HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Soil properties mapping at the field scale from DC landscape survey sensor

Vienna | Austria | 03 – 08 April 2011

Introduction

Soils are complex media whose properties can have a strong spatial variability. At the field scale when usual practises of characterization, as soil sampling, give only a rough idea on the real in-field variability, non destructive geophysical methods can overcome this difficulty from high density of measurements. These methods are also time-efficient. However data interpretation in term of soil properties is not straightforward. This requires a processing workflow developed here, from a DC dataset.

DC landscape survey sensor

Direct Current (DC) method enables to measure electrical resistivity (ER, ohm m) of soils. Its basic principle relies on an electrical current at low signal frequency generating into soil by electrodes.

- ✓ dGPS system
- ✓ Resistivity meter
- ✓ Control in real time

- High spatial resolution
- Small acquisition time
- 3 apparent soil layers
- Non destructive
- Useable for ploughed soils...

One electrode V-shape system
(contact improved) (noise restricted)

A technique adapted for field prospecting is the **MultiContinuous Electrical Profiling (MuCEP)**. It is a mobile soil electrical resistivity mapping system which comprises a multi-probe system towed by a cross-country vehicle. It cover a large area in few time and measure field resistivity at high resolution. (ARP patented, Geocarta society, Paris, France)

Processing workflow

Geophysical measurements (resistivity: ER)

- Raw ER at three apparent depths
- 52000 data/ plot of 5 ha
- Median smoothing and filtering

Soil sampling

- Local soil cores (n=30)
- Local soil properties (n=30)

Ancillary dataset

- Soil layering-soil depth measured locally
- Local Vertical Electrical Sounding (VES 1D)

Inverse modelling process

- **1D inversion** (QWinv1DN, Tabbagh, 2004)
- Two ER layers
 - o Initial ER values given by 1D sounding
 - o Layering depth fixed

Calibration

- **Statistical analysis** (PCA, standard regression)
- Transfer function development:
ER=f(soil properties)

Mapping process

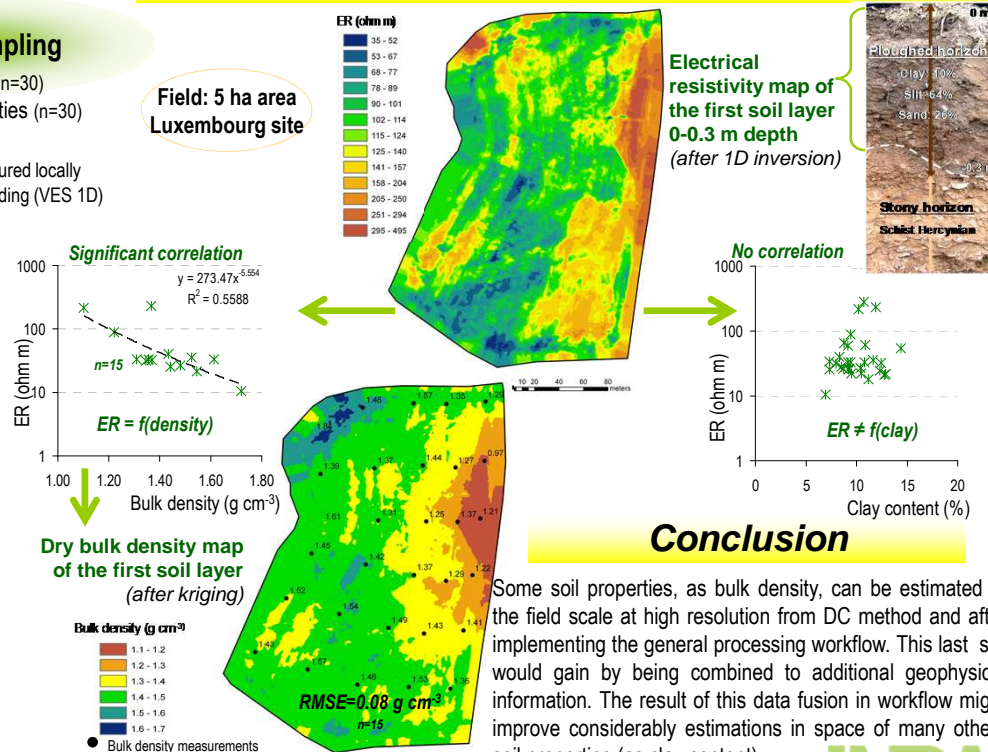

- **Spatial interpolation** of soil properties from ER by transfer function inversion

Validation

- Analysis of estimated properties versus measured properties
- RMSE calculation

Iterations

An exemple of a soil property mapping from DC (soil bulk density map)
