HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

PROGRAM AND ABSTRACT BOOK
The choice of the cultivar is one of the keystones to reduce pesticide input in peach orchards. Breeders have selected peach cultivars that have mainly been assessed on yield and fruit quality in conventional farming systems. The disease susceptibility was not considered as a key criterion. Despite a great turn-over of new peach cultivars, their suitability for organic and low-input systems remains unknown for most of them.

A first program has been carried out from 2001 to 2008 in order to assess peach leaf curl, powdery mildew and aphid susceptibilities of 28 cultivars in a farm network and experimental stations. A high variability of leaf curl and powdery mildew susceptibilities was observed among the cultivars. In 2009, the two most promising cultivars have been included in a second assessment program among 10 other cultivars. A randomized experimental plot design took into account the spatial distribution of the disease pressure. The variability of peach leaf curl susceptibility between cultivars was strongly influenced by the disease pressure. Since 2011, susceptibility to peach leaf curl, aphids, blossom and Coryneum blight of 10 established peach cultivars has been assessed in a network of commercial organically farmed plots. Methodological considerations include the interaction between disease epidemiology, design and management of the orchard and the observed cultivar responses to specific pathogens. The potential and limits of farmers' implication in cultivar assessment is discussed.
