**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# WORKSHOP ON GAMETE AND EMBRYO STORAGE AND CRYOPRESERVATION IN AQUATIC ORGANISMS; INJEP

Institut National de la Jeunesse et de l'Education populaire

Parc du Val Flory, 11 rue Paul Leplat

Tel : 33 (1) 39 68 49 11 : - : Fax : 33 (1) 39 16 57 79

78160 **MARLY le ROY/FRANCE**

(West of PARIS) 30/3 to 2/4 1992, sponsored by the CEC, Directorate for fisheries, IFREMER, Societé IMV, Societé l'AIR LIQUIDE and included in the "Reproductive Biology in Aquaculture" network.

**EFFECT OF DILUENT OSMOLALITY ON THE FERTILIZING ABILITY OF SPERMATOZOA IN ATLANTIC SALMON *Salmo salar* KEPT IN SEA WATER OR TRANSFERRED TO FRESH WATER.**

F. LE GAC, P. HAFFRAY, M. LOIR, A. FOSTIER and G. MAISSE.  
Laboratoire de physiologie des poissons INRA, RENNES, FRANCE.  
These experiments were supported by SEMII (Camaret).

Breeding management of Atlantic salmon in France requires transfer of spawners to fresh water prior to final sexual maturation, in order to avoid poor fertilization rate.

- 1) In a first experiment we studied the impact of the sea water environment during gonadal maturation on sperm quality.

Prespawners were either kept in sea cages (salinity: 3.5%) (SW) or transferred to fresh water tanks in June or at the beginning of October (FW). Fertility was tested by inseminating batches of approximately 200 freshly collected FW eggs, using DIA-532 insemination diluent (250 mOsm/kg, pH 9, sperm dilution:  $10^{-3}$ ) and assessing the eyed egg rate.

FW males show normal spermiation profiles; fertilizing ability of FW sperm was good and varied slightly between males. Data obtained with both groups of FW fish (June and October transfers) were similar.

100% of the SW mature males produced milt in normal amounts and presented spermiation profiles similar to FW fish. However, their semen had a mean fertility significantly lower ( $64 \pm 33$  % eyed eggs;  $\bar{x} \pm \sigma$ ) than FW semen ( $88 \pm 18$  % eyed eggs), with individual eyed egg rate varying from 0% to 80%.

Seminal plasma osmolality of the males kept in sea water was significantly higher ( $347 \pm 27$  mOsm/kg,  $\bar{X} \pm SE$ ) than that of the FW fish ( $265 \pm 30$  mOsm/kg).

- 2) In a second experiment we studied: a) the relationship between seminal plasma osmolality and semen fertility and b) the effect of the insemination diluent osmolality (OSM) on the fertilizing ability of sperm from SW and FW salmons.

The sperm (8 SW and 8 FW) were centrifuged and the osmolality of each seminal plasma measured. Seven aliquots of each sperm-cell pellet were tested for fertility as described above but using 7 different insemination diluents with OSM varying between 150 and 450 mOsm/kg.

Optimal diluent OSM for FW spermatozoa were 250 and 300 mOsm/kg, while for the SW spermatozoa the most favorable OSM values extended from 250 to 350 mOsm/kg. Extreme values (150 and 450 mOsm/kg) were deleterious to all sperm performances. However, sea water sperm were significantly more "resistant" to high osmolalities (350 mOsm/kg:  $36 \pm 4$  % eyed eggs; 400 mOsm/kg:  $15 \pm 5$  %; 450 mOsm/kg:  $4 \pm 1$  %) than were the fresh water sperm (350 mOsm/kg:  $24.5 \pm 5$  %; 400 mOsm/kg:  $2.8 \pm 1.3$  %; 450 mOsm/kg:  $1 \pm 0.2$  %;  $\bar{X} \pm SE$ ). Those of the sea water sperm that show very low fertilizing capacity (0 to 5% fertilization at 250 mOsm/kg) gave similarly poor results at all tested diluent OSM. No relation could be established within individuals between seminal plasma osmolality and this low fertility.

In terms of breeding management, seminal plasma osmolality cannot be retained as a criteria to select "good" SW males; the use of insemination diluent with OSM similar to the seminal plasma osmolality does not improve significantly the fertility of Atlantic salmon males kept in sea water until reproduction.
