 in 1995, to 13 in 2015; among the bottom 20 ones, no high-income countries were listed in 1995, while 5 countries appeared in 2015 and the number of African LMIC decreased from 13 to 7. Over these 20 years, African LMIC (0.654, 0.558-0.745 to 0.757, 0.703-0.801) and South-East Asian LMIC (0.794, 0.612-0.831 to 0.851, 0.822-0.903) improved significantly (P<0.001); while high-income countries (0.869, 0.821-0.900 to 0.813, 0.749-0.851), American LMIC (0.790, 0.745-0.811 to 0.741, 0.724-0.772) and Eastern Mediterranean LMIC (0.760, 0.733-0.827 to 0.744, 0.669-0.770) worsened significantly (P<0.01). European LMIC (0.823, 0.795-0.863 to 0.830, 0.807-0.855) and West Pacific LMIC (0.767, 0.605-0.818 to 0.781, 0.481-0.891) remained stable (P>0.500).

Conclusions: From 1995 to 2015, under-nutrition decreased, whereas over-nutrition increased steadily to become the main cause of malnutrition worldwide. The next Sustainable Development Goals should include alongside zero hunger – reduce obesity.

Keywords: global nutrition index, obesity, nutrition deficiency, food insecurity, time trend (1995-2015)

FACTORS INFLUENCING ON SOFT DRINKS CONSUMPTION PATTERNS AMONG SAUDI POPULATION MEASURED BY PRINCIPAL COMPONENT ANALYSIS

Benajiba, Nada.

Clinical Nutrition Program. Department of Health Sciences. College of Health and Rehabilitation Sciences. Princess Nourah Bint Abdulrahman University. Riyadh. Saudi Arabia.

Background and objectives: Introduction: Soft drinks are considerable liquid sources of added sugars in diet which may lead to obesity and type 2diabetes. Saudi Arabia is identified as the largest consumer of soft drinks in Middle East and this market increases continuously.

Objectives: To assess the soft drinks consumption patterns and identify the association between different factors influencing on these patterns among adults Saudis.

Methods: A cross-sectional study conducted from July – September 2016 in KSA. 1194 eligible Saudi participants answered an online questionnaire. Data collected was on socio-demographic characteristics, patterns of soft drinks consumption, and factors influencing these patterns including availability, affordability, social gathering, TV/electronic device use, advertising, social gathering, eating out or at home. Response categories used a 5-points Likert scale. Statistical analysis was performed using SPSS to assess the correlation between different factors. Principal component analysis (PCA) (orthogonal rotation, varimax option) was applied to ascertain influencing factors. Barlett's test was significant and KMO test=0.8.

Results: 16% of the participants reported that they consume soft drinks either daily or usually (3-6 times/week). Frequency and quantity of soft drinks consumed were significantly and positively associated (R2= 0.4 and p<0.0001). Significant and positive correlation were found between availability and social gathering, eating out of home and habits, and eating at home and watching TV. PCA revealed two component explaining 57.8% of variance labeled as: 1- "individual" grouping eating at home and watching TV/electronic device use, 2- "social-environmental" grouping the rest of the factors.

Conclusions: Messages aiming to limit soft drinks consumption should consider both frequency and quantity. Reducing soft drinks consumption needs a comprehensive approach considering the following: 1- Increasing population awareness about the negative consequences of increased soft drinks consumption, 2- promoting favorable environment by making soft drinks less affordable (increasing its price), 3- Providing healthy and competitive alternatives and 4- controlling advertising.

ASSOCIATION BETWEEN FOOD INSECURITY AND OBESITY IN MIDDLE AND LOW INCOME HOUSEHOLDS IN CASABLANCA, MOROCCO

[1]*Jafri, Ali;* [2]*Derouiche, Abdelfettah.*

[1]PhD. Research Fellow. Ben M'Sik Faculty of Science. Hassan II University of Casablanca. Morocco.; [2]PhD. Professor. Ben M'Sik Faculty of Science. Hassan II University of Casablanca. Morocco.

Background and objectives: Food insecurity is usually associated with poor nutritional status. Still, reports revealed that food insecure populations are at increased risk of obesity. This study aims to investigate the prevalence of food insecurity in middle and low income households in Casablanca and examine the relationship between food insecurity and overweight.

Methods: A cross-sectional survey was conducted between 2011 and 2013 among low and middle income households from the South-East communities of Casablanca, Morocco. Data were collected for 607 households using a standardized and validated questionnaire. A total of 424 adult women and 183 adult men participated to the survey. Food insecurity was evaluated using a set of nine questions adapted from the the Household Food Insecurity Access Scale (HFIAS) developed by the Food and Nutrition Technical Assistance project (FANTA). Anthropometric measurements (weight, height, waist circumference) were taken according to the World Health Organization's guidelines and obesity was identified as a Body Mass Index (BMI) $\geq$ 30 kg/m^2.

Results: Food insecurity affected 63.2% of the households at different levels; data revealed that food insecurity was light in 12.6%, mild in 20.2% and severe in 30.4% households. Obesity was found in 40.8% of the population; 24.6% in men and 47.9% in women (p <0.001). Food insecurity was associated with gender; more households where we interviewed women (70.9%) were classified as food insecure than households where we interviewed men (43.7%) (p < 0.001). Obesity was higher in food insecure (42.7%) than in food secure people (37.7%) [odds ratio (OR) = 1.95]. Food insecurity was associated with an increased risk of obesity for women (OR = 2.5) but not for men (OR = 0.73).

Conclusions: Food insecurity is associated with an increased likelihood of obesity in adults from low and middle income households in Casablanca and the risk is greatest in women.

Keywords: Food insecurity, obesity, gender, Morocco.

Division of Child Development and Community Health.University of California San Diego. La Jolla. California. USA; [5]Medical Doctor. Institute of Nutrition and Food Technology. University of Chile. Santiago de Chile. Chile.

Background and objectives: Adolescence is a period in which physical activity (PA) shows a great decline. PA in adolescence may be important to improve cognitive function and academic outcomes. The hippocampus, which plays a major role in learning and memory, is among the brain areas more affected by PA. We explored the association of PA and sedentary time at 16y with a number of academic indicators in the transition from high school (HS) to higher education, in youths from Santiago, Chile.

Methods: Observational study in an infancy cohort. In a sample of n=632 adolescents (52% males), we measured PA, accounting for exercise (Physical Education and extracurricular sports) , active play and active commuting; and sedentary time, accounting for screen and sitting (excluding study time) hours. To measure this, we used a questionnaire that was validated in a previous study using accelerometry-based activity monitors in Chilean high schoolers. Academic results included HS completion, repeating a grade in HS and taking exams for college. Multivariate logistic regressions tested the relation of academic variables with PA or sedentary time, after adjusting sex, family background, type of secondary education (academic vs. vocational) and health-related confounders.

Results: In students devoting <2 h/week to exercise, the odds of HS completion (OR: 0.39; 95% CI: 0.21-0.73) and taking college exams (OR: 0.51; 95% CI: 0.33-0.79) were significantly lower compared to students allocating >4h/week for exercise. Also, the chances of repeating a grade in HS were negatively associated with time devoted to exercise. Last, in students devoting ≥8 h/day to sedentary activities, the odds of HS completion (OR: 0.48; 95% CI: 0.28-0.84) were significantly lower compared to students with <8h/day of sedentary activities.

Conclusions: In this sample, exercise was positively related with academic outcomes whereas the relation of sedentary time and academic results was negative. Results: **Keywords:** Physical activity, sedentary activities, exercise, academic performance, adolescents

[1]Eme, Paul; [2]Burlingame, Barbara; [3]Kuhnlein, Harriet.

[1]Paul Eme. MSc. School of Public Health. Massey University. New Zealand.; [2]Barbara Burlingame. PhD. Professor of Nutrition and Food Systems. School of Public Health. Massey University. New Zealand.; [3]Harriet Kuhnlein. PhD. Professor Emerita of Human Nutrition. McGill University. Canada.

Background and objectives: "All food systems are sustainable" is the central feature of the UN's Zero Hunger Challenge, and an explicit feature of Sustainable Development Goal 2. The long title of SDG 2 also captures the essence of sustainable diets: End hunger, achieve food security and improved nutrition, and promote sustainable agriculture. Characterising food systems is complex, with interplay involving human, economic, social, environmental and political factors, and requiring multiple indicators for effective measurements. This paper seeks to harmonize four different methodological frameworks proposed for assessing sustainable diets and food systems.

Methods: Several divergent methodological frameworks, indicators and indices, and model systems for characterising sustainable diets and sustainable food systems have been proposed, with little or no attempt to harmonise, standardise or align. Each is assessed for relevance, reliability, advantages and limitations. Case studies on traditional food systems of indigenous peoples and model national dietary patterns (e.g., the Mediterranean diet) provide examples for testing/validation.

Results: Existing methodologies each have their own advantages; and commonly used indicators have importance in areas where data are sufficient in both quality and quantity. Each also has limitations related to data availability from the relevant sectors (health, agriculture, environment), and applicability in different ecosystems.

Conclusions: Weaknesses in the evidence base compromise the ability to effectively address the issues of sustainable diets and food systems. Nevertheless, current evidence is sufficient to warrant the development and implementation of multi-sectoral policies, programmes and interventions. A harmonised methodological approach will allow more and better data, and facilitate comparisons across nations, ecosystems and peoples, to better inform policies and actions, and ultimately to achieve the SDGs.

Keywords: Sustainable diets, methodologies, sustainable food systems, indigenous peoples, Mediterranean dieta.

PROSPECT OF FOREST FOODS TO ADDRESS HUMAN NUTRITION IN THE CONGO BASIN FOREST DEPENDENT COMMUNITIES OF DR CONGO, CAMEROON AND GABON

[1]Fungo, Robert FR Fungo; [2]Ngoye, Alfred; [3]Tchatat, Mathurin; [4]Kahindo, Jean-Marie.

[1]PhD. Nutritionist. School of Food Technology, Nutrition & Bio-Engineering. Makerere University. Kampala. Uganda; [2]Msc Forestry Institut de Recherche en Ecologie Tropicale (IRET). Libreville. Gabon; [3]PhD. Forestry. Institut de la Recherche Agricole pour le Développement (IRAD). Yaoundé. Cameroun; [4]PhD. Forestry. Université de Kisangani RDC Faculté des Sciences. Congo.

Background and objectives: The potential to use forest foods from timber tree species as an effective entry point for improving human nutrition in the Congo Basin appears to be high. These products are widely accessible, culturally acceptable and typically under the control of communities

Methods: The most consumed forest foods were documented and examined the nutrient content and nutraceutical properties of most consumed forest foods and determined their contribution to human nutrient intake

Results: In Cameroon out of the 206 identified forest food species, Irvingia gabonesnsis and Baillonella Toxisperma were the most consumed. In DR Congo, out of the 272 forest foods, caterpillars were the most important and are frequently found on tree species; Entandrophragma cylindricum and Erythropleum suaveolensis. In Gabon, the most consumed species were: Baillonella toxisperma and Poga oleosa. These species contained significant levels of vitamins C and E, essential minerals and nutraceutical properties such as flavonoids, polyphenols, phytic and proanthocyanes. Nutrient intake findings indicate that if a child aged 1-3 years and a non-pregnant non-lactating woman consumed 500gms and 750gms daily respectively, their daily total vitamin C requirement of 30mg/100g for children and 45mg/100g for adults would be met by either Baillonella toxisperma, Pentaclethra macrophylla and Trichoscypha abut forest tree species.

Conclusions: In light of benefits of vitamins, minerals and nutraceutical properties, there is an urgent need for protecting and promoting nutrient and nutraceutical properties rich forest plant foods species, particularly those having the greatest acceptability and production potential.

DEMOGRAPHIC AND SOCIOECONOMIC CHARACTERISTICS ARE ASSOCIATED WITH DIETARY AND NUTRITIONAL PATTERNS IN RURAL BUT NOT URBAN AREAS IN WEST JAVA, INDONESIA

[1]Kosaka, Satoko; [2]Umezaki, Masahiro; [2]Watanabe, Chiho.

[1]PhD. Graduate School of Medicine. University of Tokyo. Japan; [2]PhD. Graduate School of Medicine. University of Tokyo. Japan.

Background and objectives: Since the risk of chronic diseases involves dietary factors, understanding determinants of dietary/nutritional intake patterns would be of help for effective intervention programs. However, few studies have explored the urban-rural difference in determinants of dietary/nutritional intake patterns in developing countries. The objective of this study was to examine whether the relationships between individual characteristics and dietary/nutritional patterns in urban and rural areas are different in West Java, Indonesia.

Methods: A three-day weighed dietary record survey was conducted for 92 participants in Bandung (an urban area) and 202 participants in Sumedang (a rural area), together with questionnaire-based interviews and anthropometric measurement. Total energy intake and energy intake from protein, fat and carbohydrate were calculated, food items were grouped into dietary categories based on the main ingredients and energy intake from each category was calculated. The association between individual characteristics and dietary/nutritional intake was examined with the Kruskal-Wallis equality-of-populations rank test and Spearman's rank correlation test.

Results: In Sumedang, all the dietary/nutritional pattern indicators (total energy intake, energy intake from protein, carbohydrate, fat, grain/tubers, vegetables/legumes, meat/fish) were significantly related to individual characteristics such as age, sex, occupation, educational level and income, while on the other hand in Bandung, energy intake from vegetables/legumes and meat/fish were significantly related to age, occupation or income but neither total energy intake, energy intake from protein, carbohydrate, fat, nor grain/tubers were related with any of the assessed factors.

Conclusions: The results suggested that the relationship between demographic and socioeconomic characteristics and dietary/nutritional patterns are different between rural and urban areas in West Java, Indonesia. The lack of a relationship in the urban area suggested that the area has moved beyond a phase in the nutrition transition where dietary/nutritional intake patterns change drastically along with social and economic development. Different strategies are needed in each area to identify and focus on the population at risks of diet-related diseases.

CORRELATES AND TRENDS OF OVERWEIGHT AMONG CHILDREN, ADOLESCENT GIRLS AND WOMEN IN SOUTH ASIA: AN IN-DEPTH ANALYSIS OF DATA FROM ELEVEN NATIONAL SURVEYS IN SIX COUNTRIES OVER EIGHTEEN YEARS

[1]Harding, Kassandra; [1]Webb, Patrick; [2]Aguayo, Victor.

[1]PhD. Friedman School of Nutrition Science and Policy. Tufts University. United States; [2]PhD. United Nations Children's Fund Programme Division. United States.

Background and objectives: The majority of the world's undernourished live in South Asia while the number of overweight and obese in this region is growing. This study aimed to determine the correlates and trends of overweight among pre-school age children, adolescent girls and adult women in South Asia.

Methods: Data from 11 national surveys from 6 countries were pooled. Generalized linear mixed models were used to analyze relationships.

Results: Three percent of pre-school age children were overweight (weight-for-height z-score (WHZ) > 2SD) with a mean WHZ (SD) of -0.79 (1.36). Children of overweight mothers had a higher mean WHZ [-0.36 (1.36) v. -0.83 (1.35)] and a greater likelihood of being overweight [AOR: 1.52, p <0.01] than children of mothers who were not overweight.

Four percent of adolescent girls were overweight (body mass index (BMI) ≥25.0 kg/m2 based on the International Obesity Task Force adjusted BMI values). Household wealth and urban residence were positively associated with overweight among adolescent girls (APR: 2.63, p<0.01 and 2.16, p<0.01, respectively). The strength of these relationships differed by country. Eighteen percent of women were overweight (BMI ≥25.0 kg/m2 based on International Classifications). Household wealth (1.96, p<0.02), formal education (1.49, p<0.01), and urban residence (1.75, p<0.01) were positively associated with an increased likelihood of being overweight. In Bangladesh, India and Nepal the prevalence of overweight among adolescent girls and women increased over time. However, the strength of the association between predictors and outcomes attenuated over time among women.

Conclusions: The condition of being overweight is becoming more prevalent across South Asia and requires immediate attention. Once a condition of the wealthier, more educated and urban, rates of overweight are increasing among poorer, less educated and even rural women.

Keywords: South Asia, overweight, children, adolescent girls, women

EFFECT OF FOOD INSECURITY ON CHILD'S BEHAVIOR RESIDING IN SLUMS OF KARACHI, PAKISTAN

[1]Safdar, Nilofer Fatimi; [2]Hussain, Mehwish; [3]Shah, Nadia; [4]Rehman, Saifur.

[1]MSc. MS. PhD. Nutritionist. School of Public Health. Dow University of Health Sciences. Karachi. Pakistan; [2]PhD. Biostatistician. Department of Research. Dow University of Health Sciences. Karachi. Pakistan.; [3]MSc. Health Economist. School of Public Health. Dow University of Health Sciences. Karachi. Pakistan; [4]BS. Epidemiology & BioStatistics Student.

Background and objectives: Household food insecurity (HFI) has been paced up as a major public health problem worldwide but more so in South Asia. South Asians with food insecurity may find it difficult to bring up their children as socially desirable causing behavioral problems in them. Scarcity of literature was found on assessing relationship of household food insecurity and child behavior in urban families. Therefore, our objective was to determine prevalence of HFI and its effect on behavioral problems in children of mothers residing in urban slums of Karachi, Pakistan

Methods: A cross sectional study was conducted in different towns of all six districts of Karachi using multi-stage sampling methods. Selection of households was made using systematic random sampling. The Interviewers collected data from mothers of children aged 3 -11 years. The structured and validated questionnaire included household food insecurity access scales (HFIAS) and child behavior questionnaire (CBQ) related information. Factor analysis was applied to find common behavior of children. Generalized linear regression analysis was performed to determine relationship between scores of food insecurity and child behavior.

Results: Overall 67% of household were found to be food insecure. 70% of households expressed concern and showed anxiety on the quantity of food being available to them, 84% of households actually had insufficient quantity of food and 95% of households consumed insufficient quality of food during the previous month at the time of interview. Overall 70% mothers from food insecure households reported different behavioral problems in their children. The two most common among these behaviors were; being aggressive and not socializing or playing with other children. Followed by behaviors that were related to; avoiding going to school, stress, impulsiveness, having fear, bully and lacking confidence. The association between household food insecurity and child behavioral problems were found to be significantly positive and with each food insecure household the likelihood of childhood behavioral problems will increase by 26.7% in urban slums

Conclusions: Public health strategies must be designed to assist families to cope with behavioral problems in children as well as in solving their food security related issues.

Keywords: Household food insecurity, child behavior, urban slum, Pakistan

NUTRIENT INTAKE IN FRENCH ADULTS: EVOLUTION DURING THE LAST 10 YEARS BETWEEN THE TWO FRENCH NUTRITION AND HEALTH SURVEYS (ENNS 2006, ESTEBAN 2016)

[1]Torres, Marion; [2]Salanave, Benoît; [3]Verdot, Charlotte; [3]Deschamps, Valérie.

[1]PhD. Nutritional surveillance and Epidemiology Team. Santé Publique France. Université Paris 13. Centre de Recherche Epidémiologie et Statistique. COMUE Sorbonne-Paris-Cité. Bobigny. France.; [2]MsC. Nutritional surveillance and Epidemiology Team. Santé Publique France. Université Paris 13. Centre de Recherche Epidémiologie et Statistique. COMUE Sorbonne-Paris-Cité. Bobigny. France.; [3]PhD. Nutritional surveillance and Epidemiology Team. Santé Publique France. Université Paris 13. Centre de Recherche Epidémiologie et Statistique. COMUE Sorbonne-Paris-Cité. Bobigny. France.

Background and objectives: In France, the French National Nutrition and Health Programme (PNNS) aim to reduce chronic diseases associated with nutrition by establishing various health activities. The evaluation of its effectiveness requires studying the evolution of dietary intake in the French population. The objective of this paper was to compare the dietary intake in terms of nutrients during the last 10 years, in two national samples of 18-74-years-old adults, especially according to French recommendations.

Methods: Studies were based on two cross-sectional population-based surveys using a multistage sampling design: the ENNS study realized in 2006 (n=3115 adults) and the Esteban study in 2016 (n=2834 adults). Dietary information were collected through three 24h recalls realized by internet or by phone, monitored by dieticians. The two samples have been compared by linear regression and chi-2 test (gender-stratified, weighted and standardized data).

Results: Since ten years, the mean energy intake without alcohol (EIWA) increased significantly in women (1600.8 to 1675.9kcal/d, p<0.01) but not in men (2180.0 kcal/d vs 2155.8kcal/d in Esteban). Globally, lipids intakes (%EIWA) increased at the expense of proteins in men and women. Among men, 25.1% consumed less than 35% EIWA of lipids while they were 19.8% ten years later (p=0.02). Proportion of people eating less than 12.5% EIWA of simple carbohydrates from sweet products decreased significantly in both gender (80.6 to 68.9% in men, p<0.0001; 69.1 to 61.3% in women, p<0.001). Women had currently more often calcium intake lower than recommended compared to data ten years ago (68.8% in ENNS to 74.5% in Esteban, p<0.01). Adherence to the French recommendation regarding to fibre (>25g/d) tended to increase in men and women, but adherence regarding to salt consumption (<8g) decreased significantly in women (82.9 to 72.0%, p<0.0001) and tended to decrease in men (43.1 to 38.2%, p=0.07).

Conclusions: These results show that nutritional objectives of the PNNS are not achieved in the French population. As a whole, food consumption and dietary intake get worse during the last 10 years. So nutrition should be subject to next priorities of public health in France by strengthening actions of the PNNS.

Keywords: Nutrient, intake, evolution, France, epidemiology

PREVALENCE OF OVERWEIGHT AND OBESITY IN FRENCH POPULATION: EVOLUTION DURING THE LAST 10 YEARS BETWEEN THE TWO FRENCH NUTRITION AND HEALTH SURVEYS (ENNS-2006 AND ESTEBAN-2016)

[1]Torres, Marion; [2]Salanave, Benoît; [3]Verdot, Charlotte; [3]Deschamps, Valérie.

[1]PhD. Nutritional surveillance and Epidemiology Team. Santé Publique France. Université Paris 13. Centre de Recherche Epidémiologie et Statistique. COMUE Sorbonne-Paris-Cité. Bobigny. France.; [2]MsC. Nutritional surveillance and Epidemiology Team. Santé Publique France. Université Paris 13. Centre de Recherche Epidémiologie et Statistique. COMUE Sorbonne-Paris-Cité. Bobigny. France.; [3]PhD. Nutritional surveillance and Epidemiology Team. Santé Publique France. Université Paris 13. Centre de Recherche Epidémiologie et Statistique. COMUE Sorbonne-Paris-Cité. Bobigny. France.

Background and objectives: Worldwide, overweight and obesity are becoming ever more frequent, leading to an increase of chronic diseases associated. Therefore, it is necessary to promote health public policies to reduce this burden. In France, it is one of the objectives of the French National Nutrition and Health Programme (PNNS) developed since 2001 by the Ministry of Health. To assess the nutritional status of the population according to the PNNS indicators, national nutrition and health surveys were implemented in 2006 (ENNS) and 2016 (Esteban). This paper studies the prevalence of overweight and obesity among French adults and children during the last 10 years.

Methods: Data from two cross-sectional population-based surveys, using a multistage sampling design, were used: ENNS-2006 (nadults=2388 and nchildren=1314) and Esteban-2016 (nadults=2467 and nchildren=1099). Anthropometry was measured according to standardized procedures from WHO recommendations. Body Mass Index was use to classify adults according to their status ($\geq$25kg/m^2 overweight; $\geq$30kg/m^2 obesity). For children, the IOTF BMI cut-offs were used. The samples have been compared by linear regression and chi-2 test (gender-stratified, weighted and standardized data).

Results: The mean BMI was not significantly different between the two studies in adults (men: 26.1 vs 26.0kg/m^2; women: 25.1 vs 25.7kg/m^2; between ENNS and Esteban). In men, prevalences of overweight and obesity were 41.0% [36.7-45.5] and 16.1% [13.2-19.6], respectively in ENNS vs 37.1% [33.5-40.9] and 16.9% [14.2-19.9] in Esteban. In women, prevalence of overweight was 23.8% [21.2-26.7] in ENNS and 26.8% [23.8-30.1] in Esteban. Obesity reached 17.6% [15.2-20.3] and 17.4% [14.8-20.4], respectively. In boys, 13.6% [10.5-17.5] in ENNS were in overweight vs 11.8% [8.4-16.3] in Esteban, and 2.6% [1.5-4.5] to 4.1% [2.1-7.7] in obesity respectively. In girls, overweight was prevalent in 15.0% [11.6-19.2] in ENNS vs 14.2% [10.7-18.7] in Esteban, and obesity 4.0% [2.3-6.8] vs 3.8% [2.1-6.7] respectively.

Conclusions: These results show a stability of overweight and obesity in France over ten years among French adults and chil-

dren. However prevalence of these burdens remains important. Nutritional status requires also continuous attention and different actions to reverse the trend and reduce the incidence of overweight on health.

Keywords: Overweight, obesity, France, epidemiology, nutritional status

COLOR-CODED FRONT OF PACK NUTRITION LABELS – A MEANINGFUL OPTION FOR US PACKAGED FOODS?

[1]Dunford, Elizabeth; [2]Poti, Jennifer; [3]Xavier, Dagan; [4]Webster, Jacqui; [2]Taillie, Lindsey Smith.

[1]PhD. Research Fellow. The George Institute for Global Health. Australia.; [2]PhD. Research Assistant Professor. The University of North Carolina at Chapel Hill. USA; [3]Co Founder. Label Insight. USA.; [4]PhD. Assistant Professor. The George Institute for Global Health. Australia.

Background and objectives: Background: With more than two thirds of the diet of the average American deriving from packaged food and beverages, the implementation of a standardized front-of-pack-labeling (FoPL) scheme would likely be a useful tool for many consumers trying to improve the healthiness of their diets. The UK Department of Health's "traffic light" FoPL scheme has consistently come out as one of the top schemes in both consumer preference and its ability to support consumers in identifying healthier choices.

Objective: To apply the traffic light labeling scheme to packaged foods and beverages in a large nutrition label database and determine the proportion of products with each front-of-pack label rating and the nutritional profile of products covered, overall and by food category.

Methods: Data for this study are from Label Insight's Open Access branded food database and were extracted in December 2016. Nutrient levels and the proportion of products classified as "Red" (High), "Amber" (Medium) or "Green" (Low) in total fat, saturated fat, total sugar and sodium were examined. The proportion of products in each category that had each possible combination of traffic light colors, and met the aggregate score for 'healthy' was examined.

Results: Out of 175,198 products, >50% of all US packaged foods received a "Red" rating for total sugar or for sodium. 'Confectionery' had the highest mean total sugar (51.9g/100g) and 'Meat and meat alternatives' the highest mean sodium (781mg/100g). The most common traffic light label combination was "Red" for total fat, saturated fat and sodium and "Green" for sugar. Only 30.1% of products were considered "healthy".

Conclusions: Over 50% of US packaged foods contain high levels of salt and sugar. A color coded traffic light scheme appears to be a good option for implementation across the US packaged food supply to support consumers in making healthier food choices.

Keywords: food labels; processed foods; public health nutrition; nutrient profiling.

A MIXED METHODS STUDY PROVIDING INSIGHTS ON WHY TARGETS ON CHILD WELFARE CLINIC ATTENDANCE AND GROWTH PATTERNS OF PARTICIPATING CHILDREN ARE UNMET IN GHANA

[1]Agbozo, Faith; [2]Colecraft, Esi; [3]Guetterman, Timothy.

[1]PhD Candidate. Institute of Public Health. University of Heidelberg. Germany; [2]PhD. Lecturer. Department of Nutrition and Food Science. University of Ghana. Legon Accra. Ghana; [3]PhD. Assistant Professor. Department of Family Medicine. University of Michigan Medical School. Ann Arbor, Michigan. USA.

Background and objectives: Growth monitoring and promotion (GMP) programmes, delivered at Child Welfare Clinics (CWC) promote child health and survival and serve as delivery channel that enhances coverage for other crucial nutrition-specific interventions. This study compared community-based and facility-based GMP programmes with respect to attendance rates, children's nutritional status and health workers/clients' perceptions on factors influencing utilization.

Methods: Explanatory sequential mixed methods design conducted in four CWCs in Ga West municipality, Ghana. The study comprised a 12-month secondary data analysis using GMP registers of 220 infants aged 0-3 months enrolled in community-based (n=104) and facility-based (n=116) CWCs, cross-sectional survey involving 232 caregiver-child pairs accessing community-based (n=104) and facility-based (n=116) services, and in-depth interviews with ten community health workers and 15 mothers using phenomenology and case study designs. Quantitative data were analyzed with SPSS version 20 and thematic content analysis performed with the qualitative data using ATLAS.ti 7.0.

Results: Mean annual attendance to both programmes was similar with an average of six visits per year. Only 13.6% attained the Ghana Health Service target of nine visits. Targets on underweight proportions were neither met at baseline (community-based:8.7% vs. facility-based:19.8%, p=0.022) or end of follow-up (community-based:11.5% vs. facility-based:15.5%, p=0.436). Overall, weight-for-age scores (WAZ) of ≥60% children improved during participation. Significant determinants for improved WAZ were being underweight at baseline (AOR:11.1, CI:4.0-31.0), recording annual attendance of at least six (AOR:2.2, CI:1.1-4.1) and nine (AOR: 4.65, CI:1.4-15.1) visits. Significant proportions of facility-based users (57.4%) were ever visited at home compared to their community-based counterparts (31.5%). Over half were dissatisfied with services received citing long waiting times, negative staff attitude and extortion of money. Regarding perceptions

on factors hindering service utilization, emerged themes included extremes of maternal age, high parity, postpartum socio-cultural beliefs and practices, financial constraints, health system challenges, unprofessional staff behaviours and high premium on meeting vaccination targets at the expense of GMP.

Conclusions: The association of increased attendance with improved growth reaffirms the need to sensitize caregivers on the role of GMP to child growth and development, increase contact tracing through home visits and strengthen primary healthcare systems to function effectively-

EATING HABITS AND TASTE SURVEY OF NIKKEI RESIDENTS LIVING IN PARAGUAY

Tsukaguchi, Tomomi.

Rakuno Gakuen University. Japan.

Background and objectives: The purpose of this survey is to conduct surveys on dietary habits and health status for the Nikkei (people of Japanese descent and their descendants) the first, the second, the third living in Paraguay, investigates the eating habits.

Methods: We conducted a nutrition and preference survey for Nikkei residents living in Itapua prefecture of Paraguay from December 2016 to January 2017.The nutrition survey was a brief self-managed diet history questionnaire (BDHQ), and a self-reported questionnaire was used for preference survey. The final analysis compared it between two groups of Nikkei first (hereinafter called NK1) and the Nikkei the second, the third (hereinafter called NK2-3).

Results: We distributed 50 questionnaires to Nikkei, the collection rate was 27 (54.0%). The analysis was 25 (92.3% of the number collected). NK 1 was 12 personas (4 males, 6 females) NK2-3 was 13 personas (2 men, 11 females). The most frequent place was Kochi prefecture (33.3%) followed by Hiroshima prefecture (25.0%) in NK1 birth in Japan. The place where NK2-3 ancestry was born in Japan was Kochi Prefecture (38.5%) was the most frequent, followed by Hokkaido (26.3%). "What Japanese food are you eating at least once a week" was miso Soup (19.1%), simmered dish (12.8%), rice (10.6%) at NK1. In NK2 -3, miso soup (20.4%), rice (12.2%), simmered dish (10.2%), pickle (10.2%). The average number of items answered was NK1 3.9 items, it was 3.8 items of NK 2-3. There was no significant difference when we tested whether there was a difference in the average number of items between the 2 groups (p = 0.88).

Conclusions: Nikkei Paraguay turned out to always eat Japanese food in every generation. Nutrition intake situation is currently being analyzed. In the future, expand the scope and conduct similar survey.

LIFESTYLE HABITS OF HEALTHCARE PROFESSIONALS IN URBAN CITIES IN ABIA STATE, NIGERIA

(1)Ukegbu, Patricia; (2)Opara, Stella; (3)Uwaegbute, Ada.

(1)PhD Experimental Nutrition. Department of Human Nutrition and Dietetics. Michael Okpara University of Agriculture Umudike. Nigeria.; (2)BSc. Department of Human Nutrition and Dietetics.Michael Okpara University of Agriculture Umudike. Nigeria; (3)PhD. Department of Human Nutrition and Dietetics. Michael Okpara University of Agriculture Umudike. Nigeria.

Background and objectives: Health professionals have a role to play in the promotion of physical activity in order to prevent the ever-increasing burden of diseases associated with physical inactivity. Obesity is gradually becoming a problem among the health workforce due to sedentary lifestyle and unhealthy dietary practices. This study investigated physical activity and other lifestyle habits in a sample of health professionals in major urban cities in Abia State, Nigeria.

Methods: In this cross sectional survey, a total of 353 health professionals were randomly selected from various public health facilities in major cities in Abia State. The survey included questions on demographics, dietary and lifestyle habits. Self reported physical activity was assessed with an adapted version of International Physical Activity Questionnaire-Short Form (IPAQ-SF), and the level of physical activity was determined using the metabolic equivalent of task (MET)-minutes per week indicators. Height and weight were measured and used to calculate Body Mass Index (BMI). Chi square was used to examine the association between obesity (BMI$\geq$30kg/m2) and physical activity.

Results: Respondents were doctors (20%), nurses (38.2%) and other health professionals (41.4%), comprising 59.8% males and 40.2% females. Mean years in practice for the total group was 10.2 ($\pm$1.2) years, and average age was 45.5$\pm$0.7years,. Obesity was 22.8% in males and 17.9% in females. Only 29.2% consumed breakfast daily, while 61.8%, 54.9% and 41.9% consumed fast foods, carbonated drinks and alcoholic beverages 3 or more times a week, respectively. Nurses reported high physical activity levels than the other health professional groups (p>0.05), while females were significantly more active than males (p<0.05). No significant relationship was observed between obesity and physical activity levels (X2=0.781; p>0.05).

Conclusions: Despite the high and moderate levels of physical activity, the prevalence of obesity was still high. This could be due to other factors which further studies would need to address.

Keywords: Physical activity, dietary habits, health professionals

NUTRITION KNOWLEDGE AND BREAKFAST HABITS OF A GROUP OF ADOLESCENTS IN PUBLIC SECONDARY SCHOOLS IN ANAMBRA STATE, NIGERIA

[1]Ukegbu, Patricia; [2]Okoli, Cynthia; [3]Uwaegbute, Ada.

[1]PhD Experimental Nutrition. Department of Human Nutrition and Dietetics. Michael Okpara University of Agriculture Umudike. Nigeria.; [2]BSc. Department of Human Nutrition and Dietetics. Michael Okpara University of Agriculture Umudike. Nigeria; [3]PhD. Department of Human Nutrition and Dietetics. Michael Okpara University of Agriculture Umudike. Nigeria.

Background and objectives: Breakfast is often regarded as the most important meal of the day. Breakfast skipping and consumption of unhealthy food may lead to micro-nutrient deficiencies and poor nutritional status. Studies have shown that children and adolescents who habitually skip breakfast are at higher risk for skipping other meals, snacking, being less physically active and being overweight and obese. The purpose of this study was to describe nutrition knowledge and breakfast habits of a group of adolescents in Anambra State, Nigeria.

Methods: A validated questionnaire was administered to 259 adolescents (comprising 184 males and 75 females) randomly selected from 6 public secondary schools in the state to obtain information on nutrition knowledge, breakfast eating habits, consumption patterns, content of breakfast. Descriptive statistics (frequencies and percentages) and Chi square analysis were performed using SPSS version 20.

Results: The mean age of the adolescents was 12.1($\pm$5.3) years. The percentage that reported eating breakfast daily was 69% and this was significantly higher in males (p<0.05), those who skipped cited lack of appetite (35.0%) as the main reason. Commonly consumed foods for breakfast were from the bread and cereal group (36.7%) and tea/cocoa beverages (35.5%). Both male and female adolescents showed average nutrition knowledge (45.5%). No significant differences were observed in the nutrition knowledge between males and females (P>0.05). Similarly, nutrition knowledge did not differ significantly between breakfast eaters and skippers (p>0.05).

Conclusions: This study showed that nutrition knowledge was generally on the average and breakfast was consumed by about two thirds of the adolescents daily. It is suggested that the nutrient content of breakfast foods consumed be further assessed in order to ascertain the quality.

Keywords: Breakfast, adolescents, knowledge, habits

THE RELATION OF SEDENTARY BEHAVIOR AND BODY COMPOSITION AMONG CHINESE ADULTS WITH DIFFERENT GENETIC PREDISPOSITION TO OBESITY

[1]Xue, Hongmei; [2]Li, Danting; [2]Chen, Yuanyuan; [2]Yin, Jun; [3]Zhao, Li; [4]Quan, Liming; [5]Gong, Yunhui; [6]Cheng, Guo.

[1]MD. West China School of Public Health. Sichuan University. China; [2]BSc. West China School of Public Health. Sichuan University. Chengdu. China.; [3]PhD. West China Research Center for Rural Health Development. Sichuan University. Chengdu. China.; [4]MD. West China School of Public Health. Sichuan University. Chengdu. China.; [5]PhD. Department of Obstetrics and Gynecology. West China Second University Hospital. Sichuan University. Chengdu. China.; [6]PhD. West China School of Public Health. Sichuan University. Chengdu. China.

Background and objectives: Previous studies on gene-lifestyle interaction and obesity have focused mostly on the FTO gene and physical activity, whereas little attention has been paid to sedentary behavior (SB), particular in China. We aimed to examine whether the association between SB and body composition indices among Chinese adults could be modified by genetic predisposition, physical activity and energy intake etc.

Methods: Data on total time of SB, non-screen based SB, screen-based SB and specific types of screen-based SB (television watching, computer/phone using), moderate-to-vigorous intensity-activity energy expenditure (MVPAEE) and dietary intake of 3976 Chinese adults (54.92% women) aged 25-65 years were obtained by questionnaires. Height, weight and waist circumference (WC) were measured to calculate body mass index (BMI), percent body fat (%BF), fat mass index (FMI) and fat-free mass index (FFMI). Genetic risk score (GRSweighted) were calculated on 9 established obesity associated genetic variants among Chinese.

Results: Among adults with high obesity GRSweighted, time spent on television watching was positively associated with BMI, WC, %BF, and FMI, after adjusting for age, gender, family monthly income, smoking, EI and MVPAEE concurrently. For every 1-hour increment in television watching, BMI, WC, %BF, and FMI increased 0.20 kg/m2, 0.85cm, 0.27, and 0.12 kg/m2, respectively (p<0.02). After further classified by MVPAEE for three groups, however, we only observed the association between television watching and WC among adults with low/moderate MVPAEE: adults in low/moderate MVPAEE with longer time of television watching had 3.18%/3.68% higher WC (p=0.02). Time spent on other sedentary time were not associated with body composition indices.

Conclusions: Television watching is of relevance for body composition, especially for WC among Chinese adults with high genetic predispositions to obesity.

Keywords: sedentary time, television viewing, obesity, body composition, genetic risk score

BAMBARA GROUNDNUT (VIGNA SUBTERRA-NEA (L.) VERDC.) FORMULATED DIET PRO-MOTES GROWTH IN WEANING MALE WISTAR RATS

[1]Atoyebi, John Olayinka; [2]Osilesi, Prof Odutola; [3]Abberton, Dr Michael; [4]Adebawo, Olugbenga.

[1]Scientist; [2]Babcock University. Ilisan –Remo. Nigeria; [3]IITA. Ibadan. Nigeria; [4]Babcock University. Nigeria.

Background and objectives: Earlier work done before now on the formulation and nutritional quality of infant formula produced from germinated popcorn, Bambara groundnut and African locust bean flour revealed growth potentials in this blend. Hence, to be able to strike a balance in terms of the limiting amino acids in cereal and legume, the work basically is to estimate the best ratio or blend of these with Bambara groundnut that will be required to support growth, using weaning wistar rat as a model.

Methods: Formulated diets were fed with water ad libitum for 28days to twenty (20) weaning male wistar rats (60 – 70g), comprising of five (5) animals each in four (4) different groups. Group 1 is the commercial rat fillet diet, while Groups 2,3 and 4 were the experimental diets with varied percentages of Yellow maize : Bambara groundnut flour at 100% : 0%; 30% : 70% and 50% : 50% respectively supplemented with the necessary vitamins and minerals

Results: Group 1 had the highest mean dietary consumption of 100.4 ± 3.78g followed by Group 3 with 84.06 ± 3.74g; then Group 4 with 83.08 ± 4.11g and finally Group 2 with 71.6 ± 6.38g. Mean differential weight changes at the end of the 4 weeks was highest for Group 1 with 13.50 ± 2.97g; followed by Groups 3,4 and 2 in that order, with mean differential weight of 10.65 ± 2.70g, 9.34 ± 2.06g and 5.53 ± 2.13g respectively

Conclusions: The best blend of these formulated diets for growth is the group 3, as it shows comparable mean differential weight changes to those of the commercial rat fillet. Hence, possible future development of this diet into a weaning or infant formula is envisaged.

PREVALENCE OF PEDIATRIC METABOLIC SYNDROME AMONGST CHILDREN IN THE AGE GROUP OF 10-16 YEARS BELONGING TO HIGH INCOME GROUP (HIG) IN DISTRICT SHIMLA, HIMACHAL PRADESH, INDIA

[1]Sareen, Neha; [2]Kapil, Umesh.

[1]Ph.D. Research Scientist. All India Institute of Medical Sciences. New Delhi. India; [2]MD. Professor. All India Institute of Medical Sciences. New Delhi. India.

Background and objectives: Obesity is the most common cause of insulin resistance and metabolic syndrome. These are the most important risk factors for coronary heart disease. High levels of body mass index (BMI, kg/m2) among children are associated with abnormal levels of lipids, insulin, blood pressure which are components of the Pediatric Metabolic Syndrome (PMS). No evidence exists regarding the prevalence of PMS amongst children of Himachal Pradesh state, India. We aimed to evaluate the prevalence of pediatric metabolic syndrome amongst children in 10-16 years of age belonging to high income group in district Shimla, Himachal Pradesh, India.

Methods: A school based cross-sectional study was conducted in the year 2015-2016. District Shimla, Himachal Pradesh was selected for the present study. In district Shimla, all the urban schools which are located at the altitude of 1000 meters and above catering to high income group schools with monthly tuition fee of 2000 or more were enlisted along with their population. Thirty clusters/schools were identified using Population Proportionate to Size (PPS) sampling methodology. In the identified schools, all the children in schools were enlisted. Seventy children per school were selected by using random number tables. Thus a total of 2100 children in 10-16 years of age were randomly selected. The children were briefed about the objectives of the study and written consent was taken from their parents. Pre-tested, semi structured questionnaire was administered to each subject. Weight, height, waist circumference (WC), body mass index (BMI), and blood pressure were measured using standard tools. Ten milliliters of blood was taken for measuring lipid profile and fasting blood sugar (FBS) of the school children. We determined PMS according to the International Diabetes Federation (2007) criteria.

Results: Prevalence of PMS was found to be 3.5% (boys: 3.6%, girls: 3.4%) and the prevalence of overweight and obesity was 12.8% and 3.2% amongst the studied children.

Conclusions: PMS is known to be a precursor of adult metabolic syndrome in a population. The findings of the present study indicate that PMS is significant but hidden public health problem, which requires urgent attention of the programme managers and administrators in the health sector.

ASSOCIATION OF DIETARY FLAVONOID INTAKE WITH RISK OF CANCER IN THE CANCER SCREENING EXAMINATION COHORT IN KOREA

[1]Kim, So Young; [2]Wie, Gyung Ah; [3]Cho, Yeong Ah; [1]Kang, Hyun Hee; [1]Ryu, Kyoung A; [3]Yoo, Min Kyong; [4]Kim, Seong Ah; [4]Ha, Kyungho; [5]Joung, Hyojee.

[1]MS. Clinical dietitian. Department of Clinical Nutrition. Research Institute & Hospital. National Cancer Center. Republic of Korea; [2]Ph.D. Clinical Dietitian. Department of Clinical Nutrition. Research Institute & Hospital. National Cancer Center. Republic of Korea; [3]MPH. Clinical Dietitian. Department of Clinical Nutrition. Research Institute & Hospital. National Cancer Center. Republic of Korea; [4]MPH. Graduate School of Public Health and Institute of Health and Environment. Seoul National University. Seoul. Republic of Korea.; [5]PhD. Graduate School of Public Health and Institute of Health and Environment. Seoul National University. Seoul. Republic of Korea.

Background and objectives: Dietary flavonoids are thought to play a prominent role in cancer prevention through antioxidant capacity, but their association with cancer incidence has not been thoroughly investigated using epidemiological data in Korea. The purpose of this study was to investigate whether dietary flavonoid intake is associated with reduced risk of cancer based on data from the Cancer Screening Examination Cohort 2004–2008 of the National Cancer Center of Korea.

Methods: This study included 8,024 subjects who completed a written survey on demographics and lifestyles, as well as a 3-day dietary record. Prediagnostic flavonoid intakes were estimated using a flavonoid database of common Korean foods (KFDB). Hazard ratios (HRs) were estimated, comparing the highest quartile of flavonoid intake with the lowest, using Cox proportional hazard model. All statistical analyses were conducted using the STATA program version 14.0 (STATA Corporation).

Results: During the mean follow-up period of 9.0 years, 425 cancer cases were newly diagnosed. The median flavonoid intake was 111.6 mg/d. Mean of the highest quartile (287.6mg/d) was six times greater than that of the lowest quartile (46.6mg/d). After multivariable adjustment, there was a weak association between dietary flavonoid intake and overall cancer risk (HR=0.74; 95% CI 0.54-1.00; highest vs. lowest quartile; p-trend=0.088). Among men, significant association was observed in age-adjusted dietary flavonoid intake and risk of cancer (HR=0.66; 95% CI 0.46-0.94; highest vs. lowest quartile; p-trend=0.044). After multivariable adjustment, dietary flavonoid intake was associated with reduction in HR for total cancer incidence, but this association was only marginally significant (HR=0.66; 95% CI 0.45-0.98; highest vs. lowest quartile; P-trend=0.056). Among Women, there was no such an association.

Conclusions: Our results suggest that greater intake of flavonoid may reduce overall cancer risk, particularly among men. Additional research is necessary to clarify the association between dietary antioxidants including flavonoid and the risk of cancer.

Keywords: dietary flavonoid, antioxidant, cancer

THE IMPACT OF FOUR SCHOOL FEEDING FOOD PRODUCTS ON THE NUTRITIONAL STATUS OF CHILDREN IN SOUTHERN GAUTENG, SOUTH AFRICA

[1]Kearney, Jeanette; [2]Oldewage Theron, Wilna.

[1]DTech Food Service Management. Department of Hospitality, Tourism & PR Management. Vaal University of Technology (VUT). South Africa; [2]PhD RD (SA). Professor of Nutrition. Department of Nutritional Sciences. Texas Tech University. USA.

Background and objectives: School feeding programmes have been used in many parts of the world for a number of years; with varying success. Four micronutrient dense products were introduced as part of the school feeding programme in Southern Gauteng, South Africa. The purpose of this paper is to provide an overview on the impact on the nutritional status by comparing anthropometric status and biochemical variables of the children. Biochemical variables, specifically iron was measured. Blood samples were drawn for the determination of serum vitamin A, haemoglobin, haematocrit, zinc, iron, ferritin, transferrin and total iron binding capacity.

Methods: The participation of all the children in this study was voluntary and all the children taking part in this study obtained written parental consent. The food consumption patterns of the school children was determined by a food frequency questionnaire as test measurement and a 24-hour recall questionnaire as reference measurement at baseline. The impact on nutritional status was determined by evaluating and comparing the anthropometric indices: weight-for-age, height-for-age and body mass index (BMI). For the anthropometric results, data was categorised according to the percentile system, in accordance with the National Centre for Health Statistics indicators. The duration of the intervention was seven months with a total of 332 participants in the four groups, each group receiving a different product.

