**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Workshop on  
„New approaches on forest tree genetics”  
Analysis of microsatellites in Scots pine  
Sękocin, 24-27 August 2004

# Genetic variability of Polish Scots pine provenances assessed with microsatellite markers

Justyna Nowakowska<sup>1</sup>, Catherine Bastien<sup>2</sup>, Brigitte Musch<sup>2</sup>

<sup>1</sup> FRI Warsaw, Poland

<sup>2</sup> INRA Orleans, France

# Introduction

- Scots pine (*Pinus sylvestris* L.) is one of the most important coniferous species in Poland, which covers 68 % of the total forest area and serves as a main wood resource for industry
- Only few investigations have been done on genetic marker identification among native Scots pine provenances in Poland

# Introduction

## ■ Advantages of microsatellite sequences :

- short repeats of 1-6 bp,
- uniformly distributed over entire genome,
- present in high proportion in conifers,
- highly polymorphic DNA markers,
- discrete loci and co-dominant alleles,
- observed mutation rates from  $10^{-3}$  to  $10^{-6}$ .

# Aims

- Analysis of **polymorphic** nuclear microsatellite fragments within Scots pine
- Genetic structure of **30 natural populations** in Poland based on chosen microsatellite markers
- Identification of the phylogenetic relationships among analyzed provenances
- Geographical structure of gene diversity

# Material and Methods

## Plant material:

Total of **700 samples** (needles) were harvested from randomly spaced adult Scots pine (90-173 year-old) trees:

