Overview

- Objectives
- Material: data + FROGS
- Data upload into galaxy environment
- Demultiplex tool
- Preprocessing
- Clustering + Cluster Statistics
- Chimera removal

- Filtering
- Affiliation + Affiliation Statistics
- Normalization
- Tool descriptions
- Format transformation
- Workflow creation
- Download data
- Some figures

Objectives

Analyses of bacterial communities → High-throughput sequencing of 16S/18S RNA amplicons → Illumina data, sequenced at great depth → Bioinformatics data processing → Abundance table

WITH
operational taxonomic units (OTUs) and
their taxonomic affiliation.

OTUs for ecology

Operational Taxonomy Unit:
a grouping of similar sequences that can be treated as a single « species »

Strengths:
- Conceptually simple
- Mask effect of poor quality data
  - Sequencing error
  - In vitro recombination (chimera)

Weaknesses:
- Limited resolution
- Logically inconsistent definition

Objectives

	Affiliation	Sample 1	Sample 2	Sample 3	Sample 4	Sample 5	Sample 6
OTU1	Species A	0	100	0	45	75	18645
OTU2	Species B	741	0	456	4421	1255	23
OTU3	Species C	12786	45	3	0	0	0
OTU4	Species D	127	4534	80	456	756	108
OTU5	Species E	8766	7578	56	0	0	200

Why we have developed FROGS
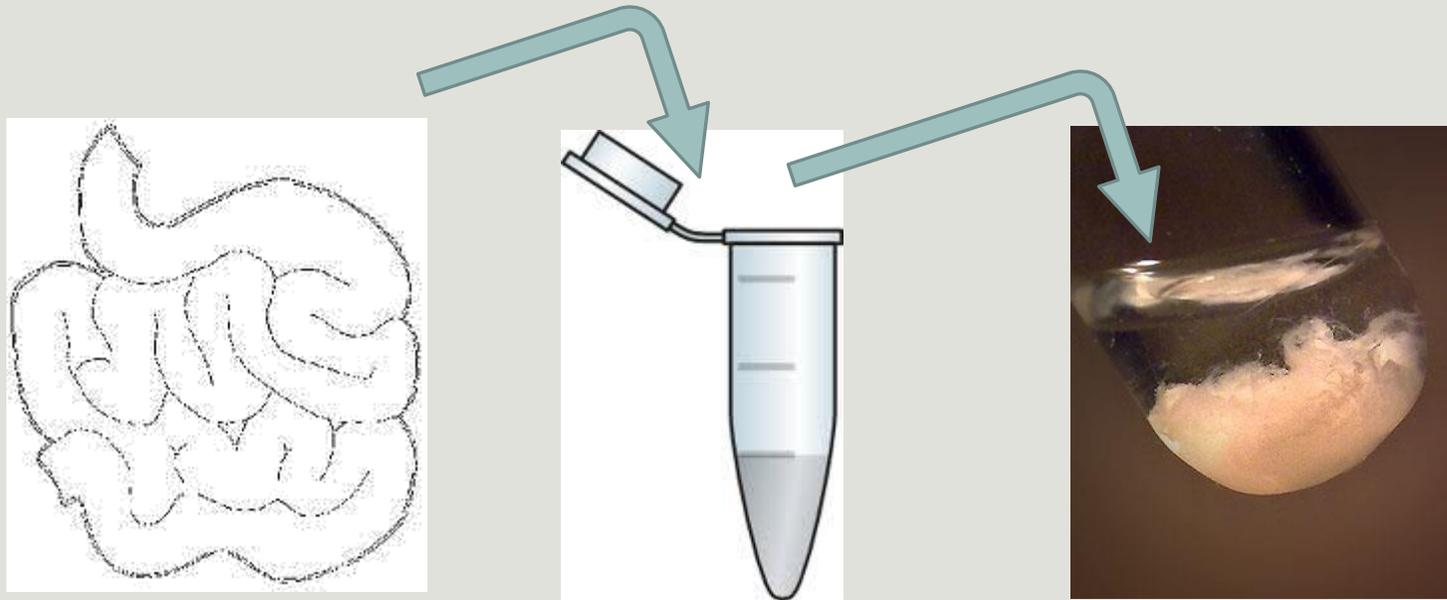

The current processing pipelines struggle to run in a reasonable time.