Results: All the interventions showed improvement in the mean energy intake of the children. The mean weight, height and BMI increased with all the interventions. Anthropometric results indicated that children in the severely underweight category, as well as the group at risk of being underweight, decreased in two of the groups. The number of children at risk of being stunted (>5 and <25th percentile) declined, with the exception of the group consuming the sorghum based product. The biochemical results indicated that normal values were present for the majority of the parameters before and after the interventions.

Conclusions: Positive changes were observed in each of the groups, indicating that any one of these products can be successfully used as part of a school feeding programme and may have a beneficial effect on hungry, malnourished children.

Keywords: school feeding products; school intervention; nutrition; health promotion, malnutrition.

FACTORS ASSOCIATED WITH THE CONSUMPTION OF SUGAR-RICH FOODS AMONG BRAZILIAN ADOLESCENTS: NATIONAL SCHOOL HEALTH SURVEY (PENSE 2015)

[1]Enes, Carla Cristina; [2]Nucci, Luciana Bertoldi.

[1]PhD. School of Nutrition. Professor of postgraduate program in Health Sciences. Pontifical Catholic University of Campinas. Brazil.; [2]PhD. School of Medicine. Professor of postgraduate program in Health Sciences. Pontifical Catholic University of Campinas. Brazil.

Background and objectives: Background: The excessive intake of sweets, deserts and sugar sweetened beverages among adolescents stands out as a major health issue in several countries.
Objective: This study aimed to analyze the consumption of high-sugar foods by Brazilian adolescents and to identify associated factors.
Methods: We used data from the National School Health Survey (PeNSE 2015) conducted by a partnership between the Brazilian Institute of Geography and Statistics (IBGE) and the Brazilian Ministry of Health. This is a cross-sectional study developed from a representative sample of ninth grade students living in all regions of Brazil, including urban and rural areas and attending public and private schools. Consumption of these foods was classified as: do not consume sweets and soft drinks regularly (≥5days/week); consume sweets or soft drinks regularly; and consume sweets and soft drinks regularly. Its association with sociodemographic information, eating habits, and family contexts were investigated by multiple ordinal regressions. All statistical analyses were performed using SAS and commands were performed taking into account the complex sample design of PeNSE. In the final model 101,812 students who presented complete information about the investigated variables were considered.
Results: About 16.0% of participants reported regular consumption of sweets and soft drinks and 35.9% regularly consumed one of these sugar-rich foods. The ordinal multiple regression analysis showed that the odds of regularly consuming sweets or/and soft drinks was higher among females; adolescents aged 15; students with mothers with higher education; those that eat meals in front of the TV; and those with a high amount of daily TV time. The largest magnitudes of association with the outcome variable were found for maternal education ≥ 12 years (OR = 1.39), being female (OR = 1.26), eating while watching TV (OR = 2.07) and time spent watching TV ≥ 5 hours per day (OR = 2.69).
Conclusions: The results highlight the clear association observed between daily time spent watching television and regular consumption of sweets and soft drinks. This scenario shows that changing these factors should be a priority for interventions to prevent negative health effects, particularly overweight and associated morbidities.
Keywords: adolescents, sugar, soft drinks, food consumption

FEEDING PRACTICES AND MALNUTRITION AMONG UNDER FIVE CHILDREN IN COMMUNITIES OF KUJE AREA COUNCIL, FCT ABUJA, NIGERIA

[1]Okoro, Clementina; [2]Owolabi, O.A.; [2]James, D.B.; [3]Maduforo, Aloysius; [4]Mbewe, A.L.; [5]Isokpunwu, Chris Osa.

[1]M.Sc. Nutritionist. Nutrition Section. Federal Capital Territory Primary Health Care Board. Abuja. Nigeria.; [2]PhD. Nutritionist. Department of Biochemistry. Faculty of Sciences. Ahmadu Bello University. Zaria. Kaduna State. Nigeria.; [3]M.Sc. RDN. Lecturer. Department of Home Science, Nutrition and Dietetics. University of Nigeria. Nsukka. Nigeria; [4]Family and Reproductive Health Cluster Lead. World Health Organization. Nigeria.; [5]MD. MPH. Nutrition Division. Federal Ministry of Health. Abuja. Nigeria.

Background and objectives: Poor dietary practices and malnutrition, including severe acute malnutrition among under five children in Nigeria has remained a great public health concern. This study assessed infant and young child feeeding practices and nutritional status of under-five children to determine the prevalence of malnutrition of under five children in Kuje area council, Abuja.
Methods: The study was a cross-sectional study. Multi-stage sampling techniques was used in selecting the population that was studied. Probability proportion by size was applied in choosing 30 clusters for the survey using ENA for SMART software 2011 version. Validated questionnaires were used to obtain information from the population, while appropriate equipment was used for measurements of anthropometric parameters. The data was also subjected to statistical analysis using statistical package and service solution version 20.
Results: The result showed that 96.7% of the children were breastfed, 30.6% had early initiation to breastfeeding within first hour of birth and 22.4% were breastfed exclusively up to 6 months, 69.8% fed infants' colostrum, while 30.2% discarded colostrum. About half of the respondents (49.1%) introduced complementary feeding before six months and 23.2% introduced it after six months while 27.7% had age appropriate timely introduction of complementary feeding.The anthropometric result showed that the prevalence of global acute malnutrition (GAM) was 12.8%, severe wasting prevalence was 5.4%, moderate wasting was 7.4%, underweight was 24.4%, stunting was 40.3% and overweight was 7.0%.
Conclusions: The result showed that there is high prevalence of malnutrition among under five children in Kuje which is generally consistent with National Average. Hence, there is need for urgent appropriate interventions to improve their nutrition and health status.

NUTRITIONAL QUALITY, NUTRIENT CLAIMS AND '1 OF YOUR 5 A DAY' LOGOS IN PRE-PACKAGED FOODS MARKETED TO YOUNG CHILDREN IN THE UK

[1]Garcia, Ada; [2]Parrett, Alison.

[1]PhD. Nutritionist. Human Nutrition. University of Glasgow. United Kindgdom; [2]PhD. Nutritionist. Human Nutrition. University of Glasgow. United Kingdom.

Background and objectives: High sugar consumption contributes to high energy intake and is linked to unhealthy eating behaviours associated with increased obesity risk in childhood. It is important that parents can understand the nutritional quality of pre-packaged foods targeted at pre-school age children to inform them about healthy choices and nutrients of concern such as sugar. We aimed to assess the nutritional quality, nutrient claims and use of '1 of your 5 a day' logos in pre-packaged foods targeted to young children (1.5-3 years) in the UK market.

Methods: A cross-sectional survey of all pre-packaged foods available from 4 major UK supermarkets. Foods were included in the survey only if they used cartoon imagery and/or child friendly related words on the packaging. Food labels were assessed for nutritional information, added vitamins, nutrient claims, and '1 of your 5 a day' logos. Nutritional quality was assessed using the Ofcom nutrient profiling model.

Results: In total, 485 food items were assessed and divided into 10 categories: fruit juice (20%) cereals (18%), ready meals (16%), yogurt (17%), fruit snacks (13%), various snacks (9%) cereal bars (5%) and smoothies (2%). The highest sugar content [mean (SD)/100g] was found in fruit snacks [44 (10)/100g] followed by cereal bars [30 (7)/100g] and cereals [24 (8)/100g]. For each of the major food categories, cereals, cereal bars and fruit snacks had the highest proportion of products assessed as being 'less healthy'. Nutrient claims were reported in 96% of products, 50% had added vitamins and 32% showed a '1 of your 5 a day' logo. Overall, 95% of foods contained at least 1 or more nutrient claim or '1 of your 5 a day' logo across all food categories but 52% (n=254) of the children's products were assessed as being 'less healthy' in accordance to the UK Ofcom nutrient profiling model.

Conclusions: Over half of children's pre-packaged food products targeted to young children were considered as less healthy food choices despite majority of these foods displaying a nutrient claim. This study suggests further efforts need to be taken to regulate advertisement of nutrient claims on products with unhealthy nutrient profiles.

Keywords: food labelling, food marketing, infants, nutrient claims, 5-a-day

Conflict of Interest Disclosure: There is no conflict of interest. This research was funded by Human Nutrition, University of Glasgow, UK.

TREND OF OVERWEIGHT AND OBESITY IN PERUVIAN SCHOOLCHILDREN OF THE PRIMARY LEVEL

[1]Tarqui-Mamani, Carolina; [2]Alvarez-Dongo, Doris; [2]Espinoza-Oriundo, Paula.

[1]Doctora. Centro Nacional de Alimentación y Nutrición. Instituto Nacional de Salud. Peru; [2]Nutricionista. Centro Nacional de Alimentación y Nutrición. Instituto Nacional de Salud. Peru.

Background and objectives: To analyze the tendency of overweight and obesity in Peruvian schoolchildren of the primary level.

Methods: A trend study that analyzed overweight and obesity in 24794 primary school children. The samples were representative and probabilistic of Peruvian households. The measurement of weight and size was made according to Peruvian regulations. Data collection was performed in Peruvian households during 2007-2014. Overweight and obesity were assessed using the body mass index for age (BMIZ); overweight was considered to be an BMIZ> 1 and ≤2 and obesity was an BMIZ> 2. It was analyzed by complex samples, prevalences and chi square of linear trend were calculated.

Results: Between 2007 and 2014, overweight increased from 15.5% to 18.1% and obesity from 6.1% to 14.1%. The trend of overweight (p <0.001) and obesity was increased (p <0.001). The trend of overweight and obesity was increased in children aged 8 to 10 years (p <0.01) and aged 11 to 13 years (p <0.01). In both sexes, the tendency of overweight (p <0.001) and obesity (p <0.001) was increased. In children that the head of the household had primary education level (p <0.001), secondary (p <0.01) and higher (p <0.01), the tendency of overweight and obesity was increasing. In the urban area (p <0.001) and rural (p <0.01), the tendency of overweight and obesity was to increase (p <0.001). In Lima Metropolitan (p <0.01), coast (p <0.001), saw (p <0.001) and jungle (p <0.001) the tendency was to increase. According to poverty condition, the tendency of overweight in the poor was to increase (p = 0.011), while obesity increased in the non-poor.

Conclusions: The trend of overweight and obesity increased in primary school students in Peru, to the predominance of obesity.

Health and Nutrition Research Team of the Mother Child Couple. Faculty of Medicine and Pharmacy. Mohammed V University of Rabat. Morocco.

Background and objectives: Morocco has recently developed a plan of reducing sugar consumption to reinforce prevention of non-communicable diseases and to contribute to the achievement of global voluntary targets for non-communicable diseases set by ICN2 by 2025. The objective of the present study is to assess acceptance of yogurts with different percentage reduction of sugar by Moroccan population.

Methods: A total of 201 participants (age >15 y.) were recruited to determine the level of sugar reduction in yogurt. Sucrose was added to a plain yoghurt in the following different concentrations 166.5; 149.8; 133.2; 116.5; 99; 83.2 mM/l, corresponding to the reduction of sugar of 0%, -10%, -20%, -30%, -40% and -50%, respectively, compared available yogurt in local market. Overall liking, "Just About Right" (JAR) and purchase scales was used to score the different yoghurts.

Results: Yogurts containing -20% and -30% added sugar were highly accepted by 81% and 74% of respondents. Based on JAR score, yoghurt with 20% (133.2mM/l) and 30% (116.5mM/l) reduction were considered as "just about right' by 42.7% and 44.3% respectively. Best average score of purchase intent is obtained for sucrose concentration of 149.8 mM/l. 35.8% and 40.3% for yoghurt with sucrose concentration of 133.2 mM/l and 116.5 mM/l respectively.

Conclusions: Finding of this study indicate that yogurts containing -20% and -30% added sugar were best accepted by respondents. Advocacy before dairy industry to make them commit toward sugar reduction in yogurt is needed, in order to help achieving the national sugar reduction strategy in Morocco.

ORAL FAT TASTE SENSITIVITY AND THE DEVELOPMENT OF OBESITY IN MOROCCAN ADULT SUBJECTS

[1]Bajit, Habiba; [2]Benkirane, Hasnae; [2]Taboz, Youness; [3]Belghiti, Hakim; [3]Mrabet, Mustapha; [4]Elkari, Khalid; [1]Bouziani, Amina; [1]Saeid, Naima; [5]Barkat, Amina; [2]Aguenaou, Hassan.

[1]PhD Student. Joint Research Unit in Nutrition and Food. Ibn Tofaïl University. National Center of Energy Sciences and Nuclear Techniques. Regional Designated Center of Nutrition (AFRA. IAEA). Rabat. Kenitra. Morocco; [2]PhD. Joint Research Unit in Nutrition and Food. Ibn Tofaïl University. National Center of Energy Sciences and Nuclear Techniques. Regional Designated Center of Nutrition (AFRA.IAEA). Rabat. Kenitra. Morocco; [3]Dr. Nutrition Unit Hygiene Service and Medicine of Collectivity. Military Hospital of Instruction . Rabat. Morocco; [4]PhD. Joint Research Unit in Nutrition and Food. Ibn Tofaïl University. National Center of Energy Sciences and Nuclear Techniques. Regional Designated Center of Nutrition (AFRA.IAEA). Rabat. Kenitra. Morocco; [5]PhD. Health and Nutrition Research Team of the Mother Child Couple. Faculty of Medicine and Pharmacy. Mohammed V University of Rabat. Morocco.

Background and objectives: In recent decades the prevalence of obesity is become an alarming threat for human health. In 2014 about 13% of the world's adult population was obese and 39% was overweight (World Health Organization). In 2011, 10.3 million adult Moroccans were overweight; 3.6 million were obese (National Survey on Anthropometry).

It is known that fats properties including olfactory, visual and textural cues play a significant role in their attractiveness. Nonetheless developing proofs think also of "Fat Taste" as a sixth taste besides the previous five basic taste modalities: sweet, salt, sour, bitter and umami; that could participate in their palatability.

The aim of our project is to investigate whether an alteration of oro-gustatory detection of lipids is associated to high fat intake and then to the development of obesity among adult Moroccan people.

Methods: Till now a total of 80 adult subjects (age $\geq$ 20 years) were recruited and all anthropometric measures were taken to classify them into obese and control groups. Participants were also exposed to oral fat test using emulsions containing food-grade oleic acid (OA), at ascending concentrations (0.018, 0.18, 0.37, 0.75, 1.5, 3, 6 and 12 mmol / L) via three-alternative forced choice (3-AFC) method, in order to compare the detection thresholds and the sensitivity to fatty acids between the two groups.

Results: The average BMI (Body Mass Index) and fat content for obese were respectively 37.84kg/m2 and 40.94% and those of control were 22.26kg/m2 and 25.00%.

Obese participants exhibit high thresholds for OA oral detection (3.87mmol/l) than control (0.17mmol/l).

The subjects were classified into 4categories: Non Tasters (all of them belong to obese group), High Tasters (from control subjects only), Middle Tasters (from the both groups) and Low Tasters (predominated by obese group).

Conclusions: Fatty acid taste sensitivity can lead to high dietary fat intake and consequently to the development of obesity.

Keywords: Obesity. Fat taste. Oro-gustatory Detection thresholds.

OVERWEIGHT, OBESITY AND METABOLIC SYNDROME IN MOROCCO: RESULTS FROM AN INTEGRATED INTERVENTION STUDY

[1]Heikel, Jaafar; [2]ElHsaini, Houda; [3]Raghni, Salwa.

[1]MD, PhD. Epidemiology. Interdisciplinary Center for Study and Research In Health. Casablanca. Morocco; [2]PhD. Nutrition. Interdisciplinary Center for Study and Research in Health. Casablanca. Morocco; [3]MD. Nutritionist. Interdisciplinary Center for study and Research in health. Casablanca. Morocco.

Background and objectives: The aim of this intervention study is to estimate the prevalence and determinants of metabolic syndrome (MS) in a urban overweight population and to assess the impact of an integrated approach to care including Mediterranean diet and a program of coached physical activity (DMAC) versus those adopting only the Mediterranean diet (DM) .

Methods: Between September 2012 and September 2016 we have recruited 983 people who consulted for overweight at the University Center for Preventive Medicine in Casablanca.

All the patients were proposed to follow or not an integrated program with specific mediterranean diet and aerobic physical coaching even if they were already treated for hypertension or diabete or hypercholesterolemia. The two groups DMAC and DM were followed during a minimum of six months and were assessed for clinical, biological and metabolic parameters.

Results: Among 983 patients, 830 have completed their program DM or DMAC with a minimum of six months follow-up. In terms of risk factors, 54.3% had a family history of diabetes , hypertension or hypercholesterolemia , 26.1 % were regular smokers , 39.2 % were regular alcohol drinkers . Weight and BMI means were respectively 86.77 kg and 28.66 kg/m2 . In total, the prevalence of metabolic syndrome (IDF 2009 criteria) was 28.1% (37, 3% in men and 21.6% in women). After 6 months of intervention , the prevalence of MS was 11.6% among those who opted for the DMAC and 23.1 % among those who opted for DM (OR = 0.43 (0.19 to 0 , 98) p = 0.04) , indicating a reduction in the prevalence of 57%. In a multiple logistic regression, factors associated with metabolic parameters improvement were the DMAC (ORadj = 9.6 , p = 0.000) , BMI (ORadj = 6.9 , p = 0.000) and sex (0Radj = 0.48 , p = 0.038).

Conclusions: Integrated intervention including specific Mediterranean diet and adapted physical activity improve Metabolic syndrome or prevent it in the Moroccan population. The incidence of some MS parameters could decrease by 25 to 50%.

Keywords: Obesity - Metabolic syndrome - Mediterranean Diet- Intervention

STRUCTURAL RELATIONSHIPS BETWEEN DIETARY DIVERSITY AND SUBJECTIVE FACTORS AMONG HEALTHY ELDERLY IN AN OKINAWAN FARM VILLAGE, JAPAN

[1]Kodama, Sayuri; [2]Kurimori, Sugako; [3]Hoshi, Tanji; [4]Ojiri, Yoshihiko.

[1]Ph D. Resistered nutritionist. Lecturer. Department of food and nutrition science. Sagami Women's Junior College. Japan; [2]Professor. Department of Nursing. Seitoku University. Japan; [3]Emeritus Professor. Tokyo Metropolitan University. Japan; [4]Professor. School of Health Sciences. Faculty of Medicine. University of the Ryukyus. Japan.

Background and objectives: In Japan, dietary diversity (DD) called "Japanese diet" characterized by rice staple, diverse plant origin foods, and fish intake, might be contributed to extend our healthy life expectancy (HLE), however, structural relationships between DD and HLE including subjective factors still remains unclear. Especially, not only direct effects, but also indirect ones between DD and subjective health (SH), which are both independently predictors of HLE, have not fully been elucidated. The purpose of this study was to clarify the structural relationships between DD and SH among healthy elderly in Japan.

Methods: A home visit survey was conducted in 2012 for elderly aged 65 years or over living in A municipality in Okinawa. A total of healthy elderly 1,525 respondents excluding long-term care needs participants were examined. "DD" was characterized by a combination of dishes, i.e. staple, main dishes, sub-dishes, milk and dairy product, and fruits, making it as a latent variable. As the subjective factor's indicators, we used economic satisfaction (ES), subjective well-being (SWB), life satisfaction (LS) and SH. Direct relationships among them were evaluated by using correlation analysis. The fit of hypothetical models was evaluated using covariance structure analysis.

Results: The largest direct relationship was identified between SWB and LS (r=0.718), then we made them for a latent variable named "mental and emotional well-being (MEWB)". We set ES for our hypothetical model's base, SH for its outcome, and DD and MEWB for mediating factors. Four groups' models; from 65 years to 74 years (<75), and 75 years or over (≥75) by men and women separately, were evaluated. The most fitted models showing indirect effects mediated by MEWB and by DD were statistically more acceptable (CFI=0.958, NFI=0.923, RMSEA=0.026), in comparison with the direct effects of ES on SH in models except men of <75. The effect of MEWB on DD was largest in women of ≥75.

Conclusions: The present findings suggest that creating support for the subjective well-being and life satisfaction based on economic satisfaction might enhance the subjective health of healthy elderly over 75 years old through improvement of dietary diversity.

TIME TRENDS IN THE AVAILABILITY AND APPARENT CONSUMPTION OF PROCESSED FOODSTUFFS IN GUATEMALAN HOUSEHOLDS IN 2006 AND 2011

[1]Sánchez León, María; [2]Ramirez-Zea, Manuel; [3]Corvalán Aguilar, Camila.

[1]MSc. Nutritionist. Institute of Nutrition and Food Technology. University of Chile. Chile.; [2]MD. PhD. INCAP Research Center for the Prevention of Chronic Diseases. Institute of Nutrition of Central America and Panama. Guatemala.; [3]MD. MPH. PhD. Institute of Nutrition and Food Technology. University of Chile. Chile.

Background and objectives: Even though consumption of processed foodstuffs is increasing in the world, trends in food consumption has not been analyzed in Guatemala. The objective is to assess time trends in the availability and apparent consumption of processed foodstuffs in Guatemalan households and to identify factors that had influenced food consumption change in the last 10 years.

Methods: Mixed methods approach. Quantitative: We classified foods from the Guatemalan National Living Conditions Survey (NCLS) 2006 and 2011 (12,766 and 12,666 representative household sample respectively), according to the NOVA classification. The availability and consumption in terms of energy, macronutrients, saturated fat, cholesterol, fiber, and sodium were calculated for each processed food group. We run T-Test analyses using Stata. Qualitative: to identify changes in food consumption, 12 focus groups with parents of children who attended public schools in three Guatemalan departments were performed, considering different geographic areas, ethnicity and socioeconomic level. Data was analyzed using QDA Miner-Lite4.

Results: Processed and ultra-processed foodstuffs accounted for almost 25% of the household food availability, without changes over time. The contribution of this group to the total energy consumption in households was 20%, with a decrease trend over time, as well as in macronutrients, saturated fat, cholesterol and fiber. Non-poor, non-indigenous and urban area households showed greater food availability and consumption. Participants perceived that consumption of processed foodstuffs in households was higher at present than 10 years ago.

Conclusions: Trend in the availability and consumption of processed and ultra-processed foodstuffs in Guatemala apparently decreased between 2006 and 2011. This was more pronounced in the non-poor, non-indigenous and urban area households. These results contradicted people's perception. The fact that the NCLS does not capture information from new processed foods in the market might explain part of these inconsistencies.

Keywords: Processed foodstuffs, food availability, apparent consumption.

CAPACITY BUILDING OF TEACHERS AND SCHOOL GIRLS THROUGH TRAINING AND EDUCATION BALANCED NUTRITION IN SENIOR HIGH SCHOOL IN MAROS DISTRICT SOUTH SULAWESI INDONESIA

[1]Patimah, Sitti; [2]Arundhana, Andi Imam; [3]Royani, Ida; [4]Thaha, Abdul Razak.

[1]Ph.D. Nutritionist. Publich Health Nutrition. School of Public Health. Universitas Muslim Indonesia. Indonesia; [2]MPH. Nutritionist. Nutrition Department. School of Public Health. Hasanuddin University. Indonesia; [3]MPH. Nutritionist. School of Medicine. Universitas Muslim Indonesia. Indonesia; [4]Prof. Ph.D. Nutritionist. Nutrition Department. School of Public Health. Hasanuddin University. Indonesia.

Background and objectives: There are many nutritional problems in adolescent girls such wasting, stunting, obesity, and anemia (10.3%, 23.6%, 6.8%, and 15.5%, respectively). This study aims to build the capacity of teachers and students through training and education to achieve balanced nutrition behavior and improvement of the nutritional status of adolescent girls.

Methods: The study is a multi-year study (3 yrs). A balanced nutrition CIE (communication, information and education) media has been developed in previous year (2015) and tested in the training for teachers and as education for the students (2016). There were four senior-high-schools selected and each school was represented by three teachers.The training for teachers (n=12) has been conducted for 2 days, then trained teachers taught the students for 4 months. For exact students, the balanced nutrition material has been inserted into biology, and physical and health education subjects, while for social science students, the material delivered through extracurricular activities.

Results: This study found that training of balanced nutrition successfully enhances teachers' knowledge in answering correctly (90%). Based on the evaluation of teachers regarding to students knowledge, they answered correctly and showed increasing score from 67 to 82. Based on the assessment of researcher, it was found that nutritional knowledge of students increase significantly before and after intervention (median score 32 to 62; p = 0,000). The eating behaviors become better for breakfast (34%), bringing food to school (46%), two-fold increase in daily fruit consumption (19%), never consume fruit reduced (13%), always consume complete food group (43.2%), BAZ-score increased significantly before and after intervention (p = 0,000), wasting student decreased 2%, microcytic anemia decreased almost half became 46.2% (p = 0,000), and anemia based on hematocrit level decreased three-fold became 4.6% (p = 0,000), .

Conclusions: By giving the training to teachers and balanced nutrition education to students, the capacity could increase in understanding the concept of balanced nutrition. It has implications for improvement of students'eating behavior and nutritional status.

Keywords: girls adolescent, balanced nutrition, education, nutritional status

Further collaborators: We potentially collaborate with the counselors to see the effect of the balanced nutrition CIE media effect in peer-counselling.

MEASURING BLOOD RETINOL CONCENTRATIONS OF INFANTS FED WITH COMPLEMENTARY FOODS FORTIFIED WITH MORINGA OLEIFERA LEAF POWDER – A PILOT STUDY

[1]*Boateng, Laurene;* [2]*Ohemeng, Agartha;* [3]*Asante, Matilda;* [4]*Steiner-Asiedu, Matilda.*

[1]MPhil. PhD Candidate. Department of Nutrition and Food Science. University of Ghana. Ghana. Lecturer. Department of Nutrition and Dietetics. University of Ghana. Ghana.; [2]PhD. Nutritionist. Department of Nutrition and Food Science. University of Ghana. Ghana.; [3]PhD. Dietitian. Department of Nutrition and Dietetics. University of Ghana. Ghana.; [4]PhD. Nutritionist.Department of Dietetics. University of Ghana. Ghana.

Background and objectives: Vitamin A deficiency (VAD) in the developing world remains a widespread public health problem. Investment in surveillance of VAD in high burden regions, using consistent methods, would provide improved information for intervention priorities. Improvement in the overall nutrition of high VAD burden populations, through dietary diversification and improved access to vitamin A rich foods, may be beneficial in combatting VAD. Leaves of the Moringa Oleifera plant reported to be a rich source of micronutrients particularly vitamin A, could be cheaply dried and stored for use in improving micronutrient content of diets of households in low resource settings. This study aimed at piloting measurement of blood retinol concentrations (using the i-check® fluorometer) among infants aged 8-12 months, whose complementary foods were supplemented with Moringa Oleifera leaf powder (MLP), in a rural district in Ghana.

Methods: Retinol concentration was measured (in 5ml of whole blood), at baseline and after 6 weeks, in a sub-sample of 103 infants participating in a 3-arm randomised controlled trial (RCT), ISRCTN14377902. One arm (n=35) received a cereal-legume blend fortified with (MLP) named MCL-35g, a second arm (n=34) received MLP as a supplement to be sprinkled on infants' usual foods (MS-5g) and a third arm (n=34) which received a cereal–legume blend, without MLP (CF-35g) served as controls. Data were analysed using SPSS for descriptive statistics, paired t-test and analysis of covariance.

Results: Sixty-five infants completed the study. Compared to World Health Oragnization (WHO) cut off for VAD (0.70 μmol/L) , mean retinol concentrations for all groups were low at both baseline and endline. There was a marginal increase at endline for all groups, but this was not statistically significant; 0.466 μmol/L at baseline to 0.548 μmol/L at endline for CF-35g (n=26), 0.509 to 0.631μmol/L for MC-35g (n=20), and 0.639 to 0.652 μmol/L for MS-5g (n=19).

Conclusions: The i-check® fluorometer has potential as a convenient tool for measuring blood retinol concentrations. Further studies on its reliability are however needed. Adequately powered RCTs with bigger sample size, which last for extended periods are needed to test the efficacy of MLP in combatting VAD.

Keywords: Vitamin A deficiency, i-check, Moringa Oleifera leaf powder, infants

Conflict of Interest Disclosure: The i-check® fluorometer was purchased with the main author's PhD grant and training on its use was provided by the manufacturer's (Bioanalyt Inc) training support staff. Aside this, there are no conflicts of interest to declare.

Further collaborators:
There are no further authors. We however wish to acknowledge Prof. Anna Lartey for her guidance and helpful inputs through all the phases of this work.

EVALUATION OF POLITICAL COMMITMENTS TO NUTRITION PROGRAMMES IN LAGOS STATE, NIGERIA

[1]*Oni, Blessing;* [2]*Oyewole, Oyediran;* [2]*Ariyo, Oluwaseun;* [3]*Atinmo, Tola.*

[1]M.Sc. Nutritionist. Department of Human Nutrition. University of Ibadan. Nigeria.; [2]PhD. Nutritionist. Department of Human Nutrition. Nigeria.; [3]Professor. Nutritionist. Department of Human Nutrition. Nigeria.

Background and objectives: Under-and over-nutrition have public health consequences including disease burden, decreased cognitive development and possible mortality. Political involvement has been proven to be a potent tool in nutrition programmes development. However, there is need to conduct an evaluation on the level of political commitment in nutrition programmes in Lagos State, which is one of the economically buoyant States in Nigeria.

The study was designed to evaluate the level of political commitments to nutrition programmes in Lagos State.

Methods: The study was exploratory and the study location was purposively selected to justify the purpose of the study. Two research tools were developed and pretested, which included: key informant interview guide and record assessment guide. The interview guide was administered to stakeholders involved in implementation of nutrition programmes in Lagos State. Available documents on nutrition programmes from the State were assessed using the developed themes from the study objectives. The interview sessions were transcribed verbatim and were analysed thematically.

Results: Nutrition programmes were developed through various methods such as survey gaps and participatory rural appraisal. This evolved into the formation of strategic plans for nutrition intervention programmes to be implemented. The priority accorded to the nutrition sector has been a major drawback. The Commis-

---

sioners for Health and Agriculture, the Governor and significant others were identified as the political class who could influence and make various commitments to nutrition programmes. The commitments to nutrition were verbal with little financial support for the sector. The quality of personnel working in the sector also determined the corresponding influence that political involvement had in the support for the sector. There were well established and planned organograms for the coordination of nutrition programmes. The relevance given to nutrition has made it to be incorporated into State development plan.

Conclusions: Political commitments should include financial support and quality officers are required to coordinate nutrition programmes.

Keywords: Political involvement, Stakeholders in nutrition, Nutrition intervention programmes.

IMPROVING THE PERFORMANCE OF THE HEALTH STAR RATING FRONT-OF-PACK NUTRITION LABELLING SYSTEM BY INCORPORATING ADDED SUGAR

[1]Peters, Sanne; [2]Dunford, Elizabeth; [3]Jones, Alexandra; [4]Ni Mhurchu, Cliona; [5]Taylor, Fraser; [6]Woodward, Mark; [6]Neal, Bruce.

[1]PhD. The George Institute for Global Health. University of Oxford. Oxford. UK.; [2]PhD. Research Fellow. Carolina Population Center. The University of North Carolina. Chapel Hill. USA.; [3]LLM (Global Health Law). Research Associate. The George Institute for Global Health. Sydney. Australia.; [4]PhD. Professor. National Institute for Health Innovation. University of Auckland. Auckland. New Zealand.; [5]MEng. Managing Director. The George Institute for Global Health. Sydney. Australia.; [6]PhD. Professor. The George Institute for Global Health. Sydney. Australia.

Background and objectives: The Health Star Rating (HSR) is an interpretive front-of-pack nutrition labelling system that rates the overall nutritional profile of packaged food and assigns a rating from 0.5 to 5 stars in half star increments. The HSR algorithm uses total sugar content as one of the components. This has been criticised because intrinsic sugars naturally present in dairy, fruits, and vegetables are treated the same as sugars added during food processing. We assessed whether the HSR could better discriminate between core and discretionary foods by including added sugar in the algorithm.

Methods: Nutrition information for 34,135 packaged foods available in Australian supermarkets were used. Products were classified as 'core' or 'discretionary' based on the Australian Dietary Guideline dichotomy between those everyday foods intended to make up the bulk of a healthy diet and those which should only be eaten occasionally. Added sugar values were estimated using a validated method and HSRs were calculated per proscribed standards. The ability of the HSR, with or without added sugar, to discriminate between core and discretionary foods was estimated using the area under the receiver operating characteristic curve (AUC).

Results: 15,965 core and 18,350 discretionary foods were included. Of these 8,230 core (51.6%) and 15,947 discretionary (86.9%) foods contained added sugar. Median (Q1, Q3) HSR and added sugar contents (g/100g) were 4.0 (3.0, 4.5) and 3.3 (1.5, 5.5) for core foods and 2.0 (1.0, 3.0) and 14.6 (1.8, 37.2) for discretionary foods. The AUC (95% confidence interval) for the current HSR algorithm was 0.825 (0.821; 0.829). The AUC for a model with added sugar alone was 0.777 (0.773; 0.782), compared with 0.692 (0.686; 0.697) for a model with total sugar alone. Including both added and total sugar increased the AUC to 0.870 (0.867; 0.874). Replacing total sugar by added sugar resulted in an AUC of 0.843 (0.839; 0.847).

Conclusions: Including added sugars in the HSR algorithm led to better discrimination between core and discretionary foods. These data argue for inclusion of added sugar in the HSR algorithm and reporting of added sugar as part of Australian nutrient declarations.

SIMPLIFICATION OF THE HEALTH STAR RATING FRONT-OF-PACK NUTRITION LABELLING SYSTEM

[1]Peters, Sanne; [2]Dunford, Elizabeth; [3]Jones, Alexandra; [4]Ni Mhurchu, Cliona; [5]Taylor, Fraser; [6]Woodward, Mark; [6]Neal, Bruce.

[1]PhD. Research Fellow. The George Institute for Global Health. University of Oxford. Oxford. UK.; [2]PhD. Research Fellow. Carolina Population Center. The University of North Carolina. Chapel Hill. USA.; [3]LLM (Global Health Law). Research Associate. The George Institute for Global Health. Sydney. Australia.; [4]PhD. Professor. National Institute for Health Innovation. University of Auckland. Auckland. New Zealand.; [5]MEng. Managing Director. The George Institute for Global Health. Sydney. Australia.; [6]PhD. Professor. The George Institute for Global Health. Sydney. Australia.

Background and objectives: The Health Star Rating (HSR) is an interpretive front-of-pack nutrition labelling system designed for packaged foods. Packaged foods are given a star rating of 0.5 to 5.0 stars in half star increments based on their overall nutrient profile score. The underpinning algorithm includes energy, risk nutrients (saturated fat; sodium; and total sugars), and positive nutrients (fibre; protein; and fruit, vegetable, nut and legume [FVNL] content). We assessed whether the HSR could be simplified, without materially changing its performance, by removing fibre and FVNL content, which are not mandatory on current nutrition labels.

Methods: Nutrition information for 34,135 packaged foods available in Australian supermarkets were used. Products were classified as 'core' or 'discretionary' based on the Australian Dietary Guideline dichotomy between those everyday foods intended to make up the bulk of a healthy diet and those which should only be eaten occasionally. Fibre content (g/100g) and FVNL content (%) were estimated using a validated method for each product. HSRs were calculated using both the standard HSR algorithm and a simplified HSR algorithm excluding fibre and FVNL values. The performance of the simplified HSR was determined by comparing the capacity to discriminate between core and discretionary foods using the area under the receiver operating characteristic curve (AUC).

Results: 15,965 core and 18,350 discretionary foods were included. The AUC (95% confidence interval) for the standard HSR algorithm with all components was 0.820 (0.816; 0.825). Removing FVNL, fibre, and both together changed the AUC by -0.0106 (-0.0134; -0.0079), 0.0001 (-0.0027; 0.0029), and -0.0099 (-0.0127; -0.0071), respectively.

Conclusions: The ability of the HSR to discriminate between core and discretionary foods did not change with the removal of fibre from the equation. Removing FVNL from the algorithm did reduce HSR performance by a small margin. Removal of both fibre content and FVNL content from the current HSR algorithm would have little material impact on performance but would greatly simplify HSR calculation for food manufacturers and researchers.

COMPARISON OF DIETARY DIVERSITY SCORES (DDS) ACCORDING TO THE STATURO-PONDERAL STATUS AND GENDER AMONG RURAL MIDDLE SCHOOL CHILDREN IN THE NORTHWEST OF MOROCCO

[1]Sbaibi, Rachid; [2]Aboussaleh, Youssef; [2]Zeghari, Lotfi; [2]Agoutim, Naima.

[1]PhD. Laboratory of Nutrition Health and Environment. Department of Biology. Faculty of Sciences. University Ibn Tofail. Kénitra. Morocco; [2]PhD. Nutritionist. Laboratory of Nutrition Health and Environment. Department of Biology. Faculty of Sciences. University Ibn Tofail. Kénitra. Morocco.

Background and objectives: Internationally, data on the nutritional health of adolescents (10-19 years) in rural areas are much rarer than those for infants (0-4 years), and adults (> 19 years). this study aims to compares the dietary diversity scores according to the staturo-ponderal status and gender among rural middle school children in the northwest of Morocco.

Methods: A sample of 300 middle school children was observed in a rural school in the northwest of Morocco. The dietary diversity scores are calculated by counting the number of the 11 most frequented food groups (grains, sweet tea, fatty substances, dairy products, vegetables, sweets, poultry, fruits, legumes, red meat, fish) consumed during the preceding 7 days by the middle school children. The staturo-ponderal status is determined by height for age and body mass index (BMI) for age.

Results: The sample consists of 102 girls (34%) and 198 boys (66%). The average age is 15.45 ± 1.64 years, ranging from 12.3 to 19.74 years. Stunting and thinness are respectively 9.7% and 10%. The comparison by Mann-Whitney test with a risk α = 5% shows that there was no significant difference in dietary diversity scores between the normal group (N = 271) and the group with stunting (N = 29): (u = 3046, p = 0, 051> 0.05), same thing between normal group (N = 270) and the group with thinness (N = 30) (u=3566; p=0,26>0,05). Also between girls and boys (u = 9588.5, p = 0.46> 0.05).

Conclusions: The study suggested that dietary diversity is not associated with the staturo-ponderal status or gender, A focused analysis is needed to determine the part of socioeconomic status.

Keywords: the dietary diversity scores, staturo-ponderal status, gender, middle school children. Morocco.

NUTRITION CONTENT OF BREAKFAST CEREALS AFTER THE FRONT OF PACKAGE LABELING REGULATION IN MEXICO

[1]Nieto, Claudia; [2]Castillo, Alejandra; [3]Carriedo, Angela; [4]Tolentino Mayo, María Lizbeth; [5]Barquera, Simon.

[1]MSc. Nutritionist. Centro de Investigación en Nutrición y Salud. Instituto Nacional de Salud Pública. México.; [2]Nutritionist. Centro de Investigación en Nutrición y Salud. Instituto Nacional de Salud Pública. México.; [3]PhD candidate. London School of Hygiene & Tropical Medicine. England.; [4]PhD candidate. Nutritionist. Centro de Investigación en Nutrición y Salud. Instituto Nacional de Salud Pública. México.; [5]M.D. PhD. Centro de Investigación en Nutrición y Salud. Instituto Nacional de Salud Pública. México.

Background and objectives: Breakfast cereals substantially contribute to daily energy and nutrient intakes in the Mexican population. One of the main dietary patterns of breakfast among Mexican children is cereals with milk. The Mexican National Health and Nutrition Survey of 2012 indicated that 49% of children aged <2 years consumed sweetened cereals. Due to the high prevalence of obesity and non-communicable diseases, the Mexican government implemented a Front of Package Labeling (FOPL) regulation. Such mandatory regulation displayed the nutrition content per package, not per serving. This regulation might have encouraged food industry to reformulate their products, since the total nutrition content of nutrients of concern would be displayed in the front of the package. The aim of this study was to identify the differences in the

---

nutrition content of breakfast cereals between 2013 and 2014, after the FOPL regulation was implemented in Mexico.

Methods: This is a cross-sectional study. Data was collected from supermarkets. Trained nutritionist took photographs of breakfast cereals (n=371) in eight food retail chains. For 2013, data of n=155 breakfast cereals were collected; and after the regulation, in 2014, data of n=216 breakfast cereals were collected. Nutrient content was standardized by 100g. Since the data was non-parametric, we used Wilcoxon test to compare the nutrition content of breakfast cereals.

Results: We assessed the nutrition content of saturated fat, sugar, sodium, energy, carbohydrates and proteins. The mean nutrition content (2013 vs 2014) was: saturated fat (1.04 vs. 1.34), sugar (26.6 vs 23.3), and sodium (462 vs. 357), and energy (382 vs. 374 kcal). Significant differences in the nutrition content of breakfast cereals in year 2013 and 2014 were found (p<.05), except for energy. We also found significant differences in the content of carbohydrates and proteins which means that reformulation of products was made by increasing the content of other nutrients in the product.

Conclusions: The nutrition content of breakfast cereals changed after the implementation of the FOPL regulation. Most of the breakfast cereals decreased the content of nutrients of concern, especially sodium content.

Keywords: breakfast cereals, nutrition content, labeling.

Conflict of Interest Disclosure: This research was part of a larger study funded by the International Development Research Centre. The authors state that there is no potential conflict of interest in relation to this investigation.

THE ASSOCIATION BETWEEN COFFEE, ARSENIC, LEAD, CADMIUM AND POLYMORPHISMS OF PON1 AND PPAR-Γ AND CHRONIC KIDNEY DISEASE

[1]Hsueh, Yu-Mei Hsueh; [2]Chen, Wei-Jen; [2]Ao, Pui-Lam.

[1]PhD. Pharmacist. Department of Family Medicine. Taipei Medical University Hospital. Taipei. Taiwan; Department of Public Health. School of Medicine. College of Medicine. Taipei Medical University. Taipei. Taiwan; [2]Ms. School of Public Health. College of public Health. Taipei Medical University. Taiwan.

Background and objectives: Environmental pollutants such as arsenic, lead and cadmium may increase the risk of CKD, by the reason of oxidative damage induced by these metals. Paraoxonase1 (PON1) as an important antioxidant enzyme, and peroxisome proliferator activated receptor-γ (PPAR-γ) as a transcription factor for regulating the gene expression of PON1. The aim of present study is to investigate the relationship among arsenic, lead, and cadmium, genetic polymorphisms of PON1 and PPAR-γ and CKD. In addition, we also explore the joint effects of the polymorphisms of PON1 and PPAR-γ on lifestyle related CKD.

Methods: Two hundred twenty CKD patients were defined using estimated glomerular filtration rate lower than 60 ml/min/1.73 m2, and recruited from the Department of Internal Medicine/Nephrology of Shin Kong Wu Ho-Su Memorial Hospital, Taipei Medical University Hospital and Taipei Municipal Wan Fang Hospital from 2007 to 2011. Age-gender matched 440 controls were recruited from a hospital-based pool, including those receiving senior citizen health examinations and adult health examinations. Concentration of urinary arsenic species, including arsenite (AsIII), arsenate (AsV), monomethylarsonic acid (MMAV) and dimethylarsinic acid (DMAV) were determined by a HPLC-HG-AAS. Polymorphisms of SNPs including PON1 (R192Q), PON1 (M55L), PPAR-γ(C1431T) and PPAR-γ(C[-681]G) were examined by PCR-RFLP.

Results: Study participants who had high educational levels, or alcohol, coffee or tea consumption had a significantly low risk of CKD, while those with diabetes, hypertension and analgesic usage routinely had a higher risk of CKD. Subjects carrying PPAR-γ (C1431T) CT genotype had a descending OR of CKD compared with CC genotype. PPAR-γ (C[-681]G)CG genotype had a lower OR of CKD than CC genotype. We also found a significant dose-response relationship between CKD risk and urinary total arsenic levels, or and erythrocytes lead and cadmium levels. The coffee non-drinkers and had higher urinary total arsenic levels, or and high erythrocytes lead and cadmium levels had a significantly higher OR of CKD than those sometimes or often drink coffee and had lower metal levels, respectively.

Conclusions: The present study is the first study to explore the association and joint effects among personal lifestyle, hypertension, diabetes, urinary total arsenic levels, erythrocytes lead and cadmium levels on CKD.

Keywords: Chronic kidney disease (CKD), Arsenic, Paraoxonase1 (PON1), Peroxisome proliferator activated receptor-γ (PPAR-γ), Polymorphism.

HEALTH, NUTRITION AND DIETARY HABITS AMONG SCHOOL-AGE CHILDREN LIVING IN SOCIOECONOMIC INEQUALITIES CONTEXTS: PRELIMINARY OUTCOMES OF "SPORT FORGOOD" PROJECT IN ITALY AND ARGENTINA

[1]Buonomo, Ersilia; [2]Moramarco, Stefania; [3]Scarcella, Paola; [2]Fusco, Giampaolo; [4]Tappa, Alessandro; [5]Palmieri, Sandro; [6]Di Michele, Sara; [7]Palombi, Leonardo.

[1]PhD. Associate Professor. Department of Biomedicine and Prevention. University of Rome Tor Vergata. Italy.; [2]MSc. Nutritionist. Department of Biomedicine and Prevention. University of Rome Tor Vergata. Italy.; [3]PhD. Researcher. Department of Biomedicine and Prevention. University of Rome Tor Vergata. Italy.; [4]President. Sport Senza Frontiere ONLUS. Italy; [5]PhD. Director. Sport Senza Frontiere ONLUS. Italy; [6]MSc. Psychologist. Sport Senza Frontiere ONLUS. Italy.; [7]PhD. Full Professor. Department of Biomedicine and Prevention. University of Rome Tor Vergata. Italy.

Background and objectives: Children living in socioeconomic inequalities contexts are at greater risk of health and nutritional diseases. This preliminary study assesses growth, health

and dietary habits of a sample of school-age children living in Italy and Argentina, enrolled in a promoting healthy lifestyle program.

Methods: Socio-demographic conditions, health, blood pressure (National High Blood Pressure Education Program-Pediatrics 2004) and anthropometry assessment (WHO standards/BMI Cole's cutoff), dietary habits (food frequency/24hours food recall) were analyzed at baseline. All children were living in socioeconomic inequalities context in Italy (Rome, Naples, Milan - (n.184, 76.7%) and Argentina (Buenos Aires - n.56, 23.3%), and were included in "Sport Forgood" program, promoting sport and healthy diet. Odds ratios (OR: 95% CI) were calculated to identify predictors of unhealthy dietary habits and malnutrition, both over and undernutrition.

Results: High rates of malnutrition were observed in 240 multi-ethnic children (72.1% males, mean age 10.2± 2.7 years). The prevalence of overweight (BMI Cole's cutoffs) was 17.5% (Italy 16.8%, Argentina 19.6%), obesity 15.4% (Italy 14.1%, Argentina 19.6%), underweight 6.7% (Italy 6.5%, Argentina 7.1%). Italian immigrant children with lack of access to water (OR:6.4; CI 1.3-30.8) and sanitation (OR:8; CI 1.7-38.4), and illiterate mothers (OR:8.8; 1.6-47.2) were at higher risk of being stunting (WHO height-for-age z-score <-2). Elevated blood pressure (>90th percentile) was detected in 7.6% of the sample, with an higher risk when BMI >25 (OR:3.7; CI: 1.2-11.7). Nearly twenty percent of the children had familiarity for chronic diseases. Dietary habits analysis showed: 41.4% of children not having breakfast or having inadequate breakfast (22.6%): having illiterate mothers increased the risk of not having breakfast (OR:2.4; CI:1.1-5.2); 53.8% of the sample not consuming adequate fruit or vegetable portions (<1 serving/day); 65.8% exceeding in sweet food consumption (>2 serving/daily) and 55.5% in sugar-sweetened beverages, especially when fathers were illiterate (OR:3.2; CI 1.1-9.2).

Conclusions: This finding adds to the growing literature that suggests living in socioeconomic inequalities contexts increases risk of childhood malnutrition, both overnutrition and undernutrition. The current study will continue to investigate changing in dietary habits after "Sport Forgood" healthy lifestyle intervention.

Keywords: dietary habits, school-age children, social inequalities context, sport.

that in LMIC mothers are more concerned about their babies not eating enough rather of being overweight. Understanding the factors that are associated to stunting, underweight and overweight could contribute to identify the population at risk and to better guide mothers on how to monitor growth and weight gain during infancy and early childhood. The aim of this study is to relationship between maternal and household characteristics and feeding practices to infant's height and weight status from 6-59m.