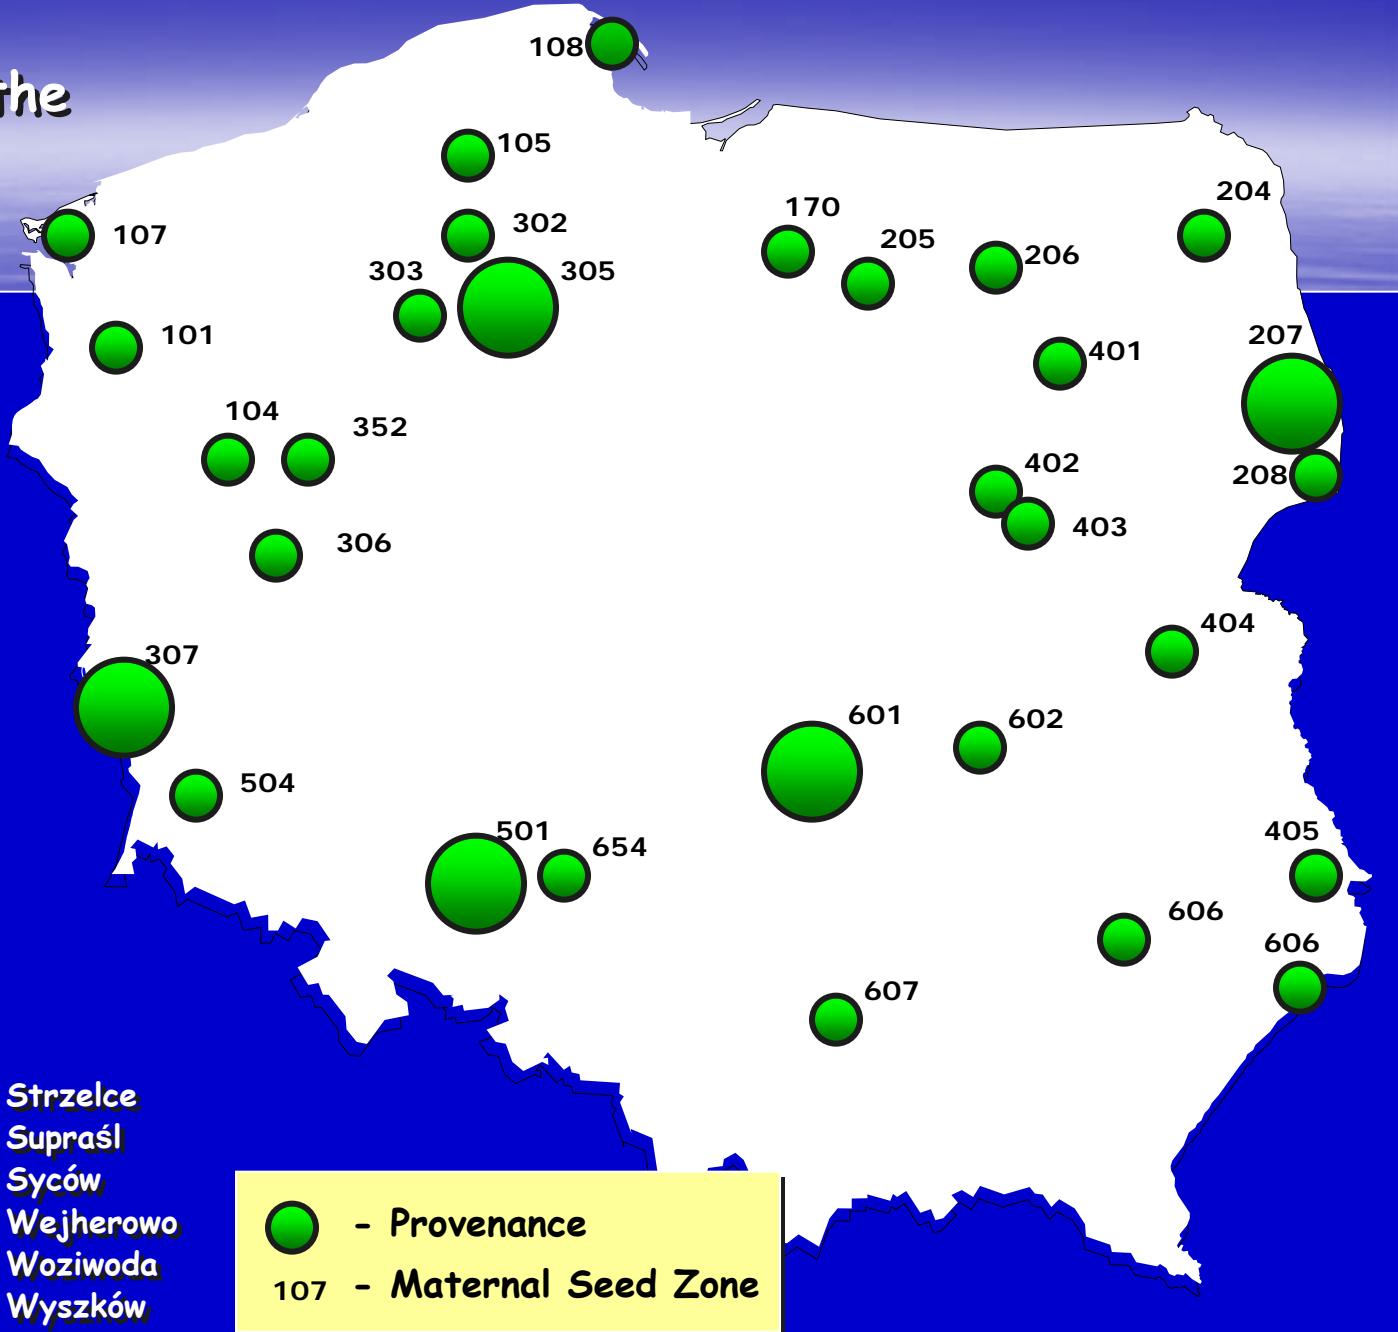

- from thirty different seed micro-zones in Poland

- according to the register of FRI and the General

Directorate of the State Forests in Poland

# Localization of the Scots pine provenances:

- 204. Augustów
- 208. Białowieża
- 504. Bolesławiec
- 306. Bolewice

# General scheme of microsatellite loci analysis

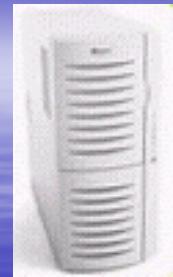

## *PCR Amplification*

# *Electrophoresis*

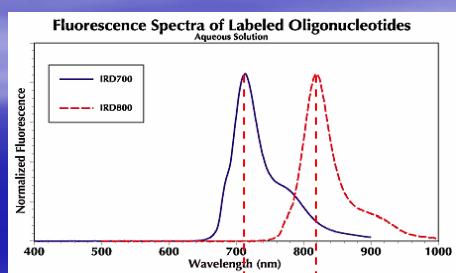

# **Load on HITACHI Abi-Prism® 3100 Genetic Analyzer**

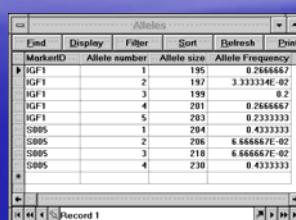

