HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

3RD INTERNATIONAL CONFERENCE ON GLOBAL FOOD SECURITY

3-6 DECEMBER 2017 CAPE TOWN, SOUTH AFRICA

Which dietary changes to move towards nutritionally adequate diets without increasing their impact on biodiversity, water and land-use? The case of Tunisia

Food security in the Mediterranean region & Tunisia

- **Epidemiological and nutritional transition**

- ➔ increase in overweight, obesity and co-morbidities
- ➔ burden of obesity especially high among women (~1/3 in Tunisia)

- **Environmental issues**

- ➔ Water scarcity, soil erosion and biodiversity loss
- ➔ Food system is responsible for a considerable proportion of environmental footprint (15-28% to overall GHGE)

Moving towards more sustainable diets

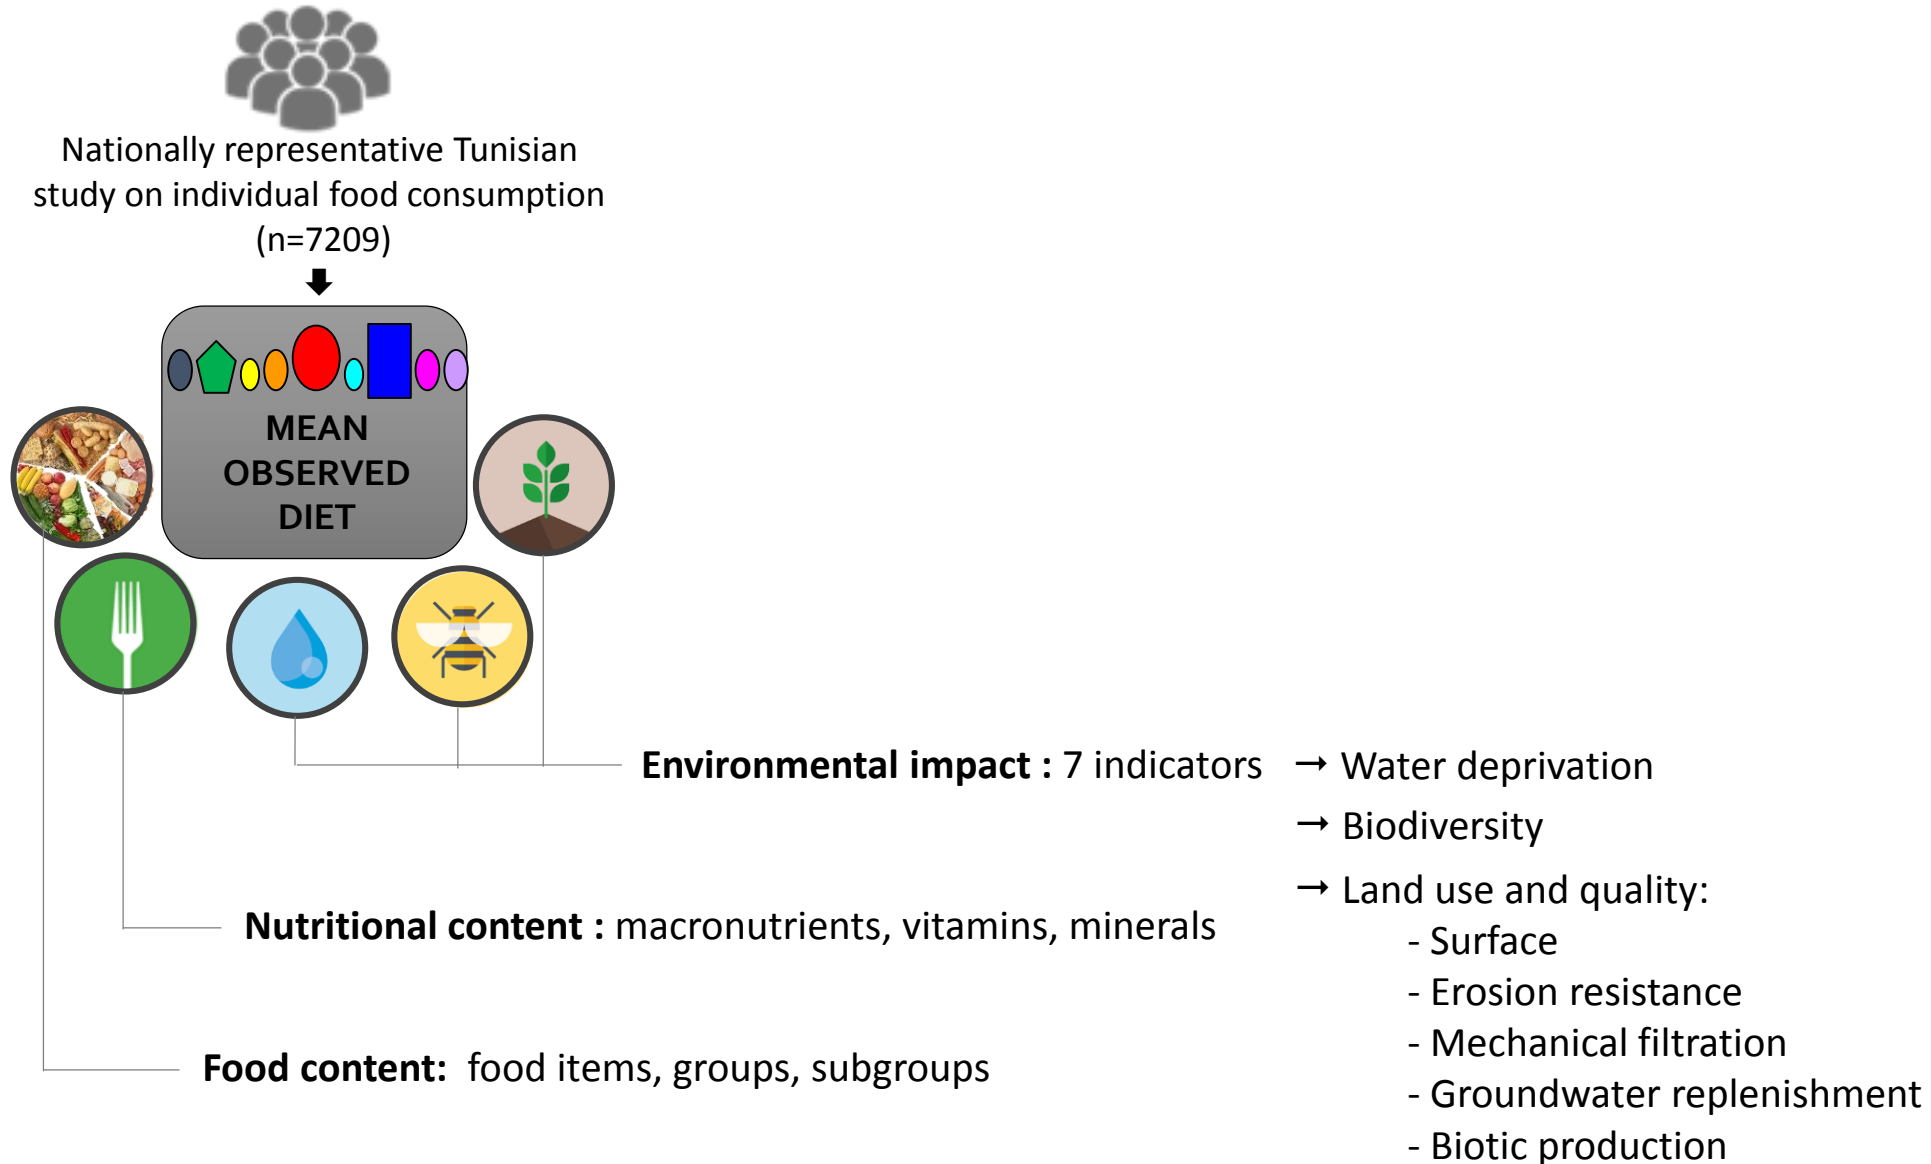

- Changes in both food consumption and food production are needed
- *“Sustainable Diets are those diets with low environmental impacts which contribute to food and nutrition security and to healthy life for present and future generations. Sustainable diets are protective and respectful of biodiversity and ecosystems, culturally acceptable, accessible, economically fair and affordable; nutritionally adequate, safe and healthy; while optimizing natural and human resources.”*
(FAO, 2010)