Methods: We combined 47 nationally representative and standardized Demographic and Health Surveys (DHS) spanning the period 2006-2015 which include over 250,000 children. We split the children population into two age groups: 6 to 23 months old; 24 to 59 months. For children aged 6 to 23 months, in some surveys there is 24 hours food intake information, which is also included in the association analysis. We ran multilevel regression models with country and year fixed-effects: a binary logistic regression on overweight, underweight and stunting and a quintile regression of z-score weight for height.

Results: For children 6-23m, we found that household wealth and maternal education was significantly negatively associated with stunting and underweight but positively with overweight. Breastfeeding status, consumption of fortified baby foods and fruits and vegetables were associated with lower rates of overweight. Infant formula, fortified baby food and fruits-and-vegetable were associated with lower rates of stunting and anemia. For children 24-59m, maternal education was no longer associated to overweight but household wealth was. Maternal overweight was associated with higher rates of child overweight in both age groups.

Conclusions: There is a strong association between maternal characteristics and children's health outcomes including weight status. The association between maternal education, household wealth and overweight should be further study. There could be cultural belief on child's healthy weight that is bias towards overweight in infancy.

Keywords: Child overweight, maternal education, infant feeding and stunting.

MONITORING OF BREASTMILK SUBSTITUTE ACT 2013 IN BANGLADESH

[1]Roy, Swapan Kumar; [2]Jahan, Khurshid; [3]Ara, Ferdous; [4]Chaklader, Hasina; [4]Salam, Suraya Bintay; [5]Islam, Sayeda Sumaiya.

[1]MBBS, MSc, Dip in Biotech, PhD, FRCP. Senior Scientist. Chairperson. Board of Trustees. Bangladesh Breastfeeding Foundation. Chairperson. Nutrition Foundation. Bangladesh.; [2]MSc. Director. Bangladesh Breastfeeding Foundation (BBF). Bangladesh.; [3]MSc., MPhil. Senior Program Officer. Bangladesh Breastfeeding Foundation (BBF). Bangladesh.; [4]M.Sc. Program Manager. Bangladesh Breastfeeding Foundation (BBF). Bangladesh.; [5]M.Sc. Assistant Program Officer. Bangladesh Breastfeeding Foundation (BBF). Bangladesh.

Background and objectives: Deaths of 823,000 children in each year could be averted through universal breastfeeding, along with economic savings of US$300 billion. Bangladesh Breastfeeding Foundation (BBF), supported by Institute of Public Health Nutrition (IPHN) & Ministry of Health and Family Welfare (MoHFW) aimed to establish Breast milk Substitute (BMS) code monitoring system in Bangladesh.

Methods: In eight divisions, two trained BBF divisional officers monitored BMS Act 2013 by visiting health care facilities, doctor's chambers, markets in divisional town and media monitoring. Health care facilities included District hospitals, Upazilla Health Complex (UHC), Maternal and Child Welfare Center (MCWC), Private hospitals and Clinics etc while doctor's chambers and markets. Media monitoring was also done.

Results: From September 2016 to February 2017, a total of 120 divisional markets from eight divisions were monitored to detect the violation of BMS ACT 2013 for print, exhibit, circulate or publish any advertisement of any BMS among departmental stores and pharmacy. On the other hand, a total of 693 government and private hospitals were visited under the same project. In Mymensingh division, among 25 health facilities, BMS products were existed among 30% of government and private hospitals while 36% hospitals have breastfeeding corner established by BMS company. Among 76 visited health facilities of Sylhet division, 18% hospitals had breastfeeding corner established by BMS company whereas 28% showed to have BMS product and 34% found to have poster/leaflet/booklet of BMS Companies in the HF. However, there were no representatives from BMS companies. Social sites (Facebook, Twitter etc) were found to be used for promoting BMS products.

Conclusions: Violation of BMS Act 2013 in government and private hospitals and shops was quite high in Bangladesh which needs to be addressed to protect IYCF practice in Bangladesh.

UNDERSTANDING THE FACTORS THAT INFLUENCE THE DIET AND FEEDING PRACTICES OF POOR URBAN HOUSEHOLDS AND CHILDREN IN NAIROBI, KENYA

[1]Ngombalu, Assumpta Ndumi Ngombalu; [2]Kiswii, Brian; [3]Mwangome, Martha; [4]Hall, Andrew.

[1]MPH. Nutritionist. Save the Children. East and Southern Africa Regional Office. Nairobi. Kenya; [2]Msc. Food Security Adviser. Save the Children. East and Southern Africa regional Office. Nairobi. Kenya; [3]PhD. Post Doctoral Research Fellow. Kenya Medical Research Institute/Wellcome Trust Research Programme. Kilifi. Kenya; [4]PhD. Nutrition Adviser. Save the Children. London. UK.

Background and objectives: Research was undertaken in the informal settlement of Kibera, Nairobi, to assess the dietary habits and monetary cost of meeting the energy and nutrient specifications of households and children aged 2-5 years and their anthropometric status.

Methods: The study was undertaken in three stages. First a Household Economy Analysis (HEA) was done involving 36 focus group discussions to assess typical income and expenditure on essentials such as food and fuel. Second a Cost of the Diet (CotD) assessment was undertaken, which involved a market survey to calculate the cost per 100 g of all fresh foods followed by focus group discussions with local women to understand their typical food habits. These data were applied to CotD software to calculate the cost of meeting the energy and nutrient specifications of households, including children aged 2-5 years. Third, a cross-sectional survey was done of children aged 2-5 years in 409 households to assess their anthropometric status and feeding habits and to obtain a 24-hour dietary recall on a sub-sample of 26 households.

Results: The HEA indicated that approximately 60% of the population were classified as poor or very poor, earning less than USD 200 monthly. Households purchased cooked food to save on fuel and commonly on credit; school meals were an important source of food for school children. The CotD assessment indicated that a nutritious diet for a family of 6 costs about USD 380 per month, so was unaffordable to most people. The survey showed that 44% of children aged 2-5 years were stunted while 10% were wasted. Their median meal frequency was 4 meals a day, including snacks. The 24-hour dietary recall found that only 31% of children had consumed any animal protein, and 88%, 65% and 54% had consumed inadequate amounts of calcium, iron and zinc respectively, compared with the recommended daily nutrient intake.

Conclusions: The studies revealed poor diets among children aged 2-5 years with poverty playing a major role in the affordability of nutritious foods and the purchasing preferences of households.

Keywords: dietary habits, urban poor, household economy, cost of the diet.

DEVELOPING AND TESTING REPORTING GUIDELINES FOR OBSERVATIONAL STUDIES IN NUTRITIONAL EPIDEMIOLOGY: A CONSENSUS BASED METHOD AND A RCT

(1)Hawwash, Dana; (2)Pinxten, Wim; (3)Kolsteren, Patrick; (4)Lachat, Carl.

(1)PhD Student. Nutritionist. Department of Food Safety and Food Quality. Ghent University. Belgium; (2)Professor. Faculty of Medicine and Life Sciences. Hasselt University. Belgium; (3)Prof. Dr. Patrick Kolsteren. Scientific staff. Director MSc. NuRuDe programm .Department of Food Safety and Food Quality. Ghent University. Belgium; (4)Professor. Department of Food Safety and Food Quality. Ghent University. Belgium.

Background and objectives: The need to strengthen the evidence base, replicate studies and systematic reviews in health research led to the development of reporting guidelines. A reporting guideline is a checklist, a flow diagram or a combination that specifies the items to be reported concerning what was done and found during the study. For use within nutritional epidemiology, Strengthening the reporting of observational studies in epidemiology – nutritional epidemiology (STROBE-nut) an extension of the STROBE reporting guideline, was developed in 2016.

The mere existence of a reporting guidelines, does not guarantee adherence or correct use. Better understanding of how to implement reporting guidelines is required. We investigate whether the implementation of a checklist as an embedded tool in Microsoft Word increases the understanding and adherence to reporting guidelines (i.e., STROBE-nut, STROBE, CONSORT, and PRISMA) compared to traditional checklists.

Methods: In the first phase of this study, STROBE-nut guidelines were developed following a recommended procedure using the Delphi method. A steering group of 21 members with varied expertise coordinated the development of the reporting guidelines while external international experts were consulted to reach consensus on the proposed items .In the second phase of the study, the reporting guidelines were developed as a Word Add-in in VisualBA. Through a Randomized Controlled Trial, we compare the traditional way of administering reporting guidelines through paper checklists (control) with administering them through an embedded writing tool during manuscript drafting (intervention). Perceived usefulness, ease of use and completeness of reporting are the main outcome measures of the study. Participants are authors of nutritional epidemiology studies, randomly recruited from protocol repository websites (i.e. clinicaltrials.gov and PROSPERO).

Results: In total, 24 recommendations for nutritional epidemiology were added to the STROBE checklist to compose STROBE-nut. STROBE-nut is translated and disseminated widely through the website http://www.strobe-nut.org . The comparison of the Word add-in to traditional implementation of reporting guidelines is ongoing and pilot results will be presented at the congress.

Conclusions: It is hypothesized that using the guidelines improves the readability of the published literature. If reporting guidelines are appropriately translated in a user-friendly tool, they might be used more consistently and rigorously.

144/653

TRENDS IN THE PREVALENCE OF OVERWEIGHT AND OBESITY AMONG BRAZILIAN SCHOOLCHILDREN, 2002, 2007, AND 2012/13

(1)Leal, Danielle; (1)De Assis, Maria Alice; (2)Lobo, Adriana; (1)Hinnig, Patrícia; (2)Engel, Raquel; (1)Soar, Claudia.

(1)PhD. Postgraduate Program in Nutrition. Health Sciences Center. Federal University of Santa Catarina. Florianopolis. Santa Catarina. Brazil.; (2)MSc. Postgraduate Program in Nutrition. Health Sciences Center. Federal University of Santa Catarina. Florianopolis. Santa Catarina. Brazil.

Background and objectives: The negative health consequences of childhood overweight/obesity (OW/OB) are well known. Therefore, an accurate monitoring of the OW/OB prevalence is essential. Anthropometry is the most practical and cost-effective method for nutritional status evaluation. The purpose this study was to describe trends in the nutritional status among 7–10-year-old children by investigating changes in the prevalence of overweight (including obese) and obesity.

Methods: A school-based sample of 7–10-year-old children participated in three cross-sectional studies in 2002 (n=2,936), 2007 (n=1,232) and 2012/13 (n=1,531) in Florianopolis, southern Brazil. The WHO Child Growth Standards were used to define the prevalence of overweight and obesity.

Results: In 2012/13, 40.2% of the boys and 33.9% of the girls were overweight (including obese), which is a substantial increase since 2002 (boys 32.9%, girls 27.6%) and 2007 (boys 36.2%, girls 32.5%). Similarly, 15.9% of the boys and 11.2% of the girls were obese, which is higher than in 2002 (boys 11.9%, girls 8.3%) and which is much higher than in 2007, mainly among girls (boys 13.9%, girls 6.9%).

Conclusions: Over the period 2002 to 2007, there were a potential leveling off in the prevalence of obesity, and an increase in the prevalence of overweight. Over the period 2007 to 2012/13, the prevalence of overweight and obesity was still rising, and at an even faster rate than the preceding period. Evidence-based interventions are needed to counter the obesity epidemic, and there is an urgent need for school intervention programs.

DIET QUALITY INDICES IN RELATION TO MET-ABOLIC SYNDROME IN AN INDIGENOUS CREE (EEYOUCH) POPULATION IN NORTHERN QUÉBEC, CANADA

[1]Lavigne-Robichaud, Mathilde; [2]Moubarac, Jean-Claude; [3]Lantagne-Lopez, Stéfanie; [4]Johnson-Down, Louise; [5]Batal, Malek; [6]Laouan Sidi, Elhadji A.; [7]Lucas, Michel.

Montreal. QC. Canada.; [3]Nutritionist. Department of Social & Preventive Medicine. Laval University. Québec. QC. Canada; Population Health and Optimal Health Practices Research Unit. CHU de Québec Research Centre. Québec. QC. Canada.; [4]Nutritionist. Centre for Indigenous Peoples' Nutrition and Environment. School of Dietetics and Human Nutrition. McGill University. Montreal. QC. Canada.; [5]PhD. Nutritionist. TRANSNUT. Department of Nutrition. Faculty of Medicine. University of Montreal. Montreal. QC. Canada.; [6]Department of Social & Preventive Medicine. Laval University. Québec. QC. Canada; Population Health and Optimal Health Practices Research Unit. CHU de Québec Research Centre. Québec. QC. Canada.; [7]PhD. Nutritionist. Department of Social & Preventive Medicine. Laval University. Québec. QC. Canada; Population Health and Optimal Health Practices Research Unit. CHU de Québec Research Centre. Québec. QC. Canada.

Background and objectives: To assess associations between three diet quality indices and metabolic syndrome (MetS) in the Cree (Eeyouch) of northern Québec Canada.

Methods: 811 Eeyouch (≥18 years old) from seven James Bay communities participated in the 2005-09 cross-sectional "Nituuchis-chaayihititaau Aschii" Environment-and-Health study. The alternative-Healthy Eating Index (aHEI-2010), the Food Quality Score (FQS) and the contribution of ultra-processed products (UPP) to the total dietary energy intake using the NOVA classification were calculated from 24-hour food recalls. MetS was determined with the harmonized International Diabetes Federation (IDF) definition. Logistic regressions assessed the relationship between quintiles of dietary quality scores with MetS and its components.

Results: MetS prevalence was 56.6% with 95.4% abdominal adiposity, 50.1% elevated fasting plasma glucose, 43.4 % high blood pressure, 38.6% elevated triglycerides and 44.5% reduced high-density lipoprotein-cholesterol. Comparing highest to lowest quintiles of scores, adjusted odds ratios (ORs) of MetS was 0.70 [95% CI: 0.39-1.08; p-trend=0.05] for aHEI-2010, 1.06 [95% CI: 0.63-1.76; p-trend=0.87] for FQS and 1.90 [95% CI: 1.14-3.17; p-trend=0.04] for the contribution of UPP to the total dietary energy intake.

Conclusions: Although diet quality indices have been associated with cardiometabolic risk, only the dietary intake of UPP was significantly associated with MetS in the Eeyouch. Indices tailored to the food environment of northern communities are essential to further understand the impact of diet quality in this context.

IS MEDITERRANEAN DIET ADHERENT IN A YOUNG ADULT ALBANIANS TO PREVENTION OF CARDIOVASCULAR DISEASES?

[1]Andreoli, Angela; [2]Dragushia, Pranvera; [3]Dibra, Arvin; [4]Cenko, Fabian.

[1]MD, PhD, Nutritionisti. Physiologist. 1Human Physiology and Nutrition. Department Medicine of System. University of Rome "Tor Vergata, University of Rome Tor Vergata; [2]MD Cardiologist. Catholic University Our Lady of Good Counsel Tirane, Albania; [3]MD Anatomist. Catholic University Our Lady of Good Counsel Tirane, Albania; [4]PhD Statistician. Catholic University Our Lady of Good Counsel Tirane, Albania.

Background and objectives: Mediterranean diet (MD) is associated with lower risk of major chronic diseases. Despite the overall documented health benefits, adherence to this MD pattern has been rapidly declining over the last decades due to youth tendency toward unhealthy foods. Albania is a Country that is living a transitional economical realty from the rural life to a more developed and westernized state. This transition is seen also in the change of lifestyles. The aim of the study to assess the adherence to MD through the Mediterranean Adequacy Index (MAI) in young adult Albanians and verify the risk for the development of cardiovascular diseases.

Methods: In 78 males and 165 females, belonging to Albanian young adults aged 18-27 years. Weight, height werw mwasured and body mass index (BMI) was calculated. Body composition ((fat mass (FM), fat free mass (FFM), body cell mass (BCM)) by bioelectrical impedance analyses (BIA), blood pressure (BP), waist hip circumferences were assessed. Food intake by food frequency questionnaire (FFQ) and physical activity questionnaires were measured. Mediterranean Adequacy Index (MAI) was computed by dividing the sum of the percentage of total energy from typical Mediterranean food Groups by the sum of the percentage of total energy from non-typical Mediterranean food groups

Results: BMI were 23.5 ± 5.0 and 22 ± 4 kg/m2 men and women respectively. FM 14.6 ± 8.0 kg, 14.0 ± 6.0 kg; %FM 18.7 ± 8.1 and 24.0±6.2; BCM 33.6±3.9 kg and 22.3 ± 2.9 kg males and females respectively There was a significant correlation between diastolic BP and waist/hips ratio in females (p< 0.05) as well as diastolic BP and MAI (p< 0.05); fat mass and MAI (p< 0.03) women; in men waist/hips and MAI (p<0.03). Overweight subjects had an higher blood pressure, practiced less physical activity and their food habits were less adherent to MD.

Conclusions: Young Albanian population is moving from a traditional rural life-style to more westernized way-to-live that can also be understood in the nutritional habits of our population

with an increasing risk for overweight/obesity and cardiovascular diseases.

Keywords: Mediterranean diet, cardiovascular diseases, fat mass

DIETARY LEUCINE, ISOLEUCINE AND VALINE INTAKE AND THEIR ASSOCIATION WITH METABOLIC SYNDROME: A POPULATION-BASED STUDY

[1]*Pallottini, Ana Carolina;* [2]*Aliete dos Santos Vieira, Diva;* [2]*Hermes Sales, Cristiane;* [3]*Machado Miranda, Andreia Alexandra;* [2]*Marchioni, Dirce;* [2]*Fisberg, Regina.*

[1]MSc. student. Department of Nutrition. School of Public Health. University of São Paulo. Brazil; [2]Ph.D. Department of Nutrition. School of Public Health. University of São Paulo. Brazil; [3]Ph.D. student. Department of Nutrition. School of Public Health. University of São Paulo. Brazil.

Background and objectives: Metabolic syndrome (MetS) is considered a cluster of factors that raises risk for cardiovascular disease and other health problems. Evidences from epidemiological studies suggest that BCAA intake may be related to chronic diseases, especially MetS, but this association is not yet clear. The aim of this study was to investigate the relationship between BCAA intake with MetS

Methods: Data of 591 adults and older adults, of both sexes, were obtained from the 2008 Health Survey of São Paulo, a cross-sectional population-based survey. Baseline characteristics were collected from a structured questionnaire and the data of consumption of BCAA was obtained from two 24-hour recalls, analyzed in the Nutrition Data System for Research (NDSR). The leucine, isoleucine and valine intake were adjusted for total energy intake and the usual intake were estimated using the Multiple Source Method. MetS was defined as the presence of at least three of the following: hypertension, hyperglycemia, dyslipidemia and central obesity. Multiple logistic regression was used to investigate the association between BCAA intake and the presence of MetS. The models were adjusted by sex, age, alcohol consumption, per capita income, smoking status, race, BMI (Body Mass Index), physical activity level, total energy intake, high-sensitivity C-reactive protein, monounsaturated fat, polyunsaturated fat and saturated fat intakes. All analyzes considered the complexity of the sample design and the significance level of 0.05 was considered.

Results: Individuals with higher leucine intake (fifth quintile) was positively associated with MetS when compared to those of the first quintile (OR=3.85, 95%CI=1.67-8.87). The same occurs with valine (OR=4.33 95%CI=1.75-10.69) and isoleucine intake comparing fifth with first quintile (OR=3.58 95%CI=1.46-8.77)

Conclusions: The highest dietary leucine, isoleucine, and valine intake were positively associated with MetS.

Keywords: food consumption; branched chain amino acids; Metabolic Syndrome; health survey.

INFLUENCE OF EXERCISE ON OBESE CHILDREN 6-12 YEARS IN ENUGU SOUTH LOCAL GOVERNMENT AREA OF ENUGU STATE, NIGERIA

[1]*Nnam, Ngozi;* [2]*Oly-Alawuba, Nkeiruka.*

[1]PhD. Lecturer. Department of Home Science Nutrition and Dietetics. University of Nigeria Nsukka. Nsukka. Nigeria.; [2]PhD. Lecturer. Imo State University. Owerri. Nigeria.

Background and objectives: Social environment or life style of an individual is created through the different social activities around him and it could affect his nutritional status. Exercise is a life style that could have positive influence on obesity. Overweight and obesity in children are increasingly becoming public health concern in the world. Obesity is a risk factor for many chronic non-communicable diseases like type 2 diabetes, high blood pressure, heart diseases and some cancers. The study assessed the effect of physical exercise on weight of obese children 6-12 years in Enugu south Local Government Area (LGA) of Enugu State, Nigeria.

Methods: A preliminary study was conducted on school children 6-12 years in Enugu south LGA of Enugu State, Nigeria, to determine those who are obese. A total of 60 children representing 49.6% of the 121 obese children identified were randomly selected for the study. The children were divided into test and control groups (n = 30) based on body weight. Test group was subjected to physical exercise (jogging, dance aerobics, rope skipping, handball and football) 2 hours a day for 8 weeks. The control group had no physical exercise. Weight measurements of the children were taken at baseline and endline of the exercise.

Results: The test group had a weight decrease of 9.88% while the control group had 7.2% weight gain. The females in the test group had a weight decrease of 9.68% while the males had 11.84% decrease. There was 8.09% and 6.37% weight increase in the female and male children, respectively in the control group.

Conclusions: Physical exercise reduced obesity in the school children and should be encouraged in children as a way of fighting obesity.

Keywords: Obesity, Physical exercise, School children.

THE ASSOCIATION BETWEEN SOCIOECONOMIC STATUS, PLACE OF RESIDENCE, OVERWEIGHT AND CENTRAL OBESITY IN POLISH FEMALES. THE GEBAHEALTH STUDY

[1]Kowalkowska, Joanna; [2]Wadolowska, Lidia; [3]Czarnocinska, Jolanta; [4]Jezewska-Zychowicz, Marzena; [5]Babicz-Zielinska, Ewa.

[1]MSc. Faculty of Food Science. University of Warmia and Mazury in Olsztyn. Poland.; [2]Prof. Faculty of Food Science. University of Warmia and Mazury in Olsztyn. Poland; [3]Assoc. Prof. Faculty of Food Science and Nutrition. Poznan University of Life Sciences. Poland; [4]Prof. Faculty of Human Nutrition and Consumer Sciences. Warsaw University of Life Sciences. Poland; [5]Prof. Faculty of Physiotherapy and Health Sciences. Gdansk Management College. Poland.

Background and objectives: Socioeconomic (SES) and demographic factors can influenced weight status. It was found that people with low SES are more likely to be overweight and obese [1]. The aim of this study was to assess the effect of SES, its single factors and place of residence on the prevalence of overweight and central obesity in Polish females.

Methods: A cross-sectional study was carried out in representative sample 1107 of Polish females aged 13-21 years. The SES index was calculated based on categorial variables: mother's education, father's education, self-declared economic status, description of household. Six regions of the country (ordered from the poorest to the richest) and rural/urban place of residence were analyzed. The prevalence of overweight was assessed using IOTF 2012 standards. The criterion of central obesity was WHtR≥0.5 [2]. Odds ratios (ORs) adjusted for age were calculated.

Results: Overweight (including obesity) was observed in 12.1% and central obesity in 7.9% of females. Females with high SES were less likely to be overweight (OR=0.52) and to have central obesity (OR=0.51). Overweight was less likely in females having father with higher education (OR=0.33) and good economic situation of the household (OR=0.49). Central obesity was less likely in females having mother with upper secondary education (OR=0.50). Compared to eastern region of the country (the poorest one), females living in northern (OR=2.61), north-western (OR=2.52) or south-western (OR=3.25) region were more likely to be overweight and females living in south-western region (OR=2.56) to have central obesity. The ORs for rural/urban place of residence were not significant.

Conclusions: SES, its single factors and region of residence were linked with overweight and central obesity in Polish females. High SES was associated with lower prevalence of overweight and central obesity. The relation with place of residence was inconsistent.

Faculté de Médecine de Pharmacie et d'Odontostomatologie Bamako. Mali; [7]MD. PhD. Division du Contrôle Médical Scolaire. Ministère de l'Education Nationale. Dakar Sénégal.

Background and objectives: Physical inactivity is an important risk factor of childhood obesity and highlight the need for more physical activity (PA) data surveillance. The aim of this study was to use a common tool: Physical Activity Questionnaire for Older Children (PAQ-C) to compare the prevalence of PA levels among school children from three West African countries.

Methods: The study is a cross-sectional one conducted in Senegal, Mali, and Mauritania. Overall 471 school-aged children, 8-11 years old (235 boys, 236 girls) were randomly selected from elementary public schools in urban area of Dakar (n=156), Bamako (n=155) and Nouakchott (n=161). BMI-for-age and Height-for-age (z-scores) were calculated according to WHO growth standard reference. PA level was assessed by PAQ-C using a harmonized protocol, and was categorized as low (score=1), moderate (score=2-4) and high (score=5).

Results: The prevalence of overweight/obesity (BMI> +1 z-score) and stunting (HAZ< -2 z-score) were comparable among the children: 4.5% and 1.92% in Senegal, 3.9% and 4.5% in Mali, and 2.5% and 5.7% in Mauritania, respectively. Thinness affected significantly more children in Senegal (30.1%) than in Mali

(13.5%) and Mauritania (15.7%, p<0.01). Mean PAQ-C score was significantly lower in the Senegalese (2.34±0.74), compared to the Malian (2.60±0.59) or the Mauritanian children (2.62±0.67, p<0.01). In the three countries, the lowest score value was recorded in girls with significant difference between boys and girls (p<0.001). Overall, 79% of the children in the 3 countries were engaged in moderate PA level (score=2-4), but the proportion was significantly lower in Senegal (65%) than in Mali (83%) and Mauritania (84 %; p=0.002). Across all countries, boys more frequently reported moderate PA than girls (p<0.05). Whatever the country or sex any intense PA level was observed among the children.

Conclusions: Similar physical activity patterns were found in the three West African countries indicating moderately active school-aged children. PAQ-C could be a suitable tool for the assessment and surveillance of PA as well as data comparisons across countries. Although PAQ-C is an uncomplicated routine method, various activities were not adapted for genuine activities and therefore need further validation.

SOCIO-DEMOGRAPHIC AND BIRTH CHARACTERISTICS INFLUENCE THE DURATION OF BREASTFEEDING IN COLOMBIA: RESULTS FROM THE 2010 DEMOGRAPHIC AND HEALTH SURVEY

[1]Lopez Arana, Sandra; [2]Barragán-González, Ana María; [3]Moreno-Montoya, José.

[1]Nutritionist, Msc, PhD. Institute of Nutrition and Food Technology. University of Chile. Chile.; [2]MPH. MD. Assistant Professor. Epidemiology, Biostatistics and Public Health Research Group, EPIBIOS_UR. School of Medicine and Health Sciences (EMCS). Universidad del Rosario. Bogotá. Colombia.; [3]PhD. Assistant Professor. Communtary Medicine Research Group. Universidad El Bosque. Bogotá. Colombia.

Background and objectives: Breastfeeding is associated with positive maternal and infant health benefits. In high-income countries, socially disadvantaged women breastfed less often. However, there is limited research in low- and middle-income countries. This study assessed the duration of total breastfeeding by region and estimated the role of socio-demographic, life-style related and birth characteristics on the duration of breastfeeding in Colombia.

Methods: We used cross-sectional data from the 2010 Colombian Demographic Health Survey. Six regions were defined according to particular physical and climatic characteristics. 16,594 mothers aged 13-49 years were included in the study. Univariate

and bivariate analyses were conducted. Time-to-event analyses were employed for the analysis of breastfeeding-related data.

Results: The association between breastfeeding duration and region varies substantially. Overall, women who reported higher age at first birth (Sub hazard ratio (SHR= 1.05, 95% CI 1.04, 1.06), higher parity (SHR= 1.13, 95% CI 1.10, 1.16) and delivery by cesarean (SHR= 1.07, 95% CI 1.02, 1.12) discontinued breastfeeding sooner than their counterparts. In contrast, breastfeeding duration was longer among lower educated (SHR= 0.77, 95% CI 0.73, 0.82) and poorest (SHR= 0.83, 95% CI 0.78, 0.89) women. Life-style related characteristics such as alcohol consumption and smoking had no significant associations on breastfeeding duration.

Conclusions: Socio-demographic and birth characteristics play a role in explaining regional differences in duration of breastfeeding. Therefore interventions looking for increasing the duration of breastfeeding should be more focused on women who are most at risk of early cessation of breastfeeding, also integrating the different regional needs to reduce the socioeconomic inequalities in breastfeeding.

SUGAR-SWEETENED BEVERAGE CONSUMPTION AND OBESITY IN CHILDREN'S META-ANALYSES: REACHING WRONG ANSWERS FOR RIGHT QUESTIONS

[1]Nissensohn, Mariela; [2]Fuentes Lugo, Daniel; [3]Serra-Majem, Lluis.

[1]PhD. Nutritionist. Research Institute of Biomedical and Health Sciences. University of Las Palmas de Gran Canaria. Las Palmas de Gran Canaria. Spain. CiberObn Physiopathology of Obesity and Nutrition. Carlos III Health Institute. Madrid. Spain.   .; [2]MD. Faculty of Health Sciences. Universidad Autónoma del Carmen. Ciudad del Carmen. México.; [3]MD,PhD. Research Institute of Biomedical and Health Sciences. University of Las Palmas de Gran Canaria. Las Palmas de Gran Canaria. Spain. CiberObn Physiopathology of Obesity and Nutrition. Carlos III Health Institute. Madrid. Spain.

Background and objectives: Recent studies assert that sugar-containing drinks may play a key role in the etiology of overweight at all ages. However, scientific literature shows contradictory findings. Whether this association is a leading cause or not is a matter of debate. It is also subject to discussion whether the quality/adequacy of studies may influence the outcome. Our aim was to explore the most recent scientific evidence focused on sugar-sweetened beverages (SSB) and child obesity and to further analyze the adequacy of the meta-analyses in terms of their results, with special emphasis in the methodology, clarity and transparence of their procedures.

Methods: We selected only meta-analyses of randomized control trial studies on PubMed database and Cochrane Website until January, 2016. Adherence to PRISMA was assessed.

Results: Six meta-analyses were included. All of them showed some degree of evidence of heterogeneity in theirs pool estimates. Two of them showed a positive association between SSB and obesity but the other four found no association. The adherence to the PRISMA criteria was higher in two of the meta-analyses that showed opposite conclusions regarding the association or non-association of SSB and obesity in children. Thus, there is no relation between the adherence of the meta-analyses to the PRISMA criteria and the results obtained.

Conclusions: The use of meta-analysis as a scientific tool requires further promotion, better refinement and widespread agreement. Available quality-assessment tools have limitations, and many contextual factors beyond the intrinsic characteristics of the reviews may influence their results. Sugary drinks are often blamed as a potential cause of the obesity pandemia, but this possible association requires a broader approach that includes a detailed analysis of the whole diet and lifestyle.

Keywords: Sugar-sweetened beverage, obesity, children, meta-analyses

MATERNAL SYMPTOMS OF MENTAL HEALTH ARE ASSOCIATED WITH MATERNAL AND CHILD DIET DIVERSITY AND MATERNAL BMI IN UPPER MANYA KROBO DISTRICT OF GHANA

[1]Marquis, Grace; [2]Colecraft, Esi; [3]Aryeetey, Richmond; [4]Aboud, Frances; [5]Aidam, Bridget; [6]Bannerman, Boat; [7]Thompson-Colon, Theresa.

[1]McGill University. Canada; [2]PhD. Dept of Nutrition and Food Science. University of Ghana. Legon. Ghana; [3]PhD. School of Public Health. University of Ghana. Legon. Ghana; [4]PhD. Dept of Psychology. McGill University. Montreal. Canada; [5]PhD. World Vision International. Washington DC. USA; [6]Dept of Nutrition and Food Science. University of Ghana. Legon. Ghana; [7]PhD. School of Dietetics and Human Nutrition. McGill University. Montrea. Canada.

Background and objectives: Poor maternal mental health may affect productivity and livelihood opportunities as well as diminish mothers' ability to provide adequate care for their young children and themselves. The objective of this analysis was to examine the association between symptoms of maternal mental health and maternal and child nutritional indicators.

Methods: Nutrition Links is a 5-y project to improve rural health and economic well-being in the Upper Manya Krobo district, Ghana. In 2013-2014, an exhaustive survey of 1096 households with infants < 12 months was completed; a one-year follow-up survey was carried out with 943 households (86%). The Self-Reporting Questionnaire with 20 symptoms of depression and anxiety (SRQ20) estimated probable mental disorder among mothers. The survey also included a socio-demographic questionnaire and a 24-hour and 7-day food frequency questionnaire for children and mothers, respectively. Child dietary diversity score (DDS) was the number of food groups (7 maximum) consumed and maternal DDS was based on 15 food groups. Weight and height were taken and WHO standardized indicators [child] and BMI [mother]) were calculated. The analysis excluded communities randomly selected to participate in an agricultural and nutrition education intervention, leaving 687 households for the linear regression models.

Results: The median SRQ20 score was 7 at baseline and 8 one year later; the two scores were strongly correlated ($r = 0.56$; $p<0.0001$). The SRQ20 score at baseline was negatively associated with both maternal ($b=-0.08$; $p<0.001$) and child ($b=-0.27$; $p=0.01$) DDS one year later. Having the highest increase in symptoms between baseline and one year (i.e., $\geq$ 75th percentile: 4+ symptoms) was associated with a further lower DDS for mothers only ($b=-0.72$; $p<0.01$). A higher SRQ20 score tended to be associated with a lower maternal BMI ($b=-0.059$; $p=0.07$) but was not directly associated with any anthropometric indicators among the children.

Conclusions: The limited association between maternal mental health symptoms and child outcomes may reflect support from alternative caregivers. Integrated nutrition programs must consider mechanisms to address mental health. The Nutrition Links project is registered as Clinical Trials # NCT01985243.

Keywords: Mental health, diet, nutrition, maternal, child

HERBS AND SPICES: NUTRIENTS, CONTAMINANTS AND RESIDUES

[1]Burlingame, Barbara; [2]Kim, Nick; [3]Eme, Paul.

[1]Professor. College of Health.; [2]Senior Lecturer. Applied Environmental Chemistry. Massey University. New Zealand; [3]Doctorate scholar. College of Health. Massey University. New Zealand.

Background and objectives: Herbs and spices as a food category have a significant role in culinary traditions around the world, and are highly traded food commodities. However, as usual consumption is low, e.g., in amounts of a few grams per person per day, dietary surveys often fail to capture their contribution, and food composition databases often omit their inclusion. Nevertheless, they are generally acknowledged as contributing to intakes of micronutrients and beneficial bioactive non-nutrients for households and communities, particularly where there is significant adherence to food traditions. Of equal interest are the exposures to contaminants and chemical residues. This paper examines the risks and benefits of herbs and spices specific to the nutrients, beneficial bioactive non-nutrients, chemical residues and contaminants.

Methods: Nutrient data from national and regional food composition databases, and data from pesticide residue and heavy metal analyses in the USA and New Zealand, and from import refusals for EU and USA, were examined for ginger, turmeric, pepper, paprika, cinnamon, nutmeg, garam masala and curry powder from various countries of origin. Original analyses for heavy metals are carried out using Graphite Furnace Atomic Absorption Spectrometry.

Results: Compositional data from popularly traded spices show levels of nutrients and beneficial phytochemicals that justify their inclusion in diets. Noteworthy are the provitamin A carotenoid contents of highly pigmented spices. The data also reveal chemical contaminants that exceed the maximum levels stipulated by global (Codex Alimentarius) and national (Food Standards Australia New Zealand) food safety bodies. In these analyses, all of the spices tested were found to contain detectable levels of heavy metals. The case study of turmeric is highlighted in the context of its recent popularity because of the therapeutic effects of curcumin, one of three major curcuminoids; the recent food safety recall in the US due to lead contamination; the surveillance measures to ensure consumer safety; and the relevance of country of origin in world spice trade.

Conclusions: As interest in the beneficial nutrients and bioactive non-nutrients in spices increases, the requirement for safety testing becomes critical. Dietary intake assessments, and exposure assessments, should always include both benefits and risks.

Keywords: spices, contaminants, food safety, exposure assessment, turmeric

CRUCIFEROUS VEGETABLE INTAKE AND LUNG CANCER RISK: A PROSPECTIVE STUDY AND A META-ANALYSIS

[1]Mori, Nagisa; [2]Shimazu, Taichi; [1]Nozue, Miho; [2]Sawada, Norie; [2]Iwasaki, Motoki; [3]Takachi, Ribeka; [1]Sunami, Ayaka; [4]Ishihara, Junko; [5]Sobue, Tomotaka; [6]Tsugane, Shoichiro.

[1]PhD. Epidemiology and Prevention Group. Center for Public Health Sciences. National Cancer Center. Tokyo. Japan.; [2]MD. PhD. Epidemiology and Prevention Group. Center for Public Health Sciences. National Cancer Center. Tokyo. Japan.; [3]Department of Food Science and Nutrition. Faculty of Human Life and Environment. Nara Women's University. Nara. Japan.; [4]Division of Nutrition Science. Graduate School of Sagami Women's University. Kanagawa. Japan.; [5]Department of Environmental Medicine and Population Sciences. Graduate School of Medicine. Osaka University. Osaka. Japan.; [6]MD. DMSc. Epidemiology and Prevention Group. Center for Public Health Sciences. National Cancer Center. Tokyo. Japan.

Background and objectives: Cruciferous vegetables, a rich source of isothiocyanates, have been reported to lower the risk of lung cancer. However, evidence from prospective observations of populations with relatively high intake of cruciferous vegetables is sparse. We examined the association between cruciferous vegetable intake and lung cancer risk in a large-scale, population-based, prospective study in Japan.

Methods: We studied 82,330 participants aged 45–74 years. Participants responded to a questionnaire that included 138 food items. The association between cruciferous vegetable intake and lung cancer incidence was assessed using the Cox proportional hazard regression model. Furthermore, we carried out a meta-analysis of all prospective studies.

Results: After 14.9 years of follow-up, a total of 1499 subjects were diagnosed with lung cancer. After the deletion of early-diagnosed cancer, we observed a significant inverse association between cruciferous vegetable intake and lung cancer risk among male current nonsmokers: multivariate HR (95% CI): 0.49 (0.27, 0.87), P for trend=0.04 for never smokers, and 0.59 (0.35, 0.99), P for trend=0.10 for past smokers. No association was noted in male current smokers and female never smokers.

Conclusions: The study suggests that cruciferous vegetable intake may be associated with reduction in lung cancer risk among male current nonsmokers.

Keywords: cruciferous vegetables, isothiocyanate, lung cancer, prospective study, Japan

QUALITY OF FOOD CARRIED OUT OF HOME BY ADULTS IN THE SANTOS CITY - SÃO PAULO (SP)

[1]Albano, Renata Doratioto; [2]De Oliveira, Carolina; [2]Dos Santos, Tayná; [3]Marqueze, Elaine Cristina.

[1]PhD Professor in Public Health Nutrition Area. Center for Applied Social Sciences and Health. Catholic University of Santos (UniSantos). Brazil; [2]Nutritionist. Center for Applied Social Sciences and Health. Catholic University of Santos (UniSantos). Brazil.; [3]PhD. Professor in School of Public Health. Catholic University of Santos (UniSantos). Brazil.

Background and objectives: Out-of-home meals are a trend in today´s society and may be associated with unhealthy eating habits. In this study, the objective was to evaluate the consumption and quality of food carried out outside the home by adults, as well as to verify the association between sociodemographic aspects, health, nutritional status and characteristics of meals outside the home.

Methods: Cross-sectional study in a convenience sample with 100 adults (20-59 years old) attending a Shopping Center in Santos/SP (Ethics Committee protocol number 1.028.804 in April 2015). Sociodemographic information and health conditions (ed-

ucation, marital status, family income, weight and height referred to the calculation of body mass index to assess the nutritional status) were been collected. Regarding food outside the home, information was collected on food assistance, daily expenditure, type of meal and preparation, place and food consumed. Chi-square or Fischer's exact tests were performed using STATA® 12.0 to evaluate the proportions of the studied variables with the characteristics of meals performed outside the home.

Results: Of the 100 individuals surveyed, 60% were women and 40% men. Most men were overweight (56,41%), but most women were eutrophic (49,12%). Most participants had higher education (73,19%), were single (65,00 %) and had a family income between US$ 1.166 and US$ 2.915 (66,65%). Most participants consumed only one meal (62,00%); preferred grilled preparation (58,00 %), lunch was the most accomplished meal (83,00%) and the place of meals was the restaurant per kilo (64,00%). The daily consumption of unhealthy foods (cold and sausage, fried salted, pizza, jam and cake) occurred in a higher proportion among people with lower schooling (53,84%; p<0,01) and lower purchasing power (50,00%; p<0,01). However, daily intakes of healthy foods (fruit, vegetables, legumes and beans) were also higher among those with low schooling (40,35%; p<0,01). Among those who ate mores meals home outside, the consumption of healthy foods was not daily (10,81%; p=0,02).

Conclusions: Lunch was the main meal performed outside the household in a restaurant per kilo and although the grills were preferred, there was consumption of "healthy" and "unhealthy" foods.

Keywords: Adult, food outside of home, eating habits.

NUTRITIONAL PROFILE AND NUTRITIONAL EDUCATION IN SCHOOLCHILDREN OF PUBLIC AND PRIVATE SCHOOLS IN SANTOS CITY/SÃO PAULO (SP)

[1]Albano, Renata Doratioto; [2]Cruz, Ana Carolina de Campos Silva; [2]López, Beatriz Peralta Arcoverde; [2]De Melo, Giovana Maggiulli Santana; [3]Marqueze, Elaine Cristina.

[1]Professor in Public Health Nutrition Area. Center for Applied Social Sciences and Health. Catholic University of Santos (UniSantos). Brazil.; [2]Nutritionist. Center for Applied Social Sciences and Health. Catholic University of Santos (UniSantos). Brazil.; [3]PhD. Professor in School of Public Health. Catholic University of Santos (UniSantos). Brazil.

Background and objectives: The school period, between 6 and 10 years of age, the child develops motor skills, has higher nutritional needs and increases food intake. Therefore, education activities in this age group are extremely important. In this context, the objective was to compare nutritional status, food consumption and performance in nutritional education among schoolchildren from a public school and a private school in Santos/SP.

Methods: Cross-sectional study of 6 to 10 year-old schoolchildren from a public school and a private school in Santos/SP (Ethics Committee protocol number 1.237.133 September 2015).

The body mass index/age and stature/age indicators were been calculated from the weight and height measured and evaluated from the WHO growth charts. Information on food consumption and nutritional education activities were also collected. To verify the proportion between food consumption and type of school type and food consumption and nutritional status, the Chi square or Fisher exact test was been used. The Mann Whitney test was used to evaluate the difference in means of correctness of nutritional education activities by type of school. A significance level of 5% and STATA® 12.0 software were been adopted.

Results: 172 students schoolchildren participated in this study: 50 from the private school and 122 from the public school. For the IMC / age indicator, 40% of them were overweight. There was a higher proportion of private schoolchildren who consumed in natura foods (28,00%, p=0,04) and higher proportion of public schoolchildren who consumed ultraprocessed foods in the morning snack (62,79%, p=0,00). At lunch and dinner, the intake of ultra-processed foods was higher among schoolchildren at the private college (44,00%, p<0,01; 58%, p<0,01, respectively). In relation to nutritional education activities, the students of the private school obtained a greater average of correct answers in activities 3 ($\overline{x}$=81,24; p <0,01) and 4 ($\overline{x}$=87,40; p<0,01).

Conclusions: Most schoolchildren were overweight. Processed and ultra-processed foods were overconsumed among public schoolchildren in morning snack and among private schoolchildren in lunch and dinner. The performance in nutritional education activities was better in activities 3 and 4 among the private schoolchildren.

Keywords: Nutritional status, food intake, nutritional education, schoolchildren.

AN ASSESSMENT OF THE ASSOCIATIONS BETWEEN COMMUNITY-LEVEL ENVIRONMENTAL FACTORS AND DIETARY INTAKE QUALITY IN GEOGRAPHICALLY ISOLATED COMMUNITIES

[1]Wycherley, Tom; [2]Van Der Pols, Jolieke; [3]Howard, Natasha; [4]Daniel, Mark; [5]O'Dea, Kerin; [6]Brimblecombe, Julie.

[1]Research Fellow. School of Health Sciences. University of South Australia. Adelaide. South Australia. Australia; [2]Senior Lecturer. School of Exercise and Nutrition Sciences. Queensland University of Technology. Brisbane. Australia; [3]Research Fellow. Aboriginal Health Research Group. Sansom Institute for Health Research. University of South Australia. Adelaide. Australia; [4]Professor. Centre for Research & Action in Public Health. Health Research Institute. Faculty of Health. University of Canberra. Canberra. Australia; [5]Honorary Professor. School of Population Health. University of Melbourne. Melbourne. Australia; [6]Associate Professor. Wellbeing and Preventable Chronic Diseases Division. Menzies School of Health Research. Darwin. Australia.

Background and objectives: Remote Indigenous Australians experience disproportionately poor cardio-metabolic health,

largely underpinned by adverse dietary intake. Little is known about the environmental-level factors that shape diet quality in this geographically isolated population group. Therefore, this study aimed to identify modifiable environmental level factors associated with features of dietary intake that underpin cardio-metabolic disease risk in this population group.

Methods: Community-level store food and beverage purchasing data collected over 49 weeks throughout 2012 were linked with social, built and physical environmental dimension data for up to 20 remote Indigenous Australian communities in the Northern Territory. Descriptive analyses were performed to investigate associations between modifiable environmental factors and diet quality.

Results: At the community level, percent of dwellings needing extra bedroom/s was negatively associated with protein intake (Pearson correlation; r=-0.64, p=0.02) and sugar-sweetened beverage intake (r=-0.55, p<0.05). Mean Indigenous household income was negatively associated with protein intake (r=-0.57, p=0.04). Indigenous unemployment was negatively associated with sugar-sweetened beverage intake (r=-0.62, p=0.02). Distance to a neighbouring store was negatively associated with discretionary food intake (r=-0.45, p<0.05) and sugar-sweetened beverage intake (r=-0.61, p<0.01).

Conclusions: In the first study of its kind, several modifiable environmental factors appear to be associated with adverse diet quality in geographically isolated communities.

Keywords: Indigenous health, spatial epidemiology, nutrition, cardio-metabolic disease

and physical activity were collected by validated questionnaires. Investigated indices for describing glucose homeostasis included fasting plasma glucose (FPG), fasting plasma insulin, glycated hemoglobin (HbA1c), the homeostatic model assessment-insulin resistance (HOMA2-IR) and odds of pre-diabetes (impaired glucose tolerance and (or) impaired fasting glucose). Waist circumference (WC), height and weight were measured, and the last two were used to calculate body mass index (BMI). Data were analyzed by multivariable regression models.

Results: The average serum 25(OH)D was 22.66 ng/ml, and percentages of vitamin D deficiency (25(OH)D < 20 ng/ml) and insufficiency (20 ≤25(OH)D ≤30 ng/ml) were 47.61% and 32.17%, respectively. Serum 25(OH)D was inversely associated with fasting insulin (p=0.0007), HbA1c (p=0.0001) and HOMA2-IR (p=0.0007), but not with FPG, after adjusting for age, gender, personal monthly income, smoking status, energy intake, physical activity and WC. Furthermore, higher serum 25(OH)D level was a protective factor of pre-diabetes, the estimates of odds ratio (OR) comparing the highest vs. the lowest tertile of serum 25(OH)D were 0.68 (95% CI: 0.47-0.99) after adjusting for the confounders mentioned above.

Conclusions: Our results support that a higher serum 25(OH)D level is associated with decreased risk of pre-diabetes by mechanism likely tied to effects on insulin sensitivity in Chinese population.