The most effective solutions are often designed for specialists making access difficult for the whole community.

In this context we developed the pipeline FROGS: « Find Rapidly OTU with Galaxy Solution ».

Material

Sample collection and DNA extraction

« Meta-omics » using next-generation sequencing (NGS)

DNA

RNA

Metagenomics	Metatranscriptomics

Amplicon sequencing	Shotgun sequencing	RNA sequencing

Wolfe *et al.*, 2014

Almeida *et al.*, 2014

Dugat-Bony *et al.*, 2015

Who is here?

What can they do?

What are they doing?

The gene encoding the small subunit of the ribosomal RNA

The most widely used gene in **molecular phylogenetic** studies

Ubiquist gene : **16S rDNA** in prokayotes ; **18S rDNA** in eukaryotes

Gene encoding a ribosomal RNA : non-coding RNA (not translated), part of the small subunit of the ribosome which is responsible for the translation of mRNA in proteins

Not submitted to lateral gene transfer

Availability of databases facilitating comparison
(Silva 2015: >22000 type strains)
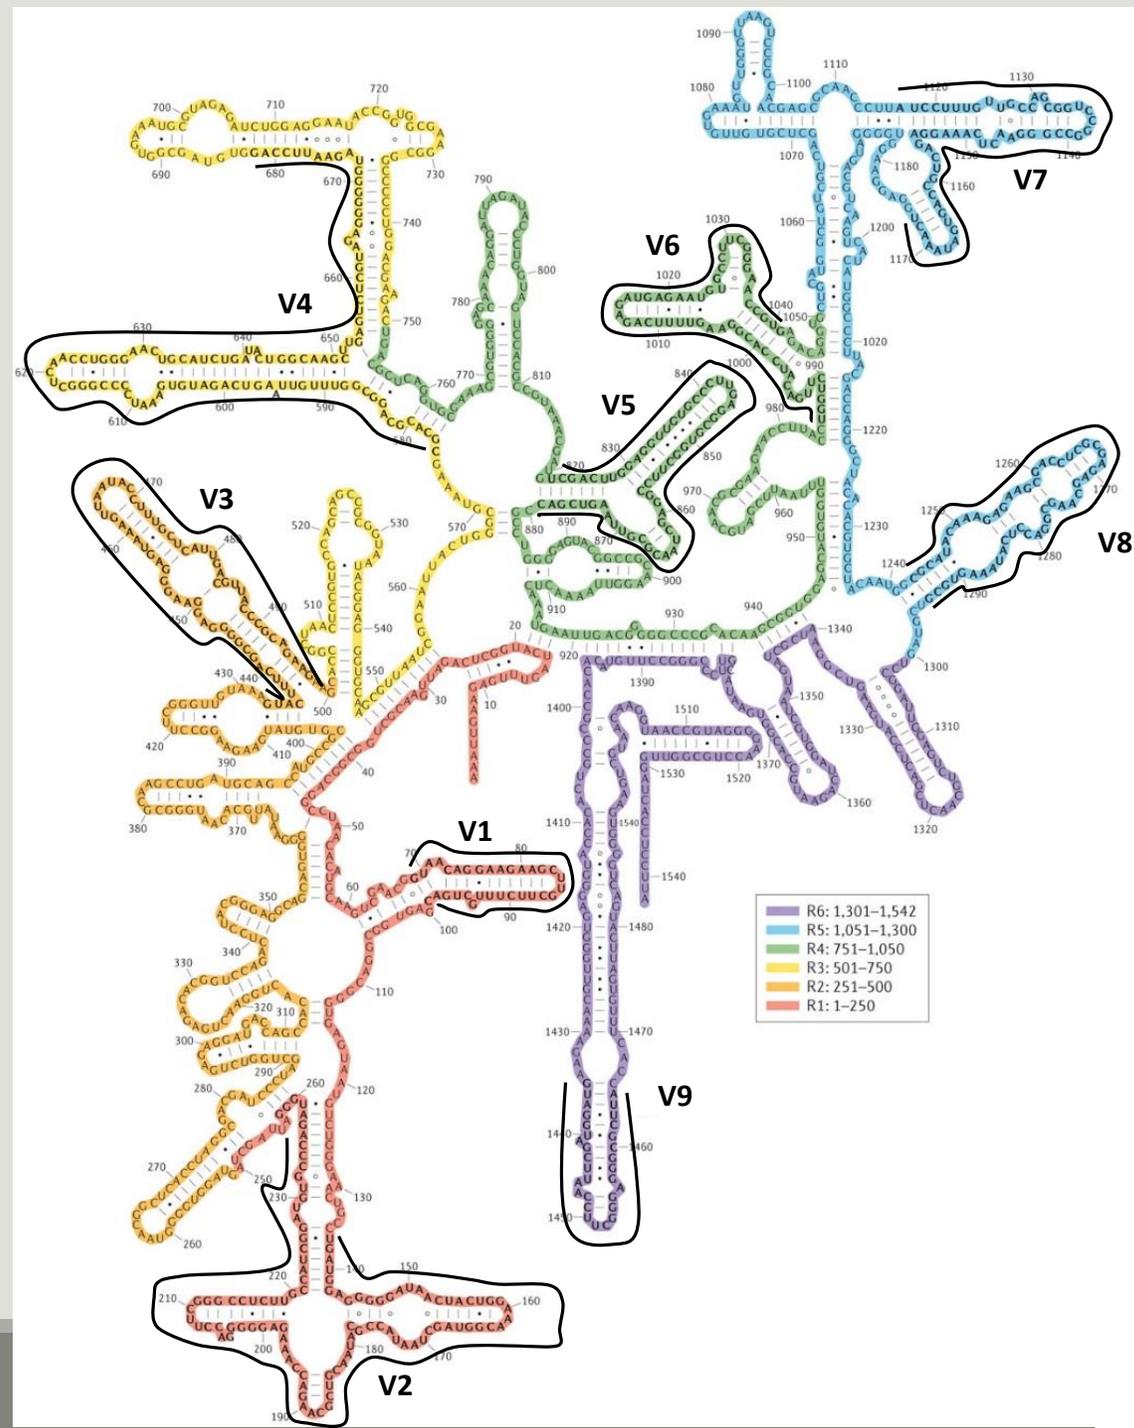

