HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

IN VITRO 3-D TOTAL CELL GUIDANCE AND FITNESS

PROCEEDINGS OF CellFit MEETING 2018

2nd-3rd of October 2018

Hvar Island
Croatia

Editors

Tiziana Brevini, Alireza Fazeli, Ana Katusic, Ana Vidos, Georgia May

We would like to thank the following organizations for their support:

European Cooperation in Science and Technology

COST is supported by the EU Framework Programme Horizon 2020

Publisher: School of Medicine University of Zagreb

Book Title: In Vitro 3D Total Cell Guidance and Fitness

Year of Publication: 2018

ISBN: 978-953-6255-70-2

**Dynamic landscape of peri-centromeric heterochromatin
during transition from naïve to primed pluripotency**

Pluripotency, defined as the potential to generate all cellular lineages, is a continuous process starting in the inner cell mass (ICM) of the blastocyst and ending up with gastrulation. In the ICM, pluripotent cells are in a naïve state, characterized by an open chromatin conformation, with poor epigenetic controls. Then these cells acquire the competency to differentiate, along with compaction of chromatin, de novo DNA methylation and reshuffling of repressive marks on gene promoters. In such highly changing context, we have studied the fate of the constitutive, peri-centromeric heterochromatin (PCH) in pluripotent cells. We show that it switches from H3K27me3 enrichment to H3K9me3/DNA methylation enrichment, while the transcription status of the repeated sequences that composed PCH sharply decreases. This dynamic pattern appears as a faithful marker of the transition from naïve to primed pluripotency as it happens both in vitro in the different pluripotent cells that mimic both states (ESC and EpiSC, respectively) and in vivo within the late inner cell mass.