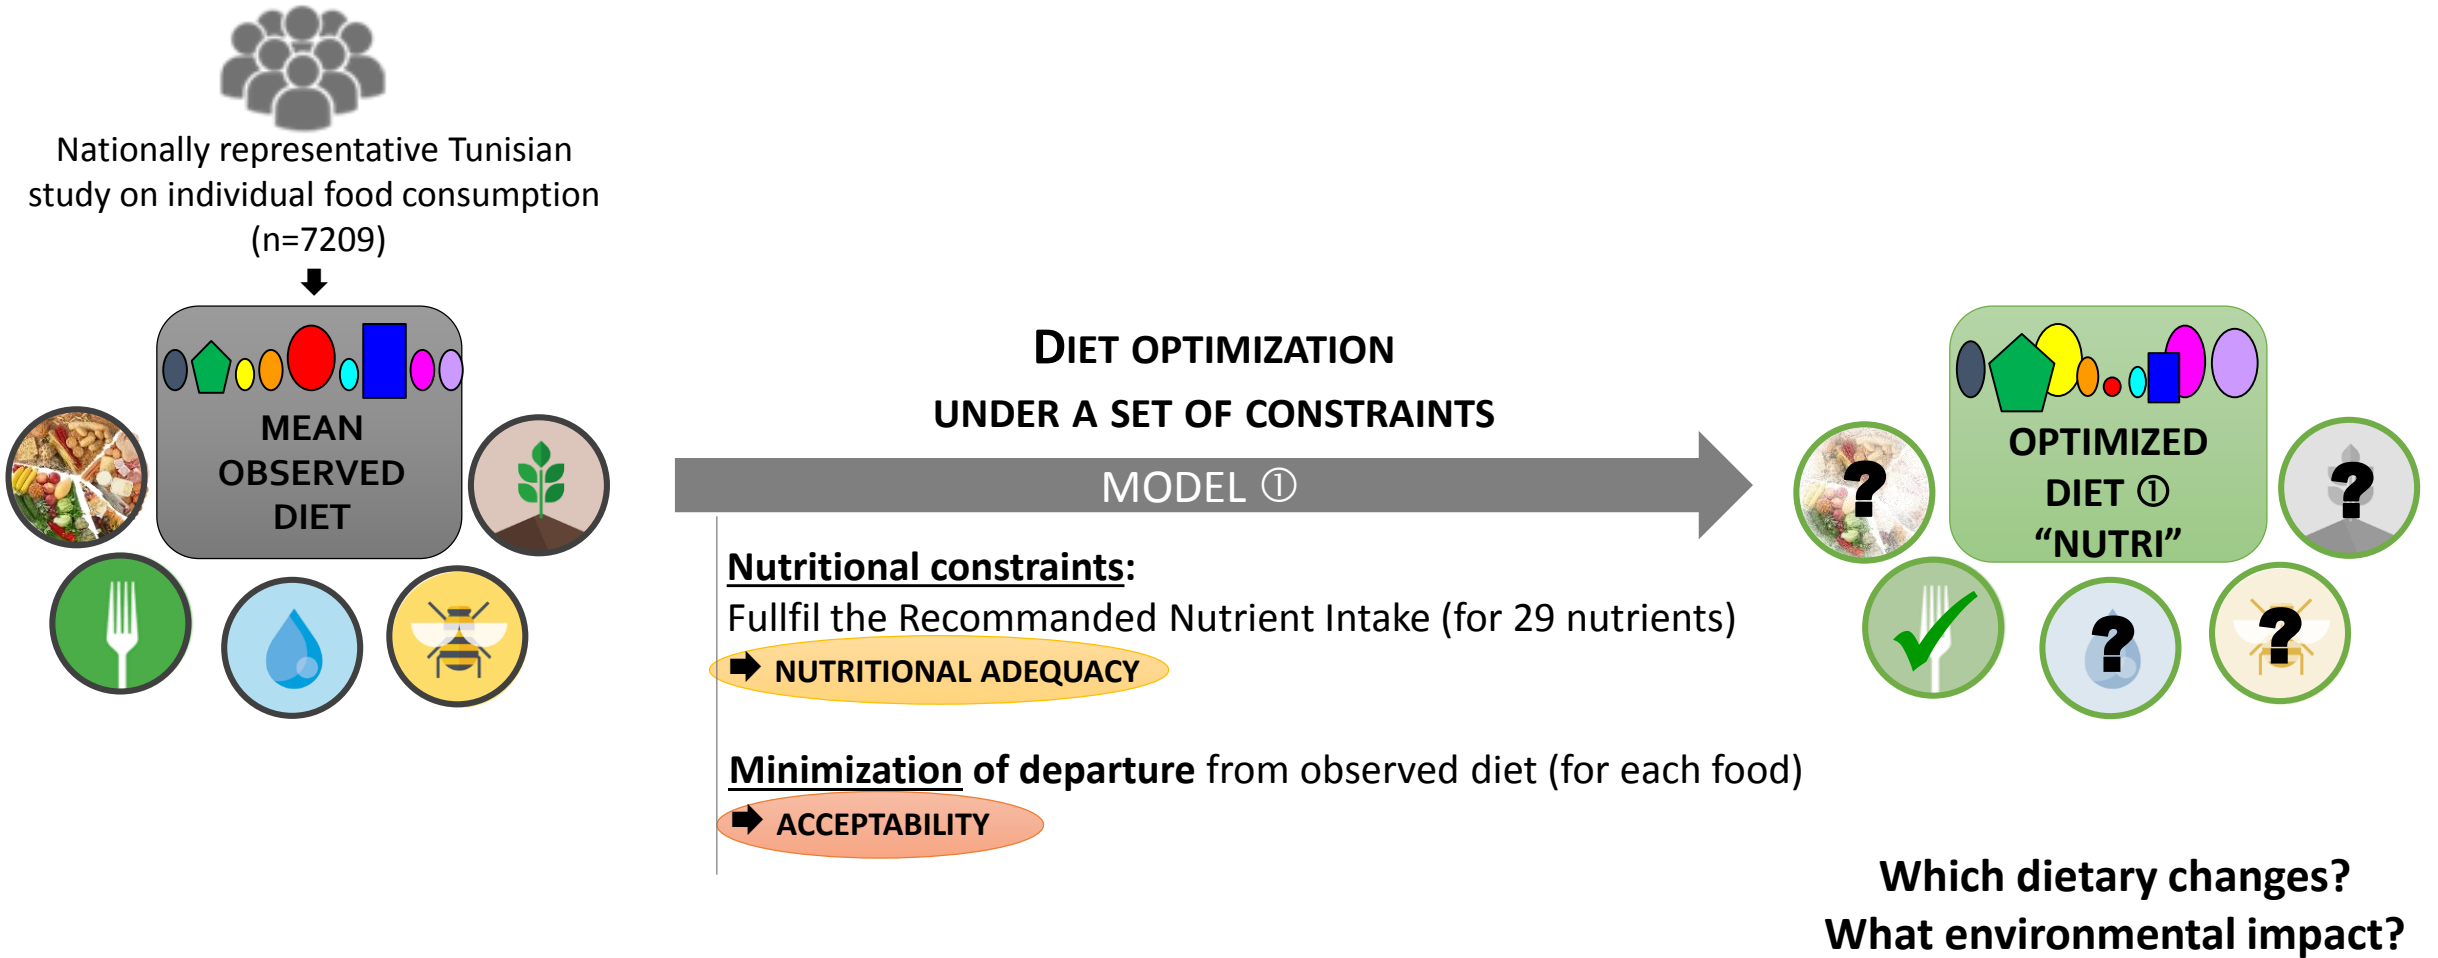

Objective:

To identify dietary changes allowing to move towards healthy and culturally acceptable diets in Tunisia without increasing their environmental impact