Secondary structure of the 16S rRNA of *Escherichia coli*

In red, fragment R1 including regions V1 and V2;
in orange, fragment R2 including region V3;
in yellow, fragment R3 including region V4;
in green, fragment R4 including regions V5 and V6;
in blue, fragment R5 including regions V7 and V8;
and in purple, fragment R6 including region V9.

Uniting the classification of cultured and uncultured bacteria and archaea using 16S rRNA gene sequences
Pablo Yarza, et al.
Nature Reviews Microbiology 12, 635–645 (2014) doi:10.1038/nrmicro3330

The gene encoding the small subunit of the ribosomal RNA

CONSERVED REGIONS: unspecific applications
VARIABLE REGIONS: group or species-specific applications

Steps for Illumina sequencing

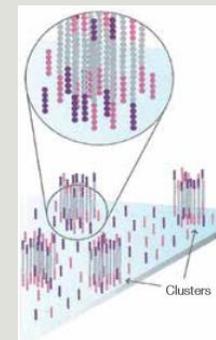

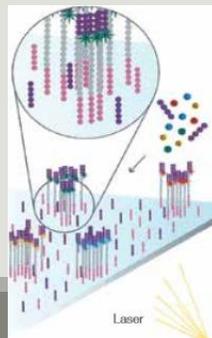

- 1st step : one PCR

- 2nd step: one PCR

- 3rd step: on flow cell, the cluster generations

- 4th step: sequencing

Amplification and sequencing

« Universal » primer sets are used for **PCR amplification** of the phylogenetic biomarker