Keywords: Vitamin D, 25(OH)D, Glucose homeostasis

SERUM 25(OH)D CONCENTRATIONS ARE ASSOCIATED WITH GLUCOSE HOMEOSTASIS AMONG ADULTS IN SOUTHWEST CHINA

[1]Danting, Li; [1]Xue, Hongmei; [1]Liang, Yi; [2]Chen, Mengxue; [1]Quan, Liming; [3]Zhao, Li; [4]Gong, Yunhui; [5]Cheng, Guo.

[1]MD. West China School of Public Health. Sichuan University. Chengdu. China.; [2]BSc. West China School of Public Health. Sichuan University. Chengdu. China.; [3]MD. West China Research Center for Rural Health Development, Sichuan University Huaxi Medical Center. Sichuan University. Chengdu. China; [4]MD, PhD. Department of Obstetrics and Gynecology, West China Second University Hospital. Sichuan University. Chengdu. China.; [5]PhD. West China School of Public Health. Sichuan University. Chengdu. China.

Background and objectives: Recent epidemiological studies have suggested inverse associations between vitamin D status and metabolic diseases including type 2 diabetes. However, the role of vitamin D in glucose metabolism remains inconclusive. We aimed to examine whether a higher serum 25-hydroxy vitamin D (25(OH)D) was associated with a more favorable glucose homeostasis among adults in Southwest China.

Methods: Serum 25(OH)D was detected in a cross-sectional sample of 920 non-diabetic adults (62.61% women) aged 25-65 years recruited from Southwest China. Data on dietary intake

National Institute of Environmental Health. Chinese Center for Disease Control and Prevention. China.

Background and objectives: Current international and national guidelines for body mass index (BMI)and waist circum-

---

ference (WC)were recommended to all adults aged 18 or older. However, the optimal BMI and WC in the oldest old (aged 80 or older) were poorly known. The present study was to investigate the relationship of BMI and WC with all-cause mortality in a large prospective community-based cohort study in the oldest old.

Methods: A total of 4361 Chinese oldest old (mean age 91.8) participated in this study. BMI and WC were measured at baseline and all-cause mortality was calculated over a 3-year period from 2011 to 2014. The BMI and WC were used as continuous variables and as categorized variables by recommendations or by tertiles. In both genders, additive Cox proportional hazards models and Cox proportional hazards models were used to explore and assess the association with adjustment for covariates.

Results: During 3 years of follow-up, 1795 participants died, and the overall all-cause mortality was 41.2%. Compared to underweight participants (BMI<18.5 kg/m2), the hazard ratios (HRs) for all-cause mortality were lower in normal weight participants (BMI:18.5-24.0 kg/m2) and overweight or obese participants (BMI≥24.0 kg/m2), were 0.71(0.60-0.83) and 0.60(0.47-0.76) for men, and 0.80(0.70-0.91) and 0.79(0.64-0.96) for women. Similarly, the HRs were lower in participants with abdominal obesity, were 0.76(0.65-0.89) for men and 0.78(0.69-0.88) for women. Compared to the upper BMI tertile, the middle and lower tertile of BMI and WC increased the risk of mortality. For men, the HRs were 1.23(1.02-1.48) and 1.53(1.28-1.82) for middle and lower BMI, 1.21(1.01-1.46) and 1.41(1.18-1.69) for middle and lower WC. For women, the HRs were 1.21(1.03-1.41) and 1.35(1.15-1.58) for middle and lower BMI, 1.35(1.15-1.58) and 1.55(1.32-1.81) for middle and lower WC. These findings were robust or more significant in further sensitive analyses.

Conclusions: In Chinese oldest old, both higher BMI and higher WC predict better survival in both genders. This study lends further support for the opinion that current international and national recommendations for the oldest old should be revised, and reminds the importance in providing Asian-specific and gender-specific guidelines for optimal BMI and WC in this age group.

Keywords: body mass index; waist circumference; mortality; obesity paradox; oldest old.

THE SOUTH AFRICAN SALT STORY: WHERE ARE WE AND WHERE ARE WE HEADING?

[1]Swanepoel, Bianca; [2]Schutte, Aletta; [3]Steyn, Krisela; [4]Wentzel-Viljoen, Edelweiss.

[1]PhD. Nutrition Lecturer. Department of Life and Consumer Sciences. University of South Africa. Centre of Excellence for Nutrition. North West University.; [2]PhD. Physiologist. Hypertension in Africa Research Team (HART). North-West University. South Africa. MRC Unit for Hypertension and Cardiovascular Disease. North-West University. South Africa; [3]MSc. MD. Chronic Disease Initiative for Africa (CDIA). Department of Medicine. Faculty of Health Sciences. University of Cape Town. South Africa; [4]PhD. Dietician. Nutritionist. Centre of Excellence for Nutrition (CEN).North-West University. South Africa. MRC Unit for Hypertension and Cardiovascular Disease. North-West University. South Africa.

Background and objectives: The mortality and morbidity burden caused by hypertension are preventable and therefore, efforts need to be taken to address this burden. Excess dietary sodium intake is associated with increased blood pressure and the reduction thereof is considered as one of the best investments for public health. As a first step the South African (SA) government has implemented a mandatory regulation (R.214) pertaining to the reduction of sodium in foodstuffs as part of a wider sodium reduction strategy. Monitoring of different aspects of such a strategy is crucial to establish effectiveness and was the main aim. Objectives included (i) establishing baseline sodium and potassium excretion; (ii) investigating appropriate monitoring methods in terms of sodium intake and (iii) to evaluate sodium content in foodstuffs set out in R.214.

Methods: We collected 24-hour urine samples and spot urine samples from three population groups i.e. White, Black and Indians in SA. Sodium and potassium were analysed. Three formulas were used to estimate sodium excretion i.e. Kawasaki, Tanaka and INTERSALT. To evaluate the sodium content of foodstuffs we randomly selected ten food products from each of the categories and measured the sodium through atomic absorption spectrometer.

Results: In total, 692 and 681 24-hour and spot urine collections were collected. Median sodium and potassium excretion was 122.9 and 33.5mmol/day, and median salt intake was 7.2g/d. The majority (92.8%) of the population did not meet the recommended potassium intake per day and 65.6% consumed more than 6g/d of salt. The Kawasaki and Tanaka formula showed significantly higher (p≤0.001) estimated sodium values than the measured 24 hour excretion in the whole population (5677.79mg/d and 4235.05mg/d vs. 3279.19mg/d). The majority of the food products tested complied with the 2016 targets (72%) and 42% with the 2019 targets.

Conclusions: These findings support the SA government's sodium reduction legislation. Estimated sodium excretion from the three formulas should be used with caution. The sodium content in foodstuffs provides valuable information with regard to monitoring and evaluation. SA is doing well in terms of the strategy but a lot still needs to be done.

WHAT FOODS WERE INSUFFICIENT AFTER THE GREAT EAST JAPAN EARTHQUAKE?

[1]Tsuboyama-kasaoka, Nobuyo; [2]Ishikawa-Takata, Kazuko; [3]Shimoura, Yoshiyuki.

[1]National Institute of Health and Nutrition. National Institutes of Biomedical Innovation, Health and Nutrition. Japan; [2]National Institute of Health and Nutrition. National Institutes of Biomedical Innovation, Health and Nutrition. Japan; [3]Committee of Japan Dietetic Association-Disaster Assistance Team (JDA-DAT). The Japan Dietetic Association. Japan.

Background and objectives: To aid in preparation for future disaster and disaster response programs, we looked at what was needed in successive phases after the Great East Japan Earthquake Disaster by exploring what shortages there were in food supplies.

Methods: Which included a question requesting detail on the "shortages of food and supplies needed in the affected areas," was mailed to 1,991 members of dietetic associations in Iwate, Miyagi, and Fukushima Prefectures. Of the 435 responses received (response rate: 21.8%), the 303 that contained responses to that question were used for the analysis. Supply shortages were tallied for four successive phases after the earthquake (within 3 days, 4 days to 1 month, 1 month to 2 months and 3 months to 6 months after the Great East Japan Earthquake).

Results: During the first month after the disaster struck, the shortages of supplies in the disaster areas were the greatest, with shortages of ordinary foods and foods for special dietary uses being especially severe. Regarding ordinary foods, there were many instances of shortages of water, food sources of protein, and sources of vitamins and minerals. Regarding foods for special dietary uses, there were conspicuous shortages of foods for vulnerable disaster victims.

Conclusions: We suggest that in order to fill the gaps between the foods needed in a particular phase and the supplies provided, in addition to a national-level disaster response plan to supply food that meets the needs of disaster victims, a system is needed to ensure the delivery of foods needed by vulnerable populations.

Keywords: food shortage, disaster nutrition, Great East Japan Earthquake, vulnerable

Conflict of Interest Disclosure: This study was suported by the Japan Dietetic Association and founded by the Japanese Society of Nutrition and Dietetic.

IS THERE A PREFERENCE FOR HEAVIER BODY SIZES FOR WOMEN LIVING IN AFRICA? EVIDENCE FROM A SYSTEMATIC REVIEW OF EVIDENCE SPANNING OVER 30 YEARS

[1]Pradeilles, Rebecca; [2]Olaitan, Oluwabukola; [3]Cohen, Emmanuel; [4]Araba Osei-Kwasi, Hibbah; [5]Holdsworth, Michelle.

[1]BSc, MSc, PhD. Research Fellow in Global Health Nutrition. Department of Population Health. London School of Hygiene and Tropical Medicine. London. UK & Public Health Section. Sheffield. UK; [3]BSc, MSc, PhD. Postdoctoral research fellow. Developmental Pathways for Health Research Unit. University of the Witwatersrand. Johannesburg. South Africa & UMI-CNRS 3189. Environment, Health, Societies. Faculty of Medicine. Marseille. France; [4]BSc, MSc. PhD student. Public Health Section. School of Health and Related Research. University of Sheffield. Sheffield. UK.; [5]BSc, MSc, PhD. Professor of Public Health. Public Health Section. School of Health and Related Research. University of Sheffield. Sheffield. UK.

Background and objectives: Overweight and obesity are increasing in Africa, particularly amongst women. The widespread belief that there is a cultural preference for heavier body sizes for African women may be a contributing factor to this growing problem. Hence, we assessed body size preferences for African women and the factors influencing these.

Methods: A mixed-methods systematic review spanning over the past 30 years was conducted. Comprehensive searches were undertaken on Medline, CINHAL, ASSIA, Web of Science and PsycINFO. Reference list searching and contact with experts in the field were also used to identify relevant studies. Studies conducted in Africa composed of Black or Arab females and/or males aged ten and above were included, providing they assessed participants preferred body size for females and/or factors influencing preferences. A sequential-explanatory approach was used to integrate quantitative and qualitative data.

Results: Fifty-one studies from 15 countries were included in the final synthesis: 37 quantitative, four qualitative and four mixed-methods. Most studies reported a preference for body sizes within the normal or overweight body mass index category. Appearance, health, wellbeing, fear of negative treatment within the community, social standing, acculturative stress and fatalistic attitudes towards body size were found to influence African women's body size ideals.

Conclusions: Obesity remains an important public health issue with a high prevalence amongst African women. It is generally assumed that larger body sizes are preferred for African women, however the evidence synthesised in this review found that overall a body size that is normal or overweight (to a lesser extent) in medical terms is preferred for African women. Numerous factors were found to influence body size preferences for African women. For example, women were aware of obesity's associated health risks,

and were willing to lose weight to improve their health. These perceived health risks were overshadowed by the community's negative perceptions towards weight loss and thinness, which are associated with HIV in some contexts and subsequently negative treatment by the community. A preference for normal or overweight body sizes among African women means that cultural norms are not an obstacle for preventing obesity in African women.

PROMOTING SUSTAINABLE FOOD SYSTEMS FOR GOOD NUTRITION AND HEALTH IN THE MEDITERRANEAN REGION: A CONCEPTUAL FRAMEWORK FROM THE MEDINA STUDY GROUP

[1]Verger, Eric; [2]Perignon, Marlène; [2]Amiot-Carlin, Marie Josephe.

[1]PhD. Nutritional Epidemiologist. Unité Mixte de Recherche 204 Nutrition et Alimentation des Populations aux Suds (UMR NUTRIPASS). Institut de Recherche pour le Développement (IRD). France.; [2]PhD. Unité Mixte de Recherche 1110 Markets, Organizations, Institutions and Stakeholders Strategies (UMR MOISA). INRA, CIRAD CIHEAM and Montpellier SupAgro. France.

Background and objectives: Countries of the Mediterranean region are undergoing different stages of nutritional transition affecting the health of inhabitants, while facing massive alteration of the environment (climate change, water scarcity, soil erosion, biodiversity loss and urbanization). The increasing demand of water in agriculture, the capacities to maintain local food production and the growing dependence on food imports are interconnected challenges to ensure food security and good nutrition in the Mediterranean region. The objective is to present the conceptual framework and methodologies developed by the MEDINA-Study Group for rethinking food systems to sustain consumption and production.

Methods: Based on its multidisciplinary expertise in nutrition, food science, agronomy and economy, the MEDINA-Study Group identified the relevant parameters for including in a conceptual framework that was developed for research activities in South of France and Tunisia, two contrasted areas in regards to the Diet-Agriculture-Environment Nexus.

Results: The conceptual framework consists of an array of elements of the food systems (from consumption to production) and scales (individual, household and national levels). We prioritized the following parameters: adherence to the Mediterranean diet pyramid and nutrient recommendations, nutritional value of foods and local recipes, nutritional potential of local agroecosystems, women's empowerment in agriculture, multiple environmental indicators of the food systems, and food trade and dependence on food imports. The proposed methodologies consist in: (1) modeling at different scales the dietary changes to optimize food consumption-production without increasing environmental impact, (2) translating the identified changes into action proposals,

(3) testing the acceptability and feasibility by multi-stakeholders, and (4) co-building guidelines to orientate sustainable food choices and production.

Conclusions: To ensure sustainable food systems in the Mediterranean region, the MEDINA-Study Group identified other perspectives to implement the initially-build framework, such as the nutrient bioavailability, the exposure to contaminants and active substances used in agriculture, and social indicators to contribute designing ambitious agricultural, food and health policies and prioritizing actions. Acknowledgement: Medina-Study is funded by the French Research Agency (ANR-12-TMED-0004).

ANAEMIA AND NUTRITIONAL STATUS IN POPULATION OF SALTA CITY. CROSS-SECTIONAL STUDY.ARGENTINA 2017

[1]Patricia Carolina, Rivas; [2]Susana Judith, Gotthelf.

[1]MSc Biochemistry. Epidemiological Research Department. National Center for Nutricional Research. ANLIS. Argentina; [2]MSc Doctor. Epidemiological Research Department. National Center for Nutricional Research. ANLIS. Argentina.

Background and objectives: Iron deficiency anemia is a nutritional disease of high prevalence especially in developing countries. In the city of Salta, malnutrition coexists with an increase in overweight and obesity. The objective of this study was to determine the prevalence of anaemia and its relationship with nutritional status in children, adolescents and adults in the city of Salta.

Methods: Cross-sectional study, secondary database (Salta Nutritional Survey 2014). Stratified two-stage sample. Variables: sex, age, anaemia (Hemoglobin level measurements were adjusted for altitudes and the cut-off points for anaemia based on WHO 2011); Nutritional status BMI (WHO z score tables in children and adolescents): normal >-2 <+1, malnutrition ≤-2, overweight ≥+1, obesity ≥+2. Adults: malnutrition <18.5; normal ≥18.5 <25; overweight ≥25 and <30; obesity ≥30. Short stature (≤-2 z score height WHO) .Analysis: Frequency distribution (chi2, Fisher), mean comparison (ANOVA), level of significance $p < 0.05$. EXCEL, SPSS V18, WHO softwares Anthro V.1.0.4 Plus, programs were used.

Results: A total of 147 children aged 6-59 months, 170 aged 5-11 years, 70 children aged 12-14 years and 533 ≥ 15 years old, of both sexes were evaluated. The overall prevalence of anaemia was 7%, the groups most affected were children 6-59 months (12.9%) and ≥ 15 years (8.3%, significant difference by sex). Mild anaemia was found in 78.1%, moderate in 20.3% and severe in 1.6% of the anaemic population. The 47.5% of children aged 6-59 months with anaemia and 56.8% of ≥ 15 years with anaemia were overweight/obese.There was no association between nutritional status and short stature with the prevalence of anaemia. Mean values of hemoglobin were: 12,18mg/dl ±1.09 (6-59m) ;13,39mg/dl ±0.74 (5-5-11 ys); 13.93±0.85(12-14 ys) and 13.91mg/dl±1,44 (≥15 ys) Mean values of weight and height were significantly lower in anemic children aged 6-59 months.

Conclusions: Although low prevalence of anemia was observed in all age groups, it remains a relevant public health problem, which also affects those with overweight and obesity.

Keywords: anaemia, nutritional status, children, adolescents, adults.

Health, Nutrition and Population Programme. BRAC. Dhaka, Bangladesh.; [7]MD, PhD. Director. Health, Nutrition and Population Programme. BRAC. Dhaka, Bangladesh.; [8]MS, PhD. Professor and Director, Global Health Initiatives. Health Promotion, Education, and Behavior. Arnold School of Public Health. University of South Carolina. Columbia, SC, USA.; [9]MS, PhD. Division Director. Poverty, Health, and Nutrition Division. International Food Policy Research Institute. Washington, D.C., USA.; [10]MSc, PhD. Senior Research Fellow. Poverty, Health, and Nutrition Division. International Food Policy Research Institute. New Delhi, India.

Background and objectives: Achieving sustained improvements in infant and young child feeding (IYCF) likely requires continued implementation of effective interventions and sustained enabling social norms. From 2010-2104, Alive & Thrive (A&T) provided intensified interpersonal counseling (IPC), mass media (MM), and community mobilization (CM) at large-scale in Bangladesh, with demonstrated impact on IYCF practices. Since 2014, geographically expanded implementation was continued by national partners, with support from other donors. In 2016, we assessed sustained impacts of the IPC + MM + CM interventions in intensive compared with non-intensive areas (standard nutrition counseling + less-intensive MM + CM) on intervention exposure and IYCF knowledge and practices.

Methods: We used a cluster-randomized design with repeated cross-sectional surveys at baseline (2010, n=2,188), endline (2014, n=2,001), and follow-up (2016, n=2,400) in the same communities, among households with children 0-23.9 months of age. Within-group differences over time were tested using regression models, and differences between groups in changes between baseline and follow-up were tested using difference-in-difference estimates (DDE), adjusting for geographic clustering, child age, and gender.

Results: In intensive areas, exposure to IPC decreased between endline and follow-up but remained high (77.2% for home visits by community health workers); exposure to CM activities decreased significantly (29.3% to 3.6% for video shows). Exposure to MM at follow-up was moderate (22.9-54.4% across 7 TV spots). There was no expanded exposure to interventions in non-intensive areas. Most IYCF indicators in intensive areas declined from endline to follow-up, but remained higher than at baseline. Larger improvements in intensive areas between baseline and follow-up remained for early initiation of breastfeeding (BF), exclusive BF, timely introduction of foods, and consumption of iron-rich food (DDE: 16.6, 17.0, 16.6, and 11.8 percentage points, respectively). Differential impact in BF knowledge remained between baseline and follow-up (DDE: 0.4 points); complementary feeding knowledge increased similarly in both groups.

Conclusions: Continued IPC exposure and sustained impacts on IYCF practices in intensive areas in 2016 indicate lasting benefits from A&T's interventions through existing delivery systems. Remaining gaps indicate that sustained delivery of behavior change interventions will be needed to support appropriate IYCF practices.

Keywords: Bangladesh, breastfeeding, complementary feeding, infant and young child feeding, sustainability

Conflict of Interest Disclosure: All authors declare no conflicts of interest. TS, ZM, MRH and KA were members of the program implementation team that designed and implemented the interventions studied and reported on in this abstract. They reviewed the abstract and provided interpretation of the results, but final decisions for content lay with the primary authors from the evaluation team (SSK, PHN, EAF, MTR and PM).

ASSOCIATION BETWEEN LEVELS OF IRON IN GROUNDWATER AND IRON STORES IN WOMEN IN KAMPONG CHHNANG PROVINCE, CAMBODIA

(1)Rappaport, Aviva; (2)Chai, Tze Lin; (3)Green, Tim; (4)Karakochuk, Crystal.

(1)MSc. Nutritionist. University of British Columbia; (2)BSc. Nutritionist. Helen Keller International. Cambodia; (3)PhD. Nutritionist. South Australian Health and Medical Research Institute. Australia.; (4)PhD. Nutritionist. University of British Columbia. Canada.

Background and objectives: Groundwater has been shown to be high in iron in some areas in Cambodia. However, little is known about the bioavailability of the iron and the potential contribution to iron stores. Further, household biosand and ceramic filters have been shown to remove 95-99% of the iron in groundwater. Our objective was to determine if levels of groundwater iron from household wells were associated with serum ferritin concentrations among women in rural Cambodia.

Methods: Water samples were collected from 80 households in Kampong Chhnang Province, Cambodia. Information on the type of household well and use of a water filtration system was collected, as iron concentrations may differ by well type and whether or not the water was filtered before consumption. Fasting venous blood samples were collected for analysis of serum ferritin, serum transferrin receptor (sTfR), C-reactive protein (CRP), and α-1 acid glycoprotein (AGP) using a sandwich ELISA. Serum ferritin was adjusted for CRP>5mg/L and AGP>1g/L. Median serum ferritin concentrations are presented for women who used ground well water with and without a filtration system, and for women who used ring well water with and without a filtration system.

Results: Overall, 50% of households had a ground well and 50% had a ring well. Mean ± SD groundwater iron was higher (1265 ± 2632 µg/L) than ring well water iron (423 ± 375 µg/L). More than half of the water samples (n=48) were above the 2011 WHO drinking water standards for iron (300 µg/L). More women with a ground well (n=17) used a water filter as compared to those who had a ring well (n=4). Median (IQR) serum ferritin concentrations were highest among women who used ground well and ring well water without filtration 53 (20,95) µg/L and 57 (23,91) µg/L, respectively. Those who used a filtration system had lower median (IQR) serum ferritin concentrations for both the ground well and ring well source 29 (17,57) µg/L and 23 (8,58) µg/L, respectively.

Conclusions: Women who used a filter had lower median ferritin concentration. Despite this, little is known about the bioavailability of iron.

Keywords: iron deficiency, serum ferritin, groundwater, ring well water, anemia

TEENEGERS' PERCEIVED QUALITY OF LIFE AND LIFESTYLE: A CROSS-SECTIONAL STUDY IN POLISH STUDENTS FROM LESS-URBANIZED REGIONS. THE POLYSES PROJECT

(1)Dlugosz, Anna; (2)Wadolowska, Lidia.

(1)PhD. Institute of Health. University of Economy. Bydgoszcz. Poland; (2)Full Professor. Faculty of Food Science. University of Warmia and Mazury in Olsztyn. Poland.

Background and objectives: Teenagers' health is positively linked to many factors of lifestyle [1]. Less-urbanized regions create specific conditions for living, including lifestyle. The association between quality of life and lifestyle of Polish teenagers living in less-urbanized regions is not well understood.

Objective: To assess association between teenagers' perceived quality of life and lifestyle.

Methods: The study involved 576 students 13-18 years old who lived in small towns and villages in less-urbanized regions of Poland. Students were chosen in a two-step random selection. Closed questions were applied to characterize lifestyle. High-active lifestyle (everyday performance with high activity outside school) and sedentary lifestyle (TV watching or computer games at least 4 hours/day) were determined. Quality of life perception was assessed by the SF-36 questionnaire (The Short Form Health Survey) with 36 items [2]. Using the alfa-Cronbacha 20 items were selected to describe teenegers' quality of life. The Cluster Analysis (k-means method) was used to identify quality of life clusters. The association between clusters and lifestyle was verified by logistic regression, with adjustment for gender, age and socioeconomic status.

Results: Two clusters differentiating with respect to quality of life in mental context, but not in physical context, were found. They were labelled: better mental quality of life (MQoL; 41% of the sample), worse MQoL (59%). Teenagers with better MQoL compared to worse MQoL were significantly less often nervous, depressed, sad, exhausted and tired. Teenagers with better MQoL compared to worse MQoL (odds ratio OR=1.00) were less likely to have high-active lifestyle (crude OR=0.83; 95% confidence interval 95%CI:0.72,0.96; adjusted OR=0.84; 95%CI:0.72,0.97). No significant association was found between sedentary lifestyle and quality of life clusters.

Conclusions: Conclusion: Worse mental quality of life was widespread among Polish teenagers from less-urbanized region. We revealed negative association between high-active lifestyle and mental quality of life. Next study are necessary to explain our findings and not compliance with previous ones.

SOCIAL INEQUALITY AND NUTRITIONAL TRANSITION IN ARGENTINA: AN ANALYSIS FROM A SOCIO-ECOLOGICAL STUDY, PERIOD 2005-2013

[1]Tumas, Natalia; [2]Scruzzi, Graciela; [3]Rodríguez Junyent, Constanza; [4]Crivelli, Verónica; [4]Galli, María Sofía; [4]Siufi Dagum, Yazmín; [5]Pou, Sonia Alejandra.

[1]PhD. Nutritionist. Centro de Investigaciones y Estudios sobre Cultura y Sociedad (CIECS). Universidad Nacional de Córdoba. CONICET. Carrera de Nutrición. Facultad de Medicina. Universidad Católica de Córdoba. Argentina.; [2]MSc. Nutritionist. Escuela de Nutrición. Facultad de Ciencias Médicas. Universidad Nacional de Córdoba y Universidad Católica de Córdoba. Argentina.; [3]PhD Student. Nutritionist. Carrera de Nutrición. Facultad de Medicina Universidad Católica de Córdoba. Argentina.; [4]BSc Student. Escuela de Nutrición. Facultad de Ciencias Médicas. Universidad Nacional de Córdoba. Argentina.; [5]PhD. Nutritionist. Instituto de Investigaciones en Ciencias de la Salud (INICSA). Universidad Nacional de Córdoba. CONICET. Facultad de Ciencias Médicas. Escuela de Nutrición. Facultad de Ciencias Médicas. Universidad Nacional de Córdoba. Argentina.

Background and objectives: Argentine society is in transition with significant sociodemographic and economic gaps. Such heterogeneous living conditions could generate inequality in the population's access to health services, education and food, all of which affects its health and nutrition. The aim of this work was to identify social inequalities according to unmet basic needs (UBN) in the distribution of nutritional transition (NT) indicators in Argentina, in the period of 2005-2013

Methods: Multi-group, ecological study (24 geographical units: 23 provinces and the Autonomous City of Buenos Aires). NT indicators were selected (in three analysis dimensions: nutritional state, physical activity, and food intake) obtained from secondary sources of information (official surveys and census data). The mean of each NT indicator was calculated according to the distribution of provinces by quartile of the indicator "proportion of households with UBN" (2010). A mean differences test was conducted between the provinces belonging to the upper and lower quartiles. In addition, the concentration index was calculated for each NT indicator according to the proportion of households with UBN using the EPIDAT version 3.1 software package.

Results: The prevalence of low height in children (p=0.003) and anemia (p=0.054) were greater in the provinces belonging to the upper quartile of UBN (over 15.27% of households with UBN), while the prevalence of childhood obesity, the frequent consumption of salt, and the use of computers was greater (p<0.05) in the provinces of the first quartile (that is, those in a better relative situation according to UBN, with fewer than 7.95% poor households). Meanwhile, the concentration index evidenced that the indicators showing greater social inequality were the consumption of salt, the prevalence of anemia, and the use of computers.

Conclusions: There are social inequalities in the distribution of NT indicators in Argentina. The results of this work could contribute to define equitable nutritional policies.

DIETARY TOTAL ANTIOXIDANT CAPACITY AND INCIDENCE OF CHRONIC KIDNEY DISEASE IN SUBJECTS WITH DYSGLYCEMIA: TEHRAN LIPID AND GLUCOSE STUDY

[1]Asghari, Golaleh; [2]Yuzbashian, Emad; [3]Mirmiran, Parvin; [4]Azizi, Fereidoun.

[1]PhD. Nutrition and Endocrine Research Center. Research Institute for Endocrine Sciences. Shahid Beheshti University of Medical Sciences. Tehran. Iran; [2]MSc. Nutrition and Endocrine Research Center. Research Institute for Endocrine Sciences. Shahid Beheshti University of Medical Sciences. Tehran. Iran; [3]PhD. Nutrition and Endocrine Research Center. Research Institute for Endocrine Sciences. Shahid Beheshti University of Medical Sciences. Tehran. Iran; [4]MD. Endocrine Research Center. Research Institute for Endocrine Sciences. Shahid Beheshti University of Medical Sciences. Tehran. Iran.

Background and objectives: We aimed to investigate the association of dietary total antioxidant capacity (TAC) with incidence of CKD in subjects with dysglycemia.

Methods: We followed-up 1179 subjects with dysglycemia from the Tehran Lipid and Glucose Study (TLGS) for 3 years, who were initially free of CKD. Dietary intakes of TAC, vitamin C, vitamin E, and ß-carotene were assessed by a food-frequency questionnaire at the baseline. Dietary TAC was estimated using the oxygen radical absorbance capacity method. Estimated glomerular filtration rate (eGFR) was calculated, using the Modification of Diet in Renal Disease Study equation and CKD was defined as eGFR <60mL/min/1.73m2. Odds ratios (ORs) using multivariable logistic regression were reported for the association of incident CKD with dietary TAC.

Results: A total of 197 (16.7%) cases of incident CKD were recorded after 3 years of follow-up. After adjustment for age, sex, smoking, physical activity, body mass index, hypertension, and total energy intake, the top tertile of dietary TAC, compared to the bottom was associated with 39% (95% confidence interval (CI) = 0.61 0.40-0.93) lower risk of incident CKD (P for trend=0.025). Furthermore, the highest tertile of vitamin C intake, compared to the lowest, the risk of incident CKD was decreased (OR: 0.60; 95% CI: 0.38-0.93, P trend: 0.023). Intakes of vitamin E and ß-carotene were not significantly associated with incident CKD risk.

Conclusions: Our findings suggest diets high in TAC are associated with a lower risk of incident CKD among subjects with hyperglycemia after 3 years of follow-up.

EVIDENCE BASED RECOMMENDATIONS TO IMPROVE THE LAW IN MEXICO TO RESTRICT UNHEALTHY FOOD ADVERTISING TO CHILDREN ON TELEVISION

[1]*Bahena, Liliana;* [2]*Rincon-Gallardo, Sofía;* [2]*Tolentino Mayo, María Lizbeth;* [3]*Vandevijvere, Stefanie;* [3]*Barquera, Simon.*

[1]Md. Nutritionist. National Institute Of Public Health; [2]Msc.; [3]Phd.

Background and objectives: In Mexico, government regulations to restrict food and beverages(F&B) advertising to children on screens during selected hours were implemented in mid-2014. The aim of the study is to compare the Mexican F&B regulation guidelines on TV with international and evidence based criteria.

Methods: Total of 1,140 hours were recorded over three years (2013,2014&2015) from four-free-to-air television channels with the highest national audience ratings over six randomly selected days from 6:25am-10:15pm. Each advertisement was analyzed following the International Network for Food and Obesity/non-communicable diseases Research Monitoring and Action Support (INFORMAS)type of program category, Nielsen definition of children peak times,and three nutrient profile models criteria (WHO Europe 2015;OPS 2016,Mexican regulation(MR).

Results: From the 6,785 F&B identified ads, 76.7% were aimed at children, and at least 50.2% of the F&B display ads contain a persuasive technique. After the MR came on channels 5 and 7(children's channels) decrease of 7% and 2.8% of F&B ads (p <0.001) were found. The soap opera shows an increase between 2014-2015 of 3% in F&B advertising and series and a 1.7% was shown(p <0.001). Contrary, children's programs showed a decrease 6.2%(p <0.001).

During the peak viewing time(PV) on 2013, 23.5 F&B per hour were advertised compared to 22.2 F&B ads in 2015.Chocolate and confectionery ads rates decreased from 2.1 to 1 ads per hour, while an increase of breakfast cereals from 1.4 to 2.1 ads/hr were observed.The nutritional quality of products aimed at children in PV.Specifically, during 2015 the MR allowed advertising during of 55.2% of total products, however WHO of 23.2%, and PAHO only allowed 5.6% of the products advertised in the Mexican TV.

Week-days at regulated times, F&B highest advertising(3.5 F&B ads unhealthy/hr) comes in unregulated hours.

Conclusions: Most of the F&B ads are targeted to children and includes a persuasive technique of attraction, which needs to be considering into the MR. Increase/migration to other types of programs that children do watch. MR need to consider more extensive time schedules and all program types, particularly those aimed at general audiences.Encourage Mexican government to take into account evidence based criteria to improve the current regulation to protect children.

THE ADVERTISING OF FOOD AND BEVERAGES ON MEXICAN TELEVISION: THE TECHNIQUES OF ATTRACTION SHAPPING CONSUMPTION HABITS IN SCHOOL CHILDREN

[1]*Bahena, Liliana;* [2]*Tolentino Mayo, María Lizbeth;* [3]*Barquera, Simon;* [3]*Rivera, Juan.*

[1]Md. Education. National Institute of Public Health; [2]Msc; [3]Phd.

Background and objectives: The National Health and Nutrition Surveys in Mexico show that between 1999 and 2012, the combined prevalence of overweight and obesity in children between 5-11 years of age, increased from 26.9% to 34.4%. México implemented guidelines governing advertising of F&B to children on screens were implemented in mid-2014.

Methods: A total of 780 hours of television programming were recorded from the four major television channels in Mexico from 6:25am-10:15pm, the December 2014 To April 2015. Each advertisement was analyzed following the International Network for Food and Obesity/non-communicable diseases Research Monitoring and Action Support (INFORMAS) type of program category, F&B advertisements were identified into three major groups: Core and Healthy Food Categories, Non-Core and Unhealthy Food Categories (NUFC) and Miscellaneous. For the analysis, programming was divided as peak viewing periods (PV) and non-peak viewing periods for children (NPV). The presence of visual, promotional, associative and audio techniques was analyzed. During the same time period, a survey among 10-12 year old children was conducted to understand the relationship between television viewing habits and brand recognition of advertised F&B products.

Results: Of the recorded hours, 390 belong to PV, and the rest to NPV. From the total number of advertisements, 3766 were F&B advertisements, comprising 12.4%. An average of 23.5 ads per hour, were of F&B. The most dominant group of F&B advertisements observed during PV was NUFC (67.3%). Most of NUFC advertisements were observed during soap operas (41.7%), followed by comedies (14.5%), movies (14.1%), and cartoons (10%). A total of 64% of F&B advertisements screened during PV utilized persuasion techniques. Survey results demonstrated that the majority of children could identify characteristics of products advertised; 97% could identify products with its television character and 73.8% could identify a product with its slogan.

Conclusions: The children are still largely exposed to NUFC advertisements during PV, even with the new Guidelines. It should also be noted that children are still exposed during unregulated programming. An overwhelming majority of F&B advertisements used persuasive techniques during PV.

FOOD PROCESSING CATEGORIES RELATING TO DIET QUALITY IN THE NURSES HEALTH STUDY

[1]Rossato, Sinara L; [2]Yuan, Changzheng; [3]Sampson, Laura; [4]Fung, Teresa T; [5]Willett, Walter C.

[1]Harvard T.H.Chan School of Public Health; [2]PhD. Research fellow. Department of Nutrition. Harvard T.H. Chan School of Public Health. Boston. United States; [3]RD. Nutritionist. Channing Division of Network Medicine, Department of Medicine, Brigham and Women's Hospital. Harvard Medical School. Boston. United States; [4]PhD. Professor. Department of Nutrition. Harvard T.H. Chan School of Public Health. Boston. United States; [5]MD. PhDr. Professor. Department of Nutrition. Harvard T.H. Chan School of Public Health. Boston. United States.

Background and objectives: High intake of ultra-processed foods has been related to an unhealthy nutrient profile; however, the relationship between food-processing categories (FPC) with diet-quality has yet to be assessed. To assess the relationship between intake of foods classified into four FPC and diet-quality.

Methods: This was a cross-sectional analysis of 52,976 women from the Nurses' Health Study. Diet was assessed with FFQ in 2006, and food intake was classified into four FPC: unprocessed, moderately, processed, and ultra-processed FPC calculated in grams and percentage of energy. We computed the following diet-quality scores for each woman: Dietary Approach to Stop Hypertension (DASH-score) and the Alternative Health Eating Index-2010 (AHEI-2010). The associations between FPCs with diet-quality was evaluated using Spearman correlation coefficients and generalized linear models adjusted for energy, age, smoking, BMI, and physical activity.

Results: In the adjusted analysis adjusted, DASH-score was 21 and the AHEI-2010 was 45 for women in the first quintile of unprocessed FPC. In comparison to the first quintile, DASH-score and AHEI-2010 were 4.7 and 7.5 higher in women in the fifth of unprocessed FPC in grams. DASH-score and AHEI-2010 were lower in women in the fifth quintile of % of energy from ultra-processed FPC (22 and 47) than in the first (25 and 50). We found modest correlations between the unprocessed PFC and the DASH-score and the AHEI-2010 for both, grams (r=0.39 and r=0.21) and percentage of energy (r=0.43 and r=0.30). Negative correlations were seen between ultra-processed FPC and the DASH and AHEI-2010 as percentage of energy (r=-0.38 and r=-0.26) and as grams (r=-0.15 and r=-0.13). Intake of unprocessed FPC in percentage of energy was negatively correlated with ultra-processed FPC (r=- 0.78).

Conclusions: Eating unprocessed foods had a positive impact on diet quality scores, which was more significant than the negative impact of consuming ultra-processed foods.

Keywords: food processing categories, ultra-processed foods, food processing, diet quality.

RELATIONSHIP AMONG BONE MINERAL DENSITY, ADIPOSITY, AND PHYSICAL ACTIVITY IN MEXICAN WOMEN

[1]Ramos Ibañez, Norma; [2]Ilse Ivonne, Larraguivel-Ruiz; [3]Karina, Caballero-Cabrera; [4]Luis, Ortiz-Hernandez.

[1]PhD. Nutritionist. Department of Health Care. Autonoma Metropolitana University. Mexico; [2]Nutritionist. Department of Health care. Autonoma Metropolitana University. Mexico.; [3]Nutritionist. Department of Health care. Autonoma Metropolitana University. Mexico; [4]PhD. Nutritionist. Department of Health care. Autonoma Metropolitana University. Mexico.

Background and objectives: It has considered that in females low intake of calcium and physical inactivity could influence on reduction of the bone mineral density (BMD) and developing osteoporosis later. The aim of this study was to determinate the relationship between BMD and nutritional status, body fat, nutrient intake, physical activity, alcohol consumption, and smoking in women from an urban area of Mexico.

Methods: The volunteers were 201 women aged 27 to 55 years old from Mexico City and Mexico State. BMD was assessed with dual energy X-ray absorptiometry (Hologic densitometer, model DiscoveryWi) in lumbar spine and femur neck. Nutritional status was evaluated with body mass index (BMI) and waist circumference. The percentage of body fat was obtained with bioelectrical impedance (Inbody 720). The intake of calcium, phosphorous, vitamin D and sodium was assessed with a food frequency questionnaire. The time spent in moderate and vigorous physical activities daily, alcohol consumption, and smoking were also assessed by questionnaire.

Results: Menopause was present in 14.7% of females. Low BMD was found in 24% of participants. It was showed a high prevalence of total adiposity (76.9%) and in abdomen (88.8%). Calcium and vitamin D intakes were deficient in most of them. The 64% did not spend enough time to moderate and vigorous physical activities. The alcohol consumption in the last 3 months was of 35.7% and 65.1% reported to smoke. Linear models of regression showed that BMI, body fat percentage, waist circumference, physical activity, and menopause were related to BMD. A high body fat percentage and frequent physical activity were associated with less probability to present low BMD.

Conclusions: In a sample of Mexican urban women the adiposity and physical activity were factors related to BDM.

Keywords: Bone mineral density, women, adiposity, physical activity.

PHYSICAL FITNESS PERCEPTION IS ASSOCIATED WITH NUTRITIONAL STATUS AND ACTUAL PHYSICAL FITNESS IN ADOLESCENTS

[1]Ramos Ibañez, Norma; [2]Cesar Ivan, Ayala-Guzman; [3]Luis, Ortiz-Hernandez.

[1]PhD. Nutritionist. Department of Health Care. Autonoma Metropolitana University. Mexico; [2]Nutritionist. Department of Health Care. Autonoma Metropolitana University. Mexico.; [3]PhD. Nutritionist. Department of Health Care. Autonoma Metropolitana University. Mexico.

Background and objectives: Although physical fitness (PF) is associated with better health outcomes, its direct assessment sometimes in not feasible; therefore surrogates of actual PF are necessary. The aim of this study was to analyze the association between the perception of PF with nutritional status and actual PF in adolescents.

Methods: The participants were 319 boys and girls aged 10 to 15 years from Mexico City. Nutritional status with evaluated with body mass index (BMI)-for-age and waist circumference-for-age. Body fat was estimated with Slaughter equation. Each component of PF (aerobic capacity, muscular strength and endurance, and flexibility) was assessed with FITNESSGRAM tests. International Fitness Scale (IFIS) was applied to evaluate the perception of PF.

Results: It was observed a high frequency in inadequate aerobic capacity (48.8%), in low strength of trunk, arms and abdomen (60.7%, 63.9% and 42.5% respectively) and flexibility of trunk and legs (68.7%). Most of adolescents did perceive themselves with a good PF (aerobic capacity: 85.2%%, muscular strength: 90.5, flexibility: 74.1%, velocity/agility: 89.6% and general PF: 92.7%). Adolescents with a high adiposity had a low aerobic capacity, muscular strength and flexibility and perceived themselves with inadequate PF. Adolescents that perceived themselves with a good general PF had an adequate aerobic capacity and strength of abdomen and arm. A good perception of aerobic capacity and muscular strength was related with an adequate aerobic capacity and strength of abdomen and arms. The level agreement between FITNESSGRAM battery and IFIS was fair (K= 0.37, p<0.05) between perception of aerobic capacity and actual aerobic capacity and there was a poor agreement in the others components of PF perception and the tests of PF.

Conclusions: Adolescents perceived themselves with better PF compared than actual PF. Nutritional status influence on the perception and actual PF. It was showed a poor agreement between both methods of assessment PF.

Keywords: Perception of physical fitness, physical fitness, adolescents,

THE POTENTIAL OF A HUMAN RIGHTS APPROACH FOR ACCELERATING THE IMPLEMENTATION OF COMPREHENSIVE RESTRICTIONS ON THE MARKETING OF UNHEALTHY FOODS AND NON-ALCOHOLIC BEVERAGES TO CHILDREN

[1]Granheim, Sabrina; [2]Vandevijvere, Stefanie; [3]Torheim, Liv Elin.

[1]Nutritionist. Faculty of Health Sciences. Oslo and Akershus University College of Applied Sciences. Oslo. Norway; [2]Senior Research Fellow. School of Population Health. University of Auckland. Auckland. New Zealand; [3]Professor. Faculty of Health Sciences. Oslo and Akershus University College of Applied Sciences. Oslo. Norway.

Background and objectives: Overweight and obesity in children is increasing at the global level, particularly in low- and middle-income countries. Among the causes for this increase is the marketing of unhealthy food and beverage products, which affects children's food preferences, purchasing requests and consumption patterns. The need to address harmful marketing to children has been recognized by the World Health Organization, with Member States having agreed in 2010 to implement a set of recommendations to restrict such practices. Concurrently, there is an increasing understanding of unhealthy food and malnutrition as human rights concerns. This study explores the potential of existing human rights instruments for accelerating the implementation of comprehensive restrictions to reduce harmful marketing of unhealthy foods and beverages to children.

Methods: A review of legally and non-legally binding human rights instruments was conducted, including the Universal Declaration of Human Rights, the International Covenant on Economic, Social and Cultural Rights, the Convention on the Rights of the Child, the Guiding Principles for Business and Human Rights and a series of General Comments as components of existing human rights frameworks.

Results: Legally and non-legally binding human rights instruments offer important opportunities to strengthen and accelerate state implementation of restrictions on marketing of unhealthy food and beverage products to children. Four relevant themes were identified in existing human rights instruments: 1) the best interest of the child should be considered above all other interests; 2) the rights to health and adequate food cannot be realized without supportive healthy environments; 3) children should be protected from economic exploitation; and 4) the persuasive marketing of unhealthy food and beverage products is explicitly recognized as a threat to the rights to food and health.

Conclusions: In conclusion, existing human rights instruments could be harnessed to advance public health measures to restrict the marketing of unhealthy foods and beverage products to children. Policy-makers and advocates should draw from these instruments and refer to State's obligations within international and domestic human rights law to strengthen their efforts to restrict harmful marketing practices to children.

MALNUTRITION IN ALL ITS FORMS AND SOCIO-ECONOMIC DISPARITIES IN GUATEMALA

[1]Mazariegos, Monica; [1]Kroker-Lobos, Maria F; [2]Ramirez-Zea, Manuel.

[1]Researcher. INCAP Research Center for the Prevention of Chronic Diseases (CIIPEC). Institute of Nutrition of Central America and Panama (INCAP). Guatemala.; [2]Director. INCAP Research Center for the Prevention of Chronic Diseases (CIIPEC). Institute of Nutrition of Central America and Panama (INCAP). Guatemala.

Background and objectives: The complex interplay of social, economic, and political determinants of malnutrition results in substantial disparities. Identification of population groups at higher risk of malnutrition will inform public health policy and aid in the design of appropriately targeted interventions. Therefore, our objective was to reveal disparities of malnutrition in all its forms by socioeconomic status (SES) in children, adolescents and women of reproductive age (WRA) in Guatemala.

Methods: We used the 2008 National Maternal and Child Health Survey conducted in Guatemala. We estimated the prevalence (95%CI) for underweight/thinness, stunting/short stature, overweight/obesity in children <5 y (n=10,645), adolescents (15-19 y) (n=2,894), and WRA (20-49 y) (n=13,925). Then we evaluated whether the prevalence of malnutrition differed according to tertiles of SES. Disparities are shown as the ratio of low to high-SES tertile.

Results: Wasting/thinness prevalence among children, adolescents, and WRA was low (<1%) and was no significantly different among SES. Stunting/short stature prevalence was 48.0% (45.8,50.2) among children, 51.1% (48.4,53.8) among adolescents, and 29.0% (27.5,30.1) among WRA. The prevalence of stunting in these age groups was 3.1, 1.9, and 3.0 times significantly higher in the poorest SES tertile than in the richest tertile, respectively. Anemia prevalence was 49.2% (47.1,51.3) among children, 25.1% (22.7,27.7) among adolescents, and 29% (27.5,30.1) among WRA. The prevalence of anemia was 1.3, 1.8 and 1.7 times significantly higher in the poorest SES tertile than in the richest tertile, respectively. Overweight/obesity prevalence was 6.0% (5.3,6.6) among children, 21.3% (19.3,23.4) among adolescents and 57.8% (56.5,59.2) among WRA. Overweight/obesity prevalence in WRA was 1.4 significantly higher in the richest SES tertile than in the poorest tertile.

Conclusions: Stunting and anemia affected the poorest two to three times more than the richest SES tertile. In contrast, only in WRA overweight/obesity was higher among the richest SES tertile. These results highlight the disparities in Guatemala and the need for targeted interventions.

METHODOLOGICAL ASPECTS OF NEW WEB-BASED TECHNOLOGIES FOR ASSESSING DIETARY INTAKE IN CHILDREN AND ADOLESCENTS

[1]Perazi, Fernanda; [2]Altenburg de Assis, Maria Alice; [2]Gracieli Kunradi Vieira, Francilene; [3]Jeremias Pereira, Luciana; [2]Faria Di Pietro, Patrícia; [2]de Fragas Hinnig, Patricia.

[1]Fernanda Machado Perazi. Nutricionista. Programa de Pós-graduação em Nutrição. Universidade Federal de Santa Catarina. Brazil; [2]PhD. Professor. Postgraduatede Program in Nutrition. Universidade Federal de Santa Catarina. Brazil.; [3]Nutritionist. Postgraduatede Program in Nutrition. Universidade Federal de Santa Catarina. Brazil.

Background and objectives: New web-based technologies have been developed in order to contribute for the improvement of dietary intake evaluation of children and adolescents. To review the characteristics of studies that developed web-based questionnaires for assessing dietary intake in children and adolescents.