Methodology : Diet optimization by linear programming

Methodology : Diet optimization by linear programming

Food group content

Food group content

STARCH

+33%

Food group content

Food group content

Food group content

Food group content

Environmental impact

Water deprivation

Biodiversity loss

Land occupation

Mechanical filtration reduction

Groundwater regeneration loss

Erosion resistance loss

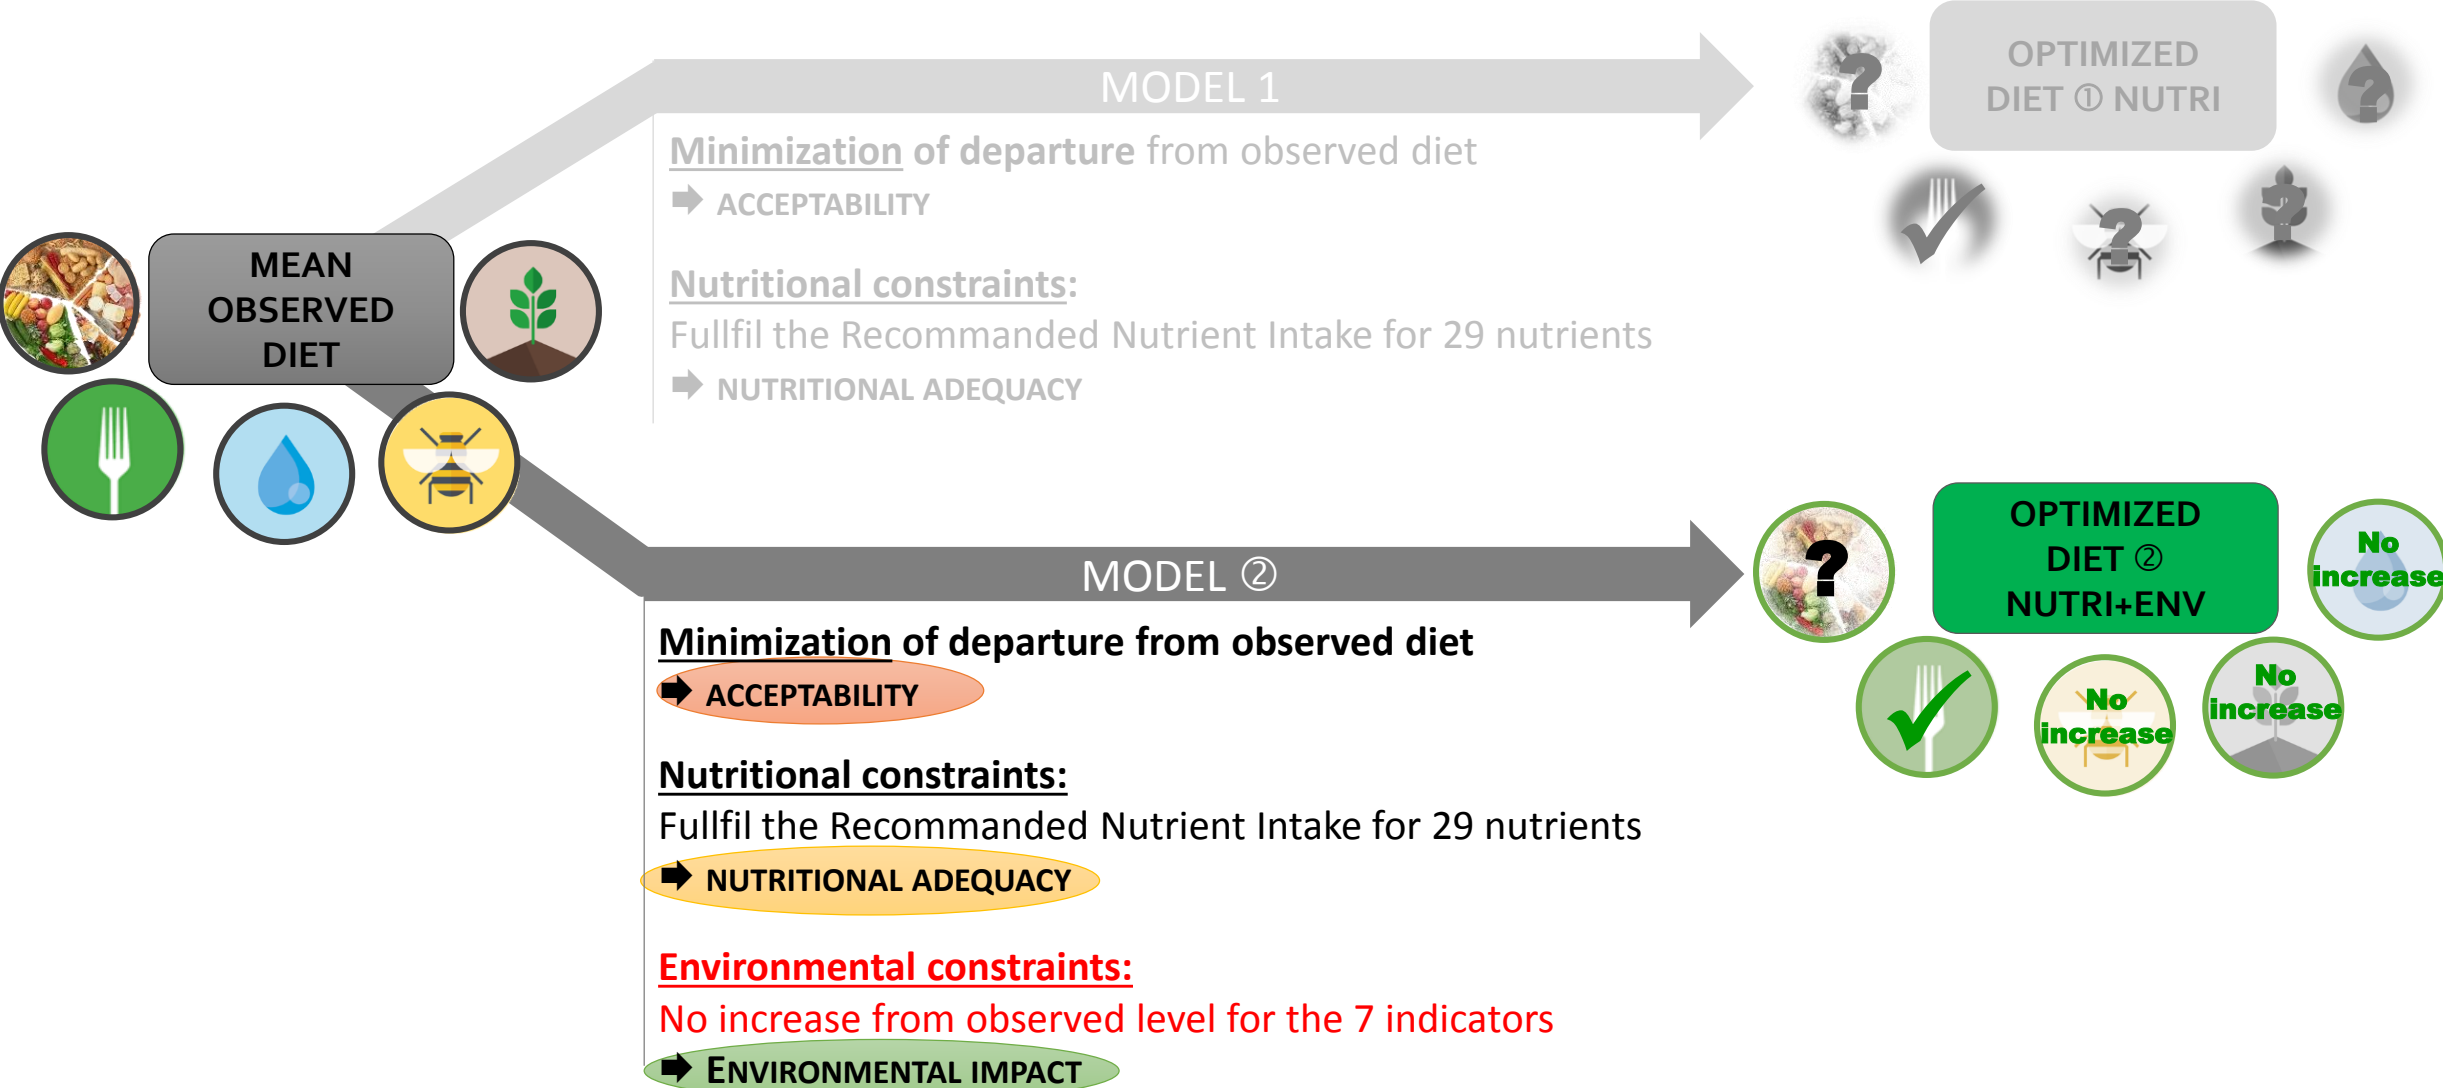

Biotic production loss

- Dietary changes to reach nutritional adequacy ↗ **the impact** on water, biodiversity and 3 indicators of landuse
- Incompatibility of the nutrition vs. environmental dimensions