The primers contain adapters used for the sequencing step and barcodes (= tags = MIDs) to distinguish the samples (multiplexing = sequencing several samples on the same run)

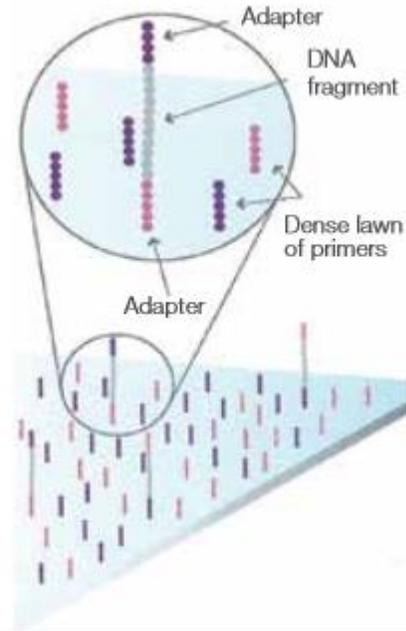

| Adapter A | BarcodeSequence | LinkerPrimerSequence | Target Sequence | ReversePrimer | Adapter B |

exemple: V3   exemple: V4

Desired Sequence

Cluster generation

Prepare Genomic DNA Sample

Randomly fragment genomic DNA and ligate adapters to both ends of the fragments.
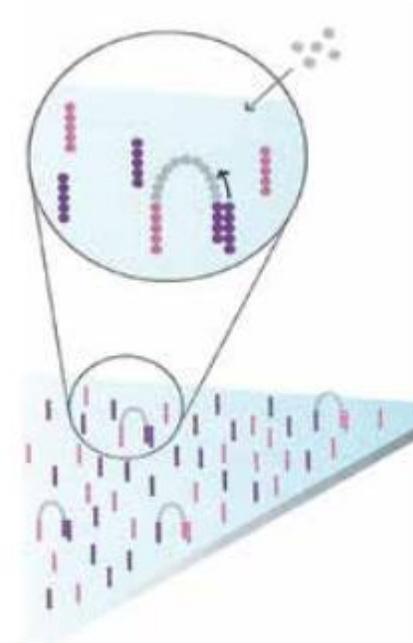

Attach DNA to Surface

Bind single-stranded fragments randomly to the inside surface of the flow cell channels.
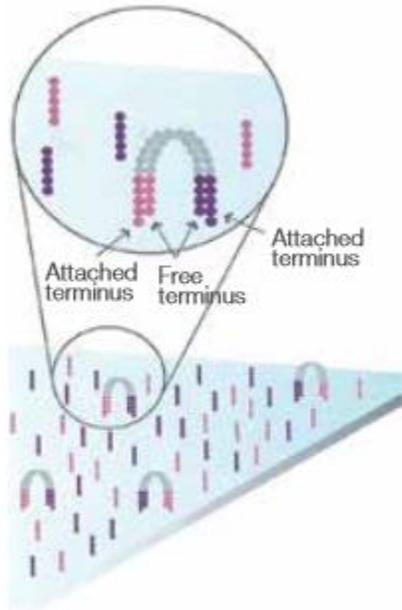

Attach DNA to surface

Bridge Amplification

Add unlabeled nucleotides and enzyme to initiate solid-phase bridge amplification.
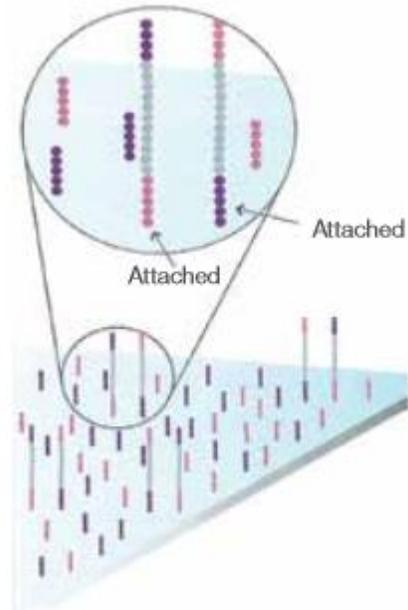