**Abi-Prism®  
GeneScan® 3.7  
software**

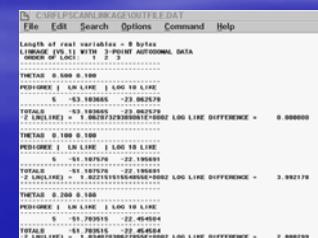

# *Genotyping*

# *Visual Inspection*

## *Text Output*

S-Plus

# *Statistical Analysis*

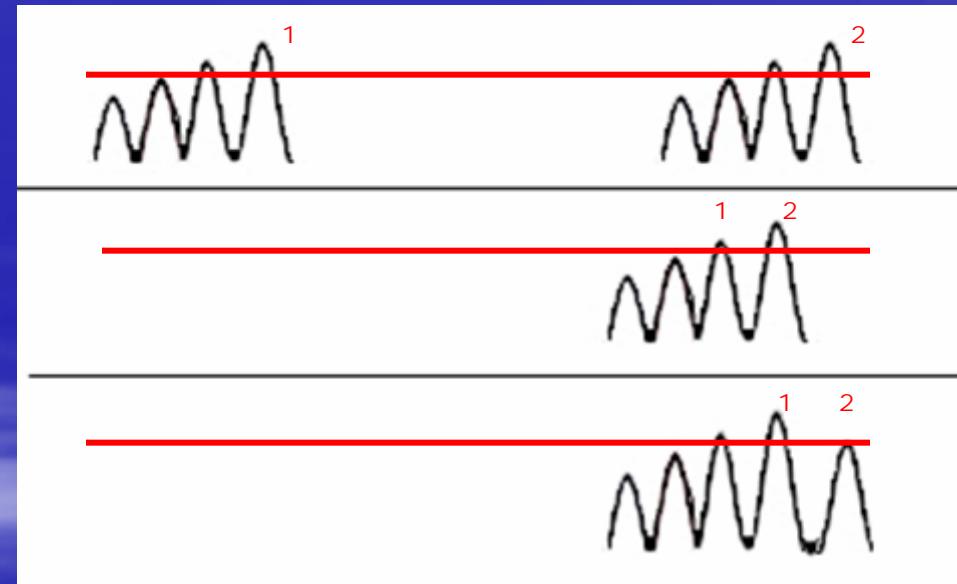

# Material and Methods

- Microsatellite alleles taken from the sequencer

Well Separated  
Heterozygote

Homozygote

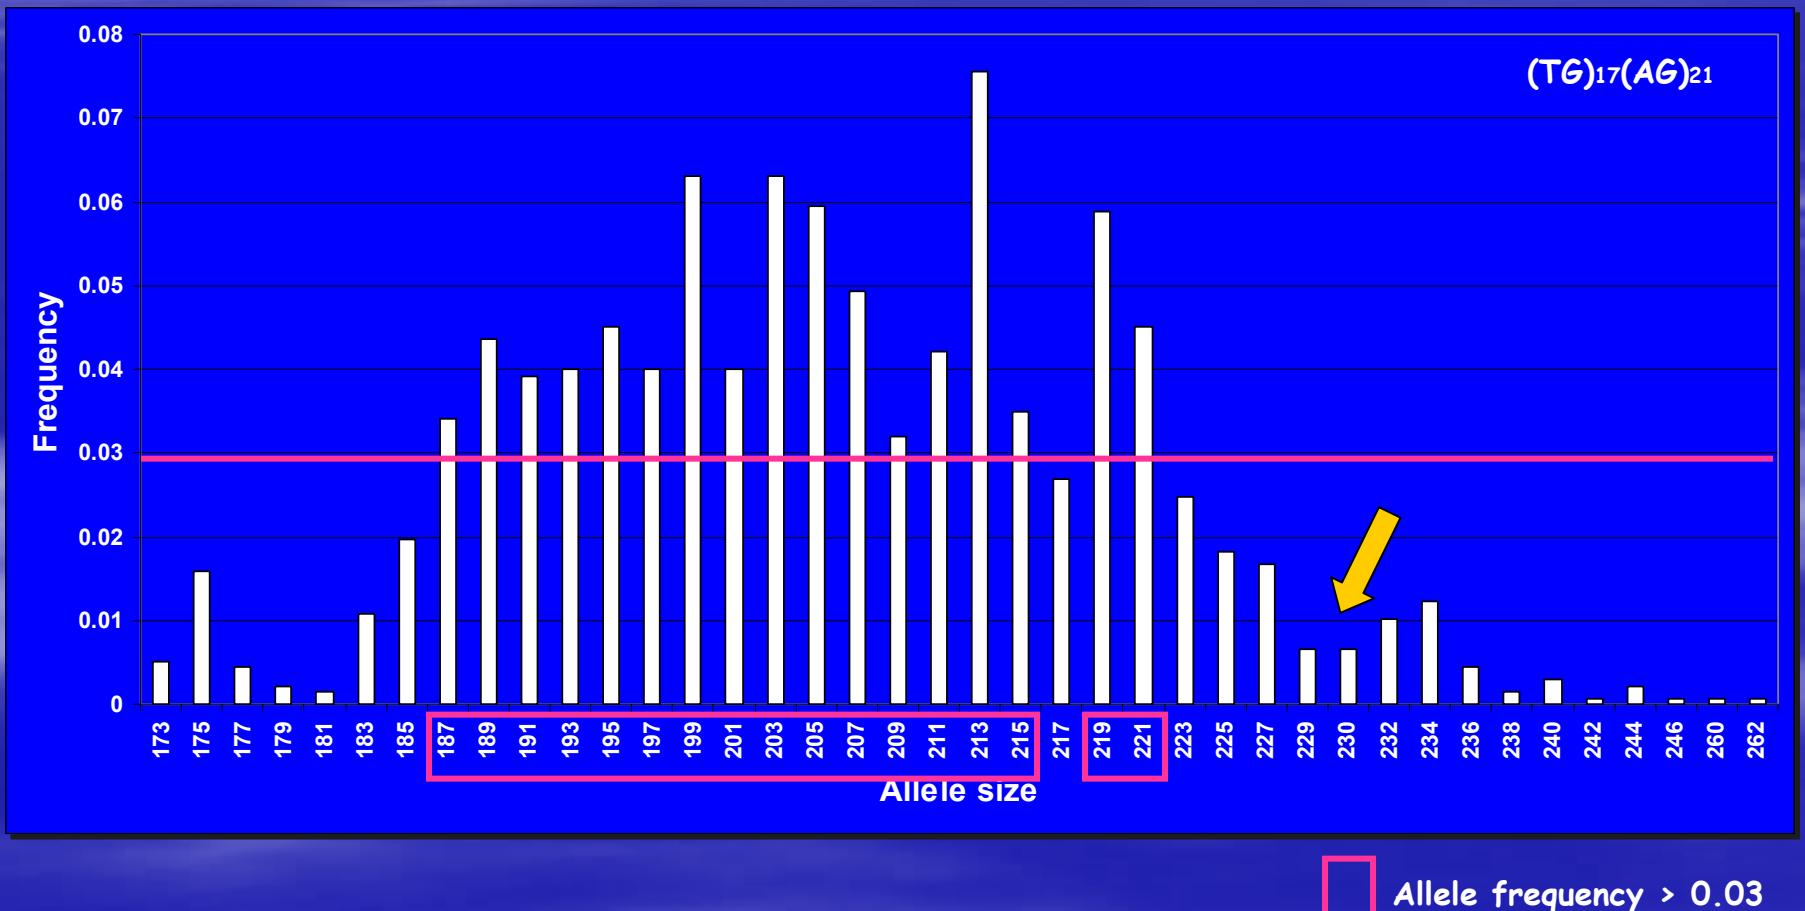

2 bp separated  
Heterozygote

Every peak was examined for appropriate threshold scoring

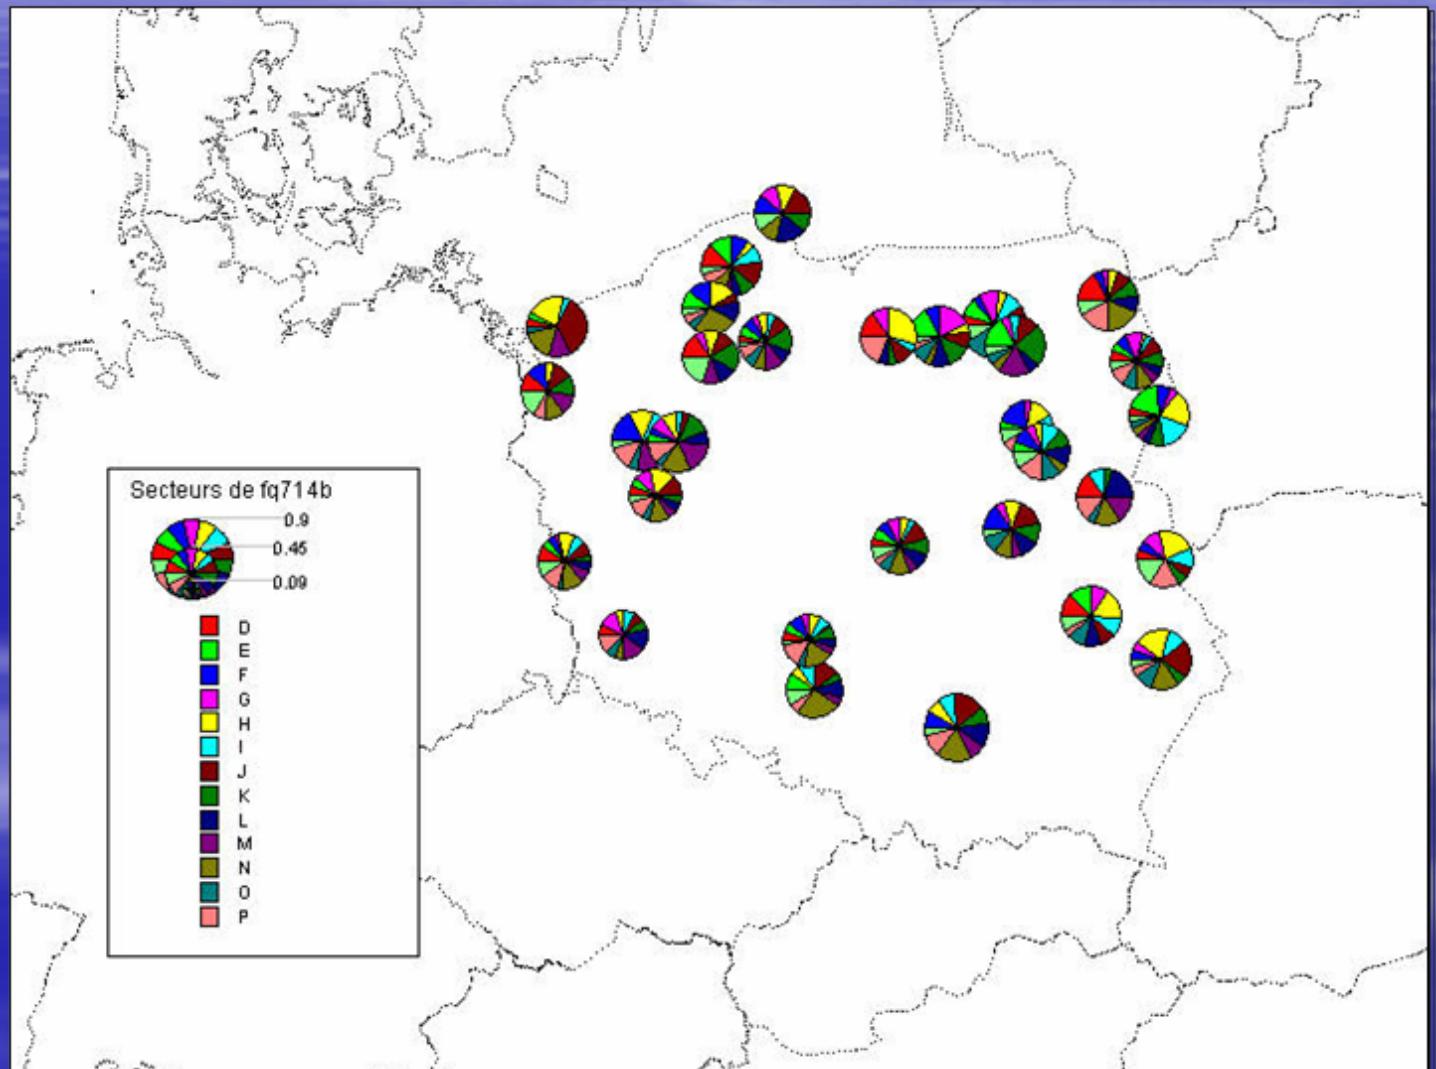

# Results

Allele frequency distribution:  
**SPAC 7.14 microsatellite loci (N=1378, 40 alleles)**