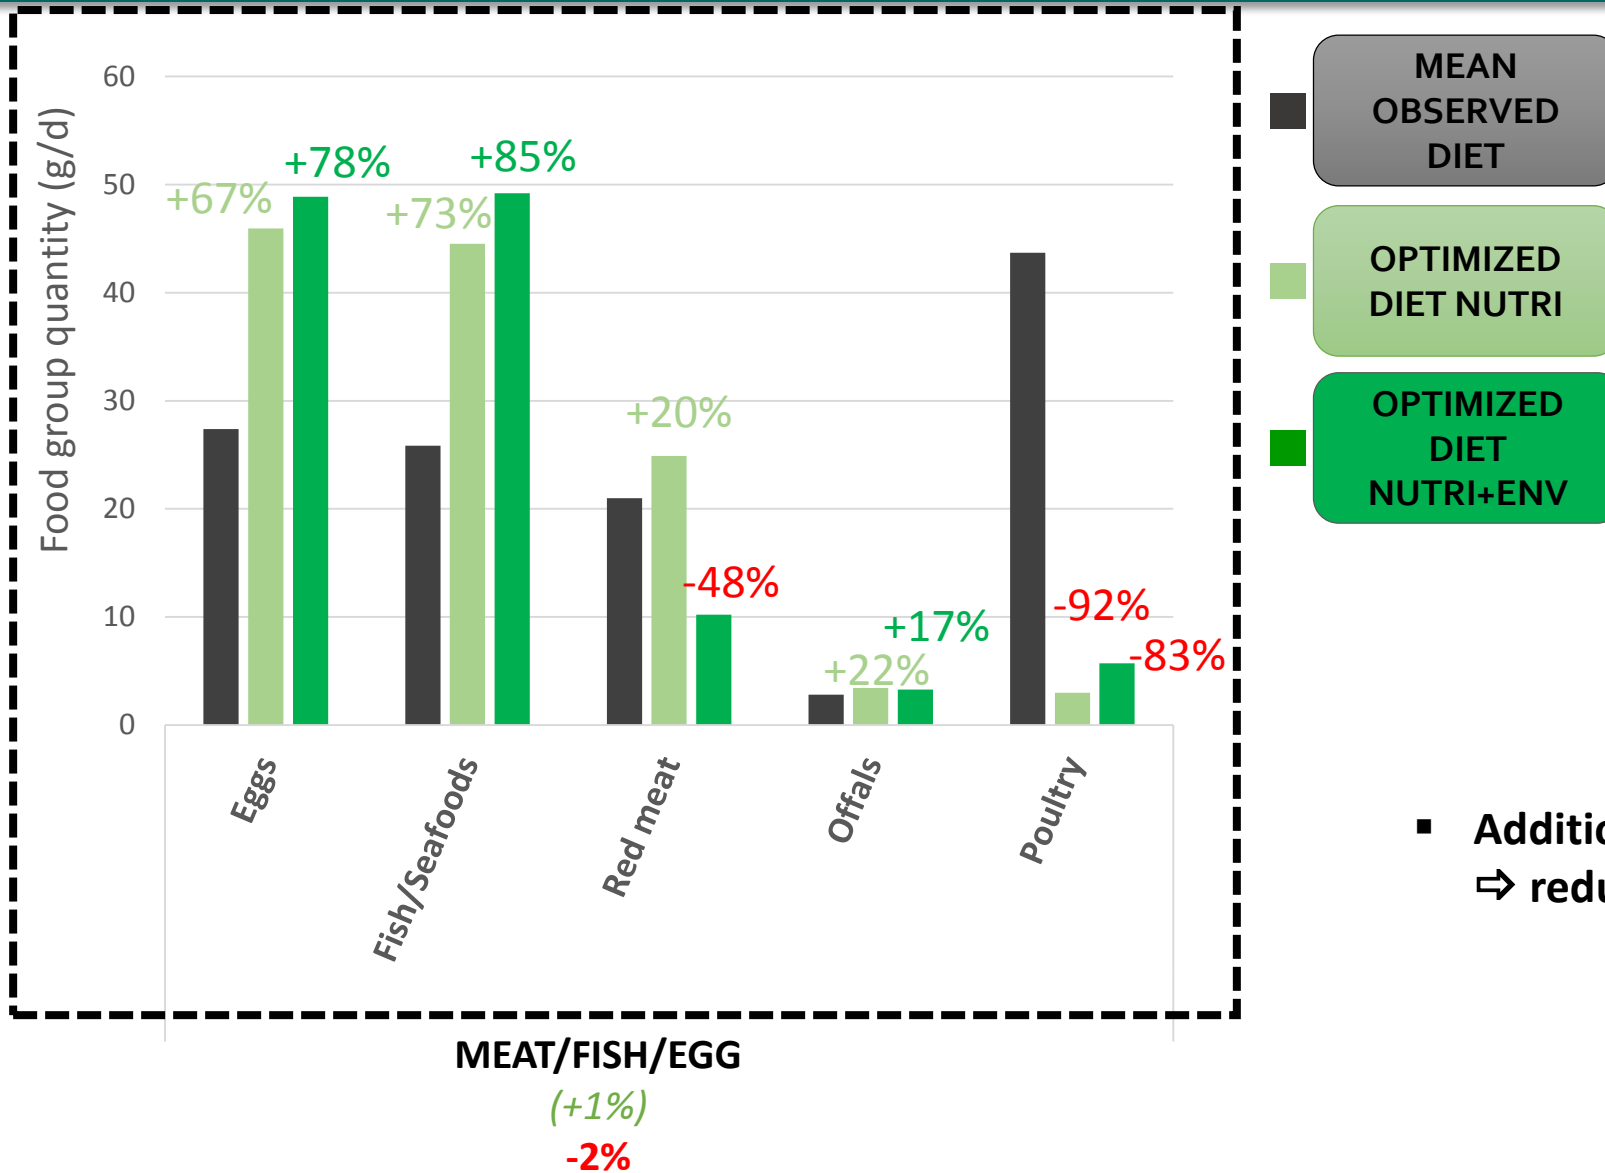

Methodology : Diet optimization by linear programming

Food group content

Food group content

- Addition of environmental constraints
⇒ reduction of red meat by half

Share of animal-based products

- **Increase of total energy share** of animal-based products
- But **restructuration of contributions** within animal-based products:
 - ↗ Dairy, Fish, Egg
 - ↘ Meat