Methods: questionnaires for assessing dietary intake in children and adolescents. Methods: **Results:** Twelve web-based questionnaires were found. Eight of them were developed for children and adolescents from European countries, two in Brazil, and two in the United States (n=2). Regarding the population age, 58.3% of the questionnaires were developed for children aged 7 to 10. Only one questionnaire developed in Brazil evaluated the qualitative dietary intake. All questionnaires were based on 24-hour recall from the previous day and were self-administered. Four instruments provided an Avatar to assist the respondent with completing the questionnaire, and five presented six eating events. Most of the questionnaires (90.9%) had images or photographs of portions size in order to assist the quantity of food reported. Of the 12 studies, 11 published results of validity and 2 of reproducibility. Regarding the reference methods for validity, half of the studies used direct observation. The percentage of agreement between the test questionnaire and the reference method ranged from 37% to 90%. Intrusion rates (false positives) ranged from 5% to 35%, and omission rates (false negatives) from 3% to 35%.

Conclusions: There are still few published studies that have developed web-based questionnaires for assessing dietary in children and adolescents. There is a wide variation in the results of agreement when compared the web-based questionnaires with the reference method, and few studies presented results of reproducibility.

Keywords: dietary intake, children, adolescents, online, questionnaires.

THE ASSOCIATION OF DIETARY APPROACHES TO STOP HYPERTENSION WITH VISCERAL ADIPOSITY INDEX IN ADULTS: TEHRAN LIPID AND GLUCOSE STUDY

[1]Mirmiran, Parvin; [2]Yuzbashian, Emad; [1]Asghari, Golaleh; [3]Azizi, Fereidoun.

[1]PhD. Nutrition and Endocrine Research Center. Research Institute for Endocrine Sciences. Shahid Beheshti University of Medical Sciences. Tehran. Iran; [2]MSc. Nutrition and Endocrine Research Center. Research Institute for Endocrine Sciences. Shahid Beheshti University of Medical Sciences. Tehran. Iran; [3]MD. Endocrine Research Center. Research Institute for Endocrine Sciences. Shahid Beheshti University of Medical Sciences. Tehran. Iran.

Background and objectives: Abdominal obesity is independently related to increased risk of metabolic and cardiovascular diseases and mortality rates. The effect of abdominal obesity on metabolic factors seems to be mainly mediated by the visceral adipose tissue (VAT) that might modify by dietary intakes. This study was conducted to examine the association of adherence to the Dietary Approaches to Stop Hypertension (DASH)-style diet and its components with prospective visceral adiposity index (VAI)-changes after 6.1 years of follow-up among an Iranian population.

Methods: We followed-up 1863 participants (50.5%women, mean age: 42.8years) of the Tehran Lipid and Glucose Study (TLGS) for 6.1years. Baseline diet was assessed using a valid and reliable 168-item food-frequency questionnaire. A DASH-style diet was calculated based on Folsom et al score. Linear regression was used to report for the association of VAI-change and logistic regression was used for calculating the odds of incident visceral adiposity dysfunction (VAD) with DASH-style diet score.

Results: The mean age of participants was 40.25y, and mean VAI was 1.85. After adjusted for age, sex, physical activity, smoking, and total energy intake, a unit increase in adherence to the DASH-style diet score was positively associated with changes in VAI (β: -0.098;P=0.009). Each increased in scores of vegetable and saturated fatty acid were associated with a 0.349, 0.287 decreased in VAI (p<0.05), respectively. Furthermore, subjects in the highest quartile of the DASH-style diet score had the lower risk of incident VAD in comparison to those in the lowest quartile (OR:0.72;95%-CI:0.55-0.94).

Conclusions: Higher adherence to the DASH-style diet was associated with a lower change of VAI and risk of incident VAD among adults during 6.1 years of follow-up.

BULLYING IN ADOLESCENCE: A MAJOR REASON TO PREVENT OBESITY

[1]Calvo, Soledad; [2]Bove, Maria Isabel.

[1]MSc. Nutritionist. Catholic University of Uruguay. Uruguay;
[2]PhD. Nutritionist. Catholic University of Uruguay. Uruguay.

Background and objectives: Interpersonal violence in teenagers is a public health problem that requires studies that delve into possible determinants. Physical appearance can predispose to intimidation experiences. Research indicates that obesity promotes discriminatory behaviours that affect the psychosocial development of young people.

To investigate the connection between obesity and bullying related to physical appearance in adolescents from Uruguay, Argentina and Chile.

Methods: It has been made a cross-sectional and descriptive study with an analytical component of the Global School Health Survey of Uruguay (2012), Argentina (2012) and Chile (2013); (30.845 adolescents).

The variables were: sex, age, bullying related to physical appearance, overweight or obesity, family support, number of close friends, feeling alone and problems for sleeping.

To study the contribution of each risk factor, a multivariate analysis was performed through binary logistic regression. The chance was expressed as Odds Ratios with a 95% confidence interval. All tests were considered statistically significant with a level α p<0,05.

Results: About 23.8% (95% CI: 23.3-24.3%) of teenagers admitted to having been bullied at least once in the last month. Argentina occupied the first place in this problematic, followed by Uruguay and finally Chile. About 27.9% (CI 95%, 27.3-28.5%) of teenagers were overweight (overweight 21.6% and obesity was 6.3%). In Chile, this figure ascended to 41.8% (95% CI, 31.4-44.4%), being the country with the highest prevalence (p<0.001). Obesity predominated in the males of the three countries (p<0.001). Bullying was more prevalent among adolescents under 15 years (p<0.001); among teenagers with poor parental support (p<0.001), among young people with little or no close friends (p<0.001), and among those who presented overweight (p=0.005) or obesity (p=0.01). The most frequent form of aggression was the jokes and within them the ones related to the physical aspect. It was observed that adolescents with obesity are more prone to bullying, they are more than twice as likely to be bullied (OR: 2.44, 95% CI 1.94-3.08).

Conclusions: Approximately 20% of adolescents in the region are victims of bullying.

The main form of aggression between peers is the physical appearance teasing.

Obesity turns out to be the greatest risk for this type of bullying.

Keywords: Adolescence. Bullying. Intimidation. Obesity

THE RELATION OF NEIGHBORHOOD ENVIRONMENT CHARACTERISTICS WITH ANTHROPOMETRIC INDICES AND ACTIVITY IN TWO IRANIAN ETHNIC GROUPS LIVING IN NORTH-WEST OF IRAN

Rezazadeh, Arezoo; Omidvar, Nasrin; Eini-Zinab, Hassan.

Department of Community Nutrition. National Nutrition and Food Technology Research Institute. Faculty of Nutrition and Food Technology. Shahid Beheshti University of Medical Sciences and Health Services. Iran.

Background and objectives: Features of living environments may contribute to weight and activity status. This study aimed to assess the relation of neighborhood environment with anthropometric indices and activity in Azeris (as major ethnic group) and Kurds (as minor ethnic group) living in Urmia city, North West of Iran.

Methods: In this cross-sectional study, 723 participants (427 women and 296 men) aged 20–64 year old, from two ethnic groups (445 Azeri Turk and 278 Kurd) were selected through a combination of cluster, random and systematic sampling methods from 38 neighborhoods. Neighborhood characteristics was obtained by using a validated 22-items neighborhood and health observational checklist. Weight and height and waist circumference (WC) were measured using standard methods and Body Mass Index(BMI) was calculated. Activity level was measured by a validated long form International physical activity questionnaire(IPAQ). Principal component analysis was used to define dominant neighborhood environment. The relation between anthropometric indices and activity with neighborhood characteristics was analyzed by multiple linear regression. P<0.05 was considered as significant level.

Results: Three common neighborhood environments were defined: "newly built and affluent", "Centrally located neighborhood with high access to social services" and "marginally located neighborhoods". Higher percent of Azeri group were settled in higher tertiles of "Modern-high quality" and "Central-high access "neighborhoods. In Azeri vs. Kurd ethnic group, the mean ± SD of BMI, WC and physical activity was 27.9±5.7 vs.26.9±5.8 kg.m2, 93.5±13.8vs. 91.7±13.0 cm and 5619±7723vs.8052±9637 MET/hour/week, respectively. In total participants, after adjustment for age, gender, marital status, SES and energy intake those living in higher tertile of "Central-high access" neighborhoods had higher WC and lower physical activity level. In Azeri Turk ethnic group, living at the highest tertile of Modern-high quality neighborhoods was significantly related with higher BMI. In Kurd ethnic group, those living in "marginally located neighborhoods" had higher physical activity.

Conclusions: Findings suggest that living in high quality neighborhoods and belonging to the major and affluent ethnic group was related with higher BMI however, living in low quality neighborhoods located in marginal part of city was related with higher activity level in minor ethnic group.

Keywords: neighborhood characteristics, anthropometric indices, activity, ethnicity, Iran.

EXAMINING FOOD ENVIRONMENT POLICY IMPLEMENTATION IN CANADA: ADAPTING THE FOOD-EPI TOOL AND PROCESS TO THE CANADIAN CONTEXT

[1]Vanderlee, Lana; [2]Karbasy, Kimiya; [3]Vandevijvere, Stefanie; [4]Swinburn, Boyd; [5]L'Abbé, Mary.

[1]PhD. Department of Nutritional Sciences. University of Toronto. Canada.; [2]BSc. MSc student. Department of Nutritional Sciences. University of Toronto. Canada.; [3]PhD. Senior Research Fellow Global Health, Food Policy, Obesity and NCD prevention. University of Auckland. New Zealand.; [4]MBChB. MD. FRACP. Professor of Population Nutrition and Global Health. University of Auckland. New Zealand.; [5]PhD. Earle W. McHenry Professor and Chair. Department of Nutritional Sciences . University of Toronto. Canada.

Background and objectives: Globally, food environment policies play a critical role in improving diet and related non-communicable diseases (NCDs). This study aimed to identify food environment policies in different policy domains in Canada to improve the food environment and address high rates of obesity and NCDs.

Methods: This study employed the Healthy Food Environment Policy Index (Food-EPI), developed by International Network for Food and Obesity / non-communicable Diseases Research, Monitoring and Action Support (INFORMAS) to measure the extent of implementation of food environment policies by governments globally. The index examines 7 policy domains (composition, labelling, promotion, prices, provision, trade, and retail) and 6 infrastructure support domains (leadership, governance, monitoring and intelligence, funding and resources, platforms for interaction, and health-in-all-policies). An inventory of current policy implementation was collated and verified by government stakeholders for accuracy. Policies were examined at national and provincial/territorial level (13 jurisdictions). Ratings were conducted by more than 70 non-governmental experts to assess the level of implementation compared to international benchmarks for 47 indicators on a scale from 1 (less than 20% implementation) to 5 (80–100% implementation). Federal policies were rated in 3 workshops in Vancouver and Toronto in May/June 2017, while provincial/territorial policies were rated using an on-line process. Concrete areas for action at the federal and provincial/territorial level were discussed and prioritized at the in-person workshops.

Results: Overall, there was no evidence of national or provincial implementation in 6 of 23 policy indicators. National and provincial policies were identified for food composition and labelling domains, while pricing policies were only implemented nationally. Policy regarding unhealthy food marketing and nutrition standards in school settings, public settings such as recreation centres and private sector settings were primarily provincial in nature. No actions relating to food retail or zoning policy or taxing unhealthy foods were identified. Ratings by experts and priority areas for action will be discussed.

Conclusions: There are gaps in food environment policy in Canada at the federal and provincial level. Prioritizing actions to improve the food environment has significant potential to influ-

ence the diet of Canadians, with downstream influences on rates of obesity and NCDs.

STUDY OF ADULT-TYPE PRIMARY HYPOLAC-TASIA IN TERMS OF THE GEOGRAPHICAL AND ETHNIC FACTORS: CASE OF MOROCCAN AND SUB-SAHARAN POPULATIONS

Lebiad, Zineb; Bour, Abdellatif.

Laboratory of Biological Tests. Team of Food and Nutritional Transition [ETAN]. Faculty of Sciences of Kénitra. University Ibn Tofail Morocco.

Background and objectives: Background: Less known in Africa, yet very widespread in the world, Lactose intolerance is a digestive problem that testifies a deficit of lactose digesting enzyme, lactase, which leads to uncomfortable digestive symptoms.

Context: The prevalence of lactose intolerance varied from one region to another with an undeniable north-south gradient ranging from 5% in North Europe to 100% in some Asian countries.

Objective: The purpose of this article is to highlight the difference in the prevalence of adult type hypolactasia according to geographical space and ethnicity.

Methods: The survey was conducted in the city of Kenitra representing the North of Morocco and the city of Agadir representing the south of Morocco on the adult population and also among the sub-Saharan adults residing in Morocco. Lactose intolerance was assessed by the rate of glucose in blood before and 30 minutes after administration of an overload taking of lactose and also taking account of the subsequent digestive symptoms. Subjects were also asked to answer some questions about their milk consumption and their knowledge about lactose intolerance.

Results: The prevalence of adult-type primary hypolactasia was higher in the sub-Saharan population than in the Moroccan population, it varies significantly with age and may be influenced by milk consumption in adulthood but less by its consumption after weaning.

Conclusions: Lactose intolerance increases as we go towards the south, several genetic and environmental factors influence this divergence. The prevalence of lactose intolerance is very high among the studied population which requires the participation of the health authorities to raise awareness of the existence of lactose intolerance in order to improve their quality of life.

Keywords: Lactose, Intolerance, Lactase, Milk, Morocco.

USING HEALTH EXAMINATION DATABASE TO STUDY PUBLIC HEALTH NUTRITION -- A DATA PROCESSING APPROACH

[1]*Hsu, Chien-Yeh;* [2]*Rau, Hsiao-Hsien;* [3]*Chao, Jane.*

[1]PhD. Department of Information Management. National Taipei University of Nursing and Health Sciences. Taipei. Taiwan.; [2]MSc. Graduate Institute of Biomedical Informatics. Taipei Medical University. Taipei. Taiwan.; [3]PhD. School of Nutrition and Health Sciences. Taipei Medical University. Taipei. Taiwan.

Background and objectives: With the rapid development of information technology, medical and health related personal data was generated very fast and diversely.

Since data collection became more and more easily, using data directly by screening, integration, processing and analyzing is a suitable approach for studying public health nutrition. A data processing procedure used to support research purpose is essential.

Methods: In this study, a health examination database was integrated with several other databases including personal behavior questionnaire, personal health records and clinical laboratory dataset to form a research data warehouse by using SQL server. All the subjects signed the consent form to agree the data without personally identifiable information used for the purpose of academic research. A standard procedure was built to connect data from different data sets and retrieved automatically according to the research problems.

Results: An integrated health related database was built which contains health examination data, behavior data, personal health records and clinical laboratory data. The researchers can set inclusion and exclusion criteria and query the data across from different datasets. This provides a very easy and efficient way for the researchers to obtain correct and clean data. Further data analysis can be done by using variety of statistical tools.

Conclusions: Data driving approach has been applied in many different research areas to obtain statistical inferences. The data warehouse built in this study is useful to do value-added applications such as finding the association between dietary patterns and metabolic and cardiovascular diseases, identifying the risk factors for building disease prediction/prevention models in public health nutrition, and applying to personalized health care.

THE FIRST INFORMAS NATIONAL FOOD ENVIRONMENTS SURVEY IN NEW ZEALAND: A BLUEPRINT COUNTRY SCORECARD FOR MEASURING PROGRESS ON CREATING HEALTHIER FOOD ENVIRONMENTS

[1]Vandevijvere, Stefanie; [2]D'Souza, Erica; [2]Mackay, Sally; [3]Buch, Tina; [4]Swinburn, Boyd.

[1]Senior Research Fellow. School of Population Health. The University of Auckland. Auckland. New Zealand.; [2]Phd student. School of Population Health. The University of Auckland. Auckland. New Zealand; [3]Nutritionist. School of Population Health. The University of Auckland. Auckland. New Zealand; [4]Professor. School of Population Health. The University of Auckland. Auckland. New Zealand.

Background and objectives: INFORMAS aims to benchmark food environments globally. We present results of the first-ever, comprehensive New Zealand (NZ) food environments study, the policies influencing those and a scorecard to measure progress over time and compared to other countries.

Methods: Implementation of priority national food environment policies, and strength and comprehensiveness of District Health Board (DHB) and school nutrition policies were assessed. Food environments were measured in 819 schools, 204 supermarkets, 1500 takeaway outlets, 28 hospitals, 70 sport centres and all school zones. Food swamps, areas with high relative density of unhealthy outlets, were identified, and food marketing to children on television, websites, magazines, packages and social media and in and around schools was measured. The proportion of packaged foods in supermarkets carrying health-related claims and promotions, and the cost differential between healthy and current diets were calculated.

Results: Implementation gaps exist for 75% of recommended national policies. Comprehensiveness and strength of policies are higher for DHBs than schools. About 75% of hospitals, 60% of schools and 44% of sport centres are sugary drink free. The average ratio of cumulative linear shelf length for healthy versus unhealthy foods is 0.42 and the average proportion of junk food free endcaps and check-outs is 47.0 and 14.7 in supermarkets. Nation-wide, one-third of census areas are food swamps with the highest number in most deprived areas. Median road distance to the closest convenience store from urban schools is higher for the least (617 m) versus the most deprived (521 m) schools. Food marketing to children through all media is predominantly for unhealthy foods. About 83% of less healthy packaged foods carry at least one nutrition claim. It is possible to consume a healthy diet at the same cost as current NZ diets, but the majority of healthy household menus are significantly more expensive than current household menus.

Conclusions: NZ food environments, especially children's environments, are largely unhealthy, and policy implementation is low. Effective policies, particularly on food marketing, healthy food in schools and food prices need to be implemented. NZ's healthy food environment scorecard will be updated regularly and benchmarked against other countries globally.

Keywords: food environments, benchmarking, monitoring, nutrition policies

INTRODUCTION OF GUAVA IN SUPPLEMENTARY NUTRITION MEAL PROVISIONED FOR 24-60MO CHILDREN BY INTEGRATED CHILD DEVELOPMENT SCHEME (ICDS) IMPROVES IRON STATUS OF BENEFICIARIES

[1]Roy Choudhury, Dripta; [2]Fernandez Rao, Sylvia; [3]Balakrishna, Nagalla; [4]K. Vijaya, Radhakrishna; [5]Ghosh, Sudip; [6]Nair, K. Madhavan.

[1]MSc. Senior Research Fellow. Division of Molecular Biology. National Institute of Nutrition. Hyderabad. India; [2]PhD. Scientist C. Behavioural Science Unit. National Institute of Nutrition. Hyderabad. India.; [3]PhD. Scientist E. Division of Biostatistics. National Institute of Nutrition. Hyderabad. India.; [4]MBBS. DCH. Retired Scientist E. Clinical Division. National Institute of Nutrition. Hyderabad. India.; [5]PhD. Scientist E. Division of Molecular Biology. National Institute of Nutrition. Hyderabad. India.; [6]PhD. Retired Scientist F and Head. Micronutrient Research Group. National Institute of Nutrition. Hyderabad. India.

Background and objectives: Simultaneous intake of guava with rice-based meal enhanced iron bioavailability by more than 100% among Indian adolescents. Hence, a RCT was done to establish the impact of regular inclusion of guava in a nutrition sensitive platform for strategy adoption.

Methods: In India, Supplementary Nutrition Programme (SNP) provides hot cooked meal to 24-60mo children under ICDS through its operational unit, 'Anganwadi Centers' (AWCs). A three-arm cluster-RCT (CTRI/2014/09/004983) integrated with SNP was designed with passive control cucumber group (minimal vitamin C), active control banana group (minimal vitamin C, high soluble fiber) and experimental guava group (high vitamin C and soluble fiber) to receive 25g of each fruit based on 1RDA of vitamin C (40mg) present in the guava portion. Written consent from parents and permission from government departments were obtained. Participants (n=261) having Hb>8g/dL with no chronic diseases/severe malnutrition were recruited from 28 AWC-clusters in rural area of Nalgonda district, Telangana State. Participants were dewormed with albendazole. Randomization was followed at village level. Fruits were supplied by a local vendor throughout study period for 6 days/week for 21 weeks. Compliance was supervised at AWC. 2mL blood samples were collected at baseline and endline to assess haemoglobin (Hb), plasma ferritin (PF), soluble-transferrin receptor (sTfR), c-reactive protein (CRP), hepcidin, IL-6, plasma vitamin B12 and folate. Ferritin was corrected for CRP values>5mg/L by multiplying with 0.67. Linear Mixed Model was used for group comparison adjusting the cluster effect. Endpoint group comparison was analyzed by adjusting the baseline as covariate if found significant (p<0.05).

Results: There were no group differences at baseline in growth, socio-economic status, age, gender and mother's education. Biochemical parameters were also comparable except for PF, B12 and IL-6. At endpoint, experimental group showed improved status compared to both passive and active control groups for Hb (p=0.001, 0.000), ferritin (p=0.000, 001) and sTfR (p=0.000,

0.000). There was no endpoint group difference for hepcidin, IL-6 and B12 except folate which was higher in experimental group only compared to active control group (p=0.032).

Conclusions: Inclusion of Guava in regular SNP meal can be an effective strategy to improve iron status of ICDS preschool beneficiaries.

DEVELOPMENT OF A MULTI-SECTORAL SYSTEM TO ENFORCE A NATIONAL CODE ON MARKETING BREAST MILK SUBSTITUTES IN CAMBODIA

[1]*Hou, Kroeun;* [2]*Prak, Sophonneary;* [3]*Aing, Hoksrun;* [4]*Green, Mackenzie;* [5]*Chai, Tze Lin;* [6]*Chum, Veasna.*

[1]MPH. Deputy Country Director. Helen Keller International. Cambodia; [2]MD.MPH. Deputy Director. Maternal and Child Health Center. Ministry of Health. Cambodia; [3]Ph. Director. Department of Drugs and Food Safety. Ministry of Health. Cambodia; [4]Msc. ARCH Regional Coordinator. Helen Keller International; [5]Bsc. Research Specialist. Helen Hellen International. Cambodia; [6]Msc. ARCH National Coordinator. Helen Keller International. Cambodia.

Background and objectives: In 2005, Cambodia endorsed Sub-Decree 133 (SD133), a national code that regulates the marketing of breast milk substitutes (BMS). In 2014, research revealed that code violations were widespread and that there were no multi-sectoral mechanisms in place to enforce SD133. To monitor national code law, WHO recommends that the Ministries of Health set up an inter-ministerial monitoring team, composed of different ministries, agencies and departments that have a direct responsibility over the marketing, availability and promotion of relevant products.

Methods: Data on code violations and gaps in enforcement were used to advocate for an evidence-based plan to strengthen enforcement of SD133. Prior to August 2014, there was confusion over the roles of the four implementing ministries and no formal monitoring system, resulting in low reporting of code violations. Meetings and consultations were conducted with key stakeholders to discuss these issues. Policymakers including Officials from the Ministries of Health, Commerce, Information, and Industry and Handicraft, along with representatives from relevant UN Agencies and NGOs, collaborated to create a multi-sectoral supervisory mechanism to enforce the National Code regulating BMS in Cambodia.

Results: In August 2014, an Oversight Board (OB) was created to monitor and enforce SD133. This is co-led by the Ministry of Health and the Council for Agriculture and Rural Development; however, the four line Ministries are also represented by their Secretaries. The OB has two executive arms: (i) the Control Committee reviews marketing content regarding breast milk substitutes, and (ii) the Executive Working Group monitors and enforces compliance. In 2015 the OB developed terms of reference and guidelines for the implementation of SD 133; which were adopted in December 2015. In 2016, the OB developed different monitoring checklists for the four line Ministries. Four provinces were selected to pilot test the system, develop implementation guidelines, and propose recommendations. Training included orientation on the national code and monitoring guidelines.

Conclusions: Cambodia's experience & lessons learned in establishing a multi-sectoral enforcement mechanism provide a valuable model for other countries wanting to establish similar systems to enforce code regulations.

SIGNIFICANT IMPROVEMENT IN SUPPLEMENTATION OF MEGA DOSE OF VITAMIN A TO UNDER FIVE CHILDREN IN INDIA

Gupta, Aakriti.

PhD Scholar. Department of Food and Nutrition. Lady Irwin College. Delhi University. India.

Background and objectives: Vitamin A deficiency (VAD) is associated with increased risk of mortality and morbidity amongst under five children (U5). VAD continues to be an important public health problem in India. A survey conducted in 2011-2012 indicated that 2.5% of U5 had VAD. A recent cochrane review revealed that the Vitamin A supplementation (VAS) should be continued for reduction in morbidity in U5.

The Vitamin A Supplementation Programme was given low priority by the Government of India during 1990-2005 which was reflected in the National Family Health Survey (NFHS)-III data which found that only 16.5% of the children received VAS during 2005.

Methods: The NFHS is a large-scale, multi-round survey which undertakes systematic and stratified sampling techniques to ensure inclusion of villages with different socioeconomic characteristics. The NFHS sample covers 99 percent of India's population living in each state. The survey provides state and national level data for India on IYCF practices, maternal and child health, reproductive health, nutrition, anaemia and food supplementation practices using the standard indicators.

An analysis of secondary data available from National Family Health Survey (NFHS)-III (2005-2006) and NFHS-IV (2015-2016) was conducted on the coverage of VAS amongst U5 in different states of the country.

Results: The coverage of VAS was found to increase from 16.5% to 60.2% amongst U5 over a decade (2005-2016). The increase in the VAS coverage was observed in the range of 20-66% in different states of the country. The states with the highest increase in the coverage of VAS were Sikkim (18% to 84%), Karnataka (14% to 79%), Chhattisgarh (9% to70%), Goa (31% to 90%) and Gujarat (13% to 71%). The improvement in coverage of VAS amongst U5

could be attributed to the close monitoring and supervision by the government and development partners.

Conclusions: The present study revealed that the Government of India and development partners have strengthened the VAS Programme in the country. There is a need of continued and sustained efforts for achieving full coverage of VAS to prevent the mortality and morbidity amongst U5.

Keywords: Vitamin A supplementation, vitamin A deficiency, Mega dose of Vitamin A

ASSOCIATION BETWEEN DIETARY CAROTENOIDS AND FLUOROSIS IN CHINESE COAL-BURNING FLUOROSIS AREA: A CROSS SECTIONAL STUDY

[1]Liu, Jun; [2]Yang, Sheng; [2]Luo, Mingjiang.

[1]Ph.D Associated professor. Department of Nutrition and Food Hygiene. School of Public Health. Zunyi Medical University. China; [2]Postgraduate. Department of Nutrition and Food Hygiene. School of Public Health. Zunyi Medical University. China.

Background and objectives: Carotenoids are a group of diet-derived phytochemicals with antioxidant and anti-inflammatory properties that have attracted substantial interest because of their capacity to reduce the risks of relevant diseases. Epidemiology and experiments have demonstrated that excessive fluoride could lead to oxidative damage and oxidative stress was an important mechanism of fluorosis. However, there has no epidemiology studies reported the association between carotenoids and the coal burning fluorosis. Thus, we investigated the relation of carotenoid intake, to the prevalence of coal-burning fluorosis.

Methods: Subjects were required to be country resident for at least 5 years, aged between 20-75 years in Zhijin county, which is the most severe coal-burning fluorosis area in Guizhou. Face-to-face interviews were conducted to assess habitual dietary intakes using a 75-item food frequency questionnaire and various covariates by structured questionnaires. Dietary consumption of carotenoids, energy and other nutrients will be caculated according to the database of the China Food Composition and United States Department Of Agriculture.

Results: A total of 899 participants were involved and the prevalence of coal burning fluorosis was estimated to be 72.9% in this cross-sectional study. In the univariate logistic regression analysis showed significantly dose-dependent inverse correlations between the prevalence of coal burning fluorosis and the intake of α-carotene, β-carotene, lutein/zeaxanthin, lycopene and total carotenids in all of the subjects (all P-trend:<0.001). But there was no associcatoin of the prevalence of fluorosis with β-cryptoxanthin. After adjustment for sociodemographic characteristics, dietary factors and other potential confounders, the associations were slightly attenuated but remained significant for all (P-trend: <0.001–0.008) except for β-cryptoxanthin (p=0.553). The adjusted odd ratios

(ORs) and 95% confidence intervals (CIs) for coal-burning fluorosis in the top quartiles (vs. the lowest quartiles) were 0.52 (0.33, 0.83) for α-carotene, 0.48 (0.31, 0.76) for β-carotene, 0.33 (0.20, 0.53) for lutein/zeaxanthin, 0.40 (0.25, 0.67) for lycopene, 1.40 (0.88, 2.24) for β-cryptoxanthin, 0.42 (0.26, 0.67) for total carotenoids, respectively.

Conclusions: Higher intake of carotenoids is independently associated with lower prevalence of coal burning fluorosis. Increasing consumption of carotenoids food may benefit the prevention of coal burning fluorosisi in Guizhou.

Keywords: Carotenoids, Coal-burning fluorosis, Cross-sectional study

A CLUSTER RANDOMISED CONTROL TRIAL OF AN INTEGRATED AGRICULTURE-NUTRITION PACKAGE TO IMPROVE CHILDREN'S DIETS THROUGH COMMUNITY BASED CHILDCARE CENTRES IN MALAWI

[1]Gelli, Aulo; [2]Roschnik, Natalie.

[1]PhD. Nutrition epidemiologist. Poverty, Health and Nutrition Division. International Food Policy Research Institute (IFPRI).; [2]MSc. Senior Research and Impact Advisor. Programme Policy and Quality. Hunger and Livelihood team. Save the Children.

Background and objectives: The Nutrition Embedded Evaluation Program Impact Evaluation (NEEP-IE) study is a cluster randomised controlled trial designed to evaluate the impact of a childcare centre-based integrated nutrition and agriculture intervention on the diets, nutrition and development of young children in Malawi. The intervention includes activities to improve nutritious food production and training/behaviour change communication to improve food intake, care and hygiene practices.

Methods: Sixty community-based childcare centres (CBCCs) in rural communities around Zomba district, Malawi, were randomised to either 1) a control group with communities with Save the Children supported CBCCs and parenting education; or 2) an intervention group where additional nutrition and agricultural support activities were provided to help communities provide nutritious meals in the preschools all year round. Primary outcomes at child level include dietary intake of children aged 3-6y (measured through 24-hour recall) and infant and young child feeding (IYCF) practices for children aged 0-24m. At household level, primary outcomes include smallholder farmer production output and crop-mix (recall of last production season). Intermediate outcomes along theorised agriculture and nutrition pathways were measured. During this trial, we followed a mixed methods approach combining child-, household-, CBCC- and market-level surveys and assessments with in-depth interviews and focus group discussions with project stakeholders.

Results: The integrated agriculture and nutrition intervention improved dietary intake and dietary diversity for pre-school children and their younger siblings. Positive effects were also observed

---

for household production and production diversity. These effects were driven by increased consumption and production of nutritious foods.

Conclusions: Assessing the simultaneous impact of pre-school meals on diets, nutrition, child development and agriculture is a complex undertaking. This study is the first to explicitly examine from a food systems perspective, the impact of a pre-school meals programme on dietary choices, alongside outcomes in nutrition, child development and agriculture domains. The findings of this evaluation will provide evidence to support policymakers in the scale-up of national programmes.

Keywords: Pre-school feeding, impact evaluation, nutrition, agriculture, diets.

AFLATOXIN EXPOSURE IN CHILDREN IN MIRPUR, DHAKA: DATA FROM A BIRTH COHORT

[1]Mahfuz, Mustafa; [2]Ashraful Alam, Mohammed; [3]Hossain, Muttaquina; [3]Amran Gazi, Mohammod; [4]Ahmed, Tahmeed.

[1]MBBS. MPH. Deputy Project Coordinator. Nutrition and Clinical Servises Division. International Centre for Diarrhoeal Disease Research. Bangladesh. Dhaka. Bangladesh; [2]MSc. Senior statistical officer. Nutrition and Clinical Services Division. International Centre for Diarrhoeal Disease Research. Bangladesh.; [3]MBBS. MPH. Research Investigator. Nutrition and Clinical Services Division. International Centre for Diarrhoeal Disease Research. Bangladesh.; [4]MBBS. PhD. Senior Director. Nutrition and Clinical Services Division. International Centre for Diarrhoeal Disease Research. Bangladesh.

Background and objectives: Dietary exposure to aflatoxin has been implicated in growth faltering in young children. Bangladesh has a hot and humid climate that is conducive to fungal growth and subsequent contamination of dietary staples. Given the high burden of childhood stunting, there has been no data on long-term exposure to aflatoxin measured by aflatoxin B1-lysine (AFB1-lys) adduct in plasma samples from children of urban Bangladesh. This study tried to explore the levels of aflatoxin exposure and its association with growth in a group of children followed longitudinally.

Methods: This study used data and biospecimens collected during 2010-2014 in MAL-ED birth cohort study in an urban slum of Mirpur, Dhaka where children were followed from birth to 36 months. AFB1-lys adduct concentrations were assessed by isotope dilution mass spectrometry from the plasma samples collected at 7, 15, 24 and 36 months. The limit of detection was 0.4 pg AFB1-lys/mg albumin. Aflatoxin exposures were compared to anthropometry, breastfeeding, dietary intake, and seasonal variation of sample collection.

Results: Number of Cohort children with available plasma samples tested at 7 months, 15 months, 24 months and 36 months were 208, 196, 173 and 167 respectively. For 744 tested plasma samples, geometric mean was 1.07 pg AFB1-lysine/mg albumin (range 0.04 - 123.5 pg/mg albumin). Percent of children demonstrated chronic aflatoxin exposure were 10.1%, 20.9%, 17.9%, and 61.7% for 7, 15, 24 and 36 months, respectively. Reduction in breastfeeding prevalence (80% at 24 months vs. 38% in 36 months) corresponds with high level detection of AFB1-lysine at 36 months. Consumption of grain significantly associated with aflatoxin exposure (OR 2.5, 95% CI 1.6-3.8, p= 0.0001). Seasonal variations detected as AFB1-lysine concentrations were highest at the end of rainy seasons. No association was detected between anthropometric indices and aflatoxin exposure.

Conclusions: Sixty two percent of children are chronically exposed to aflatoxin at the end of third year. This is the first reporting in children from Urban Bangladesh. Low mean concentration of detection could be responsible for lack of association with growth parameters. Nonetheless, more work is required to explore further the sources of aflatoxin from the dietary staples.

Keywords: Aflatoxin. MAL-ED. Bangladesh. AFB1-lys. children.

ISOFLAVONES, LIGNANS AND PROSTATE CANCER RISK: AN ANALYSIS OF INDIVIDUAL PARTICIPANT DATA FROM 5 PROSPECTIVE STUDIES

Perez-Cornago, Aurora.

PhD. Cancer Epidemiology Unit. Nuffield Department of population Health. University of Oxford. United Kingdom.

Background and objectives: The role of phytoestrogens in prostate cancer development is unclear. Previous studies have shown different results for isoflavones among Asian and non-Asian populations, and there are too few published prospective data to evaluate whether the associations differ by stage and grade of disease. The aim of this study was to determine the association between prediagnostic blood concentrations of isoflavones [genistein, daidzein, equol] and lignans [enterolactone and enterodiol]) and the risk of prostate cancer and to evaluate these associations by tumour stage and grade. Because of the large difference in circulating isoflavone concentrations between Asian and non-Asian populations, the isoflavone analyses were conducted separately for Asian and non-Asian studies.

Methods: A pooled analysis of individual participant data including up to 241 and 503 Asian cases and controls, and 1846 and 3929 non-Asian cases and controls from 5 prospective studies. Multivariable-adjusted conditional logistic regression was used to estimate the odds ratios (ORs) for prostate cancer based on the study-specific fourths of circulating concentrations of each phytoestrogen.

Results: Blood isoflavones were not associated with the risk of total prostate cancer in either Asian or non-Asian populations,

---

although in Asian populations there was a suggestion of an inverse association between blood equol and prostate cancer risk (multivariable-adjusted OR for the highest versus lowest fourth = 0.61 [95% confidence interval [CI] =0.39-0.97] and OR per 75 percentile increase = 0.69, 95 CI = 0.46-1.05). No associations between lignans and prostate cancer risk were observed (OR per 75 percentile increase = 1.06, 95 CI = 0.90-1.25 for enterolactone and OR per 75 percentile increase = 0.99, 95 CI = 0.79-1.25 for enterodiol). These associations did not differ significantly by time-to-diagnosis or by tumour stage or grade.

Conclusions: There was no strong evidence that prediagnostic blood concentrations of isoflavones or lignans are associated with prostate cancer risk, although there are still relatively few published prospective data.

Keywords: Pooled analysis, nested case-control study, prostate cancer, isoflavones, lignans

PERCEPTION OF BRAZILIAN CONSUMERS IN RELATION TO THE TERMS HOMEMADE, TRADITIONAL AND ORIGINAL IN LABELS OF PACKAGED FOODS

[1]Uggioni, Paula; [2]Muller, Jessica.

[1]PhD. Assistente Professor. Dept. of Nutrition. Nutrition Postgraduate Programme of Federal University of Santa Catarina. Brazil; [2]MSc. Nutritionist. Nutrition Postgraduate Programme of Federal University of Santa Catarina. Brazil.

Background and objectives: Terms such as homemade or traditional are present in labels of food products commercialized in Brazil. According to the Brazilian legislation, food labeling should not have terms that cannot be demonstrated, since they may induce the consumer to error in relation to its nature or composition. The study aimed at investigating the perception of Brazilian consumers from Florianópolis/Brazil, in relation to industrialized food products with the terms homemade, traditional and original.

Methods: Nine focal groups, with three to eight participants each, were conducted (October/December 2015). The group meetings were guided by a semistructured interview script with questions related to terms found in the frontal panels of industrialized products that were identified in a survey carried out in one of the ten biggest supermarket chains in Brazil. In addition, food packages were used to instigate the discussion about the meanings of each term. As criteria for inclusion: participants had to be adult; to buy food products; and, they could not have a degree in Nutrition.

Results: Forty-four subjects aged 20-58 participated in the focal groups (24 female). According to the participants, food products that present the term homemade generally refer to more natu-

---

ral products, with less processing and less food additives. This term may refer to a food product with flavors that remind consumers of the homemade product; with an artisanal appearance; and is normally considered healthier and tastier. Food products with the term traditional were similar to the term homemade. Nonetheless, they can also refer to food products with variations, or old brands, or to food products whose flavors or ingredients have been kept since the first formulation. Food products that present the term original also refer to more natural products, to products whose production mode is traditional. Participants reported feeling confused or deceived by the use of non-standardized terms.

Conclusions: Therefore, it is necessary to improve the inspection on the use of these terms in food products. The study reinforces the need for assuring consumers' rights to adequate and concise information. Thereby, with the information available in food labels, consumers may choose their food products in a conscious way.

SOCIAL DIFFERENTIALS AND NUTRITIONAL STATUS OF CHILDREN POPULATION IN THE NORTHWEST AND PAMPEANA REGIONS IN ARGENTINA

[1]Rodríguez Junyent, Constanza; [2]Román, María Dolores; [3]Pou, Sonia Alejandra.

[1]PhD. Student Nutricionist. Carrera de Nutrición Facultad de Medicina. Universidad Católica de Córdoba. Argentina; [2]PhD. Nutritionist. Instituto de Investigaciones en Ciencias de la Salud (UNC-CONICET). Escuela de Nutrición. Facultad de Ciencias Médicas. Universidad Nacional de Córdoba. Argentina.; [3]PhD. Nutritionist. Instituto de Investigaciones en Ciencias de la Salud (INICSA). Universidad Nacional de Córdoba. CONICET. Facultad de Ciencias Médicas. Escuela de Nutrición. Facultad de Ciencias Médicas. Universidad Nacional de Córdoba. Argentina.

Background and objectives: Childhood nutritional status is influenced by biological, environmental and psychosocial determinants. Until the first National Survey of Nutrition and Health (ENNyS) performed in 2005, Argentina possessed few epidemiological studies about child nutrition and health. To study social "inequities" in health (avoidable and unfair social differences) in two regions with heterogeneous socio-economic realities, allows to know some characteristics that may explain, in part, differences in health and nutrition during childhood.

Objectives: a) To describe the socio-economic context in which children (2-5 years) reside in Pampeana and Northwest regions of Argentina, according to ENNyS (2005). b) To analyze the association between potential social determinants and children's nutritional condition in both regions.

Methods: observational cross-sectional study. Social determinants were defined according to available indicators correspond-

ing to the study sample of ENNYS (n=981 children in NOA and n=898 in and Pampeana region. We examined difference in ratios of social indicators between regions. The association of the previously defined factors was analyzed with the nutritional status (reference WHO 2006) in each region using a Chi-squared and Fisher test

Results: The ratio of families with female head of household was higher (p<0.0001) in NOA (64.91% vs 35.09% in Pampeana region). Significant differences were observed in the ratio of families with unsatisfied basic needs and poverty (according to poverty line and indigence line) between both regions, as well as access to potable water, electricity and in-house bathrooms. The NOA was determined as being the most disadvantaged region (p<0.0001). The children's low height was significantly associated with poverty (yes/no) in NOA (p=0.0003) and in Pampeana region (p=0.0147), and was associated with anemia in NOA (p≤0.0001). In NOA region, both underweight (p=0.028) and overweight/obesity (p=0.016), were associated with unsatisfied basic needs.

Conclusions: the two regions studied present differential socio-economic contexts. Nutritional status in children aged 2 to 5 years old is linked to conditions of poverty of their environment, especially in the NOA region. The identification of social determinants in childhood health and nutrition contributes to the definition of policies aimed at reducing the social inequities in health, and the design of future editions of the ENNyS.

Keywords: social differentials , nutritional status, childhood, Argentina.

RETHINKING FOOD SYSTEMS AND FOOD CHOICES THROUGH COMMUNITY GARDEN PARTICIPATION: LESSONS FROM A UNIVERSITY SETTING IN BRAZIL

[1]Milhassi Vedovato, Gabriela; [2]Helena Pereira Nunes, Heloise; [3]Gobetti Leonardi, Fabricio; [4]Manchini Cardoso, Renata.

[1]MS, PhD. Nutritionist. Institute of Health and Society. Baixada Santista Campus. Federal University of Sao Paulo. Brazil.; [2]Social Work. Institute of Health and Society. Baixada Santista Campus. Federal University of Sao Paulo. Brazil.; [3]MS. Social Work. Institute of Health and Society. Baixada Santista Campus. Federal University of Sao Paulo. Brazil.; [4]Nutritionist. Institute of Health and Society. Baixada Santista Campus. Federal University of Sao Paulo. Brazil.

Background and objectives: Community gardens promote health and wellbeing by influencing nutritional and social environments, as well as health-related behaviors. Our objective is to describe the experience of developing a community garden in a university as a context to promote healthy eating.

Methods: Participatory community-based methodologies were adopted to develop collectively an urban garden at the Federal University of Sao Paulo, Santos City, Brazil. An iterative planning was conducted over a ten-month period, beginning with an initial assessment of local resources and community engagement

efforts, succeeded by interdisciplinary activities – besides gardening activities – focusing primarily on food systems and other environmental influences on food choices (i.e., workshops, cooking sessions, educational movies, debates, and social media). Direct observation was used to evaluate each activity in terms of individual responses and participation.

Results: Activities sizes ranged from 9-45 participants, and provided an opportunity for dialogue and sharing of knowledge and perceptions about current food, physical and social environmental changes, lifestyle modifications, and impacts on healthy eating. The meetings appeared to enhance engagement and critical consciousness, intentions to change behavior, and empowerment to modify the environments towards health (e.g. skills acquired were applied creating home gardens and cooking for the family using unprocessed foods). Also, the community garden showed social benefits, such as social interaction, cultural diversity, community cohesion and revitalization of the spaces.

Conclusions: This experience demonstrates the potential of community gardens as a facility to enhance local environmental changes and health-conscious food choices. It provides a basis for interventions to improve community capacity and to support social development.

Keywords: Community garden, community development, community-based participatory research, healthy food system, nutritional environment

ASSOCIATION BETWEEN USUAL FREE SUGAR INTAKE AND BMI Z-SCORE OF AUSTRALIAN CHILDREN AND ADOLESCENTS

[1]Wong, Hon Ting; [2]Louie, Jimmy Chun Yu.

[1]MNutrDiet. School of Biological Sciences. Faculty of Science. University of Hong Kong. Hong Kong Special Administrative Region. China; [2]PhD. School of Biological Sciences. Faculty of Science. University of Hong Kong. Hong Kong Special Administrative Region. China.

Background and objectives: Previous studies suggested dietary sugar consumption to be the main contributing factor in obesity, yet the findings were inconsistent. Moreover, evidence regarding the consumption of free sugar, which was defined as sugar added during manufacturing processes as well as some specific sweet foods, causing obesity was limited. In particular, free sugar from liquid and solid food was found to have different effects on obesity measures. The current analysis aimed to assess the effects

of consuming free sugar from solid and liquid food on the BMI z-score of Australian children and adolescents.

Methods: In this cross-sectional analysis, the data from the 2007 Australian National Children's Nutrition and Physical Activity Survey were used. Participants' dietary intake was collected using two separate multiple-pass 24-hour recalls, and free sugar intake was estimated using a previously established methodology. Usual intake of free sugar was estimated using Multiple Source Method. Structural equation modeling was used to determine the association between usual free sugar intake and age-and-sex-specific BMI z-score, and its indirect effect on BMI z-score moderated via energy over-consumption. Confounding variables such as physical activity level, saturated fat and fiber intake, and socioeconomic statuses were also included in the model.

Results: The association between total free sugar consumption and BMI z-score was weak and statistically non-significant (standardized β = 0.009, P = 0.672). Similar results were obtained when the predictor variable was changed to free sugar from solid food (standardized β = 0.26, P = 0.236) and liquid food (standardized β <0.001, P = 0.991). The effect of usual free sugar intake on BMI z-score mediated via energy over-consumption was minimal (standardized indirect effects = -0.035-0.16).

Conclusions: Usual free sugar intake was not associated, either directly or via energy over-consumption, with BMI z-score in this dataset. This possibly reflected the complex relationship between free sugar intake and obesity. However, limitations of this study, such as underreporting and bias in the sampling period, may also have contributed to the findings. Further research effort is needed to further elucidate the roles played by free sugar consumption in causing obesity in children and adolescents.

Keywords: free sugar, structural equation modeling, children, obesity, Australia

EFFECTS OF MACRONUTRIENT DISTRIBUTION ON WEIGHT CHANGE AND RELATED CARDIO-METABOLIC PROFILES IN HEALTHY NON-OBESE CHINESE: A RANDOMIZED, CLINICAL TRIAL

[1]Li, Duo; [2]Wan, Yi; [2]Wang, Fenglei; [3]Yuang, Jihong; [3]Li, Jie; [3]Jiang, Dandan; [4]Zheng, Jusheng; [5]Huang, Tao; [6]Mann, Jim.

[1]PhD. Institute of Nutrition & Health. Qingdao University. China; [2]Department of Food Science and Nutrition. Zhejiang University. Hangzhou. China; [3]No. 1 Department of Nutrition. Chinese PLA General Hospital. Beijing. China; [4]MRC Epidemiology Unit. University of Cambridge. Cambridge. UK; [5]Saw Swee Hock School of Public Health. National University of Singapore. Singapore; [6]Departments of Human Nutrition and Medicine. University of Otago. Dunedin. New Zealand.

Background and objectives: In the past 30 years, obesity rates in China have increased rapidly in parallel with a transition from the traditional lower fat, higher carbohydrate diet to a diet relatively higher in fat and reduced in carbohydrate.

To determine whether the traditional lower fat, higher carbohydrate diet is more effective than the higher fat, lower carbohydrate diet at preventing obesity among a non-obese healthy population in China.

Methods: Six-month randomized controlled-feeding trial conducted at Zhejiang University in Southern China, and Chinese PLA General Hospital in Northern China. Healthy young adults (aged 18-35 years, body mass index < 28) who lived on the university campus or in the hospital dormitory. (1) A lower fat, higher carbohydrate diet (fat 20% , carbohydrate 66% energy)); (2) a moderate fat, moderate carbohydrate diet (fat 30%, carbohydrate 56% energy); (3) a higher fat, lower carbohydrate diet (fat 40%, carbohydrate 46% energy). Protein provided 14% energy in all diets. Spectrum of fat intake was achieved by replacing a proportion of energy derived from carbohydrates (white rice and wheat flour) with fats (soybean oil).