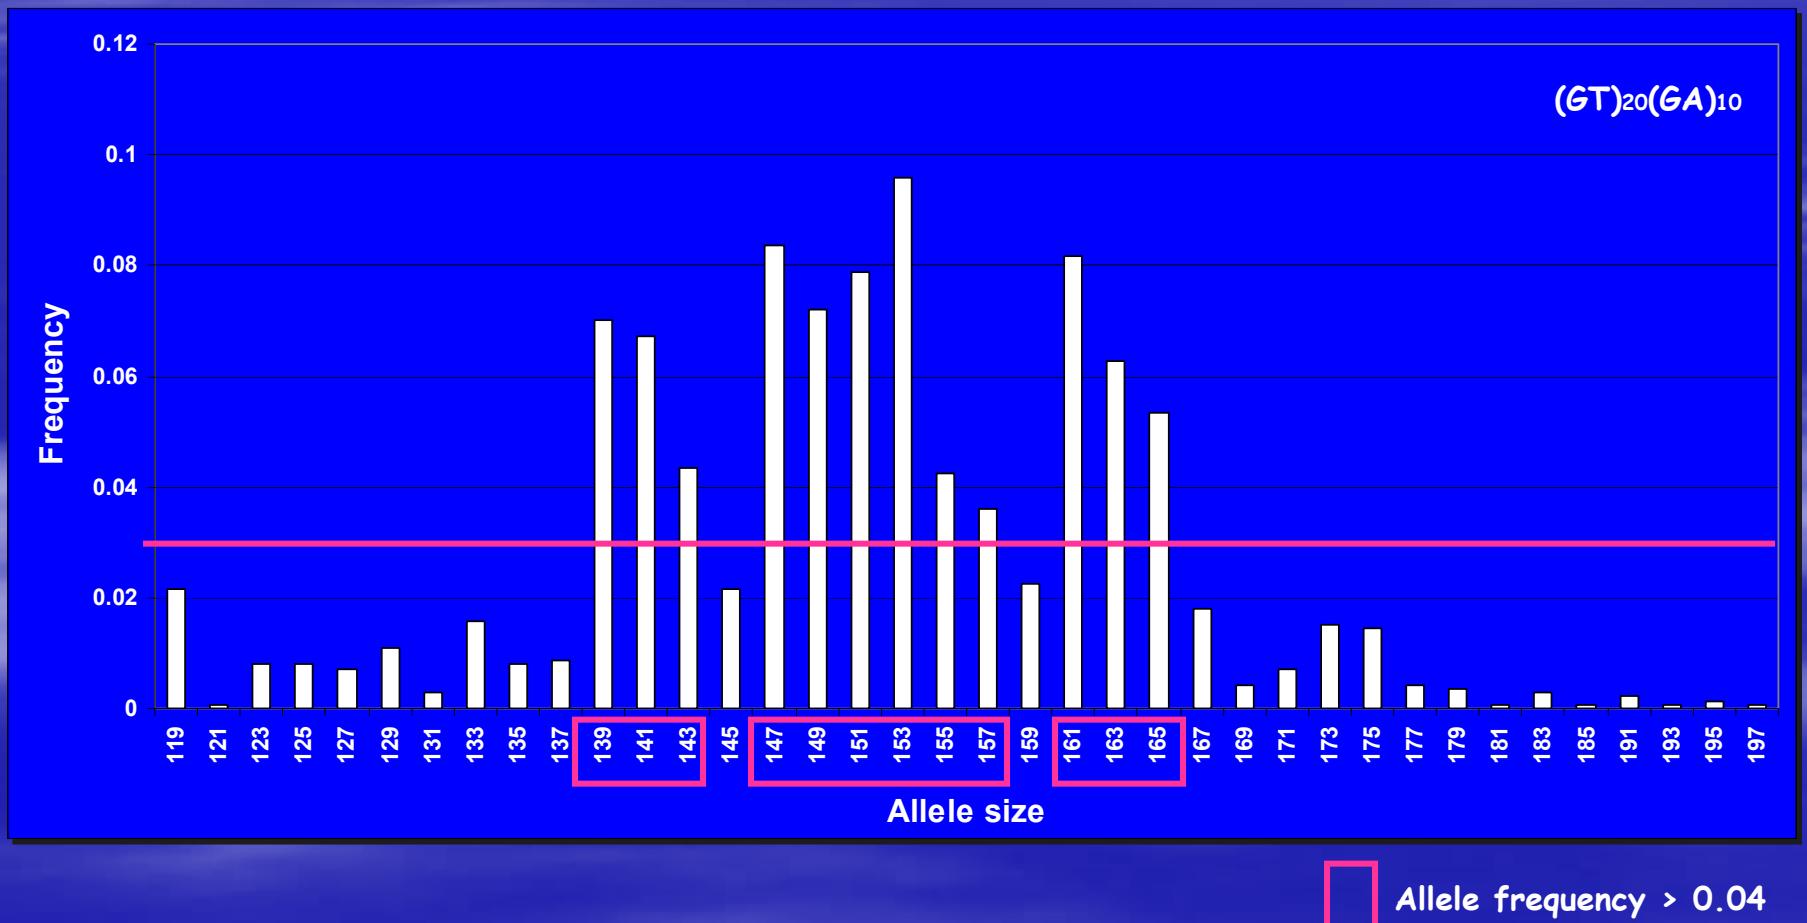

# Results

Geographical distribution of the most frequent alleles of 7.14 locus

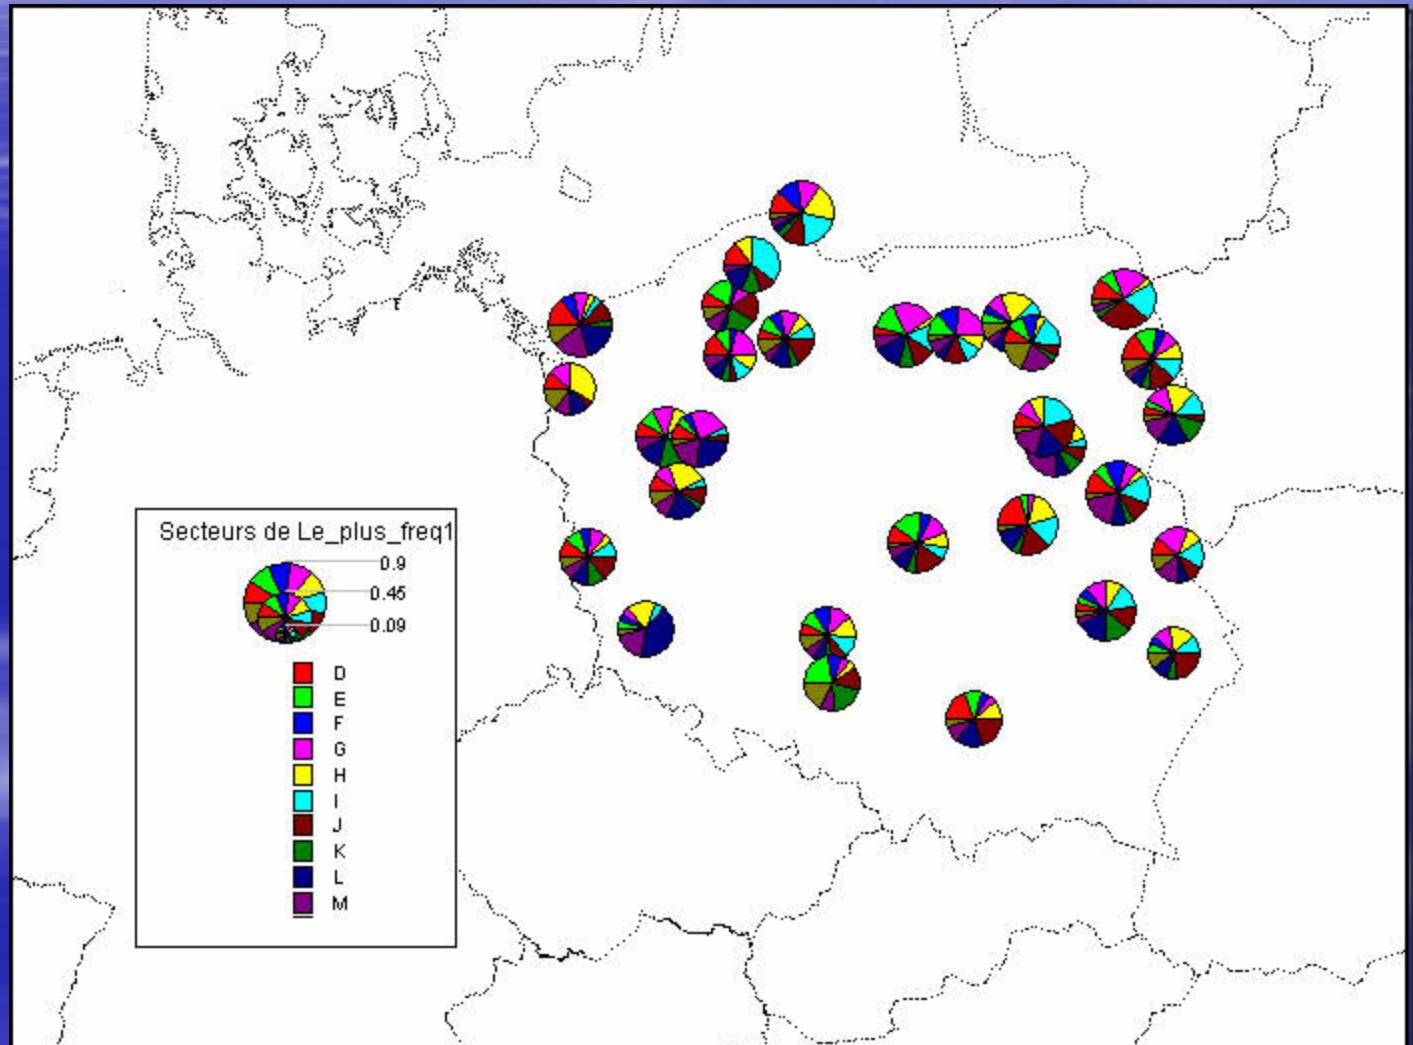

# Results

**Allele frequency distribution:  
SPAC 12.5 microsatellite loci (N=1385, 38 alleles)**

