HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

INTERACTION OF XENOBIOTICS WITH SEX HORMONE BINDING GLOBULIN

Florence Le Gac, Martine Ollitrault.

I.N.R.A-SCRIBE Equipe « Sexualité et Reproduction des Poissons ». Beaulieu –Rennes, Fr.

Sex steroid hormones circulate in the blood and extracellular compartments mainly bound to albumin and specific **Steroid Binding Proteins (SBP)**. Xenobiotics may interfere with this endocrine equilibrium by occupying the binding sites of the transport protein modify the ratio of bound/free **endogenous testosterone (T) and estradiol (E2)** and therefore the biological activity or the metabolic clearance of these natural hormones (Aldercreutz et al. 1985, 1990). Moreover, binding to SBP may influence **the bioavailability of the xenohormone itself** : it may protect the exogenous molecules against metabolism and promote their accumulation inside the organism , while the absence of binding make them more available for action on their target cells.

We have set up a sensitive and practical in vitro screening method to detect chemicals that modify SBP-sex steroid binding. We incubate increasing concentrations of xenobiotics (10^{-7} to 10^{-4} M) in competition with 10^{-9} M of labelled testosterone or estradiol ($^3\text{H-T}$ or $^3\text{H-E2}$), for binding to fish or human blood plasma SBP in vitro (Fig 1).

Table1: Effects of a few pesticides on Testo

Chemicals	INHIBITION OF BINDING TO	
	% inh. at 10^{-5} M	ED 50 M/L
Biphenyl	0	
Captan	0	
Chlorothalon	30%	3×10^{-5}
Dodemorph	60%	3×10^{-6}
Pentachlorophen	50%	2×10^{-5}
Prochloraz	50%	2×10^{-5}
Triadimefo	85%	3×10^{-6}
Carbofura	0	
Carbosulfan	20%	$> 10^{-4}$
Deltaméthrin	0	
Lindan	50%	2×10^{-5}
Parathion-	100%	5×10^{-7}

Table2: comparison SBP binding/estrogenic activity

Chemical	Inhibition T-SBP binding	E2 Recept. Activation at 10^{-7} M
Ethinyl-estradiol	100	137%
Diethylstilbestrol	0	100%
Zearalenone	0	108%
α Zearalanol	0	146%
β Zearalanol	20	62%
α zearalenol	100	20%
β zearalenol	15	134%

30 active pesticides used in French agriculture were screened (exemples in table1): four of them had significant affinity for SBP with $ED_{50} = 0.5 - 5 \times 10^{-6}$ M (Parathion-methyl > Bifenox > Dodemorphe = Triadimefon, in decreasing order of activities) and should be considered as potential endocrine disruptors.

Among estrogen-like compounds, the phytoestrogens *equol* and, to a lesser extent, *genistein* competed with E2 and T for binding to SBP, as well as *Nonylphenol4* and its *ethoxyl derivatives* (ED_{50} : $2 \text{ à } 10 \times 10^{-6}$ M). None of the polychlorinated derivatives of biphenyl (PCBs) tested revealed activity.

Most of the anabolic molecules used in farming, or their metabolites, are able to bind to vertebrate SBP and to inhibit natural hormone binding to their specific blood transport proteins. Exposition of either human or wild vertebrates to one of these compounds could therefore have consequences on free estrogens/free androgens equilibrium or disrupt endogenous steroid hormone action on target tissues, especially if the xenobiotic compound considered is susceptible to bioaccumulate in the organism.

The case of *Zeranol* and its metabolites is of special interest as their very high estrogenic activity is not "buffered" by binding to an high affinity protein in the extracellular compartment (table2): this could make it more available for action on target cells (as proposed for the action of Diethylstilbestrol on the human foetus).