Results: Reduction in body weight was significantly greater in the lower fat, higher carbohydrate group throughout the intervention (P < .001 for the interaction between diet group and time). Weight change at 6 months was -1.6 kg (95% CI: -1.8, -1.4) for the lower fat, higher carbohydrate group, -1.0 kg (95% CI: -1.2, -0.8) for the moderate fat, moderate carbohydrate group, and -0.8 kg (95% CI: -1.1, -0.5) for the higher fat, lower carbohydrate group. Reductions in waist circumference, total cholesterol, lower-density lipoprotein cholesterol, non-higher-density lipoprotein cholesterol and apolipoprotein B on the lower fat, higher carbohydrate group were greater than those observed on the other two diets groups.

Conclusions: Among healthy non-obese Chinese, a lower fat, higher carbohydrate diet is more effective than higher fat, lower carbohydrate diet at preventing obesity and improving cardiometabolic risk profile. (ClinicalTrials.gov NCT02355795.)

Keywords: Fat, carbohydrate, intervention, cardiometabolic risk, body weigh

PARENT`S KNOWLEDGE, ATTITUDES, AND PRACTICES ABOUT SALT/SODIUM INTAKE IN CHILDREN

[1]Gaitan-Charry, Diego; [2]Arboleda, Juan; [3]Marroquin, Juan; [4]Lozano, Gustavo; [5]Cadavid Castro, Martha Alicia; [6]Arboleda, Luz Marina.

[1]Md, Phd. Assistant Professor. Nutrition And Dietetics School. University Of Antioquia. Colombia; [2]Bsc. Faculty Of Medicine. University Of Antioquia. Colombia; [3]Bsc. School Of Nutrition And Dietetics. University Of Antioquia. Colombia; [4]Msc. Professor. School Of Nutrition And Dietetics. University Of Antioquia. Colombia; [5]Msc. Assitant Professor. School Of Nutrition And Dietetics. University Of Antioquia. Colombia; [6]Phd. Faculty. School Of Nutrition And Dietetics. University Of Antioquia. Colombia.

Background and objectives: PAHO promotes implementation of a knowledge, attitudes and practices (KAP) questionnaire as an element to support strategies to reduce blood pressure (BP) and cardiovascular diseases risk throughout reducing sodium in-

take. PAHO´s KAP is targeted to adult population, however, a reduction of sodium intake also reduces BP in children. Considering that a family environment and parent`s decisions may influence children salt/sodium intakes, our propose was to identify parent's KAP related to salt/sodium intake of children.

Methods: PAHO´s KAP questionnaire was adapted to evaluated salt/sodium variables focusing in Children. The adapted questionnaire was applying to parents and caregivers of children beneficiaries of a food complementary program in Antioquia – Colombia.

Results: Questionnaires were obtained from 2997 parents and caregivers; 37.5 (SD±10.9) years old, 94.3% female, and 65% from rural areas. Related with knowledge, 15.6% of respondents declare that know difference between salt and sodium, 11.4% always know the amount of sodium ingested by children, 15.4% declare that always labeling of children´s food has information about sodium content, 63.5% agree that sodium affects children's health and 62.1% consider that the amount of sodium ingested by their children is adequate. About attitudes, 57.4% and 29.2% of respondent try their children reduce salt and sodium intake, respectively. About practices, 81.7% of respondent declared some action to reduce children's salt/sodium, among them: 22% read food labeling related with sodium, 19.6% choose to buy low sodium content foods, and 68.9% avoid children's addition of salt on the table.

Conclusions: Parents and caregivers recognize that sodium intake has a negative effect on children's health. However, they lack knowledge about what is sodium, furthermore, they think that sodium intake is adequate in children. Parents try to reduce children sodium intake, nevertheless, their actions generally aimed to decrease salt addition, rather than avoid foods source of sodium. It is important to implement educational strategies to sensitize parents and caregivers about a possible excessive intake of sodium in children and identification of food sources of the mineral.

Keywords: Sodium, knowledge, attitudes, practices, parents, children

DIET AND EATING PRACTICES AMONG ADOLESCENT GIRLS IN LOW AND MIDDLE INCOME COUNTRIES: A SYSTEMATIC REVIEW

[1]Keats, Emily; [2]Carducci, Bianca; [3]Gaffey, Michelle; [4]Bhutta, Zulfiqar.

[1]PhD. MPH. Centre for Global Child Health. The Hospital for Sick Children. Toronto. Canada.; [2]MSc. Centre for Global Child Health. The Hospital for Sick Children. Toronto. Canada.; [3]MA. MSc. Centre for Global Child Health. The Hospital for Sick Children. Toronto. Canada.; [4]Phd. MBBS. FRCPCH. FAAP. Centre for Global Child Health. The Hospital for Sick Children. Toronto. Canada.

Background and objectives: Adolescent girls in LMICs have worse nutrition profiles when compared to their counterparts in high-income settings, including greater risks for undernutrition, overweight/obesity, and micronutrient deficiencies. Considering the dramatic shift from communicable to non-communicable diseases (NCDs) in LMICs, the recognition of poor diet as a key risk factor for NCD is also becoming increasingly important. Additionally, adolescent pregnancy is three times higher in LMICs, highlighting the dual burden of poor nutrition and increased pregnancy rates for adolescents in these contexts. It is well established that malnutrition in pregnancy, particularly for adolescents, can lead to poor maternal and infant birth outcomes and sustained intergenerational effects.

Adolescence represents a key entry point for nutrition interventions that will underlie good health and practices in adulthood, especially considering the psychosocial growth and increasing autonomy that occurs during this period. However, before establishing appropriate interventions, we must first understand current trends in intake. As such, the objectives of this review are to describe the dietary intake and practices of adolescent girls in LMICs.

Methods: Using an adapted version of the UNICEF framework for child undernutrition as a logic model, we will systematically evaluate existing literature on the dietary intake and practices of adolescent girls in LMICs. Types of studies and documents to be reviewed will include observational studies, surveys, qualitative research studies, program evaluations, and other descriptive program documents. Participants must include adolescent girls (10-19 years). Primary outcomes assessed will include: types of food consumed, food composition, place consumed, and frequency of consumption. Secondary outcomes will be data dependent and will include height, weight, BMI, and micronutrient deficiencies. Studies conducted in high-income settings and those published prior to 2000 will be excluded.

Results: Pending.

Conclusions: Understanding adolescent girls' dietary intake and practices is critical for identifying causes of malnutrition in order to offer strategic recommendations for improvement through programming, advocacy, and future research. This study will not only synthesize existing evidence across several contexts, but it will translate knowledge into useable action points for country officials.

Keywords: Adolescent, LMIC, diet, eating practices, nutrition transition

POLYCYCLIC AROMATIC HYDROCARBONS BIOMARKER AMONG NON-OCCUPATIONALLY EXPOSED INDIVIDUALS IN SILESIA

(1)Zając, Joanna; (2)Kolarzyk, Emilia; (3)Szot, Wojciech; (4)Potocki, Artur; (5)Koperny, Magdalena.

(1)MSc. Nutritionist. Biologist. Department of Hygiene and Dietetics. Jagiellonian University. Medical College. Krakow. Poland.; (2)Prof. Biologist. Department of Hygiene and Dietetics. Jagiellonian University. Medical College. Krakow. Poland.; (3)PhD. MD. Department of Hygiene and Dietetics. Jagiellonian University. Medical College. Krakow. Poland.; (4)MSc. Chemist. Department of Hygiene and Dietetics. Jagiellonian University. Medical College in Krakow. Poland.; (5)MSc. Public health practitioner. Systematic Reviews Unit – Polish Cochrane Branch. Jagiellonian University. Medical College. Krakow. Poland.

Background and objectives: Polycyclic aromatic hydrocarbons (PAH) constitute a composition of different molecules, ubiquitously present in the environment. Typically are connected with cigarette smoke and heavy industry, while those compounds can be present in food as a result of heat processing, such as: grilling, smoking or frying. The aim of presented study was measurement of PAHs' biomarker: 1-hydroxypyrene, among non-occupationally exposed individuals.

Methods: 206 individuals from region of Silesia in Poland were analyzed with respect to 1-hydroxypyrene urine concentration. High performance liquid chromatography with solid phase extraction and fluorescent detection was used for measurement. Biomarker concentration was normalized for creatinine. Questionnaires for all participants focusing on smoking status and knowledge about PAH sources were obtained.

Results: Mean concentration of biomarker was 0,74 µg/g (SD: 0,39; max: 1,94 µg/g; min:0,06 µg/g). 15% of participants were no-smokers. Smokers obtained higher values comparing to non-smokers (0,82 µg/g; CI: 0,76 to 0,87 vs. 0,73 µg/g; CI: 0,67 to 0,78). Participants were not aware about food sources of PAHs.

Conclusions: Results measured for non-smoking individuals are higher than guidelines described as guidance value for non-smokers, not exposed at work (0,46 µg/g). The basic knowledge about presence of PAHs in food and practical ways how such exposition can be lowered is especially important as for general population diet remains substantial PAHs' source.

Keywords: biomarker, 1-hydroxypyrene, polycyclic aromatic hydrocarbons

FOOD ENVIRONMENTS OF SCHOOL-AGED CHILDREN AND ADOLESCENTS IN LOW- AND MIDDLE- INCOME COUNTRIES: INVESTIGATING A PROPOSED CONCEPTUAL FRAMEWORK

(1)Carducci, Bianca; (2)Keats, Emily; (3)Gaffey, Michelle; (4)De-Regil, Luz Maria; (5)Roth, Daniel; (6)Bhutta, Zulfiqar.

(1)MSc. Centre for Global Child Health. The Hospital for Sick Children. Canada.; (2)PhD. MPH. Centre for Global Child Health. The Hospital for Sick Children. Canada.; (3)MA. MSc. PhD candidate. Centre for Global Child Health. The Hospital for Sick Children. Canada.; (4)DSc. MSc. Micronutrient Initiative. Canada.; (5)MD. PhD. Department of Paediatrics and Centre for Global Child Health. The Hospital for Sick Children and University of Toronto. Canada.; (6)PhD. MBBS. FRCPCH. FAAP. Centre for Global Child Health. The Hospital for Sick Children. Canada.

Background and objectives: Adequate nutrition during school-age and adolescence is important for both current and future health, and these periods are key windows of opportunity for the catch-up growth needed to prevent persistent intergenerational effects of malnourishment (Black et al., 2013; PAHO, 2011). While there have been efforts to determine the burden of malnutrition (undernutrition, overweight/obesity and micronutrient deficiencies) among school-aged children (SAC) and adolescents in LMICs, little is known about the influence of the food environment, particularly in low- and middle-income country (LMIC) settings. Food environments are defined as the collective physical, economic, policy and socio-cultural surroundings, opportunities and conditions that influence people's food and beverage choices and nutritional status (Swinburn et al., 2014). The objective of this study is to synthesize available evidence on the characteristics of the food environment of SAC and adolescents in LMICs in order to substantiate a proposed conceptual framework.

Methods: We comprehensively searched for and evaluated studies and reports published since 2000 in the peer-reviewed and grey literature that describe or assess characteristics of the food environment including product (food availability, assistance and supply), proximity (accessibility), promotion (advertising), prominence (shelf-space), purchasing (sales analysis), price (affordability), preference (choice, desirability and acceptability) and policy (legislation and regulation) among school-aged children (5-9 years) and adolescents (10-19 years) across LMICs. We included observational and experimental study designs, national and subnational policy, program and strategy documents, while excluding animal studies and systematic reviews. Electronic databases (Medline, Embase, CAB abstracts, PsycINFO, Web of Science, The Cochrane Library, CINAHL) were searched using a combination of appropriate keywords, MeSH, and free text terms.

Results: Pending – synthesis is ongoing.

Conclusions: From this synthesis, we will substantiate a proposed conceptual framework of the food environment of SAC and adolescents. Understanding characteristics of the food environment is critical for identifying associations to diet-related health

outcomes and possible indicators of the food environment of SAC and adolescents.

Keywords: Food Environment, Nutrition, Diet, School-age Children, Adolescents

NUTRITIONAL CONDITION OF CHILDREN AND SOCIAL REPRESENTATIONS OF THE RIGHT OF HEALTH OF CAREGIVERS

[1]Boni, Lucia; [2]Crespo, Lucia; [3]Rodríguez Junyent, Constanza; [4]Scruzzi, Graciela.

[1]BSc Nutritionist. Carrera de Nutricion. Universidad Catolica de Cordoba; [2]BSc Nutritionist. Carrera de Nutricion. Universidad Catolica de Cordoba. Argentina; [3]PhD Student. Carrera de Nutricion. Universidad Catolica de Cordoba. Argentina; [4]MPh. Escuela de Nutrición. Universidad Nacional de Córdoba y Universidad Católica de Córdoba. Argentina.

Background and objectives: Introduction: Human rights approach allows you to define the obligations of States against major human rights; the concept of health has evolved, is now recognized as a fundamental right determined by a set of personal, social, economic, political and environmental conditions; proper nutrition is necessary but not enough to be healthy.

Objective. Investigate the nutritional condition of children in a kindergarten and social representations of the right to health of caregivers.

Methods: This research was carried out from two perspectives. In a first stage it was approached from the quantitative perspective, determining the nutritional condition of 89 children attending the kindergarten. In a second stage, from the qualitative perspective, a study on the representations of the right to health of caregivers was done through purposive sampling. They were conducted seven interviews, also participant observation. The analysis of qualitative data was performed using the constant comparative method and inter-method triangulation.

Results: 9% of children were stunted, and 35% overweight or obese. No sex or age differences were found. As for the performances all mothers considered health as absence of disease and parents as primarily responsible for the health of children, malnutrition was not visualized as a health problem; while teachers and health professionals, had a more comprehensive view, they recognize the health situation of children and incorporate the state as guarantor. Violence, drug and alcohol, and pollution were the main problems represented by the interviewees.

Conclusions: It requires a paradigm shift in terms of concepts of health, rights, citizenship, and empower citizens to recognize and exercise their rights, highlighting the State's obligation to adopt measures to guarantee and fulfill the right to health in this community.

Keywords: social representations, rights, health, childhood, nutritional condition.

HEALTHY DIETS ARE NOT MORE EXPENSIVE THAN THE CURRENT DIET IN NEW ZEALAND

[1]Mackay, Sally; [2]Lee, Amanda; [3]Vandevijvere, Stefanie; [4]Swinburn, Boyd.

[1]MSc. Registered Nutritionist. School of Population Health. University of Auckland. New Zealand.; [2]PhD. The Australian Prevention Partnership Centre. Sax Institute. Australia.; [3]PhD. School of Population Health. University of Auckland. New Zealand.; [4]MD. School of Population Health. University of Auckland. New Zealand World. Health Organization Collaborating Centre for Obesity Prevention. Deakin University. Australia.

Background and objectives: Price and affordability of diets are important determinants of food choice and therefore health. A standardized method to determine the relative price and affordability of healthy diets compared to current diets was developed and tested in New Zealand.

Methods: A healthy diet meeting food and nutrition guidelines, nutrient reference values, and energy requirements for a healthy BMI, and a current (unhealthy) diet based on eating patterns identified from national nutrition surveys and energy requirements for the current population BMI were developed. Food prices were collected from three supermarkets, fresh produce stores and takeaway outlets. Affordability of the diets was assessed using three income scenarios for a household of four. Only the current diet contained alcohol, takeaways or discretionary foods (energy dense, high in saturated fat, sugar, sodium). A range of scenarios assessed the cost of diets after changing different metrics such as the type of price (e.g. usual, discounted), diet composition or energy adjustments.

Results: The healthy and current diets were similar in cost at NZ$566 per fortnight. If households were receiving welfare assistance, the healthy and current diets would require 45% of household income and, if receiving the median household income, 18% of household income. If GST were removed from healthy foods, the healthy diet would become 6% cheaper than the current diet. The relative differences between diets changed when scenarios were modeled for inclusion of foods in the healthy diet (healthier takeaways, discretionary foods at 6% of energy, moderate amount of alcohol), which price to use (discounts, brand choice), and whether the diets were isocaloric.

Conclusions: The relative price and affordability of a healthy and current New Zealand diet was similar, however changing some aspects of price or diet changed the price differential. It is essential when comparing diet costs over time or between locations to use the same principles and methodology.

Keywords: Food affordability, Diet cost

THE PATIENTS WITH GESTATIONAL DIABETES AND OBESITY MOSTLY REQUIRE INSULIN AS A TREATMENT AUTHORS

[1]Saurral, Ruben; [2]Manià, Silvana; [3]Fernandez, Daniela; [3]Rafael, Rodnay; [3]Sanchez, Nelson; [3]Avendaño, Ariel; [3]Pool, Ramiro.

[1]MD. Departamento de Diabetes y Embarazo. Maternidad Municipal Maria Eva Duarte de Peron. Buenos Aires. Argentina; [2]Nutritionist. Departamento de Diabetes y Embarazo. Maternidad Maria Eva Duarte de Peron. Buenos Aires. Argentina; [3]MD. Departamento de Diabetes y Embarazo. Maternidad Maria Eva Duarte de Peron. Buenos Aires. Argentina.

Background and objectives: Determining nutritional status, diagnostic method and treatment in patients with gestational diabetes.

Methods: Descriptive, retrospective, observational study of the pregnant population attending the Diabetes and Pregnancy clinic of the Maternity Municipality of Malvinas Argentinas, Buenos Aires, between January and December 2014. Information was gathered from clinical records.

The diagnosis method of fasting plasma glucose and Oral glucose tolerance test according to the latin american association of diabetes (ALAD) criteria, insulin treatment or dietary plan only, the mean of BMI and age. The data was processed with the EPI INFO7 statistical program.

Results: 227 cases of GDM were confirmed in relation to the 3975 registered births. The nutritional status based on the BMI: obesity 35%, overweight 27% , normal 36%, underweight 2%.

The average age was 29 years, the mean BMI was 28. It was detected with OGTT: 81%, and with FPG: 19% .

From the group of patients diagnosed with gestational diabetes through OGTT: 34% required only food plan, his average age was 28 years and the BMI 25; 37% required insulin with an average age of 30 years and BMI of 30; 29 % failed to evaluate treatment for concurrent treatment with full term.

From the group of patients diagnosed with gestational diabetes through FPG: 22% required only food plan, his average age was 25 years and BMI 27.5; 64% required insulin with an average age of 28 and a mean BMI of 31.5; 14% failed to evaluate treatment for concurrent treatment with full term.

Conclusions: In our population with GDM, 35% presented obesity and 27% were overweight; The patients who required an insulin treatment the average presented obesity, regardless of the diagnostic method, which shows the need to act on modifiable risk factors.

DETERMINING THE PREVALENCE OF EATING DISORDERS AMONG DIETETIC STUDENTS IN SOUTH AFRICA

[1]Barnard, Jandri; [2]Veldman, Frederick; [3]Kassier, Suna.

[1]MSc. Dietetics. College of Agriculture Earth and Environmental Sciences. University of KwaZulu Natal. South Africa; [2]Head of Department and Professor. School of Health Care Sciences. Sefako Makgatho University. Pretoria. South Africa; [3]PhD. Nutrition and Dietetics. Dietetics and Human Nutrition Department. University of KwaZulu Natal. South Africa.

Background and objectives: It is expected that eating disorders (EDs) are more prevalent among first year dietetic students, but results contra-indicate that it is higher in first year non-dietetic students. Eating behaviour and eating attitude of students also vary among study majors, as well as subsequent years of dietetic study. To determine and compare the i)BMI (body mass index), ii)eating behaviour and iii)eating attitude of a sample of 62 first- ,third- and fourth year dietetic- versus 83 first year non-dietetic students.

Methods: A cross-sectional descriptive survey was conducted by using the 'Sick, Control, One stone, Fat, Food' (SCOFF)- and Eating Attitude Test-26 (EAT-26) questionnaire (eating behaviour) and Three Factor Eating Questionnaire (TFEQ) (eating attitude) to compare a convenience sample of female undergraduate students (N = 145). It was compared for first- (n = 24), third and fourth year (n = 38) dietetic students and first year non-dietetic students (n = 83).

Results: First year non-dietetic students had a higher prevalence for Bulimia Nervosa (SCOFF1 - 11%), binge eating (SCOFF2 - 53.7% and EAT A – 22.9%), weight loss (SCOFF3 – 20.7%) and believing themselves to be fat (SCOFF4 – 50%). While first year dietetic students had a higher indication for food dominating their lives (SCOFF5 - 41.7%), Bulimia Nervosa (EAT B – 4.2%), using diet pills for weight loss (EAT C – 16.7%) and being previously treated for an ED (EAT D –8.3%). But the mean BMI of first year dietetic students (23.2±4.3 kg/m2) was lower than first year non-dietetic students (24.2±5.3 kg/m2).

Conclusions: A standardized screening tool could be used to select prospective dietetic students at Universities, in order to determine if they suffer from an existing or undiagnosed ED, as it should be emphasised that the core business of the dietititian is to help others with their eating habits. Thus firstly be in a position to address their own eating habits and behaviours. During selection the proposed screening tool 'ED questionnaire' (shortened version of the SCOFF questionnaire and behavioural questions of the EAT-26 questionnaire) was developed. They can then receive timeous intervention regarding existing eating habits and food-related behaviours.

ASSOCIATION BETWEEN DIETARY PATTERNS AND SLEEP APNEA SYNDROME SEVERITY

[1]Lopes, Tássia; [2]Eduardo de Souza Borba, Matheus; [3]Tadashi Hattori, Wallisen; [4]do Vale Cardoso Lopes, Raíssa; [5]Mara Fisberg, Regina; [6]Shivappa, Nitin; [7]Zalcman Zimberg, Ioná; [8]Aparecida Crispim, Cibele.

[1]PhD candidate. Nutritionist. Health Sciences Post-graduation Program. Federal University of Uberlândia; [2]Nutrition Student. Federal University of Uberlandia. Brazil; [3]PhD. Biologist. Professor. Faculty of Medicine. Federal University of Uberlandia. Brazil; [4]MSc.Nutritionist.Department of Nutrition. University of Sao Paulo. Brazil; [5]PhD. Nutritionist. Professor. Department of Nutrition. University of Sao Paulo. Brazil; [6]PhD. Researcher. Arnold School of Public Health. Cancer Prevention and Control Program. University of South Carolina. United States; [7]PhD. Nutritionist. Researcher. Monash University. Australia; [8]PhD. Nutritionist. Professor. Faculty of Medicine. Federal University of Uberlandia. Brazil.

Background and objectives: Studies have shown a strong positive association between obstructive sleep apnea syndrome (OSAS), body mass index (BMI) and obesity. Some studies have shown that an increased intake of some nutrients intake - such as fat - can aggravate OSAS; however, studies evaluating the dietary pattern of individuals with OSAS are still scarce. Therefore, the objective of this study was to evaluate the association of dietary intake and OSAS severity.

Methods: A total of 305 OSAS patients were evaluated in a private clinic in Uberlândia city, Minas Gerais State, Brazil. Dietary intake was evaluated using a food frequency questionnaire (FFQ), and Dietary Inflammatory Index (DII) scores were computed. Higher DII scores indicate a more pro-inflammatory diet and lower scores indicate a more anti-inflammatory. Association between macronutrients, alcohol intake and DII data and apnea severity (mild, moderate and severe) was evaluated in different multinomial logistic regressions, using the mild degree of apnea severity as a reference. Analyses were adjusted for age, BMI and sex.

Results: It was observed that saturated fat intake (Beta=0.072, p=0.012,CI95% 1.016-1.136) showed a positive association with moderate degree of OSAS; alcohol showed a positive association with moderate (Beta=0.058,p=0.004, CI95% 1.019-1.102) and severe degree of OSAS (Beta=0.057, p=0.004, CI95% 1.019-1.099). Carbohydrate (Beta=-0.112, p=0.040, CI95% 0.986-1) and fiber (Beta=-0.064, p=0.014,CI95% 0.891-0.987) intake presented an inverse association with OSAS. There was no significant association between DII, energy, fat, protein and cholesterol intake and OSAS severity.

Conclusions: In conclusion, dietary patterns had an association with degrees of apnea severity, with more impact on moderate than severe apnea.

HIGHER SERUM CAROTENOIDS ASSOCIATED WITH IMPROVED CARDIOMETABOLIC PROFILES IN MIDDLE-AGED AND ELDERLY ADULTS: A 6-YEAR PROSPECTIVE STUDY

[1]Chen, Yuming; [2]Wang, Cheng; [3]Zeng, Fang fang; [2]Cao, Wenting; [2]Chen, Geng-dong; [4]Cao, Yi; [5]Liu, Jun; [4]Qiu, Rui; [4]Xiao, Mian-li.

[1]Sun Yat-sen University; [2]PhD student. Department of Medical statistics and Epidemiology. Sun Yat-sen University. China.; [3]PhD. Research fellow. Department of Medical statistics and Epidemiology. Sun Yat-sen University. China.; [4]MSc student. Department of Medical statistics and Epidemiology. Sun Yat-sen University. China.; [5]PhD. Associate professor. Department of Medical statistics and Epidemiology. Sun Yat-sen University. China.

Background and objectives: Previous studies suggested greater levels of carotenoids in diet or blood might be associated with cardiovascular risk factors, but scare data are available from prospective studies. This prospective study examined the associations of serum concentrations of carotenoids with cardiometabolic profiles (body fat, metabolic syndrome [MS], carotid intima-media thickness [cIMT], and non-alcoholic fatty liver disease [NAFLD]) in a community-based Chinese population.

Methods: A total of 4066 participants (40-75 years, 68% women) were recruited in urban Guangzhou (South China) at baseline, 79.3% and 73.0% of them were followed-up at the 3rd and 6th years. We collected general information, lifestyle factors and other covariates using Face-to-face interviews at each visit. Serum levels of carotenoids (α-, β-carotene, β-cryptoxanthin, lycopene and lutein/zeaxanthin) were examined by HPLC at baseline. MS-related indices and cIMT (by ultrasonography) were determined at each visits. Body fat (by dual-energy X-ray absorptiometry) and NAFLD (by abdominal ultrasonography and serum triglycerides and transaminases) were measured at the first and second follow-ups. Serum inflammatory biomarkers (CRP and RBP4) were also tested.

Results: After adjustment for multiple covariates, HRs (95% CIs) of incident MS for the highest (vs. lowest) quartile (Q) were 0.39 (0.31-0.51) for lycopene, 0.42 (0.32-0.54) for α-carotene, 0.45 (0.34-0.56) for β-carotene, 0.72(0.57-0.90) for lutein/zeaxanthin, and 0.47(0.37-0.61) for total carotenoids (all P-trends <0.05). Greater total carotenoids in serum were associated significantly lower %fat mass (4.0%-7.8%, Q4 vs. Q1, p-trends<0.001) and lower changes in trunk fat and waist circumference (p-trends <0.05). cIMTs of common artery tended to be less increased in the higher group of some serum carotenoids (p-trends<0.05). The percentage mean difference in serum carotenoids in the improved (vs. progressed) NAFLD group were 9.1% for alpha-carotene, 22.0% for beta-carotene, 14.6% for beta-cryptoxanthin, 4.3% for lutein/zeaxanthin and 12.1% for total carotenoids in total subjects (all p<0.05) after adjusting for potential covariates. Path analyses showed that CRP and RBP4 played a significant intermediation role between carotenoids and MS and NAFLD.

Conclusions: Higher blood concentrations of carotenoids are associated with low risk of MS, favorable progress in body fat, cIMT and NAFLD mediated by inflammatory biomarkers in middle-aged and elderly Chinese adults.

Keywords: blood carotenoids; metabolic syndrome; carotid intima-media thickness; non-alcoholic fatty liver disease; body fat

EFFECT OF POLICY REFORMS ON FOOD AND NUTRITION TRENDS IN VIETNAM AND MYANMAR FROM 1960 TO 2015

[1]Nguyen, Tuan; [2]Lapping, Karin; [3]Mathisen, Roger; [4]Itzkowitz, Laura; [5]Cashin, Jennifer; [6]Frongillo, Edward.

[1]MD, MS, PhD. Technical specialist. Alive & Thrive Southeast Asia. FHI 360. Vietnam.; [2]MPH, PhD. Project Director. Alive & Thrive. FHI 360. USA.; [3]MPH. Program Director. Alive & Thrive Southeast Asia. FHI 360. Vietnam.; [4]MPH. Consultant. Alive & Thrive Southeast Asia. FHI 360. Vietnam.; [5]MPH. Consultant. Alive & Thrive Southeast Asia. FHI 360. Myanmar.; [6]PhD. Professor. Arnold School of Public Health. University of South Carolina. USA.

Background and objectives: Global and national policy changes and events can affect food and nutrition trends. We conducted this study to examine the ecological association between policy changes and events and trends in food- and nutrition-related measures in Vietnam and Myanmar from 1960 to 2015.

Methods: We used an interrupted time-series design at the country level for this study. We identified relevant policies and events from 1960 to 2015 in Vietnam and Myanmar from WHO's Nutrition Landscape Information System and other available sources. We examined national trends in economy, agriculture, nutrition, and health measures gathered from World Bank, FAO, WHO, and UNICEF databases in relationship to policy changes and events in the two countries.

Results: In the last 50 years, both Vietnam and Myanmar had increased urban populations, increased life expectancy at birth, and decreased mortality rates for neonates, infants, young children, and mothers. Both countries had overall growth in gross domestic product, contributed to initially by increased agriculture production and then by trade, manufacturing, industry, and services. The two countries changed toward market economies, joining and getting support from Association of Southeast Asian Nations (ASEAN), lifting of economic sanctions, and implementing trade agreements. There were periods when the economies were negatively impacted by wars and conflicts (e.g., Sino-Vietnamese war and prolonged civil war and political unrest in Myanmar) or failed policies (e.g., "price, salary, and money" reform in Vietnam). In Vietnam, the implementation of policies, including National Nutrition Strategies, was associated consistently with economic, agricultural, and nutritional measures. In contrast, during Myanmar's 2011–2015 political, economic, and administrative changes, growth in gross domestic product slowed. Reduction in prevalence of stunting and underweight was negligible after the Myanmar's National Plan of Action for Food and Nutrition in 1994, but greater after the National Plan of Action in 2011.

Conclusions: Policy changes toward becoming a market economy and National Nutrition Strategies contributed to economic growth, agricultural production, and improved nutritional status in Vietnam and Myanmar. In addition, political stability was critical for these improvements.

SYSTEMATIC ASSESSMENT OF POLICY SPACE IN NEW ZEALAND FOR PRIORITY FOOD ENVIRONMENT POLICIES FOR OBESITY/NCD PREVENTION IN RELATION TO INTERNATIONAL TRADE AND INVESTMENT AGREEMENTS

[1]Garton, Kelly; [2]Thow, Anne Marie; [3]Vandevijvere, Stefanie; [4]Swinburn, Boyd.

[1]MSc. PhD candidate. School of Population Health. University of Auckland. New Zealand.; [2]PhD. Senior Lecturer. Menzies Centre for Health Policy. University of Sydney. Australia.; [3]PhD. Senior Research Fellow. School of Population Health. University of Auckland. New Zealand.; [4]MD. Professor. School of Population Health. University of Auckland. New Zealand.

Background and objectives: Confronting the growing global burden of non-communicable diseases requires policy actions to improve food environments. There are, however, real and perceived barriers to policy development and implementation due to binding commitments under existing international trade and investment agreements (TIAs), which may contribute to regulatory chill. The monitoring of policy space for food environment interventions is thus an important public health priority. This study aims to systematically identify the areas of conflict and coherence between existing trade commitments and priority food environment policies at a national level in New Zealand, to determine where such policies may or may not face real or perceived legal challenges.

Methods: Using the trade and investment law implications of tobacco control policy as a framework, a realist review was carried out to determine the relevance of trade and investment agreement

provisions for public health nutrition. A set of 10 priority policy actions previously identified by public health experts in New Zealand were then cross-referenced with the terms and provisions of 9 international, regional and bilateral TIAs that New Zealand has signed and/or ratified in the last 10 years. These policies were then ranked by order of probability of legal risk.

Results: The results to be presented demonstrate the potential legal implications of national food environment policy priorities for New Zealand, including labeling measures, food composition standards, public procurement, marketing restrictions, and fiscal policy. Their estimated legal risk ranges from high certainty of no conflict (as is the case for introduction of a non-discriminatory excise tax on sugar-sweetened beverages) to high certainty of conflict under certain circumstances (as is the case for some mandatory labeling measures). Primary areas of concern for the selected policies include lack of scientific proof and/or measures not being the least trade restrictive to achieve objectives, interference with usage of trademarks, inconsistent product specifications, and indirect expropriation of investment.

Conclusions: Some priority food environment policy interventions may be pursued with minimal concern of legal challenges under international trade and investment regulations. Others require further analysis to determine under what conditions they could be challenged.

DOES LOVE MAKE MOTHERS BLIND? A TRANS-CONTINENTAL LARGE PAN STUDY ON MOTHERS' UNDERESTIMATION OF THEIR OVERWEIGHT/OBESE CHILDREN'S WEIGHT

[1]*Gafare, Claudia;* [2]*Lorenzoni, Giulia;* [2]*Azzolina, Danila;* [3]*Hochdorn, Alexander;* [4]*Gregori, Dario.*

[1]BS. Dietitian. Department of Nutrition. University of Buenos Aires. Food and Diet Therapy Service. Acute General Hospital Juan A. Fernàndez of Buenos Aires. Argentina.; [2]MA. PhD student. Unit of Biostatistics, Epidemiology and Public Health. Department of Cardiac, Thoracic and Vascular Sciences. University of Padova. Italy.; [3]PhD. Post-doctoral fellow in Psychology. Generational processes, violence and collective imaginary (GEVIM). Post-graduation Program in Psychology. Catholic University of Brasília. Brazil.; [4]PhD. Full Professor in Biostatistics. Unit of Biostatistics, Epidemiology and Public Health. Department of Cardiac, Thoracic and Vascular Sciences. University of Padova. Italy.

Background and objectives: Assessing factors that affect the likelihood to change weight is crucial to develop effective public health strategies fighting the concerning obesity epidemic occurring worldwide. Recently, it has been suggested that parents' misperception of their children body size may affect children's likelihood of losing weight. The present study aimed at assessing

maternal misperception rates (in terms of perception as normal of an overweight/obese child), and the role played by misperception in affecting the chance of implementing actions changing kids' weight in Latin American children.

Methods: Large multicenter cross-sectional study enrolling children from five Latin American countries: Chile, Argentina, Brazil, and Mexico. Kids' eating habits, lifestyles, and families' characteristics were evaluated through a cultural specific validated tool, and mother's perception of children weight status was assessed using a projective test. Children underwent anthropometric assessment, and their Body Mass Index (BMI) was classified in underweight, normal weight and overweight/obese (OWO) according to CDC standards. For the purpose of the analysis, we considered only OWO children.

Results: Six hundred eighty children were enrolled, of these 235 (35%) were OWO. Most of mothers (164, 70%) of OWO children did not correctly perceived their body size, underestimating it. OWO misperceived children were significantly younger (p-value <0.001) compared to those perceived correctly. At multivariable analysis, OWO misperceived children were less likely to be involved in a program to lose weight (p-value <0.001), together with those who ate more frequently snacks (cookies particularly).

Conclusions: Present findings clearly showed that the chance of being involved in a program to lose weight is affected by maternal perception of her child's body size. These results highlight the fact that parental misperception must be taken into account in the planning of public health interventions fighting childhood obesity, since it might negatively affect the effectiveness of such interventions.

IMPACT OF CHILEAN LAW ON FOOD LABELLING AND ADVERTISING ON CHILEAN POPULATION'S KNOWLEDGE ABOUT AND ATTITUDES TOWARDS FOOD LABELLING: A BEFORE-AFTER STUDY

[1]*Gregori, Dario;* [2]*Lorenzoni, Giulia;* [2]*Azzolina, Danila;* [3]*Lanera, Corrado;* [4]*Gafare, Claudia.*

[1]PhD. Full Professor in Biostatistics. Unit of Biostatistics, Epidemiology and Public Health. Department of Cardiac, Thoracic and Vascular Sciences. University of Padova. Italy.; [2]MA. PhD student. Unit of Biostatistics, Epidemiology and Public Health. Department of Cardiac, Thoracic and Vascular Sciences. University of Padova. Italy.; [3]MS. PhD student. Unit of Biostatistics, Epidemiology and Public Health. Department of Cardiac, Thoracic and Vascular Sciences. University of Padova. Italy.; [4]BS. Dietitian. Department of Nutrition. University of Buenos Aires. Food and Diet Therapy Service. Acute General Hospital Juan A. Fernàndez of Buenos Aires. Argentina.

Background and objectives: Childhood obesity represents a severe public health burden, especially in South American coun-

tries where the highest obesity rates worldwide have been registered. Several governments are trying to fight such epidemic by adopting food labelling interventions aimed at reducing the purchase of caloric-dense food. However, real-world data on effectiveness of such interventions are lacking, in particular in this area. The present study aimed to compare Chilean population knowledge about and attitudes towards food labelling before and after the introduction of the Chilean Law on food labelling and advertising.

Methods: A Computer-Assisted Telephone Interview (CATI) was performed in 2012 and 2016 on a sample of Chilean population, enrolled in 2012, using a stratified random sampling procedure. The questionnaire aimed at investigating subjects' socio-demographic characteristics, attitudes towards nutrition and food labelling, willingness-to-pay an additional fee for detailed labels.

Results: One hundred and sixty-seven subjects were interviewed in both 2012 and 2016. Subjects declared to read usually food labelling, and a significantly higher proportion of subjects (32% in 2016 vs 9% in 2012, p-value 0.003) thought that food labelling is the most effective intervention fighting obesity epidemic introduced so far. Unfortunately, the proportion of subjects who provided a correct definition of GDA (guideline daily amount), "per 100 grams", and "per 100 Kcal", did not improve, along with subjects' willingness to pay (46% of subjects in 2016 stated to be not willing to pay an additional fee for more detailed labels compared to none in 2012, p-value <0.001).

Conclusions: Despite the declared interest by consumers in food labeling, worryingly, consumers' understanding of food labelling did not improve after the introduction of the Law in 2016.

PRESENCE OF A RISK POLYMORPHISM FOR OBESITY IN NORTHWEST MEXICO

[1]Astiazarán-García, Humberto; [2]Rendon Del Cid, Pablo Alejandro; [3]Anduro-Corona, Ivan; [3]Contreras Vergara, Carmen; [4]Morales-Figueroa, Gloria Guadalupe; [5]Pacheco-Moreno, Bertha Isabel.

[1]PhD. Research professor. Centro de Investigacion en Alimentacion y Desarrollo. CIAD. Mexico; [2]MSc. Nutritionist. Centro de Investigacion en Alimentacion y Desarrollo. CIAD. Mexico; [3]PhD. Research Associate. Centro de Investigacion en Alimentacion y Desarrollo. CIAD. Mexico; [4]MSc. Research Associate. Centro de Investigacion en Alimentacion y Desarrollo. CIAD. Mexico; [5]BSc. Laboratory Technician. Centro de Investigacion en Alimentacion y Desarrollo. CIAD. Mexico.

Background and objectives: Obesity is an important public health problem due to morbidity and mortality associated to it. There are polymorphisms that may explain, in part, the interaction between obesity and some risk factors. We searched for the presence of FTO SNP rs8050136 and its possible relationship with obesity, diet and metabolic condition, in a cross-sectional study in young-adults from Northwest Mexico.

Methods: Blood samples were collected from 18 young-adults and a fragment of the FTO gene was sequenced, body mass index (BMI) and two-compartment body composition were determined. Dietary intake and physical activity were recorded.

Results: The SNP rs8050136 risk polymorphism (variant A) was found in 33.33% of subjects. Risk carriers were more likely to be obese, they had higher weight (71.97 ± 11.07 vs 60.66 ± 8.39 kg, p = 0.015), Body Mass Index (BMI) (25.57 ± 3.09 vs. 22.65 ± 2.30 kg / M2, p = 0.021) and energy intake (2684.94 ± 689.01 vs 1828.72 ± 343.06 kcal, p = 0.004) compared to no-risk polymorphism. Also variant A carriers showed higher fasting plasma glucose levels (89.66 ± 4.48 vs 84.71 ± 5.45 mg/dL, p=0.036) and tended to have higher triglycerides levels (p=0.093) and lower HDL-cholesterol levels (p=0.059).

Conclusions: Circulating polymorphism SNP rs8050136 of the FTO gene, was found among young-adults from Northwest Mexico (Sonora) and is an important risk factor for obesity.

Keywords: Obesity, Young-adults, FTO, snp rs8050136

DEVELOPMENT OF COMPETENCY SCALE FOR HEALTHCARE STAFF WORKING ON NON-COMMUNICABLE DISEASE PREVENTION AND CONTROL IN FIJI

[1]Ishikawa, Midori; [1]Nomura, Marika; [1]Miyoshi, Miki; [2]Tukana, Isimeli; [3]Matsuura, Shinya; [1]Nishi, Nobuo; [1]Silatolu, Anasaini; [1]Yokoyama, Tetsuji; [4]Kikuchi, Masako; [1]Miura, Hiroko.

[1]PhD; [2]MBBS; [3]BS; [4]MSc.

Background and objectives: This study aimed to develop a scale of competency in healthcare workers for prevention and control of non-communicable diseases in Fiji, and to examine their competency by social factors.

Methods: A cross-sectional survey was conducted with 378 healthcare workers in central Fiji from May to June 2016, and data from 179 complete responses (47.4%) were used for analysis. The survey comprised social factors (sex, age, marital status, academic qualification, ethnic background and religion), working situation factors (facility type, professional qualifications, experience, and location), and competency in 42 items based on previous studies on public health. Exploratory factor analysis was used for competency, and validity and reliability of scale items were assessed using Cronbach's α coefficient, item–total analysis, good–poor analysis, and analysis of variance. The respondents' factor score was compared by social and working situation factors.

Results: Using factor analysis, 16 items were selected to identify four work types of competency: work management, monitoring and evaluation, community partnership, and community diagnosis. The reliability and the validity were confirmed. Ethnic background was related to work management (p = 0.014), monitoring and evaluation (p = 0.002), and community partnership (p = 0.003). Academic qualification was related to monitoring and evaluation (p = 0.026) and community diagnosis (p = 0.004).

Conclusions: We developed a scale of competency for four work types, and found that social factors such as ethnic background and academic qualification were related to the competency. The scale will help healthcare workers to engage in better management of residents with non-communicable diseases in Fiji.

Keywords: Non-communicable diseases, healthcare worker, competency, social factors, Fiji

CHANGES IN DIET QUALITY INDEXES AND SUBSEQUENT RISK OF MORTALITY IN THE MULTIETHNIC COHORT

[1]Park, Song-Yi; [1]Boushey, Carol; [2]Wilkens, Lynne; [3]Le Marchand, Loïc.

[1]PhD. Cancer Epidemiology Program. University of Hawaii Cancer Center. USA.; [2]DrPH. Cancer Epidemiology Program. University of Hawaii Cancer Center. USA.; [3]MD. PhD. Cancer Epidemiology Program. University of Hawaii Cancer Center. USA.

Background and objectives: Healthy eating patterns assessed by diet quality indexes (DQIs) have been related to longevity. Little is known about the influence of changes in diet quality over time on subsequent risk of mortality. We investigated the associations between changes in 4 DQIs (the Healthy Eating Index 2010, the Alternative Healthy Eating Index 2010, the alternate Mediterranean diet score [aMED], and the Dietary Approaches to Stop Hypertension [DASH] score) and mortality in Multiethnic Cohort Study (MEC).

Methods: We analyzed data from the food frequency questionnaires on changes in the 4 DQIs between the baseline (1993-1996) and the 10-year follow-up (2003-2007) in relation to subsequent mortality among 58,837 participants in the MEC in Hawaii and California. The participants were African American, Native Hawaiian, Japanese American, Latino, and white, aged 45-75 years at baseline, and did not report heart diseases or cancer at either survey. Cox proportional hazards model was used with multivariate adjustment.

Results: During an average of 8.2 years of follow-up after the 10-year survey, 7,480 deaths were identified. Compared with individuals whose DQIs changed minimally, those with the largest increase showed the lowest risk for all-cause mortality (8-14%), while those with the largest decrease had the highest risk of death (14-39%) for all 4 DQIs both in men and women (P's for trend < 0.001, P's for heterogeneity by sex > 0.33). In men and women combined, the associations did not vary by age group (45-54, 55-64, and ≥65 years at baseline, P's for heterogeneity > 0.08) and race/ethnicity (P's for heterogeneity > 0.16). An inverse trend for cardiovascular disease mortality was found with all 4 DQIs (P's for trend < 0.004), whereas for cancer mortality this was only found with aMED and DASH.

Conclusions: Our findings suggest that improving diet quality is related to a reduced risk of mortality and a decline in diet quality is related to an elevated risk of mortality. These relationships seen in older adults imply that it is probably never too late to improve the quality of one's diet to achieve better health.

Keywords: cohort, diet quality index, mortality, multiethnic population

ANAEMIA AND IRON DEFICIENCY IN PREGNANT WOMEN LIVING IN AREAS OF LOW AND HIGH IRON IN GROUNDWATER IN BANGLADESH: IMPLICATIONS FOR IRON-FOLIC ACID SUPPLEMENTATION PROGRAMME

[1]Ahmed, Faruk; [2]Khan, Moududur Rahman; [2]Shaheen, Nazma; [3]Chowdhury, Ireen.

[1]PhD. Associate Professor. Public Health. School of Medicine. Griffith University. Gold Coast. Australia; [2]PhD. Professor. Institute of Nutrition and Food Science. University of Dhaka. Dhaka. Bangladesh.; [3]MPH. Nutrition Officer. Unicef. Dhaka. Bangladesh.

Background and objectives: National Micronutrient Status Survey 2011-12 showed a low prevalence of iron deficiency anaemia (IDA) in reproductive-age women of Bangladesh. It was attributed to drinking water. IFA supplementation during pregnancy has been running in Bangladesh for few decades. Given findings of Micronutrient Status Survey 2011-12, relevancy of this intervention needs investigation. Therefore, the objective of this study was to assess the benefits and/or risks of routine IFA supplementation in pregnant women living in both low and high groundwater iron areas in Bangladesh.

Methods: Pregnant women living in low groundwater iron areas (n = 260) and high groundwater iron areas (n = 262) were given iron (60 mg) and folic acid (400 μg) supplements daily for 3.5 months. Data on socio-demographic, pregnancy-related information and dietary pattern were collected. Blood samples were collected at baseline and at the end the supplementation. Haemoglobin and serum ferritin concentrations were measured at both points.

Results: At baseline, mean haemoglobin and serum ferritin concentrations were significantly higher in women of high groundwater iron areas. However, post-supplementation haemoglobin concentrations in two groups were not different, but mean ferritin concentration was significantly higher in the women of high iron areas. Mean change in haemoglobin in women of low groundwater iron areas was higher than in the women in high iron areas and approached statistical significance (p = 0.052). Mean change in serum ferritin did not differ significantly between the groups. No significant changes were observed in the prevalence of anaemia and iron deficiency in either group, while IDA decreased significantly in the women of low groundwater iron areas. However, a significant proportion of pregnant women in areas of high and low iron in groundwater remained anaemic and iron deficient after IFA supplementation for 3.5 months. The risk of anaemia, iron deficiency and IDA after supplementation did not differ significantly between the groups. None had iron overload.

Conclusions: IFA supplementation significantly increased haemoglobin concentration in pregnant women living in low

groundwater iron areas. Routine supplementation with 60 mg iron and 400 µg folic acid, do not pose any significant risk haemoconcentration or iron overload.

Keywords: Anaemia, iron deficiency, iron deficiency anaemia, pregnant women, Bangladesh

THE VITAMIN D STATUS AND ITS RELATIONSHIP WITH SLEEP PATTERN AMONG ADULTS IN SOUTH CHINA

[1]Chen, Mengxue; [2]Xue, Hongmei; [2]Liang, Yi; [2]Li, Danting; [3]Cheng, Guo.

