HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
Experiences in estimation of metafounders ancestral relationships of dairy sheep

A. Legarra and J.M. Astruc

**Session 67. Multidisciplinary approaches for improving sustainable livestock production: user application needs**

**Date:** Thursday 30 August 2018; 14.00 – 18.00

**Chair:** M.H. Pinard-Van Der Laan / J. Van Milgen

**Theatre Session 67**

**invited** Innovations for sustainable animal nutrition

**invited** L.A. Den Hartog and F. Brinke

**invited** Expectations of breeding industry from research projects

**invited** J.A.M. Van Arendonk

**invited** The importance of research for developing standards to control animal diseases: the role of the OIE

S. Messori and E. Erlacher-Vindel

Effects of protein restriction on rumen metagenome and metabolic profile in Holstein calves

The adoption of environmental practices is an important issue for livestock production. This study explores the main drivers of the adoption of nine environmental practices in the case of French dairy farms. We first tested the role of internal farm factors related to its structure and governance, followed by the role of external factors related with spatial, regulatory and market features. We used data of 47,562 dairy farms from the 2010 French Agricultural Census to study the correlation between internal and external factors and each one of the nine environmental practices. The results show that among governance and managerial characteristics, attitudes towards uncertainties play a more important role than individual characteristics of the farmer (e.g. age, gender, or training). The results also suggest that farm size has a negative effect on the adoption of permanent grassland, leguminous for forage, no irrigation, crop rotation and no fertilisers and no pesticides practices. However, farm size has a positive effect on the adoption of no-till, manure treatment and agroecological structures as hedges, lines of trees, woods, and fallow lands. In terms of external factors, the paper shows the central role of the spatial environment of the farm and, more specifically, the environmental behaviour of neighbouring farms as a major driver of farm adoption behaviour. The statistical analysis also highlights the strong correlation of positioning on alternative markets, short circuits, organic products, or quality markets on the adoption of these practices. Finally, as the literature suggests, we show that environmental regulations also drive the adoption of farming environmental practices.

Panel discussion 2: user needs and applications
