HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

An architecture for the integration of different functional and structural plant models

ABSTRACT

Functional Structural Plant Models (FSPMs) have limitations due to resource constraints. To allow FSPMs to abstract complex plant systems beyond a single model's limitation, the integration that compound different FSPMs could be a possible solution. However, the integration involves many technical dimensions and a generic software infrastructure for all integration cases is not possible. In this paper, we analyze the requirements of the integration with all the technical dimensions. Instead of an infrastructure, we proposed a generic architecture with specific processes components as a logical level solution by combining an ETL based sub architecture and a C/S based sub architecture. Which allows the integration of different FSP models hosted on both different and same FSP modeling platforms in a flexible way. We implemented the architecture for the integration of two specific platforms based FSPMs, and we demonstrate several running examples of the integrated FSPMs to illustrate the usability of the architecture.
