HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

EVOLUTION OF INBREEDING DEPRESSION IN SPECIES COMBINING SELF-INCOMPATIBILITY AND ASEXUAL REPRODUCTION

INTRODUCTION

The origin and maintaining of self-incompatibility systems in angiosperms are still debated questions. The level of inbreeding depression in species that show a self-incompatibility system is a key parameter for the maintenance of the system. Several studies were developed to predict when the system can breakdown. A decrease of inbreeding depression, but also a reduction in the number of alleles at the self-incompatibility locus and outcross pollen limitation, are generally associated with that breakdown. Two studies (Chen *et al.*, 1997; Vallejo-Marín & O'Brien, 2007) have suggested that clonality could relieve the main selective pressures favouring the breakdown of self-incompatibility. In this study, we developed a model to simulate the evolution of inbreeding depression in a diploid species that reproduce both asexually and sexually with a self-incompatibility system. Our aim was to answer the following question:

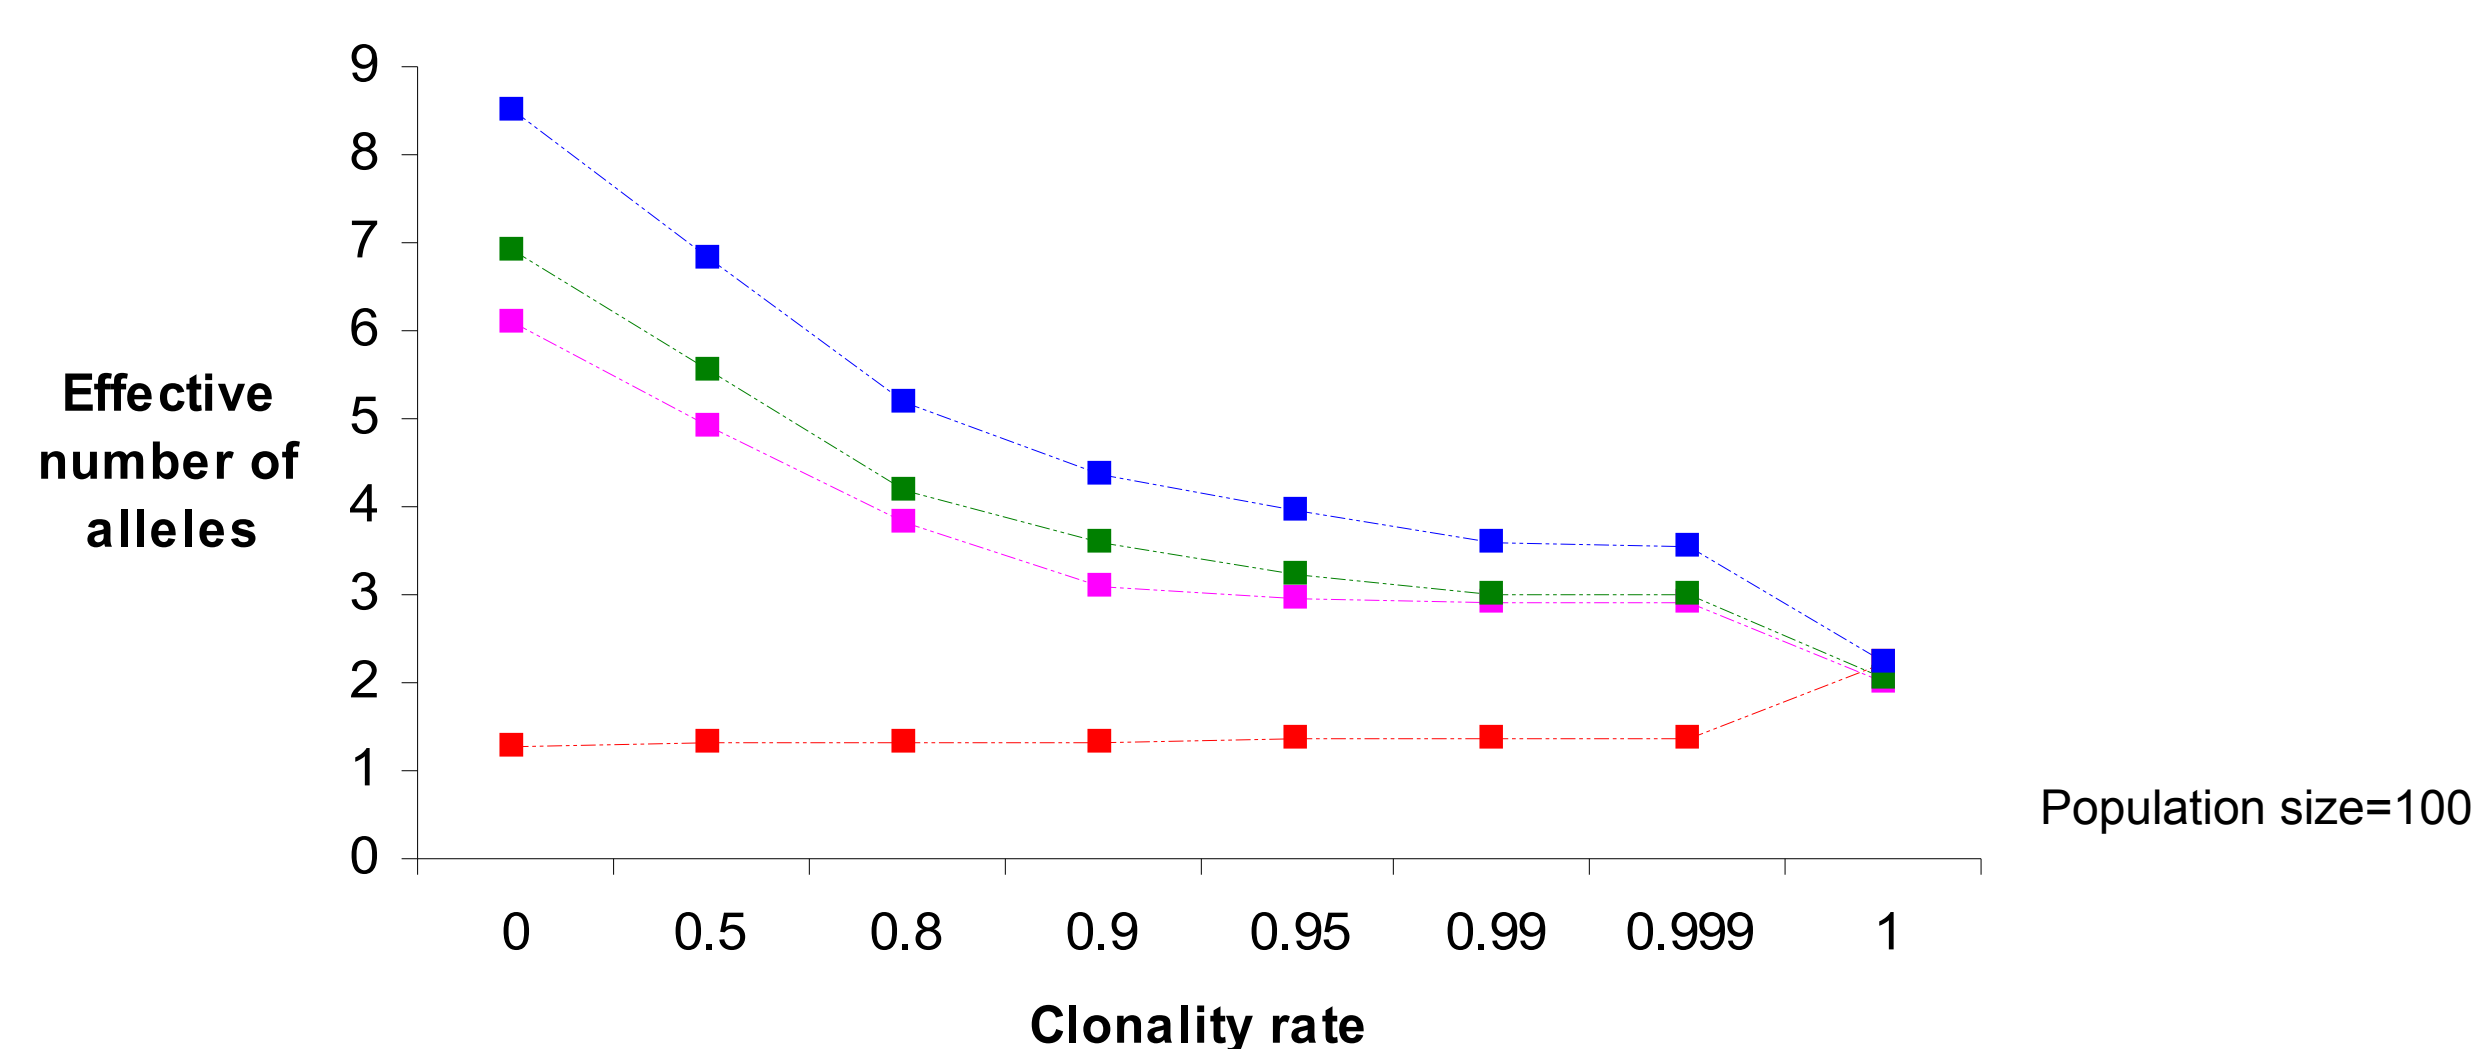

➔ Does clonality allow maintaining self-incompatibility in plants?

DESCRIPTION OF THE MODEL

RESULTS

1. Effective number of alleles as a function of clonality

The effective number of alleles at neutral loci ($\mu_N=10^{-3}$) increases with clonality. Our results show that the effective number of S alleles decreases with mutation rate ($\mu_S=10^{-3}$, $\mu_S=10^{-4}$, $\mu_S=10^{-5}$) at the S locus but also with clonality.