[1]BSc. West China School of Public Health. Sichuan University. Chengdu China.; [2]MD. West China School of Public Health. Sichuan University. Chengdu China.; [3]PhD. West China School of Public Health. Sichuan University. Chengdu China.

Background and objectives: Previous studies have suggested that vitamin D may be involved in the regulation of sleep. While, no study focused this issue on Chinese adults. Here we aimed to assess the vitamin D level among adults in South China, and to examine the association between adult's vitamin D level and sleep pattern.

Methods: Cross-sectional data on 1056 subjects aged 20-70 years old in South China were analyzed. Using PSQI questionnaire, we obtained main sleep information. The total score of questionnaire ranged from 0 to 21: the lower the score was, the better the quality of sleep was. And the nap time of subjects were collected according to the answer by the question, "How many days do you have a nap in a week? How long does it takes each time". Total sleep duration was calculated as a sum of the night sleep duration and nap time. Anthropometric parameters, including weight and height, were measured to calculate body mass index (BMI). The concentration of serum 25(OH)D3 was detected by HPLC.

Results: The median of 25(OH)D3 concentration among all of subjects was 20.90 ng/mL, 19.70 ng/mL for male and 22.10 ng/mL for female. The concentration of serum 25 (OH) D3 in male was lower than that in female ($p < 0.0001$). Percentages of Vitamin D deficiency (defined as 25 (OH) D3 concentration < 20 ng/mL) was 47.16% (n = 498). For women, 25(OH)D3 concentration was not correlated with sleep quality, total sleep duration or nap time ($p > 0.05$). For men, the concentration of serum 25(OH)D3 was positively correlated with nap time ($p<0.05$), but not with sleep quality or total sleep duration ($p > 0.05$). After adjusting for age, season and BMI, however, the relationship between nap time and male 25 (OH) D3 concentration disappeared ($p>0.05$).

Conclusions: Our data suggests, in South China, deficiency of vitamin D levels are prevalent, and vitamin D level might not associate with sleep pattern.

Keywords: PSQI, Vitamin D, 25(OH)D3, Sleep pattern

DIETARY-LIFESTYLE PATTERNS IN YOUNG MEN: A CROSS-SECTIONAL STUDY (MEDISH PROJECT)

[1]Lonnie, Marta; [1]Kowalkowska, Joanna; [2]Wadolowska, Lidia; [3]Bandurska-Stankiewicz, Elzbieta.

[1]MSc. Department of Human Nutrition. Faculty of Food Science. University of Warmia and Mazury in Olsztyn. Poland.; [2]Full Professor. Department of Human Nutrition. Faculty of Food Science. University of Warmia and Mazury in Olsztyn. Poland.; [3]Full Professor. Department of Internal Medicine. Faculty of Medical Sciences. University of Warmia and Mazury in Olsztyn. Poland.

Background and objectives: Although some evidence that dietary and lifestyle behaviours may cluster together exist [1], not much is known about the coexistence of different dietary and lifestyle behaviours in a population of young men. Objective: to identify dietary-lifestyle patterns in young men.

Methods: In all, 235 men 19-40 years old participated in the study. Food frequency method was applied. Dietary and lifestyle characteristics were collected using food frequency questionnaire (KomPAN) [2]. To identify dietary-lifestyle patterns 31 standardised variables were included in Principal Component Analysis: 25 dietary characteristics and 6 lifestyle characteristics.

Results: Four dietary-lifestyle patterns were found explaining 34% of variance (14%,8%,6%,6%). 'Guidelines followers' were characterised by frequent consumption of eggs (factor loading 0.67), groats, oats wholegrain pasta (0.62), poultry (0.59), white rice, pasta, fine groats (0.58), vegetables (0.45), fish (0.45), beans and sprouts (0.43), fruit (0.41), higher number of meals/day (0.55) and leisure-time physical activity (0.54). 'Western diet–active workers' were characterised by frequent consumption of tinned meat (0.49), butter (0.48), red meat (0.47), fried foods (0.46), white bread (0.44), lard (0.42), sweetened beverages (0.37), cheese and processed cheese (0.33), sweets (0.33) and work-time physical activity (0.41). 'Dairy and plant eaters' were characterised by frequent consumption of fermented dairy products (0.59), cheese curd (0.58), milk (0.51), fruit (0.49), wholegrain bread (0.47), vegetables (0.42) and butter (0.32). 'Convenient foods and stimulation seekers' were characterised by frequent consumption of energy drinks (0.55), alcohol (0.46), sweetened beverages (0.41), meat, sausages, frankfurters (0.40), fast foods (0.30) and current and past smoking (0.69 and 0.59, respectively).

Conclusions: Two patterns, among four identified, clustered both: dietary and lifestyle behaviours. Only one pattern was consistent with nutritional and physical activity recommendations. Two dietary-lifestyle patterns were clearly unhealthy. One unhealthy pattern clustered work-related activity with western diet, and another: fast foods consumption with stimulants. In prevention programs, focus should be laid on blue-collar workers and stimulants' users.

DIETARY CARBOHYDRATES: A REVIEW OF INTERNATIONAL RECOMMENDATIONS AND THE METHODS USED TO DERIVE THEM

[1]Buyken, Anette; [2]Mela, David J.; [3]Dussort, Pierre; [4]Johnson, Ian T.; [5]MacDonald, Ian A.; [6]Stowell, Julian D.; [7]Brouns, Fred J.P.H.

DuPont Nutrition & Health. Danisco Ltd. Reigate. United Kingdeom; [7]Professor. Faculty of Health. Medicine and Life Sciences. Department of Human Biology. Maastricht University. Maastricht. The Netherlands.

Background and objectives: Renewed dietary recommendations for carbohydrates have recently been published by various international health authorities. The present work 1) reviews the methods and processes (systematic approach/review, inclusion of public consultation) used to identify, select and grade the evidence underpinning the recommendations, particularly for total carbohydrate (CHO), fibre and sugar consumption, and 2) examines the extent to which variation in the methods and processes applied relates to any differences in the final recommendations.

Methods: A search of WHO, US, Canada, Australia and European sources identified 13 authoritative documents with the desired detailed information. Processes and methods applied to derive recommendations were compiled and compared.

Results: 1) A relatively high total CHO and fibre intake and limited intake of (added or free) sugars are generally recommended. 2) Even where recommendations are similar, the specific justifications for quantitative/qualitative recommendations sometimes differ across authorities. 3) Differences in recommendations mainly arise from differences in the underlying definitions of CHO exposure and classifications, the degree to which specific CHO-providing foods and food components were considered, and the choice and number of health outcomes selected. 4) Differences in the selection of source material, time frames or data aggregation and grading methods appeared to have minor influence.

Conclusions: Despite general consistency, apparent differences among the recommendations of different authorities would likely be minimized by: 1) More explicit quantitative justifications for numerical recommendations and communication of uncertainty, and 2) greater international harmonization, particularly in the underlying definitions of exposures and range of relevant nutrition-related outcomes.

NUTRIENT PATTERNS WITH HYPERTENSION AND THEIR ASSOCIATIONS TO SOCIO ECONOMIC VARIABLES AND OBESITY IN TRIBAL POPULATION OF ADULTS IN INDIA

[1]Balakrishna, Nagalla; [2]Varanasi, Bhaskar; [3]Arlappa, Nimmathota; [4]Rachakulla, Harikuumar; [5]K, Sreeramakrishna; [3]Indrapal I, Meshram; [6]Avula, Laxmaiah.

[1]Ph.D. Scientist 'E'. National Institute of Nutrition. Hyderabad. India; [2]Bio Statistics. National Institute of Nutrition. Hyderabad. India; [3]MD.Community Medicine. National Institute of Nutrition. Hyderabad. India; [4]DPH.Community Medicine. National Institute of Nutrition. Hyderabad. India; [5]Community Medicine. National Institute of Nutrition. Hyderabad. India; [6]PH.D.Community Medicine. National Institute of Nutrition. Hyderabad. India.

Background and objectives: Tribal people constitute 8.6% of the nation's total population, over 104 million people according to the 2011 census. The Objective of the study was to identify nutrient patterns and how they associate with socio-demographic,

and body mass index, WHR and hypertension with nutrient patterns in tribal adults in India.

Methods: A total of 4965 men and 7612 women (≥ 20 year of age) in the selected households were covered for various investigations. Nutrients were calculated from 24hr recall diet survey. Factor Analysis was applied to study the nutrient patterns. Multiple linear regression models were fitted and computed respectively for each of the retained factor scores on socio-demographic and obesity variables. Prevalence of hypertension was calculated and associations with nutrient patterns by logistic regression.

Results: Three nutrient patterns explaining 69% of the total variance were identified in both genders: First factor explained 28% of variation by protein & fat; Second factor (24%) by B vitamins, thiamine and niacin; 3rd factor (17%) by Vitamin A & C nutrients. Nutrient patterns were significantly associated with various obesity variables. Prevalence of hypertension was 23.5% and 20.6% respectively for men and women. Hypertension was inversely associated with 1st component and positively related with 3rd component after adjusting confounding variables of obesity, age and socio economic variables.

Conclusions: Three components namely macro nutrients, B vitamins and Vitamins A & C were explained 69% of total variance. Nutrient patterns were significantly associated with obesity variables. Also hypertension was associated with nutrient patterns.

PREVALENCE OF LOW BIRTH WEIGHT IN DHAKA CITY AND ITS ASSOCIATION WITH MOTHER'S AGE

[1]Shaheen, Razia; [1]Roy, Medha; [1]Anny, Aklima; [1]Shova, Nelufa Yeasmin; [1]Hema, Tasmia; [2]Ratna, Moffashara Sultana; [3]Ara, Ferdous; [4]Jahan, Khurshid; [5]Roy, Swapan Kumar.

[1]BSc. Nutritionist. College of Home Economics. University of Dhaka. Bangladesh; [2]MSc. Assistant Professor. Dept. of Food & Nutrition. College of Home Economics. University of Dhaka. Bangladesh; [3]MSc, MPhill. Senior Program Officer, Bangladesh Breastfeeding Foundation. Bangladesh; [4]MSc. Director. Bangladesh Breastfeeding Foundation (BBF). Bangladesh; [5]MBBS, MSc, Dip in Biotech, PhD, FRCP. Senior Scientist. Chairperson. Board of Trustees. Bangladesh Breastfeeding Foundation. Chairperson. Nutrition Foundation Bangladesh.

Background and objectives: Low birth weight (LBW) is a major risk factor for perinatal and infant mortality. In Bangladesh, LBW rate was 36% in 2004. Due to lack of information, estimating the current birth weight situation was necessary. The study was conducted to estimate the current rate of low birth weight in Urban Dhaka and to observe its association with mother's age.

Methods: This was a cross- sectional study, carried out at six government and non-government hospitals in Dhaka city. Birth weight of seven hundred and thirty six babies born from 2014-2016 was taken from the databases of the selected hospitals in Dhaka City. Information on Mother's age, father's occupation was also taken from mothers of new born babies who were present during data collection.

Results: The prevalence of LBW was 30.2%. The mean birth weight was 2.65kg. About 16% of the mothers were adolescent (≤19 years), 82% were between 20-35 years and only 2% was above 35 years. Among the adolescent mothers, the LBW rate was 41%, mothers aged from 20 to 35 years, the percentage was 28 and mothers aged ≥36 years the rate was 27%. There was a significant association between mother's age and birth weight (p value=0.020). A linear co-relationship has been found between mother's age and birth weight. The LBW rate was 14%, 19% and 35% whose fathers were businessmen, service holder and day laborer, respectively (p value=0.046). About two third of the samples were taken from government facilities having LBW of 38% while the rest one third were taken from non-government facilities having LBW rate of 17%.

Conclusions: The results of the study indicated that at least three children in every ten live births are born with low birth weight in urban Dhaka per day. The teenage mothers experienced significantly more low birth weight babies than adult mothers. The findings of the study will help to initiate preventive programs and to develop public health nutrition interventions to reduce low birth weight.

Keywords: Low birth weight, preterm birth, IUGR, mother's age, Dhaka City.

TYPOLOGY OF FOOD CONSUMPTION AND ITS ASSOCIATION WITH CALCIUM AND PHOSPHORUS METABOLISM AMONG MOROCCAN WOMEN

[1]Nejjar, Basma; [2]Cavalier, Etienne; [3]Bengueddour, Rachid; [4]El Arabi, Fatine; [3]Bour, Abdellatif.

[1]MSc. Departement of Biology. Faculty of Sciences Kenitra. Morocco. Departement of Clinical Chemistry. Faculty of Medicine Liège. Belgium; [2]PhD. Professor. Departement of Clinical Chemistry. Faculty of Medicine Liège. Belgium.; [3]PhD. Professor. Departement of Biology. Faculty of Sciences Kenitra. Morocco.; [4]MSc. Dietician. Departement of Biology. Faculty of Sciences Kenitra. Morocco.

Background and objectives: The Moroccan diet, characterized as a Mediterranean regime, has accused a decline in his nutritional quality which affects the health of Moroccan individual particularly the health of the musculoskeletal system. The objective of this study is to describe the typology of food consumption among Moroccan women in Meknes region and to highlight the association between these food profiles and the biological concentration of calcium and phosphorus metabolism.

Methods: We enrolled 116 women from a randomized sample. No exclusion criteria have been retained in order to ensure the representativeness of the sample. The data focused on sociodemographic parameters, sun exposure during a week ("less versus

more" than 15 minutes per week), and food frequency questionnaire divided into nine items. A fasting blood sample was made in order to characterize the concentration of : calcium, phosphorus and 25 hydroxyvitamin D (25OHD). Sun exposure was used as an adjustment factor. Factor analysis (FA) described the typology of food consumption. The association between the calcium and phosphorus metabolism and the sun-adjusted dietary profiles was assessed. The sun-adjusted multiple linear regression model (SAMLRM) was used to identify the food items associated with calcium-phosphorus parameters.

Results: The mean age was 50.1 ± 15.3 years. The FA made a state of two profiles: one based on vegetable consumption and the other on animal consumption. The adjusted-food vegetable profile was associated with phosphorus ($p=0.09$) however, the adjusted food animal profile was associated with calcium($p<0.001$) and 25OHD ($p<0.001$). The SAMLRM showed that item of oilseeds was associated with the concentration of calcium, phosphorus, and 25OHD ($p<0.001$).The frequency intake of fruits & vegetable item and fishes item was different depending on personal income ($p=0.002$) and marital status ($p=0.05$).

Conclusions: The typology of food consumption among Moroccan women in Meknes region was split into two profiles one focusing on vegetable diet and the other on animal diet. Each sun-adjusted food profile was differently associated with calcium and phosphorus metabolism.

Department of Nutrition, School of Public Health. Universitas Hasanuddin Makassar. Indonesia.

Background and objectives: Implementation of the Scaling Up Nutrition program requires strong commitment from local leaders and multisectoral action. The present study's objectives were to show evidence of how a multisectoral approach was implemented and to determine whether this approach affected indicators related to the nutrition-sensitive intervention.

Methods: We interviewed and collected data from the key informants at the departments and organizations serving as stakeholders for the multisectoral approach, such as the district's irrigation, social, health, family planning, planning and development, agriculture and horticulture, and food security offices. We analyzed the data by examining the results after both the first year (2015) and the second year (2016) of implementation.

Results: Multisectoral action was started in the beginning of 2015. All stakeholders received information about the importance of nutrition in the first 1,000 days of life and the role of multisectoral approach from seminars, discussions, posters, and leaflets. Two regulations were produced, and a task force was established to coordinate implementation. After two years, we found that clean water coverage increased, from 81.8% in 2015 to 83.4% in 2016; that the percentage of households using latrines increased from 66.8% to 71.8%; that the median age for the first marriage for women has increased from 21 to 25; that the percentage of women using contraception increased from 62% to 65%; that the percentage of poor people with insurance increased from 39% to 51%; and that the percentage of poor people decreased from 9.84% to 9.48%.

Conclusions: Commitment from local leaders has been earned, and indicators related to the nutrition-sensitive intervention have shown increases. However, analysis of nutrition-specific indicators is needed.

Keywords: Multisector, nutrition, nutrition-sensitive intervention

INTEGRATING NUTRITION SERVICES INTO THE MATERNAL, NEWBORN, CHILD HEALTH AND FAMILY PLANNING SERVICES IN RURAL BANGLADESH: SUCCESSES AND CHALLENGES

[1]Arafat, Yasir; [2]Islam, A B M Muzharul; [3]Bhuiyan, Mamun Mohiuddin; [4]George, Joby; [5]Khan, Marufa Aziz; [6]Mannan, Imteaz.

[1]MPH. Senior Nutrition Manager. Save the Children. Bangladesh.; [2]MBBS. Line Director. National Nutrition Services. Institute of Public Health. Ministry of Health and Family Welfare. Bangladesh.; [3]MPH. Capacity Building and Quality Assurance Manager. MCHIP. Save the Children. Bangladesh.; [4]MHA. Chief of Party. MCHIP. Save the Children. Bangladesh.; [5]MPH. Senior Operations Research Manager. MCHIP. Save the Children. Bangladesh.; [6]MSS. Senior Advocacy and Communications Advisor. MCHIP. Save the Children. Bangladesh.

Background and objectives: Attention has increasingly focused on mainstreaming nutrition services in public health programs at different levels, when 14% children <5 years of age are wasted and 33% are underweight in Bangladesh. National Nutrition Services (NNS) of Ministry of Health and Family Welfare and USAID's MaMoni Health Systems Strengthening (MaMoni HSS)

project supports integrated nutrition service delivery through existing maternal, newborn, child health and family planning (MNCH/FP) platforms within the district health system. Aim of this analysis is to understand the contributions of these interventions using DHIS2 data.

Methods: Building on existing MNCH/FP services from community to district levels, NNS and MaMoni HSS collaborated to strengthen integrated delivery of nutrition interventions in four low performing districts. This joint effort supported competency based training of all government service providers followed by regular GMP for early case screening and referral at every contact and set up "malnutrition corner' at referral facilities equipped to manage SAM children. The project also institutionalized Joint Supervision Visits (JSV), strengthened record keeping, reporting and use of information for regular performance review.

Results: Implementation districts show progress on case screening and referral over the last two years. The integration helped to reach 388,017 children (about 50% of total) to access GMP services between January 2015 and December 2016. As a result, 9,624 children (2.5%) with MAM were identified to receive food based IYCF counseling and all 2,352 (0.6%) children with SAM referred for in-patient care. Only 352 SAM cases admitted to in-patient and managed under existing facility based SAM care protocol that observed very low cure rate (20%) and high defaulter rate (75%).

Conclusions: Integration of nutrition interventions into existing MNCH/FP platforms helped leveraging all opportunities to screen a large number of children under 5 years with undernutrition. Immediate attention is crucial to ensure implementation of CMAM in Bangladesh including to improve service readiness, quality and so treatment outcome within the existing program.

NUTRITION INTERVENTION MAKING A DIFFERENCE: ASSESSMENT OF THE IMPACT OF A FEEDING PROGRAMME ON THE NUTRITIONAL STATUS OF PRE-SCHOOL CHILDREN IN GAUTENG PROVINCE, SOUTH AFRICA

Nyathela, Tshinakaho.

PhD. Senior lecturer. Cape Town Hotel School. Cape Peninsula University of Technology. South Africa.

Background and objectives: Feeding programmes are interventions that offer meals at schools with the aim of improving short-term hunger and the nutritional status of the children (Kearney 2009:6). Effective feeding interventions alleviate micro-nutrient, vitamin and mineral deficiencies that have a negative effect on growth and development during childhood (Kounnavong et al. 2011:5).

The purpose of this paper is to report on the impact of a feeding programme on the nutritional status of pre-school children from in Evaton West, Gauteng Province, South Africa.

Methods: A cross-sectional survey and descriptive design was used to conduct the study. Nutritional status data was collected from of 100 randomly selected children attending pre-school in Evaton West. Three pre-schools were purposively selected from the area. Four techniques were used for pre and post data collection, namely; dietary intake questionnaire, anthropometric measurements and hemocue. Anthropometric measurements included weight; height and mid-upper-arm-circumference (MUAC) were used to assess the nutritional status. A Hemocue was used to assess haemoglobin levels.

Results: During the follow-up study, 37 children dropped out from the study. Malnutrition is still prevalence at baseline; stunting (20.7%), wasting (12.7%) underweight (1.6%) and overweight 7.0%. Improvement was observed after the intervention, whereby 17.4%, 3.2%, 6.4%, 6.9% and 2.1% respectively. The mean±SD for MUAC measurements of the pre-school children was 15.89±1.29 cm and after and 15.97± 1.35cm. These results indicated that more than 95 percent of the children were normal and less than 5 percent were moderately malnourished before and after the intervention. The mean±SD serum Hb levels were normal, however, IDA was observed in 12 percent of the participants and after the intervention, the percentage increased to 20 percent.

Conclusions: Few statistically significant differences were observed with regard to nutritional status and IDA, however positive changes were observed, indicating that food provision may have a positive impact on an impoverished and malnourished community.

Keywords: Pre-school children, nutritional and biochemical status, feeding programme

EARLY INTRODUCTION OF FOOD AND FLUIDS FOR HEALTHY INFANTS IN 6 MONTHS OF FOLLOW-UP

[1]Carvalhaes, Maria Antonieta; [2]Mialich, Maiara Aparecida; [3]Rossato, Sinara L; [4]Ferrari, Anna Paula; [5]Tonete, Vera Lúcia; [5]Parada, Cristina Maria.

[1]PhD. Nutritionist. Faculdade de Medicina de Botucatu da Universidade Estadual Paulista. Brazil; [2]Ms. Nurse. Nursing Department. UNESP. Brazil; [3]PhD. Nutritionist. Department of Nutrition. Harvard T.H. Chan School of Public Health. United States; [4]Ms. Nurse. Nursing Department. Faculdade de Medicina de Botucatu. UNESP. Brazil; [5]PhD. Nurse. Nursing Department. Faculdade de Medicina de Botucatu. UNESP. Brazil.

Background and objectives: Complementary feeding before six months of age are associated with detriment on health of mother and child . Modifiable determinants of early introduction of foods into an infant diet within the six first months of life warrant further investigation in Brazil. To examine determinants of timing and type of additional food on the zero to six months old infants' diet.

Methods: In a prospective cohort design, 656 pairs of 0- to 6-month-old children and mother were selected from June/2015

to January/2016 in the public health neonatal service, covering 80% of the population of Botucatu, in Brazil. Sociodemographic, biological, health status information were documented at the baseline. Mothers were inquired over the introduction of 48 food items into an infant's diet (e.g. water, tea, non-maternal milk, cereal, vegetables, fruits, etc). The age of the introduction of tree foods groups - non-maternal milk, fluids, and solid/semi-solid foods- were classified into: before 2-months-old, two to four-months-old, and four to six-months-old. The median age when these

food groups were introduced into an infant's diet was assessed using Kaplan-Meier survival curve for the entire population and per income, education, mother's working status, delivery mode, and the pacifier use as determinants of early introduction of foods into diet. The log-rank test was used to compare the survival distributions.

Results: From 656, 595 children completed the 6-months of follow-up. Of this, 80.5% initiated the use of non-maternal milk at 90 days-old (median), 99.7% initiated fluids at 120 days-old (median), and 97.5% initiated solid/semi-solid foods at 135 days-old (median). 33.9% of the study participants added non-maternal milk and 20.8% added fluids foods into an infant's diet before the 2-months of age. Between 2- and 4-months of age, 40.9% of infants had eaten solid or semi-solid foods. Introduction of non-maternal milk happened 30 days earlier for Infants who used pacifier than non-users (p=0,0001) and 15 days earlier for

infants from cesarean (p=0,007).

Conclusions: Modifiable determinants such as cesarean and the pacifier use influenced early introduction of complementary foods into infants' diet before 6-months-old, indicating nutritional vulnerability that demands intervention in public health service.

Keywords: Breastfeeding, infant diet, complementary feeding, survival curve.

NUTRITIONAL STATUS IN CHILDREN FROM 1 TO 19 YEARS OLD IN BULGARIA AND RELATION OF SOME RISK FACTORS

[1]Duleva, Vesselka; [2]Rangelova, Lalka; [3]Petrova, Stefka; [3]Dimitrov, Plamen.

[1]Professor. PhD. MD. National Center of Public Health and Analyses. Sofia. Bulgaria; [2]PhD. MD. National Center of Public Health and Analyses. Sofia. Bulgaria; [3]Professor. PhD. MD. National Center of Public Health and Analyses. Sofia. Bulgaria.

Background and objectives: Nutritional status of children has an impact on their health and development and it is important to identify the problems and associated risk factors for adequate interventions.

The aim of this study is to evaluate the prevalence of underweight, overweight and obesity and and relation of some risk factors in children from 1 to 19 years of age.

Methods: Cross-sectional study on dietary intake and nutritional status of a representative sample of 991 children aged

1-18 years was conducted in 2014. Height and weight of all children were measured. International anthropometric indices and standards were used for assessment of children's nutritional status (WHO Child Growth Standards, 2006 for children from 1 to 5 years old and WHO Growth Reference, 2007 for children 5-18 years old). The relationship between anthropometric status of children and breastfeeding of children, as well as basic socio-economic factors were investigated.

Results: The underweight prevalence in children from 1 to 5 years old (Weight-for-age <-2Z) was 1.9% and for children 5-18 years was 1.6%. Stunting (Height-for-age<-2Z) was determined in 7.0% of children from 1 to 5 years and 2,3% of children aged 5-18 years. Rate of stunting was the highest in boys from 1 to 3 years old – 21,4%. Overweight among children from 1 to 5 was 8,3% (Body-mass-index-for-age>+2Z), but in children aged 5-18 years (BMI-for-age>+1Z) it was 30,1%. Obesity were respectively 5,1% (BMI-for-age>+3Z), and 10,3% (BMI-for-age>+2Z). The highest frequency was identified among boys aged 10-13 years (46,2% overweight, 19,8% obesity). Higher prevalence of overweight in children from 1 to 19 years old with mothers with lower education, lower employment status and single mothers was revealed, but statistically significant differences wasn't established (p>0.05). Breastfeeding of infants was related to lower rate of overweight in children from 1 to 5 years old (p<0.05).

Conclusions: The study revealed relationship between overweight/obesity among children and some risk factors. Social-economic factors didn't influence the problems in child growth in Bulgaria.

Keywords: children, obesity, risk factors

THE IMPACT OF COMMUNITY VOLUNTEER ACTIONS ON CHILD NUTRITION

[1]Pereko, Kingsley; [2]Steiner-Asiedu, Matilda; [3]Nti, Christiana; [4]Adu-Oppong, Ahmed.

[1]PhD Nutriton. Department of Community Medicine University of Cape Coast. Ghana; [2]Prof. Nutrition. Department of Nutrition and Food Science. University of Ghana. Ghana; [3]Prof. Nutrition. Department of Family and Consumer Sciences. University of Ghana. Ghana; [4]Prof. Public Health. Department of Community Medicine. University of Cape Coast. Ghana.

Background and objectives: Despite the age long tradition of involving Community-based volunteers in nutrition and health service delivery as a primary health care concept, gaps exist in literature on the impact of their actions on various service outcomes. The study aimed at assessing the effect of volunteer actions on addressing childhood malnutrition in the KEEA Municipality.

Methods: Using a quasi-experimental study design, a pre- and post- surveys were conducted within a period of 9 months for two groups (intervention and control). Six intervention communities of three sub-districts in the KEEA- Municipality where community-based volunteers administer nutrition services for children

under age two and three control communities (one from each selected sub-district) without community health volunteers were involved in this study. Data on socio-demographic and cultural factors, child nutrition, mother/caregiver infant and child feeding and care knowledge and practice and factors sustaining volunteerism were collected from beneficiary mothers with children under age two years, community leaders and programme implementers by mixed methods.

Results: A total of 308 and 282 mother-child pairs were assessed at baseline and endline respectively. The interventions and controls were comparable in various characteristics except for formal education which intervention mothers had significantly higher proportion of mothers with formal education (83.8%) compared to controls (73.1%). No significant variations were observed in prevalence of child under two malnutrition comparing the intervention to controls both at baseline and endline. The utilisation of nutrition services generally was high among communities with volunteers. Both groups recorded significantly lower maternal/caregiver knowledge scores at endline however, the mean change in knowledge scores were not significantly different comparing the two groups. Continuous breastfeeding (for children after 6 months old) frequency at endline was significantly high for intervention groups (94.5%) compared to the controls (85.5%).

Conclusions: Community volunteer activities had no direct impact on child nutrition outcomes however, engaging community volunteers in nutrition service delivery has the potential improving the utilisation of child nutrition services.

Keywords: Community-based, volunteers, child nutrition, impact

HOUSEHOLD-BASED NUTRITION SURVEILLANCE SYSTEM IS AN ESSENTIAL INSTRUMENT FOR MONITORING EFFORT TO ACCELERATING SCALING-UP NUTRITION IN INDONESIA

[1]*Thaha, Abdul Razak;* [2]*Sugihantono, Agung;* [3]*Izwardy, Doddy;* [4]*Machdar Dachlan, Djunaidi.*

[1]Dr. Msc. Prof. nutritionist. Hasanuddin University. Indonesia; [2]MD. Mkes. Health Policy. Ministry of Health. Indonesia; [3]ir. MA. Nutritionist. Ministry of Health. Indonesia; [4]MD. MS. Nutritionist. Hasanuddin University. Indonesia.

Background and objectives: Household-based nutrition surveillance is an essential instrument for detection of nutrition and nutrition-related issues that can accelerate implementation of the policy and intervention programs of scaling-up of nutrition. Objective: to develop sentinel Household-based nutrition surveillance on Posyandu (integrated post unit) to ensure availability of periodic data as the target of interventions, and monitoring effort of nutrition management program

Methods: Through a process of review (literature, programs and expert panels), workshops, and roundtable taskforce and after field trials, then formulated a model-based sentinel survailanse family with three guides, the operational model of the field, indicators and measurement instruments and data management. This surveillance will to Ensure availability of periodic records: by characteristics of the family, by names, by the addresses as the targets of interventions, and monitoring effort of nutrition management program

Results: Basic data of 8 posyandu development region HH sentinel surveillance of basic data obtained in 1538 families with 6114 individuals, which periodically updates and monitoring is done periodically. Where the family data every 1 year, every 6 months the individual data and measurement data every three months. Monitoring is carried out by students of nutrition s1 Hasanuddin university where every student watching the 30-40 families. Results: **Conclusions:** The role of HH nutritional surveillance in detecting trends of nutritional problems and predicting their risks has become more important as its strong scientifically based method and evidences may provide insights on addresse to accelerate scaling-up nutrition

Keywords: Household-based; nutrition surveillance; scaling-up nutrition

FACTORS ASSOCIATED WITH ANOREXIA IN SCHOOLED ADOLESCENTS IN MOROCCO: FEZ CITY REGION

[1]*Makdad, Meryem;* [2]*Najdi, Adil;* [3]*Bour, Abdellatif.*

[1]Makdad Meryem. MD. Departement of Biology. Faculty of Sciences.University Ibn Tofail. Kenitra. Morocco.; [2]Adil Najdi. PhD. Professor. Faculty of Medicine and Pharmacy.Tanger. Morocco; [3]Bour Abdellatif. PhD. Professor. Departement of Biology. Faculty of Sciences. University Ibn Tofail. Kenitra. Morocco.

Background and objectives: Anorexia is an eating disorder (ED) that mainly affects adolescents.The objective was to estimate the prevalence of anorexia and to identify the factors associated with this disorder.

Methods: A cross-sectional study on a representative sample of 367 students from colleges and high schools degree both from the public and private. A self-questionnaire with items on socio-demographic characteristics and lifestyle and food was administered. The screening of ED was made using a specific Eating Attitudes Test (EAT-26). Depressive disorders were assessed by the Hospital scale Anxiety and Depression (HAD). Anthropometric measurements were carried out in a standard manner in all adolescents.

Results: The mean age was 15.58 ± 2.01 years with the range of [12-19]. The mean body mass index (BMI) was 19.99 ± 2.47. The sex ratio M/F =0.94. The prevalence of anorexia was 10.1%, this prevalence is higher among girls than boys (70.3% vs 29.7%, p <0.015). The depression HAD score was positive in 43.2% of adolescents with anorexia versus 15.1 % in students without anorexia (p <0.000). Anorexia is higher in students with normal BMI (67.6%) compared to those with underweight and overweight (16.2%, p <0.000). The diet was the most widely used method of weight control in adolescents with anorexia (48.5%, p <0.000).

Conclusions: Anorexia is a frequent public health problem in our context, where from the necessity of undertaking preventive measures of this pathology.

Keywords: Adolescent, anorexia, prevalence, depression, Fez.

RISK FACTORS FOR HEALTH OF CHILDREN AGED 1-6 YEARS

[1]Rangelova, Lalka; [2]Duleva, Vesselka; [2]Petrova, Stefka; [3]Dimitrov, Plamen.

[1]MD.PhD. Assistant Professor. Department of Food and Nutrition. National Center of Public Health and Analyses. Sofia. Bulgaria; [2]MD.PhD. Professor. Department of Food and Nutrition. National Center of Public Health and Analyses. Sofia. Bulgaria; [3]MD.PhD.Professor.Department of Health promotion and disease prevention. National Center of Public Health and Analyses. Sofia. Bulgaria.

Background and objectives: National program for prevention of chronic non-communicable diseases has been launched in 2014 in Bulgaria. The main objective of the program is to improve public health and to enhance quality of life by reducing premature mortality, morbidity and disability. National survey of risk factors for health among the population has been conducted under the program (smoking, drinking alcohol, low physical activity, unhealthy diet) which are causes for the development of chronic non-communicable diseases.

The aim is to examine the level of the leading risk factors for health-related lifestyle of the population.

Methods: A cross-sectional study of a representative sample of 307 children aged 1-6 years and their mothers is carried out. The study included direct face-to-face interviews with the mother of each child tested. Major risk factors were studied, which are related to pregnancy, periods of breastfeeding, complementary feeding and socio-economical status.

Results: In families with two parents who have entered into an official marriage or de facto marital cohabitation live 93% of the children; The percentage of mothers with secondary (22.6%) or higher (68.2%) education is relatively high.

The proportion of mothers with low weight before pregnancy is 4%, and 12.3% of the mothers are overweight, 4% of mothers have inadequate weight gain during pregnancy; A relatively small proportion of women consumed alcohol during pregnancy (7.3%); 11.1% of the mothers smoked during pregnancy.

The rate of children that were breast-fed in the first days after birth is 86.3%. Only 9.9% were breast-fed during their first hour; 21.7% of the infants were at exclusive breast-feeding. Up to 1 month were breast-fed 13.6%, up to 2 months – 10.5%, up to 6 months – 7.4%. A positive trend for breastfeeding beyond 6 months is observed in 44% of children. Early inclusion of fruit juices is observed in 87.3% of infants up to 6 months of age.

Conclusions: National study of risk factors for health among children aged 1-6 years, provide reliable information on the prevalence of major risk factors, leading to the development of chronic non-communicable diseases in later life.

Keywords: children, risk factors, survey

NUTRITION POLICY: A NEW PUBLIC ACTION MODEL

Sebillotte, Clementina.

PhD. Management sciences. Unité de recherche Alimentation et Sciences Sociales ALISS UR1303. INRA. Ivry-sur-Seine. France.

Background and objectives: French National Nutrition and Health Program (PNNS) was implemented in 2001 succeeding many years of separated policy acts. This study analyses how the French government acts and changes to take action on nutrition issue which challenges its traditional intervention strategies. Are the existing traditional regulation strategies adequate or is it necessary to develop other regulation modalities? The study aims to understand the specificity of government action concerning nutrition and how it could constitute a new model for public action.

Methods: This empirical research adopts a qualitative approach through the lens of policy instruments. The method applied is longitudinal study (Pettigrew, 1990). Data was gathered through 40 semi-structured recorded and transcribed interviews with public and private players involved in food policy and agrifood sectors, through observation, original written and audio sources and specialized literature. This material was collected between 2007 and 2015. Data was analyzed using table structures for organizing, comparing and ranking.

Results: This work demonstrates the emergence of a new original regulation model based on state intervention on food demand and supply. It combines innovative policy instruments (eg. new type of voluntary agreements) with traditional ones in a particular complementary arrangement which we qualified as "discrete coupling of food supply and demand".

By coupling supply and demand in a non-directive way, the state tries to discreetly transform : i) food firms, which invest in developing new skills and capacities of innovation, ii) its food products, which become healthier iii) consumers, who adopt dietary guidelines and new lifestyles. The stake of this long term process is that supply and demand meet in a more desirable position.

We show that policy intervention on nutrition : i) cannot be reduced to the alignment of practices of demand and supply, ii) must allow state to build a frame of legitimacy for its actions, iii)

must consider the offer and supply network and their interactions and iv) time necessary to allow behavior changes.

Conclusions: This new model constitutes a new theory for contemporary state action. It allows economic growth with purpose which goes far beyond economic benefit and which produces a common good, improving individual and collective welfare.

Keywords: Nutrition policy, common good, voluntary agreement, public action, discrete coupling

RISK FACTOR INFLUENCING FOOD SECURITY OF THE CHILDREN DURING FLOOD DISASTER

[1]Alias, Nur Atiqah; [2]Md Nor, Norazmir; [3]Mohd Asmawi, Ummi Mohlisi; [2]Mohd Fahmi Teng, Nur Islami.

[1]PhD. Candidate. Faculty of Health Sciences. Universiti Teknologi MARA 42300 Puncak Alam Selangor. Malaysia; [2]PhD. Lecturer. Faculty of Health Sciences. Universiti Teknologi MARA 42300 Puncak Alam Selangor. Malaysia; [3]PhD. Lecturer. Faculty of Medicine. Universiti Teknologi MARA 47000 Puncak Alam Selangor. Malaysia.

Background and objectives: Food security is when all people at all times have access to adequate, safe, healthy food to sustain a healthy and active life. Food security in children expressed that the children have adequate food daily and have a normal growth development without suffering any malnutrition. During flood situation, the food security and insecurity may happen to children due to the unavoided risk factor. Bera, Pahang had been selected as the area of research as it was one of the most severe flooding districts in December 2014. In this study, the risk factor of food security faced by children during the flood disaster are being identified. Secondly is the nutritional status of the respected informant are evaluated by using the anthropometry data.

Methods: The methodologies used are observation and interview with the respected victims to collect further information and opinion regarding the flood disaster. The selected informant consist of five female and four male from a different village. The post-flood questionnaires are being used to guide the responds from the informant. The data collected are being analysed by using thematic analysis to determine the risk factor of food security associated with children.

Results: Findings showed that food supply, food choice and food intolerance might play as a vital part in food security during flood disaster. Children who move to the relocation centre said that they eat less quantity of food during flood due to the repeated menu being cooked everyday. Even though, they may eat less quantity of food than normal, their nutritional status after the flood disaster such as weight and height only had minimal differences as compared to the control subject.Most of them didn't lose any weight during and after the flood.

Conclusions: In conclusion, even though there are risk factors associated with the food security, the effect on their nutritional status such as weight and height are minimal.

Keywords: Risk factor; Children; Flood disaster; Food security

COVERAGE OF FOOD INTAKE ASSESSMENT IN THE BRAZILIAN FOOD AND NUTRITION SURVEILLANCE SYSTEM: 2008 AND 2013

[1]Alves do Nascimento, Fabiana; [2]Araújo da Silva, Sara; [3]Constante Jaime, Patrícia.

[1]MSc Fabiana Alves do Nascimento. Nutrition in Public Health Graduate Program. School of Public Health. University of Sao Paulo. Brazil.; [2]MSc Sara Araújo da Silva. General Coordination of Food and Nutrition, Basic Care Department, Health Care Secretariat, Ministry of Health. Brazil.; [3]PhD Patrícia Constante Jaime. Nutrition Department. School of Public Health. University of Sao Paulo. Brazil.

Background and objectives: The Food and Nutrition Surveillance System continuously provide data on nutritional status and food intake of the population attended by the Primary Healthcare services for the formulation of actions, programs and policies. This study aims to describe and analyze the coverage of the assessment of the food intake of the users of the public health services registered on this System between 2008 and 2013.

Methods: This is an ecological study. The population registered on the System is described according to federation units, macro-regions and/or life stages. The indicators used were: percentage of registration and use and coverage. The analyses were performed using descriptive statistics, linear regression models and Spearman's correlation.

Results: More the 99% of municipalities presented at least one individual registered and the percentage of utilization varied from 19.39% in 2008 to 32.5% in 2013. The national coverage ranged from 0.13% to 0.41%, with a statistically significant trend of increase. The Center-West region had the highest regional coverage. All life stages presented statistically significant trends of increase in the coverage, especially children and pregnant women. The presence of nutritionists remained close to the statistical significance threshold.

Conclusions: Despite the continuity of the collection of these indicators, the assessment of food consumption as a food and nutritional surveillance dimension was incipient and little-lined in Brazilian municipalities.

Keywords: Nutrition Programs and Policies; Nutritional Surveillance; State Health Care Coverage.

THE CONSUMPTION OF ULTRA-PROCESSED FOODS AND THE OVERALL NUTRITIONAL QUALITY OF DIETS IN THE UK

[1]Rauber, Fernanda; [2]Louzada, Maria Laura da Costa; [2]Steele, Euridice Martínez; [3]Millett, Christopher; [2]Monteiro, Carlos; [4]Levy, Renata.

[1]PhD. Núcleo de Pesquisas Epidemiológicas em Nutrição e Saúde. Departamento de Nutrição. Faculdade de Saúde Pública. Universidade de São Paulo. FAPESP's Post-Doctoral fellowship nº 16/14302-7. Brazil.; [2]PhD. Núcleo de Pesquisas Epidemiológicas em Nutrição e Saúde. Departamento de Nutrição. Faculdade de Saúde Pública. Universidade de São Paulo. Brazil.; [3]PhD. Núcleo de Pesquisas Epidemiológicas em Nutrição e Saúde. Universidade de São Paulo. Brazil. Public Health Policy Evaluation Unit. School of Public Health. Imperial College London. United Kingdom.; [4]PhD. Núcleo de Pesquisas Epidemiológicas em Nutrição e Saúde. Departamento de Medicina Preventiva. Faculdade de Medicina. Universidade de São Paulo. Brazil.

Background and objectives: Population-based studies conducted in the United States, Brazil, and Canada suggest an inverse relationship between the dietary share of ultra-processed foods, as defined by NOVA classification, and the overall dietary nutritional quality. This study aimed to describe food intake in UK according to NOVA classification and the association between the dietary share of ultra-processed foods and the dietary nutritional profile.

Methods: Data from cross-sectional UK National Diet and Nutrition Survey (2008–12) were evaluated. Dietary information was collected using four-day, unweighted, food-diaries. Total energy intake and percentage provided by each of the NOVA food groups as well as the average nutrient content of the overall diet across quintiles of dietary share of ultra-processed foods.

Results: The average energy intake was 1,790.52 kcal/day, 56.8% of calories coming from ultra-processed foods, 30% from natural or minimally processed foods, 9.1% from processed foods, and 4.1% from processed culinary ingredients. As the ultra-processed food consumption increased, the dietary content in carbohydrates, free sugars, total fat, saturated fat, and sodium increased significantly. Most important was the difference in free sugars content which increased by 51% (from 10.1 to 15.2% of total energy) from the first to the last quintile. Protein content and fibre and potassium densities decreased significantly as the dietary share of ultra-processed foods increased. Particularly relevant was the decrease across quintiles in protein from 17.3 to 13.9% of total energy from the first to the last quintile (p<0.05).

Conclusions: These results are consistent with previous findings from other countries suggesting that decreasing the dietary share of ultra-processed foods may improve substantially the nutritional quality of diets.

Keywords: Food processing; ultra-processed; diet quality; dietary intake; UK.

COMPARISON OF CONSUMERS' OPINIONS FOR GENETICALLY MODIFIED ORGANISM (GMO)

[1]Sato, Mizuho; [2]Nakano, Masaru; [3]Wunderlich, Shahla.

[1]Ph.D. National Registered Dietician. Senior Assistant Professor. Graduate School of System Design and Management. Keio University. Japan; [2]Ph.D. Professor of Graduate School of System Design and Management. Keio University. Japan; [3]Ph.D.Professor of Nutrition and Food Science. Montclair State University. USA.

Background and objectives: The food label policy for Genetically Modified Organism (GMO) products is different in Japan and USA. In the USA, GMO ingredients are allowed to be used for food products. However, in Japan food using the GMO ingredients are prohibited with the exception of 8 items and 7 additives. Japanese consumers do not accept GMO containing food and normally do not buy these foods and they discard them if they learn that they have GMO which leads to food waste. The same could be true in the USA, consumers do not accept GMO food that can increase the food waste as well. The purpose of this study, therefore, was to investigate and to compare consumers' opinions for GMO in Japan and the USA.

Methods: Questionnaire survey were administrated among 123 students at Montclair State University. In Japan, the government have conducted the questionnaires on "The opinion for GMO and biotechnology" to 500 Japanese peoples. Additional questionnaires were conducted among of employees of the supermarket in Japan.

Results: The opinion for GMO is different in these two countries. Fifty one percent (51%) of Japanese and 7% of the supermarket employees had negative image of GMO. It was also observed the majority of people (64%), were not satisfy with the information about GMO labeling in Japan. When the question about the non -GMO food label, was asked, 73% of supermarket employees preferred and bought the non-GMO labeled foods. Furthermore, when it was asked, "Do you prefer to purchase the following food items with a non-GMO label? thirty three percent (33%) answered for daily foods, 28% for vegetable and fruits. Majority of Japanese (73%) request for the certification of non-GMO on the food label. It is important to explore the optimum labeling policy of non-GMO foods in order the consumers have correct information about the food they are purchasing.

Conclusions: The food label policy and education regarding GMO food is inadequate in Japan. It is desired that consumers and employees in food supermarket be educated so can convey the correct information to consumers.

Keywords: Genetically Modified Organism, Consumer Behavior, Food Label, Food Waste, Supermarket

ASSESSING THE RETAIL FOOD ENVIRONMENT IN CANADA: PROCESS, PROGRESS, AND PRACTICAL IMPLICATIONS

Minaker, Leia.

PhD. Assistant Professor. School of Planning. Faculty of Environment. University of Waterloo. Canada.

Background and objectives: Canada's retail food environment is an important setting for population dietary health and equity, since 70 cents of every food dollar is spent in food stores, and this proportion increases with decreasing household income. The objective of this presentation is to share the process, progress to date, and practical implications of assessing the retail food environment in Canada using a standard assessment tool.

Methods: A brief history of retail food environments research in Canada will be described, and findings will be synthesized and compared with international research. The process of developing a Canadian retail food environment assessment manual, and international partnerships to advance the retail food environments research agenda will be discussed. Practical implications for the fields of public health nutrition and for urban plan planning will be summarized in terms of research, policy and practice.

Results: In 2015, Canada's first Food Environments Symposium was hosted by researchers in partnership with Canada's federal Office of Nutrition Policy and Promotion. Canadian retail food environments researchers came together to present new information and methods, to network, and to build consensus around future directions. With support from the Office of Nutrition Policy and Promotion, a Canadian retail food environment assessment manual was created, and is currently being pilot tested by several urban, rural, and remote Canadian communities. New connections between Canadian researchers and the INFORMAS network have the potential to take existing local, provincial, and national research partnerships in Canada to an international scale. Future research will examine time-space food environment exposures in epidemiological research, future municipal policy will consider zoning and other urban planning approaches to create health-promoting retail food environments, and future practice should include capacity building for community food environment assessment within diverse Canadian contexts.

Conclusions: The field of retail food environments research in Canada is relatively new. Momentum at the local, provincial, and national scale has been building, and there is great potential for long-term, practical application of research findings to municipal policy, and to public health and urban planning practice. Embedding the Canadian research within the INFORMAS network will encourage best practices in food environment research, surveillance, and monitoring.