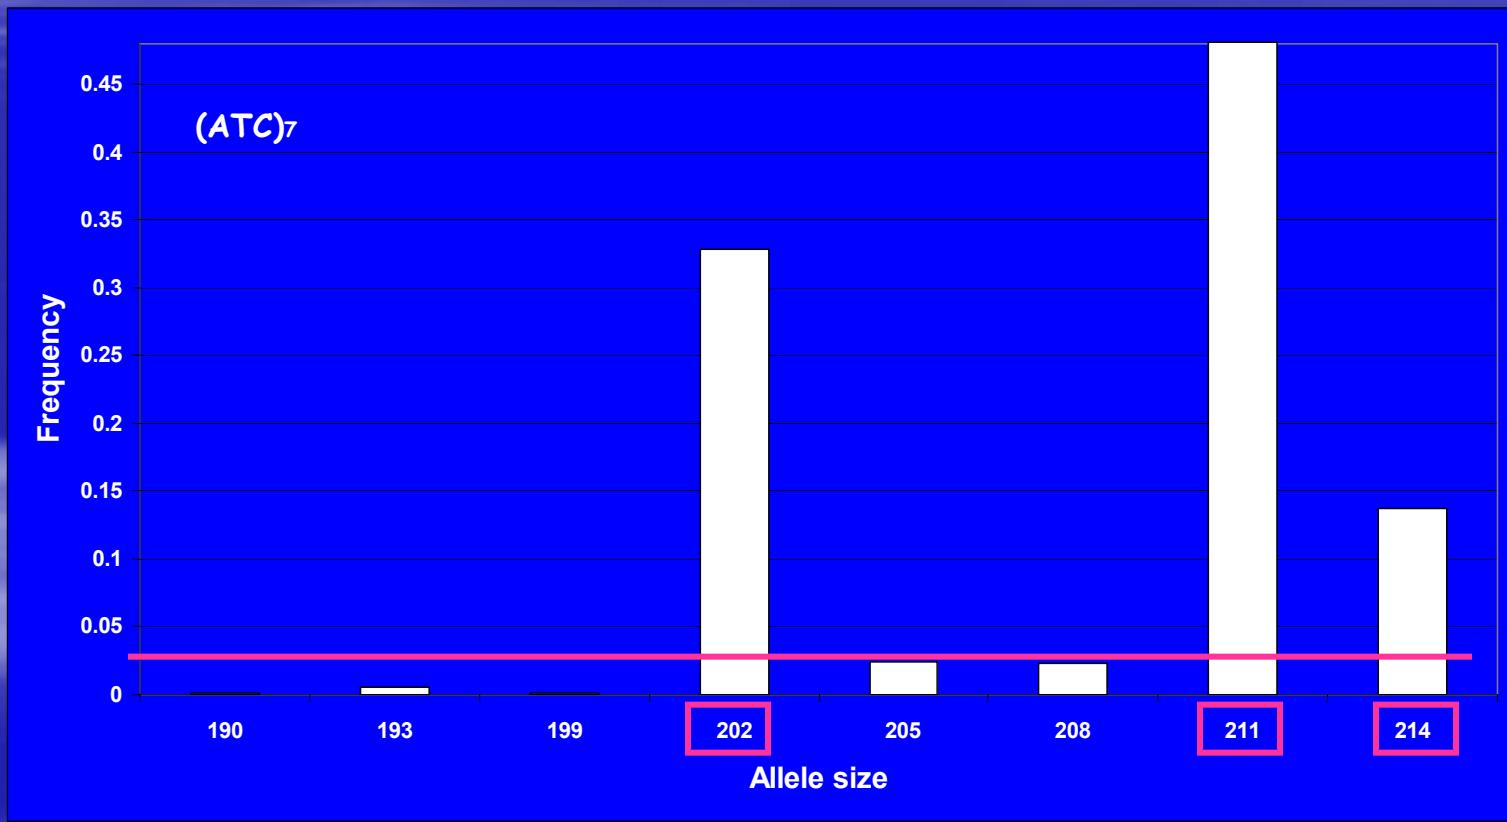

# Results

Geographical distribution of the most frequent alleles of 12.5 locus

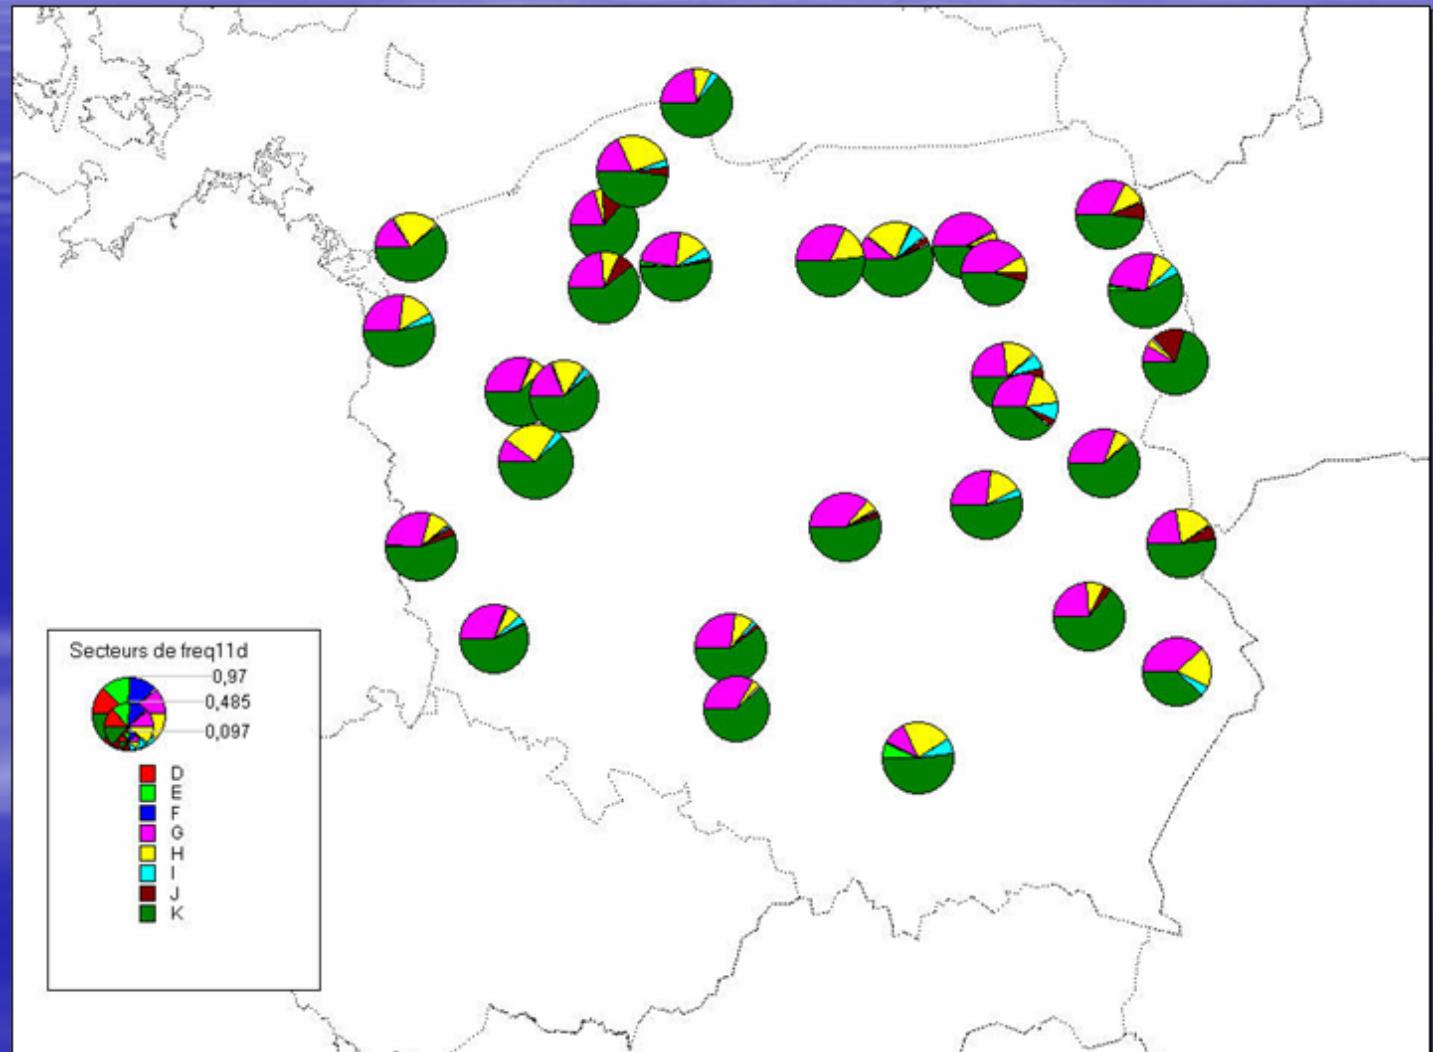

# Results

Allele frequency distribution:  
Rptest11 microsatellite loci (N=1398, 8 alleles)

