HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

ABSTRACT FORM

Presenting Author

Family name	Remot
First name	Aude
Degree	PhD
Institute University	INRA
Address	Domaine de Vilvert, 78350 Jouy-en-Josas, France
Phone	+ 33 6 76 89 58 65
Email	Aude.remot@jouy.inra.fr
Participant number	724904
Abstract category ¹	<ul style="list-style-type: none">- Immune tolerance in allergy and asthma- Hygiene hypothesis in immune regulation

¹ ABSTRACT CATEGORIES

Please select one or maximum two. State topic(s) in the abstract form:

Basic Mechanisms

- Innate immune response
- Dendritic cell subsets and immune regulation
- B cell subsets and immune regulation
- NK cells and NK-T cells
- Innate lymphoid cells
- Transcriptional regulation of immune responses
- Development of effector and regulatory T cells
- T and B cell memory and immune regulation
- T cell subsets and effector mechanisms and interaction with other cells
- Chemokines and receptors in peripheral tolerance
- Apoptosis in the regulation of immune responses
- Mechanisms of immune privilege
- The role of microRNAs in immune regulation and effector functions
- Immune regulatory mechanisms related to resident tissue cells
- Epigenetic-mediated immune response and immune memory
- Metabolism and immunity

Focus on clinical application, drug discovery and novel biotechnological developments

- Hygiene hypothesis in immune regulation
- Regulatory and effector T cell subsets and cytokines: from bench to bedside
- Immune response to parasites
- Tumor antigen-specific immune regulation
- Immune tolerance and autoimmunity
- Immune tolerance and neuroimmunology
- Immune tolerance in allergy and asthma
- Immune regulation in organ transplantation tolerance
- Experimental models of inducing and breaking peripheral tolerance
- Mucosal tolerance and intestinal homeostasis

- Development of novel vaccines and drugs
- Immunomodulation in vivo, „biologicals“
- Cellular therapies including stem cell therapies

OBLIGATORY FORMAT

For every submitted abstract:

Title: Arial, 10, bold, single spaced, not capitalized
Authors: Arial, 10, single spaced, first name, last name, underline presenting author
Author affiliations: Arial, 10, name of institution, town, country, use numbers to link to the authors
Text body: Arial, 10, single spaced, max. 300 (only text, excl. authors and affiliations)

! do NOT use „symbol font“, please spell out greek letters and avoid using other symbols

! do NOT include tables, figures or references

Abstract (please strictly adhere to the above rules of abstract submission)

Impact of the development of the pulmonary microbiota on neonatal immunity

While the healthy lungs had been thought of as sterile, the concept and the description of a commensal lung flora recently emerged. It has been described a bacterial community in the healthy Human lung, with *Pseudomonas*, *Streptococcus*, *Prevotella*, *Fusobacteria*, and *Veillonella* as dominant members. As it is now admitted for intestinal tract, the pattern of colonization in respiratory tract influences the health. Indeed, bacterial colonization is critical for the development of mucosa and the balance of the immune system.

The exploration of the impact of the development of the pulmonary microbiota on neonatal immunity is a new and promising area which will impact the management of newborn health. We combined *ex vivo* and *in vivo* strategies to put in evidence how lung bacteria shape the innate and acquired respiratory immunity in mice.

First, we isolated and characterized the primocolonizing bacteria arriving early in the lung of newborn specific pathogen free (SPF) BALB/c mice, using both molecular approaches and *in vitro* cultures. We were able to isolated lung bacteria (mainly facultative anaerobes bacteria) as soon as 3 days after birth. Their number was significantly increased after 3 weeks.

Then, the effects of the establishment of the flora on lung epithelium and immunity were assessed with naive lung explants from SPF or germ-free animals. Co-culture of explants with lung bacteria revealed differences in the cytokine secretion pattern according to age, microbial status and the type of bacteria used.

Finally, the influence of the microbiota on the lung protection will be investigated *in vivo* by induction of asthma with House Dust Mite in SPF, gnotobiotic (inoculated with primocolonizing bacteria) or germ-free newborn mice.

To better understand how the microbial factors influence the immune defenses at early age should improve fundamental knowledge and led to envisage innovative pediatric treatments for respiratory diseases.