Keywords: food environment; partnerships; public health nutrition; surveillance; monitoring

EATING OUT: FREQUENCY OF EATING FOODS PREPARED AWAY FROM HOME AND ASSOCIATIONS WITH DIETARY AND WEIGHT OUTCOMES IN A POPULATION-BASED SAMPLE FROM ONTARIO, CANADA

Minaker, Leia.

PhD. Assistant Professor. School of Planning. Faculty of Environment. University of Waterloo. Canada.

Background and objectives: Eating foods prepared away from home is a growing trend in Canada, and has implications for long-term health. The types of restaurants and other sources of prepared foods where people usually go can influence their overall diet quality and health. This study will describe the frequency with which Waterloo Region residents eat out, reasons for choosing different outlet types, and the extent to which eating out is associated with diet quality, fruit and vegetable intake, and weight outcomes.

Methods: A stratified random sample of households in Waterloo Region, Ontario, Canada, were recruited in 2009/2010 to participate in the NEWPATH study. Data from 2223 household (n=4102 individuals over 10 years of age) were used to examine associations between participants' frequency of eating out and dietary- and weight-related outcomes using generalized linear models to account for the nested structure of the data. All analyses accounted for participants' age, sex, education level, and household income.

Results: About 30% of residents ate at a fast food restaurant at least once per week. Almost half (49%) ate at a coffee shop and 18% ate at a sit-down restaurant at least once per week. The most popular reasons for people patronizing fast food outlets were: 1) a lack of time to prepare food, 2) convenience (easy to get to), and 3) the taste of the food. Diet quality and fruit and vegetable consumption were poorer among those who frequently patronized fast food outlets compared to those who did not. People who frequently patronized fast food outlets and coffee shops had significantly higher BMI and waist circumference than those who did not.

Conclusions: Dietary and weight outcomes vary significantly by participants' eating-out behaviours. Fast food outlets and coffee shops might be especially relevant settings for health promotion interventions, which should consider 1) convenience (in terms of proximity and time), and 2) taste of the food.

Keywords: restaurants; public health nutrition; food purchasing; diet quality; foods prepared away from home

ESTABLISHING A PLATFORM FOR BUSINESS ENGAGEMENT ON NUTRITION. THE SUN BUSINESS NETWORK IN NIGERIA

[1]Theobald, Hannah; [2]Igbeka, Uduak; [3]King-Harry, Ibiso; [4]Attah, Eno Angela; [5]Schofield, Dominic; [6]Aminu, Francis; [7]Tench, Jonathan.

[1]BSc. PhD. Scaling Up Nutrition Business Network & Global Alliance for Improved Nutrition. London. United Kingdom; [2]BAgric. Scaling Up Nutrition Business Network & Global Alliance for Improved Nutrition. Abuja. Nigeria; [3]BSc. MPH. Scaling Up Nutrition Business Network & Global Alliance for Improved Nutrition. Abuja. Nigeria,; [4]MB,BS, MPH. Scaling Up Nutrition Business Network & Global Alliance for Improved Nutrition. Abuja. Nigeria; [5]MA. MBA. Global Alliance for Improved Nutrition. Ottawa. Canada; [6]Global Alliance for Improved Nutrition. Abuja. Nigeria; [7]Scaling Up Nutrition Business Network & Global Alliance for Improved Nutrition. London. United Kingdom.

Background and objectives: The Scaling Up Nutrition (SUN) Movement was established in 2010 to encourage government led, collective action to end malnutrition in all forms. The SUN Business Network (SBN) is one of four networks supporting the SUN Movement and acts to engage and support the private sector to undertake business action on nutrition in support of national nutrition objectives. SBN operates at the global and national levels, with 13 national networks engaging the private sector on nutrition in Africa, Asia and Latin America.

SBN wanted to establish a functioning private sector engagement and commitment platform on nutrition in Nigeria, aligned with the Government's nutrition strategy.

Methods: Between August 2015 and April 2016 a strategy for private sector engagement was developed, following a review of national nutrition priorities, stakeholder interviews and analysis of existing business activities to address malnutrition in Nigeria. Priority areas for business action on nutrition were identified and a business engagement and commitment platform on nutrition developed.

Results: 'Increasing consumer awareness and demand creation for nutritious foods' and 'nutrition in the agriculture value chain' were identified as priority areas for business action. These areas were validated by stakeholders including the Federal Ministries of Health, Agriculture and Budget and National Planning.

SBN Nigeria launched its membership and commitment platform in April 2016, with 20 business members signing up with commitments to address malnutrition. As of end March 2017, the membership has grown to 44 businesses (59% small-medium enterprises, 23% multinationals). Commitments made include activities to include availability and/or affordability of nutritious products (47%), increasing consumer awareness of nutrition (26%) and increased food fortification and use of bio-fortified crops (13%). Businesses have also signed up to activities within the priority workstreams.

Conclusions: SBN Nigeria was successfully launched as the only business platform dedicated to nutrition in the country. In order to deliver impact and ensure business action to improve nutrition, SBN Nigeria will convene workstreams for action in priority areas, facilitate partnerships and the provision of technical assistance as well as track progress of members' nutrition commitments. SBN Nigeria will monitor business progress towards their nutrition commitments and business impact on nutrition.

Keywords: Nigeria, multi-sector, scaling up nutrition, business
Conflict of Interest Disclosure: HT, UI, IKH, EAA, DS, FA & JT all work or have worked for the SUN Business Network, one of the four support networks of the Scaling Up Nutrition Movement. The SUN Business Network works to encourage private sector action on nutrition and is made up of more than 350 business members. The SUN Business Network does not receive any fees from business members.

PREGNANCY OUTCOMES AND THE DIAGNOSTIC ABILITY OF TWO STANDARDS TO ASSESS ADEQUACY OF MATERNAL BODY MASS INDEX IN URUGUAY

[1]Mardones, Francisco; [2]Burgueño, Leticia; [3]Rosso, Pedro; [4]Villarroel, Luis; [5]Bacallao, Jorge; [6]Farias, Marcelo.

[1]MD. MSc. Department of Public Health. Pontificia Universidad Catolica de Chile. Chile.; [2]MD. MSc. Department of Public Health. Pontificia Universidad Católica de Chile. Chile.; [3]MD. Department of Pediatrics. Pontificia Universidad Católica de Chile. Chile.; [4]PhD. Department of Public Health. Pontificia Universidad Católica de Chile. Chile.; [5]PhD. Universidad de Ciencias Médicas. Cuba.; [6]MD. PhD. Department of Obstetrics and Gynecology. Pontificia Universidad Católica de Chile. Chile.

Background and objectives: The Rosso and Mardones (RM) and the Atalah et al (AEA) maternal weight gain charts are widely used in Latin America. The purpose of this study was to compare birth length (BL) and birth weight (BW) outcomes of both charts at the beginning and at the end of pregnancy using national data from Uruguay.

Methods: Data of pregnant women and their children registered at the national level in the maternity hospitals between 2010 and 2012 were considered: 51,420 women and newborns (RN) with valid records were obtained. Just healthy pregnant women and term single live births were included. Maternal nutritional status was classified at the beginning and at the end of pregnancy according to both curves. The diagnostic ability of both instruments regarding inadequate fetal growth was compared using sensitivity and specificity values. Inadequate fetal growth was defined as birth weight < 3000 g, birth weight > 4,250 g, and birth length < 50 cm.

Results: The selected sample reached 23,832 pregnant women and their newborns. Proportions of BL < 50 cm and both BW < 3000 g and > 4250 g were similar at each nutritional category of both charts; absolute figures for at risk newborns were much higher in the RM underweight and obese women. The RM chart showed higher sensitivity values than the AEA chart, both at the beginning and at the end of the pregnancy.

HOW MANY ANTHROPOMETRIC BODY PHENOTYPES A UNDER BODY MASS INDEX MEASURE? AN ALTERNATIVE TO DESCRIBE RISK FOR NON-COMMUNICABLE DISEASE FROM BODY MEASURES

[1]*Lisboa Conde, Wolney;* [2]*Mazzeti, Camila;* [2]*Cumpian-Silva, Jéssica;* [3]*Giatti, Amana;* [4]*Rinaldi, Ana Elisa Madalena;* [5]*Enes, Carla Cristina.*

[1]PhD. Nutricionist. Professor of Nutrition. School of Public Health. University of Sao Paulo. Brazil; [2]MD. Nutricionist. School of Public Health. University of Sao Paulo. Brazil; [3]Student of Nutrition. School of Public Health. University of Sao Paulo. Brazil; [4]PhD. Nutricionist. Federal University of Uberlandia. Brazil; [5]PhD. Nutricionist. Pontifical Catholic University. Brazil.

Background and objectives: Body mass index (BMI) is always under critics by predicting risk for non-communicable disease imprecisely. Body phenotypes (BP) based on anthropometrics and body composition measures has raised as one response to overcome those handicaps. To describe body phenotypes anthropometric-based in adults and to correlate them to BMI.

Methods: We select 7 anthropometric and 3 body composition variables from adults in NHANES 1988-1994 and 1999-2006. We have performed Principal Component Analysis and estimated individual scores for 4 components (C#) at first and 3 at second surveys. We have described components with eigenvalues >= 0.7 and characterized them by variables with loadings >= 0.20. We measured correlation among components and BMI using Pearson coefficient.

Results: In 1988-1994, C1 was characterized by bones length and weight variables; C2 by circumference and skinfold; C3 by skinfold and waist circumference and bi-iliac breadth; C4 by bioelectrical impedance variables. In 1999-2006, C1 was characterized by circumference and adiposity body composition measures; C2 by bone length and lean mass body composition measures; C3 by bioelectrical impedance and lean mass body composition variables. Correlation among BMI and components was 0.32, 0.78, 0.77 and -0.61, respectively, in 1988-1994 and 0.96, 0.56 and 0.48, respectively, in 1999-2006. Body composition measures were relevant but anthropometric measures were prevalent within leading components in both surveys.

Conclusions: BMI was well correlated with BP characterized by adiposity. BP scores offer possibilities will to identify individuals with high adiposity body composition from BMI spectrum and improve estimating nutritional risk at clinical epidemiology context.

Keywords: BMI; non-communicable disease; Body phenotypes; Nutritional assessment.

[1]Nutritionist. Center for Molecular Nutrition and Chronic Diseases. School of Medicine. Pontificia Universidad Católica de Chile. Chile; [2]MSc. Engineer. Center for Molecular Nutrition and Chronic Diseases. School of Medicine. Pontificia Universidad Católica de Chile. Chile; [3]PhD, Nutritionist. Nutrition and Dietetics. School of Medicine. Pontificia Universidad Católica de Chile. Chile; [4]MSc. Nutritionist. School of Nutrition. Universidad Finis Terrae. Chile; [5]PhD. MD. Department of Nutrition, Diabetes and Metabolism. School of Medicine. Pontificia Universidad Católica de Chile. Chile.

Background and objectives: Mediterranean diet (MD) has been consistently associated with decreased cardiovascular risk factors and chronic diseases as well as increased longevity. Different scores have assessed the adherence to a MD pattern and its association with risk factors and chronic diseases. We evaluated the adherence to MD in Chilean population, comparing two validated MD indexes (a Spanish index used in the PREDIMED study, and a local one, the Chilean Mediterranean Diet Index, Chilean-MDI) and their association with socio-economic variables.

Methods: We used data from a representative sample of 879 Chilean subjects (15-65 years-old) -included in a cross-sectional Latin American Study on Nutrition and Health (ELANS)- and calculated a posteriori both Mediterranean diet scores obtained from two 24-hour dietary recalls. All participants had socio-demographic information.

Results: Chilean population exhibited poor adherence to MD measured by Chilean-MDI (3.28 ± 1.40 points, range 0-9.5 points) and by the PREDIMED index (3.27 ± 1.50 points, range 0-8 points). Score averages were similar (p=0.394) with a high significant correlation between them (r=0.551, p<0.001). Higher adherence to MD was found in women, people older than 50 years of age, higher socio-economic levels, and residents in Central Chile.

Conclusions: Despite their differences in three of 14 items, both scores qualifies adherence to MD similarly in the Chilean population. Both indexes were higher in Chilean regions with Mediterranean ecosystems and showed demographic trends that are comparable to those obtained with analogous scores in other countries. Thus, Chilean-MDI and PREDIMED indexes can be used to assess overall diet quality in the Chilean population.

Keywords: Mediterranean diet, Mediterranean diet indexes

ANTHROPOMETRIC BODY PHENOTYPES RELATE TO MORTALITY IN US ADULTS

[1]Lisboa Conde, Wolney; [2]Cumpian-Silva, Jéssica; [2]Mazzeti, Camila; [3]Rocha Cruz, Danielle; [4]Enes, Carla Cristina; [5]Rinaldi, Ana Elisa Madalena.

[1]PhD. Nutricionist. Professor of Nutrition Departament. School of Public Health. UNiversity of Sao Paulo. Brazil; [2]MD. Nutritionist. School of Public Health. University of São Paulo. Brazil; [3]Student of Nutrition. School of Public Health. University of São Paulo. Brazil; [4]PhD. Nutritionist. Pontifical Catholic University. Brazil; [5]PhD. Nutritionist. Federal University of Uberlandia. Brazil.

Background and objectives: Body mass index (BMI) covers a great diversity of body phenotypes (BP). Some of phenotypes are associated to body fat and could be linked to risk for non-communicable disease and mortality. Body phenotypes based on anthropometrics and body composition measures has raised as one response to overcome those handicap. To describe nutritional status from BP anthropometric-based in adults and correlate them to mortality.

Methods: We select 3 body composition variables from adults in NHANES 1999-2006. We have performed Principal Component Analysis and estimated individual scores for 4 components (C#) at first and 3 at second surveys. We have described components with eigenvalues >=.7 and characterized them by variables with loadings >=.20. Finally, we linked dataset with diabetes or hypertension mortality register. We estimated each component mortality risk (IRR) by Poisson model adjusting for age at survey.

Results: In 1999-2006, C1 was characterized by circumference and adiposity body composition measures; C2 by bone length and lean mass body composition measures; C3 by bioelectrical impedance reactance and lean mass body composition variables. IRR for diabetes mortality was higher in component linked to adiposity: 1.3 for man and 1.1 for woman. For hypertension mortality, BP characterized by lean mass was protection: 0.4 for all sexes combined. For diabetes/hypertension combined mortality, IRR from adiposity pattern (C1) was similar for man and woman: 1.1.

Conclusions: Adiposity BP it's a risk for diabetes and diabetes/hypertension mortalities among men and women. BP refine risk to morbi-mortality estimation and offer possibilities of identifying individuals with BMI characterized by high adiposity to avois negative or fatal outcomes.

NUTRITIONAL STATUS IN RURAL SCHOOL CHILDREN IN MOROCCO

[1]EL Hioui, mohamed; [2]Azaoui, Fatima Zehra; [3]Ahami, Ahmed Ot; [3]Aboussaleh, Youssef.

[1]PhD. Equip of Clinic and Cognitive Neurosciences and Health. Laboratory of Biology and Health. Department of Biology. Faculty of Science. IBN TOFAIL University. Kenitra. Morocco; [2]Pr. Equip of Clinic and Cognitive Neurosciences and Health. Laboratory of Biology and Health. Department of Biology. Faculty of Science. IBN TOFAIL University. Kenitra. Morocco; [3]Pr. Equip of Clinic and Cognitive Neurosciences and Health. Laboratory of Biology and Health. Morocco.

Background and objectives: Nutritional status is the best indicator of the global well-being of children. However, malnutrition affects physical growth, cognitive development, physical work capacity, and it consequently influences human performance and health. The present study was designed to identify factors that may influence the nutritional status and educational achievements of the children in a rural area of ANTI Atlas of Morocco

Methods: The nutritional status of 162 children (12 to 15 years of age) was assessed by nutritional anthropometry and compared with tables of weight-for-age and height-for-age z-scores (WAZ and HAZ) identifying wasting and stunting, respectively. A questionnaire was developed to collect information about socio-economic and demographic status of the children's families. Also, educational achievements were assessed by their score in mathematics

Results: A total of 162 children (64 boys and 98 girls), aged 12 –15 years. Results: **Conclusions:** In this area of study, malnutrition remains a major problem among adolescents' school performances, which can affect their future. The main causes of malnutrition seem to be the bad weaning practices among school children and cultural attitudes of food. The educational achievements of school children are influenced by maternal education and stunting.

Statistician. Department of Nutrition. University of California Davis. CA. USA.; [8]MPH. Nutritionist. Innovations for Poverty Action. Kenya.; [9]PhD. Senior Researcher. Mathematica Research Institute. Washington DC. USA.

Background and objectives: Anemia may be caused by micronutrient deficiencies, infection, and genetic hemoglobin disorders among children. Nutritional supplementation and improvements in water, sanitation, and handwashing may reduce the burden of anemia and improve micronutrient status.

Methods: We conducted a cluster-randomized controlled trial in rural western Kenya enrolling pregnant women and following their children for 2y. A biochemical subsample included children in four intervention groups: combined water, sanitation, and handwashing improvements (WSH); nutrition improvements, including lipid-based nutrient supplements (LNS) for children 6-24 mo and infant and young child feeding counseling (N); WSH+N; and control. Blood samples were collected at the 2y follow-up and hemoglobin, serum ferritin, transferrin receptor, folate, vitamin B12, retinol binding protein, c-reactive protein (CRP), and alpha-1 acid glycoprotein (AGP) measured.

Results: 699 children were included in this analysis at a mean (SD) age of 22.1 (1.8) mo. In the control group, there was a high prevalence of anemia (48.8%), iron deficiency (80.9%), and vitamin A deficiency (52.9%), but lower prevalence of folate deficiency (9.6%) or B12 depletion (21.8%). The N and WSH+N groups had significantly lower prevalence of anemia ([Prevalence Ratio, 95% CI] N: 0.74, 0.58-0.94; WSH+N: 0.56, 0.42-0.75), iron deficiency (N: 0.71, 0.62-0.80; WSH+N: 0.77, 0.66-0.90), vitamin A deficiency (N: 0.66, 0.41-0.87; WSH+N: 0.54, 0.40-0.72), folate deficiency (N: 0.12, 0.03-0.54; WSH+N: 0.07, 0.01-0.49), and B12 depletion (N: 0.66, 0.50-0.87; WSH+N: 0.54, 0.40-0.72). Additionally, the prevalence of high folate (>45.3 nmol/L) increased in the N and WSH+N groups. There was a marginally significant 25% lower prevalence of anemia in WSH+N compared to N. There were no differences in micronutrient status or anemia between the WSH and the control groups.

Conclusions: The nutrition intervention reduced the prevalence of anemia and deficiencies in iron, vitamin A, folate and B12. It also increased prevalence of high folate status. The WSH intervention did not reduce the risk of anemia, but WSH+N appeared to reduce anemia more than the nutrition-specific intervention. LNS combined with infant and young child feeding behavior change communication is an effective strategy to improve nutritional status.

Keywords: Lipid-based nutrient supplement, anemia, micronutrient, children

EXPLORING THE RELATIONSHIP BETWEEN ENVIRONMENTAL IMPACT AND NUTRIENT CONTENT OF SANDWICHES & BEVERAGES AVAILABLE IN CAFES IN A UK UNIVERSITY

[1]Graham, Fiona; [2]Russell, Jean; [3]Holdsworth, Michelle; [4]Menon, Manoj; [5]Barker, Margo.

[1]The University of Sheffield. UK; [2]PhD. Statistician. Corporate Information and Computing Services. The University of Sheffield. UK.; [3]PhD. Professor. Public Health. The University of Sheffield. UK.; [4]PhD. Lecturer. Geography. The University of Sheffield. UK.; [5]PhD. Reader. Food and Nutrition Group. Sheffield Hallam University. UK.

Background and objectives: Current dietary patterns in the UK are having a negative impact on health and the environment. Adoption of healthier and more environmentally sustainable diets is needed, yet concerns over the nutritional quality of low environmental impact diets have been raised.

We examined the relationship between the environmental impact and nutrient content of sandwiches and beverages commonly consumed in cafes in a UK university to explore how choosing low environmental impact options would affect nutrient intake and subsequent health.

Methods: Greenhouse Gas Emission (GHGE) and Water Footprint (WF) values for ingredient foods of sandwiches and beverages were combined with recipe information to calculate GHGEs (gCO2e per portion/serving) and scarcity weighted WFs (litres per portion/serving). These estimates were then combined via orthogonal regression to give a single environmental impact

score (EIS). The relationship between EIS and nutrient content was explored by correlation.

Results: Sandwiches that contained meat and animal products (i.e. roast beef, corned beef, cheese and pork) and beverages that contained milk, cocoa and/or coffee had the highest EIS. EIS was positively associated with portion size of sandwiches, but not serving size of drinks. EIS was positively correlated with nutrients to limit for health, namely sodium (sandwiches rs= .67 p<0.01, beverages rs= .76 p<0.01), saturated fat (sandwiches rs= .37 p<0.01, beverages rs=.80 p<0.01), and free sugars (sandwiches rs=.44, p<0.01). However, EIS was also positively correlated with nutrients to encourage for health; protein (sandwiches rs = .45 p<0.01, beverages rs.83 p<0.01), iron (sandwiches rs=.44 p<0.01, beverages rs=.38 p<0.01), calcium (beverages rs =.78 p<0.01) and B12 (beverages rs=.76, p<0.01).

Conclusions: Choosing plant-based sandwiches and drinks without milk may help to reduce environmental impact. Selecting smaller sandwiches would also help to reduce environmental burden and calorie intake. However, intakes of health-promoting nutrients may be adversely affected if consumers adhere to environmental dietary messages. This reduction may have health implications for individuals in the population already vulnerable to micronutrient deficiencies.

INTERVENTIONAL PROMOTION FOR CONSUMPTION OF FRUITS AND VEGETABLES IN A PRIMARY HEALTHCARE SERVICE - A RANDOMIZED CONTROLLED TRIAL

[1]Mendonça, Raquel; [2]Mingoti, Sueli; [3]Gazzinelli Bethony, Maria Flávia; [4]Lopes, Aline Cristine.

[1]PhD student. Nutritrionist. Department of Nutrition. Universidade Federal de Minas Gerais. Brazil; [2]PhD. Statistic. Department of Statistics. Universidade Federal de Minas Gerais. Brazil; [3]PhD. Biologist. Department of Applied Nursing, Universidade Federal de Minas Gerais. Brazil; [4]PhD. Nutritionist. Departament of Nutrition. Universidade Federal de Minas Gerais. Brazil.

Background and objectives: The consumption of fruits and vegetables (FV) is one of the ten main factors in the global burden of disease. Futhermore, the studies are usually developed far from the subjects' reality, with respect to availability to health services in particular. A most of intervention nutritional do not regard to the individual's perception of their consumption. To assess the impact of an intervention aimed to increase fruit and vegetable (FV) consumption.

Methods: A seven-month assessment of a randomized controlled trial of a nutritional intervention in the promotion of FV intake was conducted with 3,778 adults (≥20 years of age) in the healthcare service – Brazil. In 18 units' healthcare were randomly assigned to a control (n=9) or intervention group (n=9). The intervention was based on the Transtheoretical Model and Paulo Freire pedagogy and included: group educational sessions, motivational messages by postcard, written material and environment-based activities. The control received periodic health intervention (lecture on nutrition) at the health service. Control and intervention group members participated in physical activity, for three times a week during one hour. The primary outcome was change in FV consumption (grams). Intermediate outcomes included: increase self-efficacy, decrease perceived of barriers of FV consumption and progress of action stages. Analyses utilized a generalized estimating equation analysis.

Results: We assessed 3,778 individuals, of these 364 were excluded (112 were not meeting inclusion criteria and 252 declined to participate). 3,414 individuals (intervention group= 1,931; control= 1,483) had completed follow-up at seven month, of whom 1,305 in the intervention group and 936 in the control group. The intervention group participants reported improvement in self-efficacy (<0.001), fewer perceived of barriers (0.003) and greater progression to action stages (57.2% to 70.1%; p<0.001); and participants in the lowest quartile of FV consumption at baseline increased their FV intake (β=27.5; CI95%:6.4 to 48.6) compared to the control group.

Conclusions: The intervention reached the goal. The intervention promoted consumption among people who had low FH consumption, maintenance along with adequate of the FV intake, of decreasing perceived barriers and to increase self-efficacy. More research on longer-term FV intake maintenance is needed.

RELATIONSHIP OF SOCIO-DEMOGRAPHY, PARENTAL ANTHROPOMETRY AND BIRTH HISTORY WITH WEIGHT STATUS AMONG URBAN AND RURAL ADOLESCENTS (13-18 YEARS)

[1]Chopra, Mansi; [2]Siddhu, Anupa; [3]Tandon, Nikhil.

[1]MSc. Assistant Professor. Department of Food and Nutrition. Lady Irwin College. University of Delhi. India.; [2]PhD. Associate Professor. Department of Food and Nutrition. Lady Irwin College. University of Delhi. India.; [3]PhD. Professor. Department of Endocrinology and Metabolism. All India Institute of Medical Sciences. New Delhi. India.

Background and objectives: Increasing prevalence of adolescent obesity in a developing country like India, undergoing socio-economic and epidemiologic transition warrants assessment of associated risk factors. The study aims to determine socio-demographic, birth history and parental characteristics among adolescents and assess their relationship with weight status.

Methods: Using a cross-sectional study design, a total of 499 school-going adolescents (13-18 years) belonging to urban (New Delhi; n=261) and rural areas (Harsaru Village, District Gurgaon and Duhai Village, District Ghaziabad; n=238) of north India were enrolled. Information on socio-demography, including date of birth, gender, location (urban/rural), facilities at home (car, television, computer, air conditioner, cooler), number of living rooms (<3, 3-5, >5), ownership of house; birth history, including birth weight, number of siblings (0, 1-2, ≥3), birth order (1, 2-3, >3), total breastfeeding duration; information on parents anthropometry and weight status computation based on BMI (WHO), educational status (≤high school/ ≥graduation), occupational status (working/not working), smoking and alcohol status (never/sporadic/regular), were obtained by a parent-administered questionnaire. Anthropometric measurements including height and weight were measured and adolescents were classified based on weight status (overweight/obese [OW/OB], normal [NW] and lean weight [LW], respectively) using BMI for age reference values (WHO).

Results: Parental educational status, paternal occupational status, facilities at home and number of living rooms were significantly higher among OW/OB as compared to NW and LW group, respectively (p<0.05). Mean values of paternal height, parental weight and BMI were significantly higher among OW/OB group as well (p values ranging from <0.001-0.039). Furthermore, OW/OB adolescents had significantly higher birth weights, were least breastfed, were first born and majority were less likely to have siblings (p values ranging from <0.001-0.038). Logistic regression analyses adjusted for age, gender and location showed higher maternal educational status (OR:2.60), paternal (OW, OR:1.84; OB, OR:3.27) and maternal (OW, OR:4.16; OB, OR:3.35) weight status, regular parental smoking (OR:2.56) and higher birth weight (OR:2.64) increased, and ≥3 siblings (OR:0.25) and higher breastfeeding duration (OR:0.95) significantly decreased the odds of developing OW/obesity among adolescents (p values <0.001-0.046).

Conclusions: The results highlight the importance of socio-demographic, parental characteristics and birth history in the development of OW/obesity among adolescents.

Keywords: socio-demography, adolescent obesity.

THE EFFECT OF DOUBLE FORTIFIED SALT ON HEMOGLOBIN CONCENTRATIONS: A SYSTEMATIC REVIEW AND META-ANALYSIS

[1]Ramirez-Luzuriaga, Maria J; [2]Larson, Leila; [3]Martorell, Reynaldo.

[1]MSc. Nutrition and Health Science Program. Laney Graduate School. Emory University. Atlanta. Georgia. USA.; [2]MPH. Nutrition and Health Science Program. Laney Graduate School. Emory University. Atlanta. Georgia. USA.; [3]PhD. Nutrition and Health Science Program. Laney Graduate School and Hubert Department of Global Health. Rollins School of Public Health. Emory University. Atlanta. Georgia. USA.

Background and objectives: Background: Double-fortified salt (DFS), containing iron and iodine, has been proposed as a feasible and cost-effective alternative for iron fortification in low and middle-income countries (LMICs). Objectives: The aims of this meta-analysis were to 1) examine the effect of DFS on hemoglobin concentrations, and 2) assess differential effects on hemoglobin by iron concentrations and type of formulations (ferrous sulfate, ferrous fumarate and ferric pyrophosphate).

Methods: A systematic search of randomized and quasi-randomized controlled trials using MEDLINE, EMBASE, Cochrane, Web of science, and other sources identified 220 articles. A total of 12 studies, all efficacy studies, met pre-specified inclusion criteria.

Results: All studies were conducted in LMICs; eight in India, two in Morocco, one in Cote d'Ivoire and one in Ghana. The pooled analysis showed that DFS increased hemoglobin concentrations significantly (SMD 0.28; 95% CI: 0.11, 0.44; P< 0.001). Significant heterogeneity was observed and random effects models were used. Stratified analyses by population sub-groups indicated significant effects among school-age children (SMD 0.32; 95% CI: 0.04, 0.60; P< 0.05; n=7) and women of childbearing age (SMD 0.24; 95% CI: 0.04, 0.44; P< 0.05; n=6). Ferrous fumarate (SMD 0.22; 95% CI: 0.05, 0.38; P< 0.05; n=3) and ferrous sulfate (SMD 0.23; 95% CI: 0.01, 0.46; P< 0.05; n=6) showed similar effects. Hemoglobin concentrations and deworming at baseline, sample size, study duration and study quality were not associated with effect size.

Conclusions: DFS is efficacious in increasing hemoglobin concentrations in LMIC populations. Effectiveness studies are needed.

Keywords: Hemoglobin, double fortified salt, fortification, salt iodization, iron

PREVALENCE OF OVERWEIGHT AND OBESITY AMONG CHILDREN IN PRIVATE PRIMARY SCHOOLS IN KENITRA, MOROCCO

[1]Sbai, Meriem; [2]Aboussaleh, Youssef.

[1]Phd. Nutrition, Health and Environment laboratory. Department of Biology. Faculty of Sciences. Ibn Tofail University. BP 133 14000 Kenitra. Morocco; [2]Professeur. Laboratory of Biology and Health. Department of Biology. Ibn Tofail University. Faculty of Sciences. Morocco.

Background and objectives: Background. The rising prevalence of childhood obesity poses a major public health challenge in both developed and developing countries by increasing the burden of chronic non communicable diseases.

Objectives . The aim of our study was to estimate the prevalence of overweight and obesity among primary school age children in Kenitra.

Methods: We conducted a cross-sectional study of a random sample of 331 school children including 173 boys and 158 girls aged 6-7 years. Children were recruited from private primary schools. Anthropometric parameters (weight, height, body mass index) were measured. Obesity indices (Thinness, Severe thinness,

normal weight, overweight and obesity) were defined according to WHO standards published in 2007. Data were collected using a questionnaire. Statistical analysis was performed using SPSS version 20.0 and using a macro of WHO Anthro plus .

Results: The results showed that 17.8% of school children are overweight/obese, and 2.7% are Thinness /Severe thinness . Age and anthropometric parameters between BMI for age groups showed that the weight, height, BMI z score of weight, size and z score of BMI z score at very high Among overweight/obese groups than other groups. Groups of BMI for age are not influenced by gender as p = 0.665.

Conclusions: The prevalence of obesity and overweight among school children is high. School children are at risk of developing diseases associated with obesity. Which may cause problems at the age of adolescence and adulthood. Several studies of nutritional status are recommended for preschool children in Morocco.

Keywords: Overweight, obesity, children, Morocco,6-7 years

HEALTH STATIONS PROGRAM IN THE CITY OF BUENOS AIRES

[1]Gonzalez, Veronica; [1]Antún, María Cecilia; [2]Lava, María del Pilar; [1]De Ruggiero, Marina; [1]Mirri, María Eugenia; [1]Alonso, Natalia; [1]López, María Carla.

[1]BSc in Nutrition. Directorate-General of Health Development. Deputy Mayor's Office. Buenos Aires City Government. Argentina.; [2]BS in Sociology. Directorate-General of Health Development. Deputy Mayor's Office. Buenos Aires City Government. Argentina.

Background and objectives: As a response to the growing burden of non-communicable diseases (NCD), in 2012 the Health Stations Program (HS) was created by the Directorate-General of Health Development of the Deputy Mayor's Office of the Buenos Aires City Government.

Among its objectives are the detection of NCD risk factors and the promotion of healthy lifestyles in children and adults. It is available to the community free of charge through 40 health promotion points located within Buenos Aires City.

The object of this paper is to describe the scope of the HS Program through a series of indicators.

Methods: Cross-sectional study based on data from HS user database.

Results: Since its start in 2012, a total of 1 044 641 people visited the HS 3.4 times on average, totalizing 3 937 422 sessions (3 593 454 health checkups and 693 820 nutritional counselings). Fifty-six percent of users were female, 44% were male, and 56% were over 45 years of age. Fifty-six percent resided in Buenos Aires City and 27% in Buenos Aires Province.

During the past year 13 300 new monthly contacts were made on average, and an estimated one out of five Buenos Aires City residents have attended HS at least once.

Blood pressure controls were carried out on 762 124 people, glycemia on 248 083 people and body weight controls on 346 278

people. Among the latter, over half (56.2%) were overweight, this being the principal reason for consultation among nutritional counseling users.

Outdoor gym classes are offered within the HS premises, as well as other programs such as Healthy Awakening, consisting of cognitive stimulation exercises and physical activity for senior citizens, and Game Zones, where physical activities for children are offered. Furthermore, conferences open to the community have convened 16 200 people.

Conclusions: The HS Program enables access to the control of a series of NCD risk factors in the population and constitutes an original strategy for promoting healthy lifestyles.

ASSOCIATION BETWEEN MARKERS OF INFLAMMATION WITH CARDIO-METABOLIC RISK FACTORS, DIET AND PHYSICAL ACTIVITY AMONG APPARENTLY HEALTHY INDIAN ADOLESCENTS

[1]Chopra, Mansi; [2]Siddhu, Anupa; [3]Tandon, Nikhil.

[1]MSc. Assistant Professor. Department of Food and Nutrition. Lady Irwin College. University of Delhi. India.; [2]PhD. Associate Professor. Department of Food and Nutrition. Lady Irwin College. University of Delhi. India.; [3]PhD. Professor. Department of Endocrinology and Metabolism. All India Institute of Medical Sciences. New Delhi. India.

Background and objectives: Obesity is associated with metabolic derangements and sub-clinical inflammation, coexisting with adverse lifestyle behaviours. The study aims to assess the relationship between cardio-metabolic risk factors, diet and physical activity (PA) with inflammatory markers among adolescents.

Methods: Using a statistical approach, a total of 499 school-going adolescents from urban (New Delhi; n=261; 3 schools) and rural areas (Harsaru Village, District Gurgaon and Duhai Village, District Ghaziabad; n=238; 3 schools) of north India, were enrolled, based on weight status (overweight/obese [OW/OB], normal weight and lean weight) using BMI for age WHO guidelines, in this cross-sectional study. Measurements of anthropometry, body composition, blood pressure and fasting blood samples for cardio-metabolic variables including glucose, HbA1c, total cholesterol, LDL-c, HDL-c, TG, urea, creatinine, uric acid and inflammatory markers including CRP, IL-6, TNF-alpha, resistin, leptin and adiponectin were done. Diet information was obtained using 24hr diet recall for three non-consecutive days (2 school-days and 1 weekend-day) and Global PA Questionnaire (v.2) was used to compute METs/week spent on total PA and its domains.

Results: OW/OB group had higher concentrations of cardio-metabolic and inflammatory markers as compared to other groups (except HDL-c and adiponectin, which were lower; p<0.05). Mean dietary intakes of energy, macronutrients, fatty acids [FA], fibre and select micronutrients were significantly high-

er (p<0.05), with lower METs/week for total PA and for activities related to work, transport and recreation among OW/OB adolescents (p<0.001). Individual linear regression models adjusted for age, gender, location, BMI and fat mass showed significant association of CRP with dietary vitamin B12 (β:-0.28); TNF-alpha with LDL-c (β:0.45), urea (β:2.31), PUFA (β:6.09), sodium (β:0.14), vitamin A (β:0.17); IL-6 with LDL-c (β:0.13), moderate work (β:-0.02); resistin with glucose (β:0.13), PUFA (β:0.68), MUFA (β:-0.45), fibre (β:-0.22); leptin with TG (β:0.01), uric acid (β:0.15), trans-fat (β:0.20), β-carotene (β:0.01); adiponectin with HDL-c (β:14.24), HbA1c (β:298.63), β-carotene (β:0.11) (p values <0.001-0.047).

Conclusions: Significant positive associations of TNF-alpha, IL-6, resistin and leptin with select cardio-metabolic variables, dietary PUFA, trans-fat, sodium and vitamin A, and negative associations with MUFA and fibre, highlight the importance of early identification and modification of risk factors to delay the onset of cardio-metabolic complications among adolescents.

Keywords: cardio-metabolic risk; inflammation.

DEVELOPMENT OF A NEW METHODOLOGY TO DEFINE AN OPTIMAL PORTION SIZE OF FOOD TAKING INTO ACCOUNT CONSUMER SATISFACTION, APPETITE SENSATIONS AND ENERGY INTAKE

[1]Lesdema Laurent, Aurelie; [2]Heyraud, Caroline; [2]Hachefa, Celia; [3]Vinoy, Sophie.

[1]PhD. Research scientist. Global Nutrition Research and Communication. Mondelēz International. USA.; [2]MSc. Nutrition scientist. Global Nutrition Research and Communication. Mondelēz International. France.; [3]PhD. Research scientist. Global Nutrition Research and Communication. Mondelēz International. France.

Background and objectives: Food portion size has increased over the last decades and can be influenced by a wide variety of internal and external factors (individual characteristics, food related characteristics and food environment). Recommended food portion size are mainly based on calories and recommended daily intake without considering consumers' needs and expectations. The aim of our studies was to develop a new methodology to help defining an optimal portion size by taking into account three dimensions: energy intake, fullness and overall satisfaction.

Methods: To achieve this goal quantitative consumer studies were run on different food categories (baked potato snacks and chocolate). The baked potato snacks study was launched on 120 consumers and was repeated in 2 countries. 3 hours after their lunch, 200 g of baked potato snacks were provided in a dispenser so that the consumers did not have visual clues of the quantity provided and eaten. Consumers were asked to eat as much as they wanted to feel fully satisfied for a snack at this moment of the day. Actual consumption (g and Kcal), appetite sensations before and after consumption and liking were assessed. Satisfaction related to the overall eating experience was measured with a questionnaire designed for the study. A similar protocol was used for the study on chocolate and the satisfaction questionnaire was improved by adding sensory dimensions.

Results: The study on potato snacks allowed to identify the optimal portion size that reduced significantly the appetite while bringing the maximum of satisfaction (between 30 to 40g). For chocolate, drivers of satisfaction and reason to stop consumption were also identified.

Conclusions: This new approach has provided promising results to recommend an optimal portion size. It provides relevant information to design satisfying portion sizes of snacks for consumers to help them better manage their daily energy intakes and to adopt healthier food pattern.

Keywords: portion size, satisfaction, appetite, consumer studies, sensory drivers

Conflict of Interest Disclosure: All authors worked for Mondelez international at the moment of the study. No specific conflict of interest.

Background and objectives: Diet quality is considered a key factor in the development of chronic diseases. Availability of brief dietary indexes that can effectively evaluate dietary patterns and their association with health is critical for prevention and management of chronic diseases. Based on the increasing scientific evidence that supports the health benefits of adopting a Mediterranean diet, the objective of this study was to develop a valid and self-applicable Chilean Mediterranean Diet Index (Chilean-MDI)

---

that evaluates food intake quality -based on adherence to this dietary pattern- in our population.

Methods: The Chilean-MDI was developed based on a previous Mediterranean eating score that was adapted to Chilean dietary habits. This index was further validated in a sample of 153 adults by comparing the concordance between the results obtained by self-application of the Chilean-MDI with those obtained by a trained nutritionist. Additionally, this index was applied in 53,366 Chilean adults in order to describe the diet quality of our population.

Results: There was an adequate concordance (kappa>0.69 in all items) and high correlation (r=0.94, p<0.001) between findings obtained by self-application of the Chilean-MDI and those achieved by the nutritionist. The application of the index in Chilean adult population showed a better diet quality (high Mediterranean diet adherence) among women, with advanced age and in higher educational levels.

Conclusions: The Chilean-MDI can be successfully self-applied to portray the overall diet quality in the Chilean adult population. Additionally, this index showed demographic trends in food intake that are comparable to those obtained with similar indexes applied in other populations. Supported by Fundación Banmédica.

GLOBAL EVIDENCE ON NUTRIENT PROFILE MODELS WITH APPLICATIONS IN GOVERNMENT-LED NUTRITION POLICIES AIMED AT HEALTH PROMOTION AND NONCOMMUNICABLE DISEASE PREVENTION: A SYSTEMATIC REVIEW

[1]Labonté, Marie-Eve; [2]Poon, Theresa; [3]Gladanac, Branka; [4]Ahmed, Mavra; [4]Franco-Arellano, Beatriz; [5]Rayner, Michael; [6]L'Abbé, Mary.

Nuffield Department of Population Health. University of Oxford. United Kingdom.; [6]PhD. Department of Nutritional Sciences. University of Toronto. Canada.

Background and objectives: Worldwide, government bodies increasingly recognize the importance of using transparent and reproducible methods to evaluate the nutritional quality of foods and beverages for nutrition-related policies. Nutrient profile (NP) models meet this need, but an up-to-date, accessible, and global resource summarizing existing NP models is currently unavailable. The aim of this study was to develop such a resource which summarizes and evaluates key characteristics of NP models with applications in government-led nutrition policies.

Methods: NP models were first identified from a key, but unpublished catalogue of NP models built in 2012 by Rayner and colleagues. A systematic literature search was also conducted in three databases of the peer-reviewed literature (e.g. PubMed) and fifteen grey literature databases (e.g. PAIS Index). Included models had to meet the following characteristics (out of twelve eligibility criteria): a) Developed or endorsed by governmental or intergovernmental organizations; b) Allow for the evaluation of single food items; c) Consider multiple nutrients or food components; d) Have publicly available nutritional criteria.

Results: A total of 387 potential NP models were initially identified, including n=119 models from Rayner's catalogue and n=268 models from the full text assessment of >600 publications. Seventy-eight models were included. The majority of models (n=75; 96%) provide summary ratings of the healthfulness of food products as opposed to separate ratings for individual nutrients. Almost half of the models originate from the Americas, followed by the Asia/Pacific region (23%) and Europe (22%). Most (n=55; 71%) were introduced within the last 10 years, and only 6 models (8%) were endorsed as opposed to specifically developed by a governmental or intergovernmental organization. The most common primary applications of the models included school food standards or guidelines (n=27), food labelling (e.g. front-of-pack; n=12), restriction of the promotion of foods to children (n=10), and claims (e.g. health claims; n=7).

Conclusions: Given the proliferation of NP models worldwide, this new resource will be highly valuable for assisting health professionals, nutrition professionals and policy makers in the adoption or adaptation of an existing model appropriate for the establishment of specific nutrition policies that require the use of nutrient profiling.

Conflict of Interest Disclosure: Prior to this study, Beatriz Franco-Arellano was a PepsiCo employee. Also, Theresa Poon is currently employed part-time by Intertek Scientific & Regulatory Consultancy. These companies had no connection with the present research. The other authors have no conflicts of interest.

GENDER IS ASSOCIATED TO MINIMUM ACCEPTABLE DIET AMONG INFANT AND YOUNG CHILDREN AGED 6-23 MONTHS IN SOUTHERN OF BENIN

[1]Mitchodigni, Irene; [2]Amoussa-Hounkpatin, Waliou; [3]Ntandou-Bouzitou, Gervais; [4]Termote, Celine; [5]Kennedy, Gina; [6]Hounhouigan, Joseph.

Bioversity International. Italy; [6]Ph D. Professor. Dean of Faculty of Agronomic Sciences. University of Abomey Calavi. Benin.

Background and objectives: Socio-demographics factors, childcare practices, poverty, low levels of education, women's disempowerment are the most important factors contributing to persistent child under-nutrition in developing countries including Benin. The achievement of healthy growth and survival of young children in their early years requires appropriate complementary feeding practices. This study aimed to identify socio-economic and demographic factors associated with adequate complementary feeding (CF) practices.

Methods: A cross-sectional study of 1219 children aged 6-23 months was carried out in Bopa and Houeyogbe districts in Southern Benin. Socio-demographic information was obtained using a semi-structured questionnaire administered to the child primary caregivers. CF practices were assessed through WHO/UNICEF infant and young child feeding (IYCF) indicators. "Random Forest" was used to eliminate confounding factors. Logistic mixed regression models performed in "R" software were used to test significant effects of explanatory variables on CF practices.

Results: Majority of mothers (67%) did not attend formal school and 6% of households are female-headed. Poor nutritional status was observed in study area with 27% of stunting and 5% of wasting. The proportion of children who achieved minimum dietary diversity (MDD), minimum meal frequency (MMF) and minimum acceptable diet (MAD) was 60%, 71% and 46%, respectively. Education level of mothers was not significant as main effect on MAD. However, there was a significant two ways interaction effect of sex of household head and education level of mothers on MAD (Coef β =2.8; OR = 16.5; 95%IC: 1.8-50.7; P=0.013). The probability that a child meets the minimum acceptable diet increased drastically among female-headed households with higher schooling level.

Conclusions: The study findings suggest that empowerment of women and their level of education have an important role to play as factors contributing to appropriate IYCF practices. A combination of nutrition specific and nutrition-sensitive interventions including gender aspect are necessary to address child under-nutrition.

COST AND COST-EFFECTIVENESS OF FOOD-ASSISTED MATERNAL AND CHILD HEALTH AND NUTRITION PROGRAMS IN BURUNDI AND GUATEMALA

[1]Heckert, Jessica; [2]Richter, Susan; [3]Iruhiriye, Elyse; [4]Leroy, Jef; [4]Olney, Deanna; [5]Ruel, Marie.

Division Director. Poverty, Health and Nutrition Division. International Food Policy Research Institute. USA.

Background and objectives: Despite the popularity of food-assisted maternal and child health and nutrition (FA-MCHN) programs, little is known about their (cost-)effectiveness. This study examines the cost and cost-effectiveness of two FA-MCHN programs implemented during the first 1,000 days in Burundi and Guatemala. Both programs included food assistance (family + individual ration), strengthening of health services, and a nutrition/health behavior change communications strategy. Using a cluster-randomized controlled trial (c-RCT), the Burundi study evaluated the optimal timing and duration of food assistance: from pregnancy until the child is 24 months (T24), until the child is 18 months (T18), and birth until 24 months (TNFP). The 5-treatment arm Guatemala c-RCT compared the optimal composition of the individual ration (corn-soy blend (CSB), micronutrient sprinkles (MNP), lipid-based supplements) and optimal size of the family ration (full, reduced, none).

Methods: We used the activity-based costing-ingredients method and collected detailed data on program activities, inputs (e.g., labor, supplies), and input allocation across activities. We calculated total costs, activity-specific costs, and start-up costs. We also estimated the cost and cost-effectiveness for each version using stunting as the outcome. Since a cost-effectiveness ratio only accommodates one outcome, it is artificially inflated for integrated programs. We thus compare versions across a range of outcomes.

Results: In Burundi, T24 was the most expensive (766 USD/beneficiary), had a large range of impacts, and was the most cost-effective in reducing stunting (108 USD/beneficiary/percentage point (pp) reduction in stunting). In Guatemala, the full family ration combined with CSB or MNP were the most expensive (1,076 and 1,086 USD/beneficiary respectively), had the highest concentrations of positive impacts, and were the only versions that reduced stunting. The CSB version led to the largest stunting reductions and was more cost-effective than the MNP version (97 and 161 USD/beneficiary/pp reduction in stunting, respectively). However, the CSB version also had unintended negative effects. In both countries, start-up costs accounted for a significant share of non-food costs (17.3%, Guatemala; 10.1%, Burundi).

Conclusions: In both countries, the most expensive program versions were also the most cost-effective. Longer implementa-

tion periods would reduce the share of start-up costs and increase cost-effectiveness.