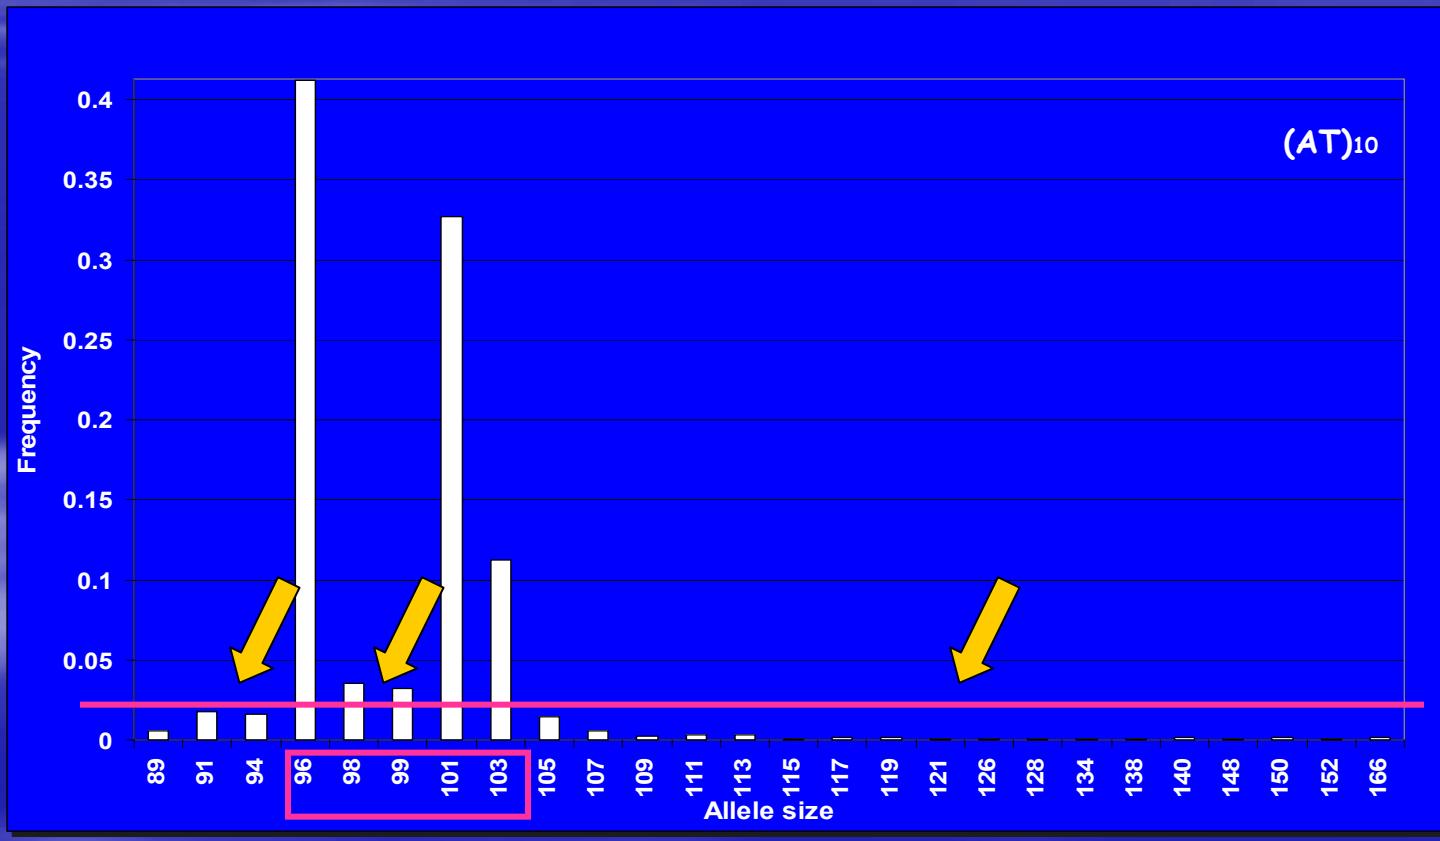

# Results

Geographical distribution of the most frequent alleles of Rptest11 locus

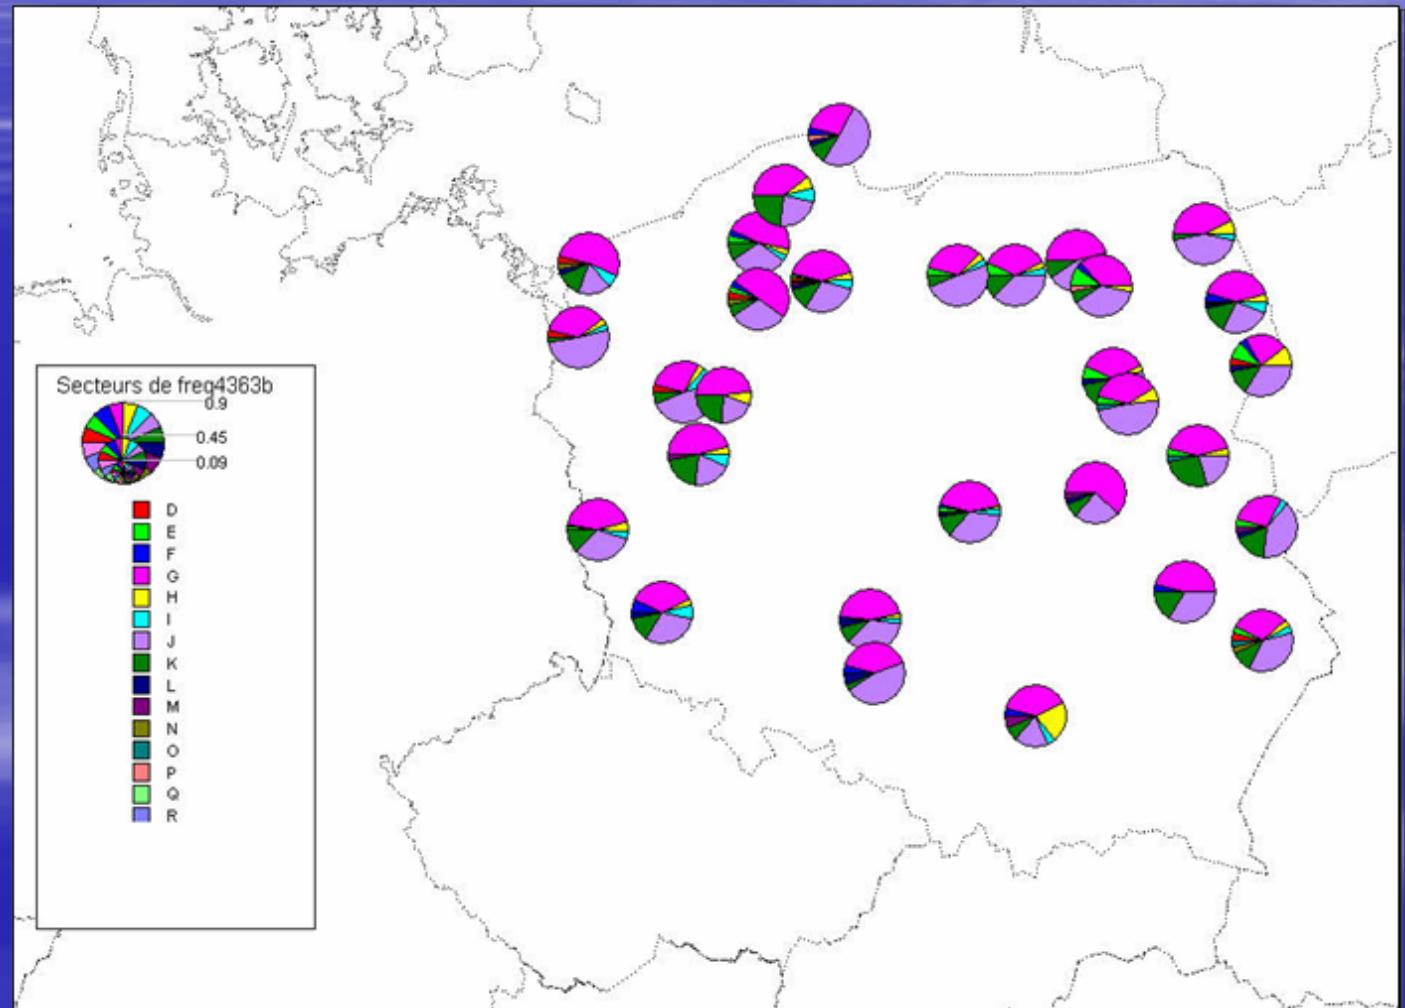

# Results

**Allele frequency distribution:  
SsrPt-ctg4363 microsatellite loci (N=1385, 26 alleles)**

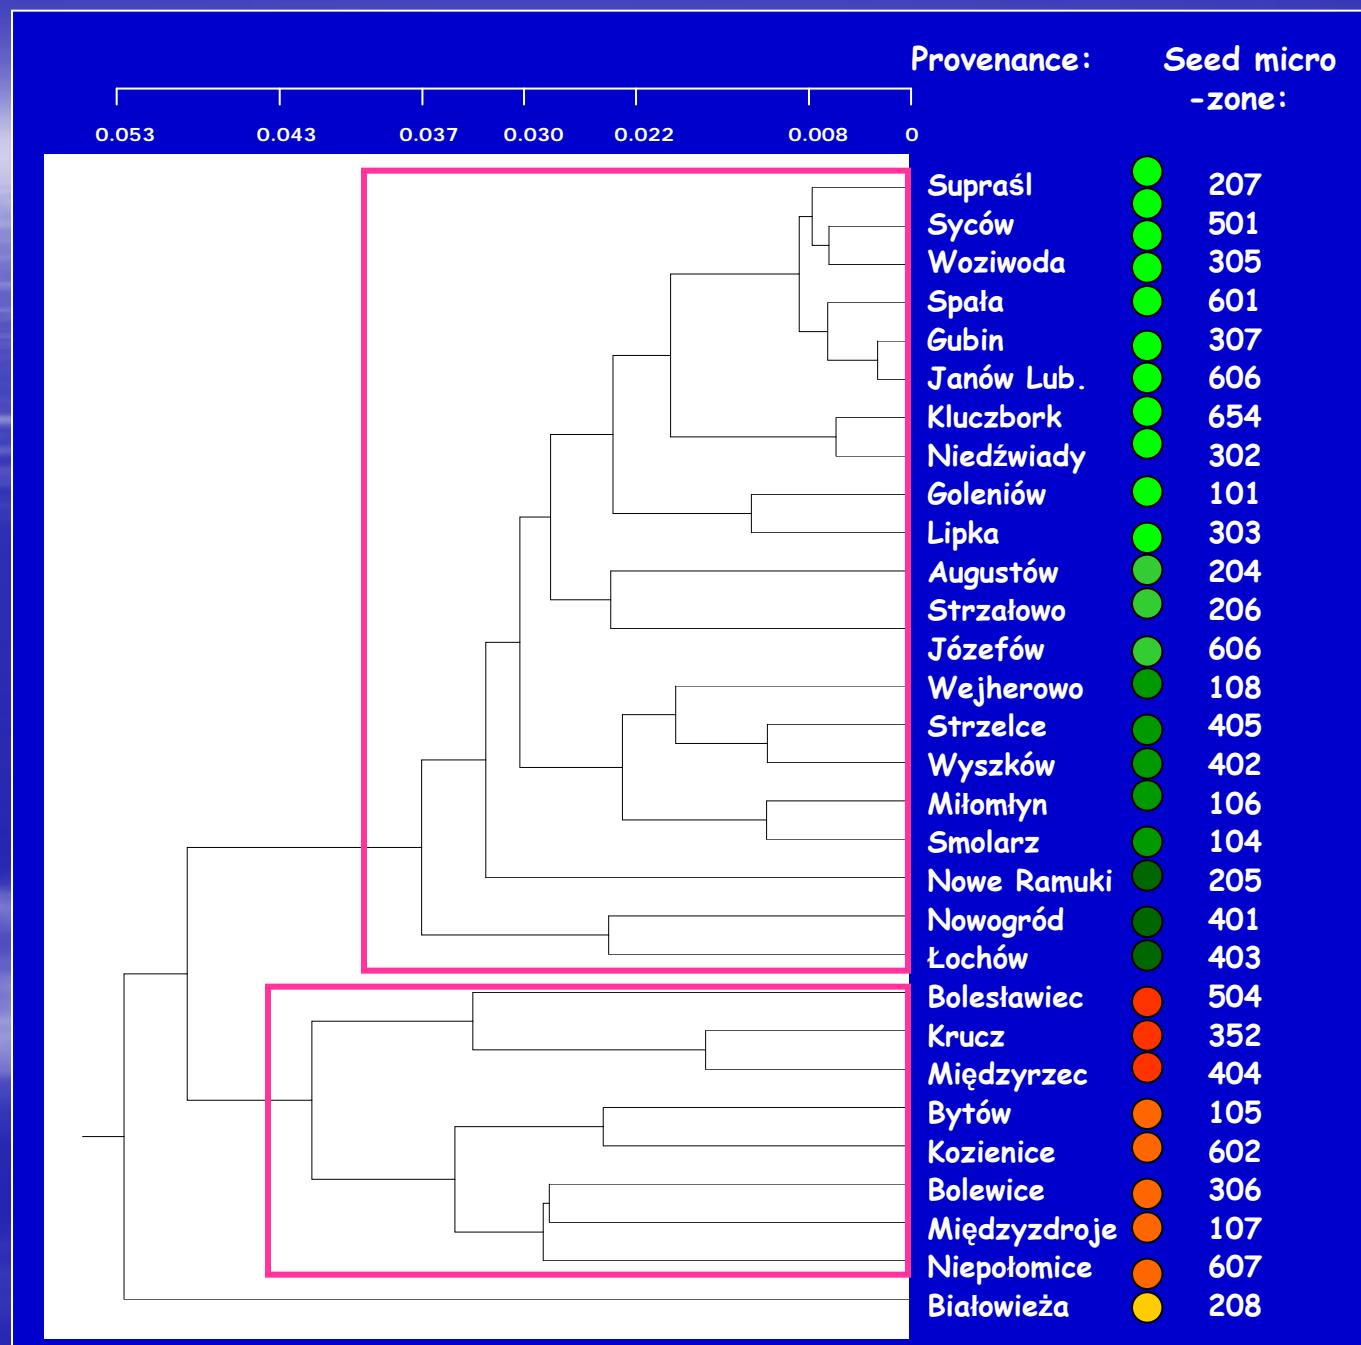

# Results

Geographical distribution of the most frequent alleles of SsrPt-ctg4363 locus

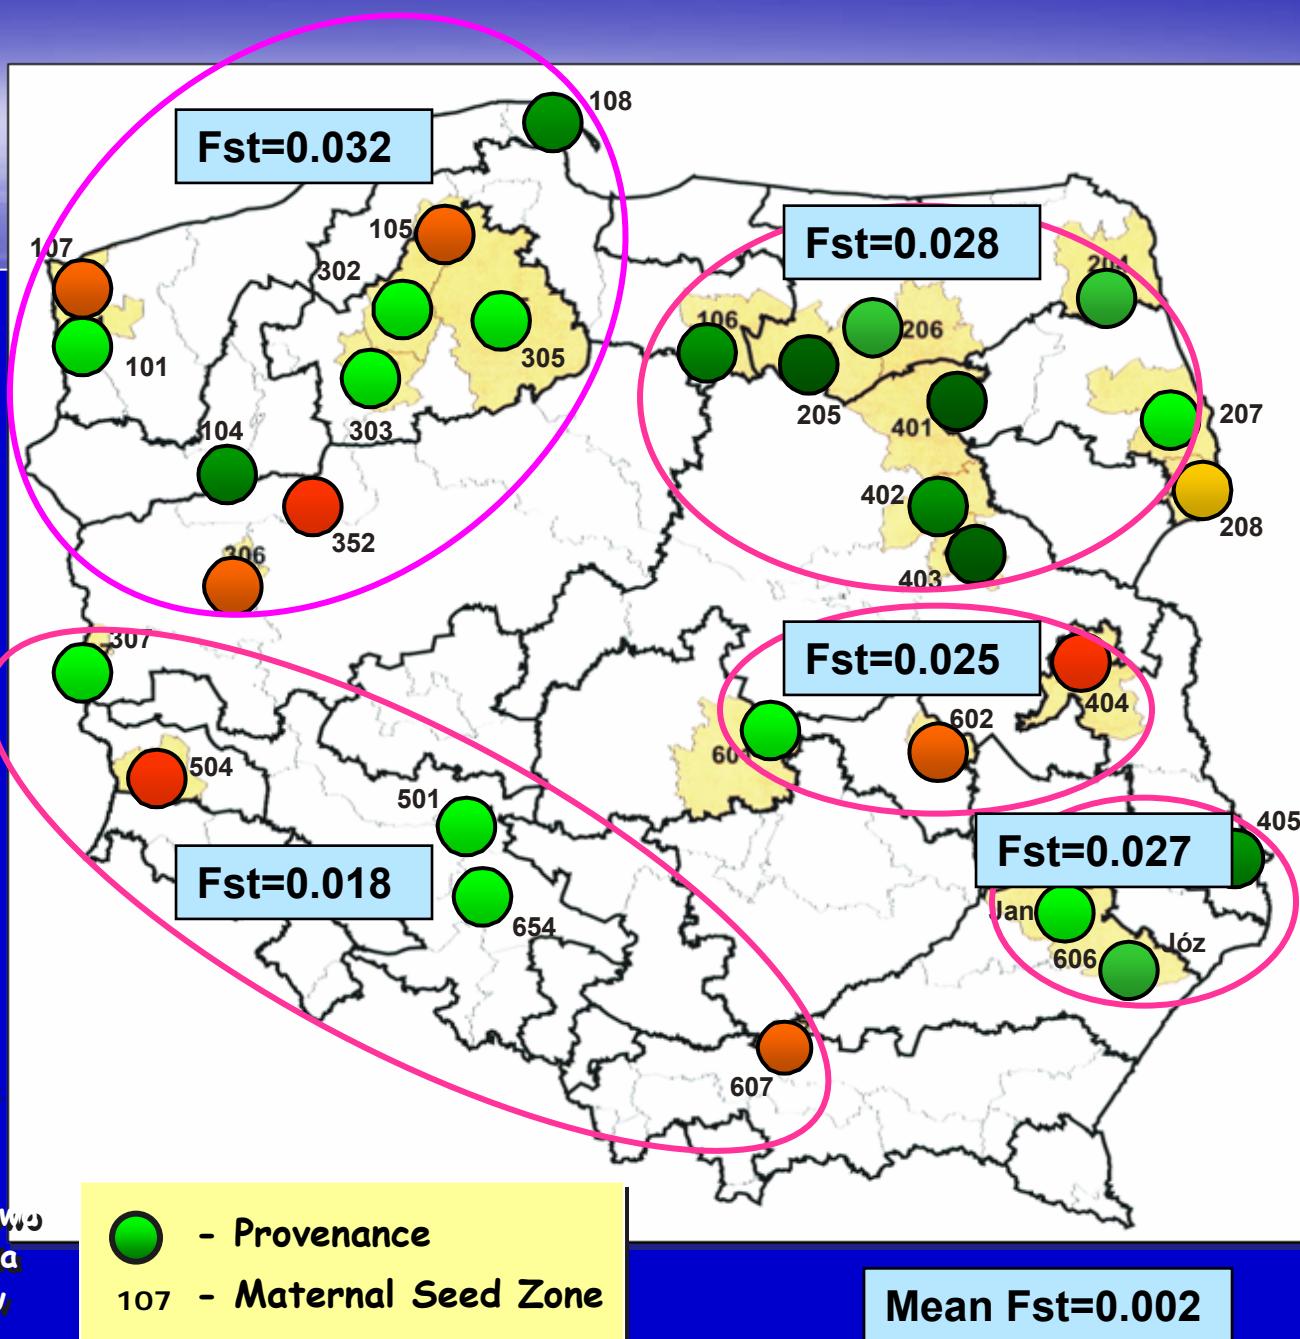

# Neighbor-joining tree of Scots pine provenances in Poland based on microsatellite data

POPGENE v 1.32.

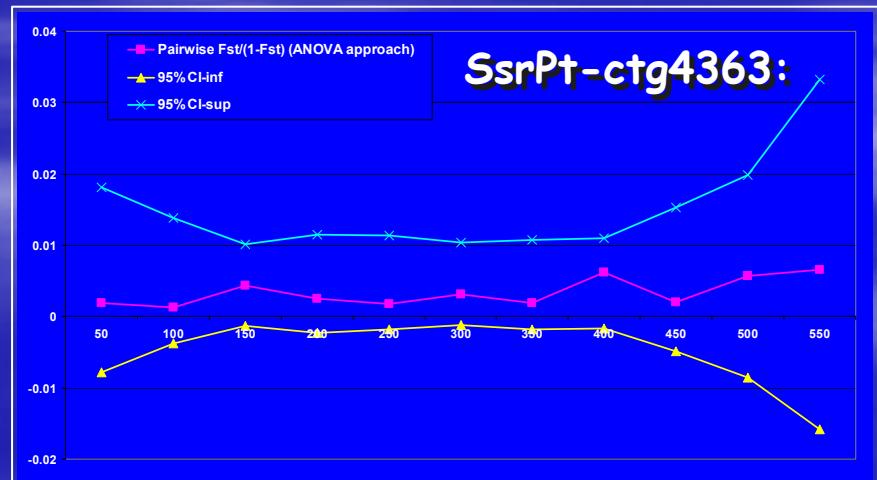

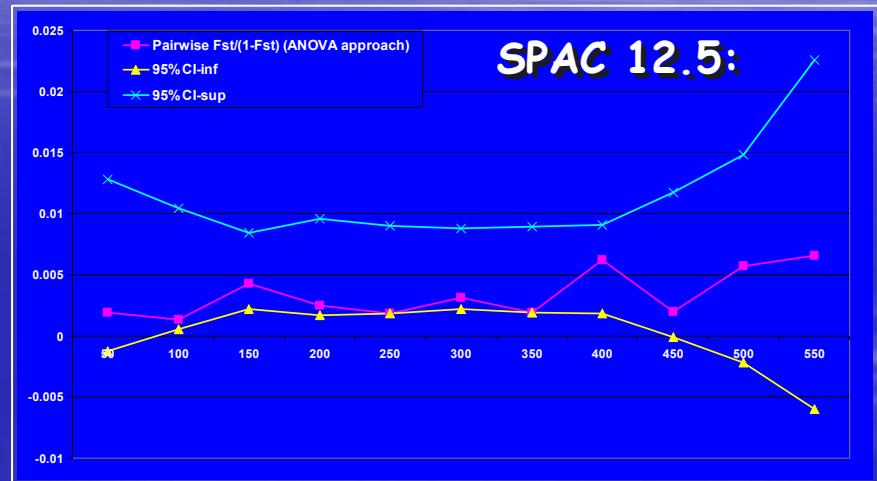

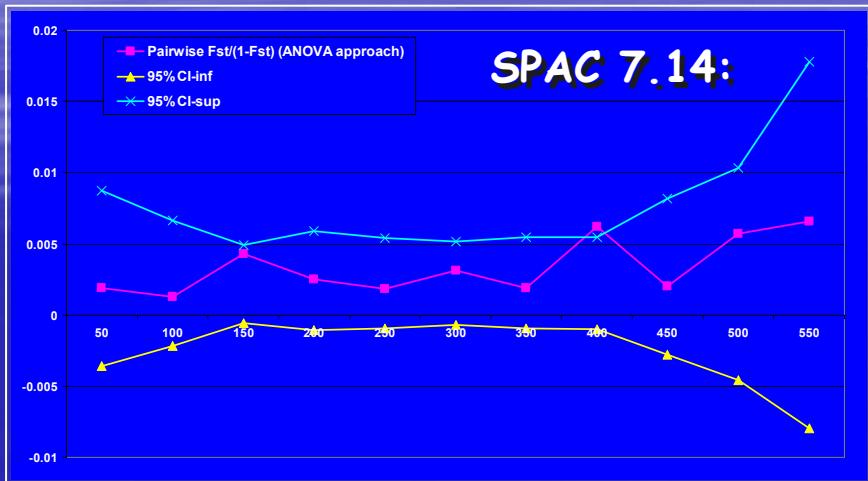

# Geographical distribution of the Scots pine linkage groups in Poland

# Results

## Spatial correlations of gene dispersal

Pairwise Fst/(1-Fst) ANOVA approach

# Conclusions

- There is possible to transfer microsatellite markers from *P. pinaster* to *P. sylvestris*