2. Mutation load as a function of population size and clonality

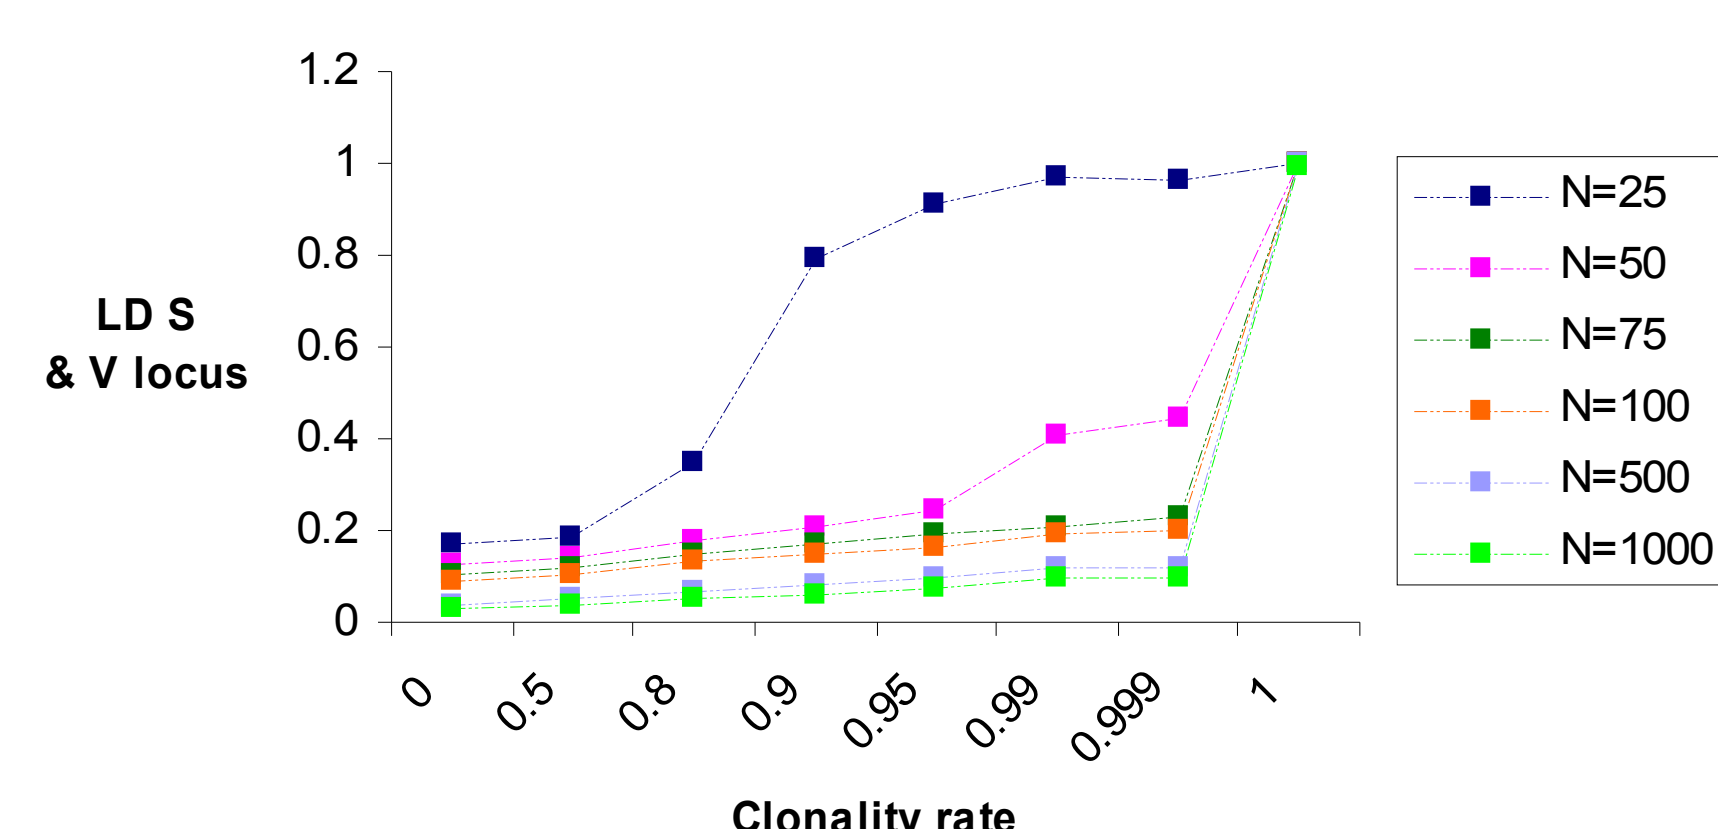

For a fixed clonality rate, the mean mutation load (selection coefficient=0.1 and dominance coefficient=0.2) increases as population size decreases. For a fixed initial population size, it increases as clonality rate increases (except for $N=25$ for which it slightly decreases between $c=0$ and $c=0.5$).

3. Inbreeding depression as a function of population size and clonality

For low clonality rates ($c < 0.8$), inbreeding depression decreases when population size decreases. For $c > 0.8$, inbreeding depression is higher in small populations than in large ones. Inbreeding depression increases with clonality rate (except for $N=25$ for which it slightly decreases between $c=0$ and $c=0.5$).

4. Linkage disequilibrium between the S locus and the viability locus as a function of population size and clonality

Linkage disequilibrium between all pairs of loci increases when clonality increases. The linkage between the S locus and any other locus was higher than the linkage between the other loci (data not shown).

CONCLUSIONS & PERSPECTIVES

Clonality favours heterozygosity at all loci (Balloux *et al.* 2003), homozygotes at the viability locus cannot be produced, and thus eliminated. As a result, the frequency of deleterious alleles (data not shown), mutation load and inbreeding depression increase with clonality. This effect is reinforced in small populations. At the same time, our results showed that a strong linkage disequilibrium is created between the S locus and the viability locus while increasing clonality, this can theoretically also reinforces polymorphism at the viability locus (Glémin *et al.* 2001). Simulations without self-incompatibility are necessary to disentangle the effect of clonality alone and the effect of self-incompatibility on the viability locus. As a consequence, clonality can theoretically favours maintaining self-incompatibility in populations. However, since our results also showed that the effective number of S alleles decreased with clonality, this may create cases for which self-incompatibility can breakdown.