Deviation from actual diet

Diet deviation from observed diet

- Reaching nutritional adequacy without increasing environmental impact is possible but requires **higher diet deviation**
- but **small additional changes** vs. NUTRI

	Obs	NUTRI	NUTRI+ENV
Total diet weight (g/d)	1556	1829	1830

Conclusion

▪ Compatibility of sustainable diet dimensions:

- ↳ Dietary changes **improving nutritional quality may induce a higher environmental impact** of diet
 - ⇒ Both **dimensions should be considered together** when designing guidelines for healthy & sustainable diet
- ↳ It is **possible to reach nutritional adequacy without increasing the environmental impact of diet**
 - ⇒ it requires **higher deviation from observed diet** (but additional changes are small)

▪ Main dietary changes identified to move towards more sustainable diet in Tunisia:

Animal-based products ~ 20% of total energy
(~ 1/4 of total weight)

Translation into action proposals

DIETARY CHANGES

Dairy

Improve stability of supply/availability : to expand the installation of small, mobile or industrial processing units to transform the surplus seasonal products into stabilized ingredients and food products for off-season use and consumption.

Fish & seafoods

Improve access (physical) : improve distribution channels to ensure regular access to fresh seafoods, and encourage the artisanal seafood processing sector (salting, drying, smoking and pickling techniques)

F&V

Improve access (economic): Promote deployment of sales points "from producer to consumer". This action will be accompanied by a communication campaign to encourage the use of these local distribution channels

Fats

Rebalance the utilization of vegetable oils: remove the subsidy for imported vegetable oils (soybean) and transfer this subsidy in the form of vouchers for olive oil (reserved for people living below the poverty line)

Sodium / salt

Improve formulation of main contributors: set a maximum permitted level of salt in manufactured products that are highly contributors (bread, cheeses and processed meats). A quality label will be awarded to products complying with these standards

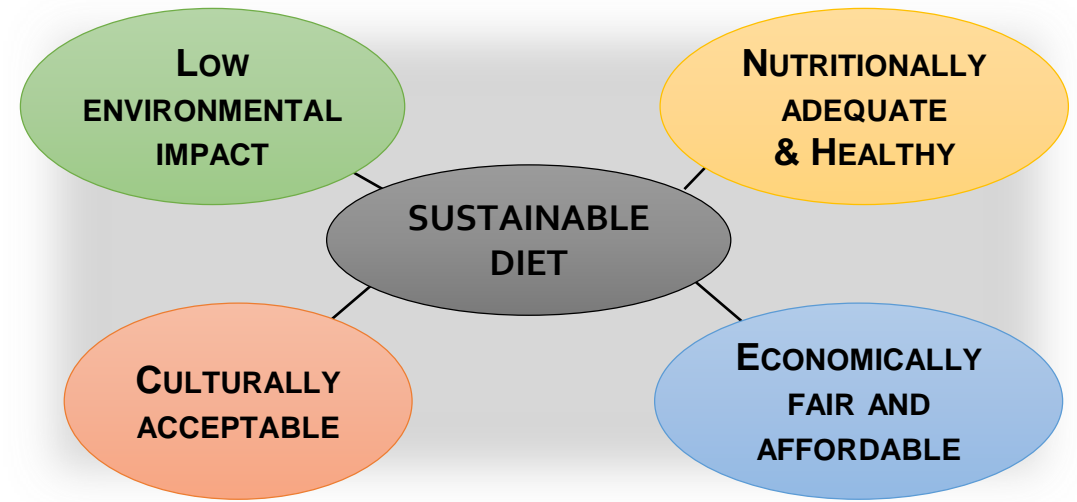

...

...

EXAMPLES OF ACTION PROPOSALS

Perspectives

- **Evaluation of the actions proposals** by key stakeholders
- **Diet optimization with reduced environmental impact**
- **Models improvement:**
 - ➔ Marine biodiversity and GHGE
 - ➔ Iron bioavailability, quality of protein
 - ➔ Optimization at the individual level
 - ➔ Diet cost