Bridge amplification

Cluster generation

Fragments Become Double Stranded   **Denature the Double-Stranded Molecules**   **Complete Amplification**

The enzyme incorporates nucleotides to build double-stranded bridges on the solid-phase substrate.
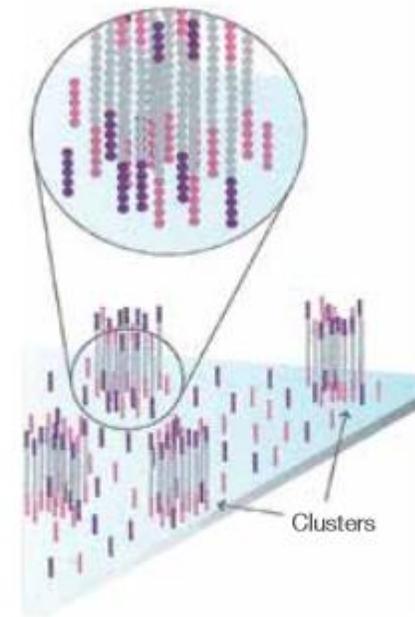

Fragments become double stranded

Denaturation leaves single-stranded templates anchored to the substrate.

Denature the double-stranded molecule

Several million dense clusters of double-stranded DNA are generated in each channel of the flow cell.

Cycle of new strand synthesis and denaturation to make multiple copies of the same sequence (amplification)
Reverse strands are washed

Sequencing by synthesis

Determine First Base

The first sequencing cycle begins by adding four labeled reversible terminators, primers, and DNA polymerase.

Light signal is more strong in cluster

Image First Base

After laser excitation, the emitted fluorescence from each cluster is captured and the first base is identified.

Determine Second Base

The next cycle repeats the incorporation of four labeled reversible terminators, primers, and DNA polymerase.
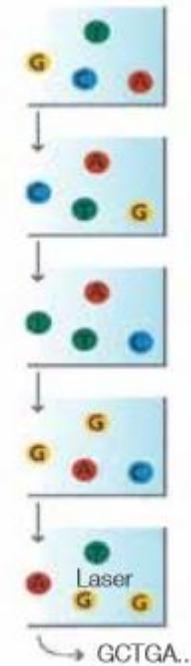

Sequencing by synthesis

Image Second Chemistry Cycle

After laser excitation, the image is captured as before, and the identity of the second base is recorded.

Sequencing Over Multiple Chemistry Cycles

GCTGA...

The sequencing cycles are repeated to determine the sequence of bases in a fragment, one base at a time.
Barcode is read, so cluster is identified.
After first sequencing (250 or 300 nt of Reverse strand), fragment form bridges again and Forward strand can be sequenced also.
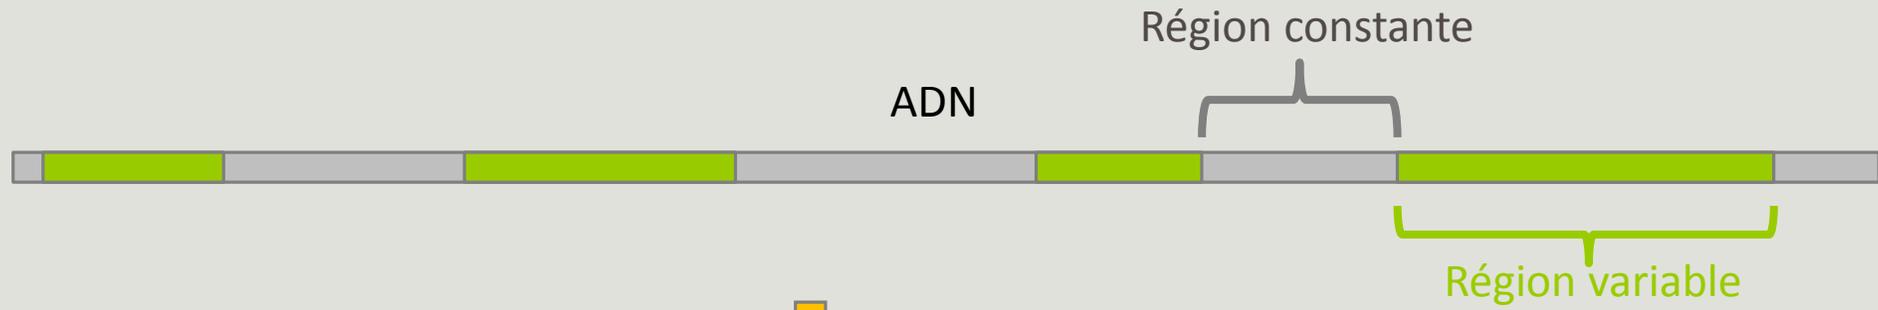

