HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

The “food metabolome” comprises all metabolites present in biological fluids that are directly derived from the digestion of food. A large proportion of the food metabolome consists of phytochemical metabolites, which are products of intestinal and hepatic or microbial metabolism of molecules such as polyphenols, terpenoids and alkaloids. Identification of unknowns in metabolome profiles is a laborious step-by-step process and often a bottleneck in biomarker discovery. One major limitation for the interpretation of the food metabolome profiles is the incompleteness of existing databases with regard to phytochemical metabolites.

As part of the ANR PhenoMeNep project, we have designed an online database called PhytoHUB, dedicated to the study of the phytochemical part of the “food metabolome”. The database will contain all phytochemicals present in edible plants and their known metabolites manually extracted from the literature. Since the metabolism of many phytochemicals has not been studied in humans, a list of predicted metabolites will be generated from expert knowledge of the metabolism of each phytochemical class and analysis of precursor functional groups on precursor phytochemicals. Mass spectral data will be included from various sources: literature, other databases on plant phytochemicals and experimental data from our collaborative platforms.

Built with MySQL and Perl processing chains, an efficient relational design will underpin a powerful and intuitive web interface. For a queried monoisotopic mass or molecular formula, the database will return a list of possible metabolites, along with their physic-chemical properties, spectral data and possible dietary precursors linked to food sources. For a queried food, it will return a list of metabolites likely to be present in biofluids after consumption.

PhytoHUB will be the first publicly accessible database to collate information on phytochemical metabolites from a metabolomics standpoint, and should facilitate identification of unknowns in non-targeted profiling. A first version of the database is planned for 2013.