- SPAC 7.14 was the most polymorphic locus
- Rptest11 was the less polymorphic one
- Slippage effect occurred in loci developed in *P. sylvestris* (SPAC 7.14) as well as in locus transferred from *P. pinaster* (SsrPt-ctg4363)

ctg4363

# Conclusions

- Amplification of alleles of non expected size may be due to:
  - polymerase slippage for large fragment size (229-230 bp for **SPAC 7.14**)
  - some fluorochrome e.g. Ned (**SsrPt-ctg4363**) are more likely to nonspecific amplification (*Delmotte et al. 2001*)
  - composition of microsatellite loci (two motif repeats, **SPAC 7.14**) may lead to nonstandard length of alleles

# Conclusions

In Poland, nuclear microsatellite analysis revealed:

- Similar diversity pattern of studied Scots pine provenances in Poland (mean  $F_{ST}=0.002$ )
- no significant differences between  $F_{ST}$  value in different regions of Scots pine provenances

# Conclusions

- Relative **homogeneity** of Scots pine provenances (no spatial correlation observed between gene diversity and geographical localization)
- Little inter-population variation in genetic diversity is often observed for:
  - species with **continuous distribution**
  - and **long-distance pollen** and seed dispersal

# Conclusions

The present distribution of the genetic diversity level may also reflect:

- Large transfer of the seed material in the past among all Scots pine provenances in Poland
- Białowieża Primeval Forest (East of Poland), is supposed to be less influenced by human activity during ages

# Acknowledgments

- This work represents a part of genetic diversity research on conifer species financed by Polish General Directorate of the State Forests and French Ministry (DSUR-NGE-4C1-701 Project).
- Special thanks are addressed to Dr Sylvie Oddou (INRA Avignon, France) for valuable discussions and to Mrs. Bénédicte LeGuerroué and Mrs. Vanina Benoit - (INRA Orleans, France) for help in the laboratory task.