Identification of bacterial populations may be not discriminating

0   ARNr 16S total   1500

F   V3   V4   R

Amplicon

Constant regions

Divergent regions
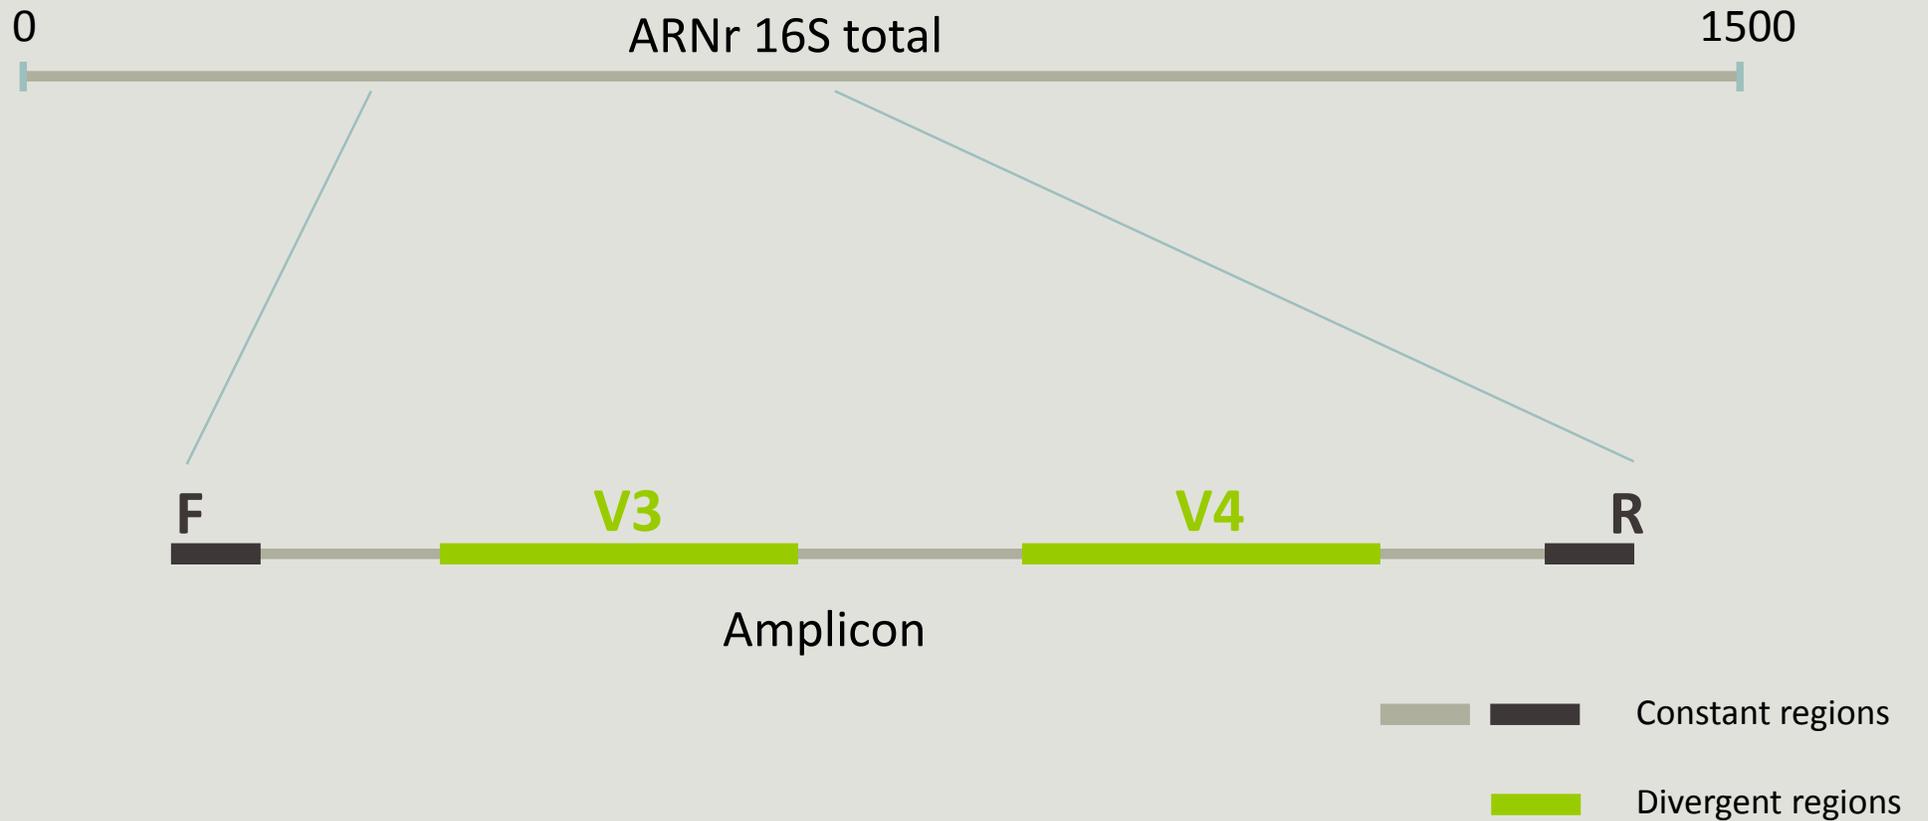

Amplification and sequencing

Sequencing is generally perform on **Roche-454** or **Illumina MiSeq** platforms.

Roche-454 generally produce ~ 10 000 reads per sample

MiSeq ~ 30 000 reads per sample

Sequence length is **>650 bp** for pyrosequencing technology (Roche-454) and **2 x 300 bp** for the MiSeq technology in paired-end mode.
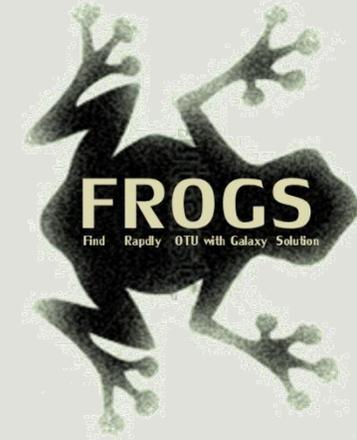

Methods

Which bioinformatics solutions ?

	Disadvantages
QIIME	Installation problem Command lines
UPARSE	Global clustering command lines

Create the 1st history **multiplexed**

Import files « **multiplex.fastq** » and « **barcode.tabular** » present in the **Genotoul** folder /work/formation/FROGS/

Create the 2nd history **454**

Import file « **454.fastq.gz** » present in the **Genotoul** folder /work/formation/FROGS/
(datatype fastq or fastq.gz is the same !)

Create the 3rd history **MiSeq R1 R2**

Import files « **sampleA_R1.fastq** » and « **sampleA_R2.fastq** » present in the **Genotoul** folder /work/formation/FROGS/

Create the 4th history **MiSeq contiged**

Import archive file « **100spec_90000seq_9samples.tar.gz** » present in the **Genotoul** folder /work/formation/FROGS/

History creation
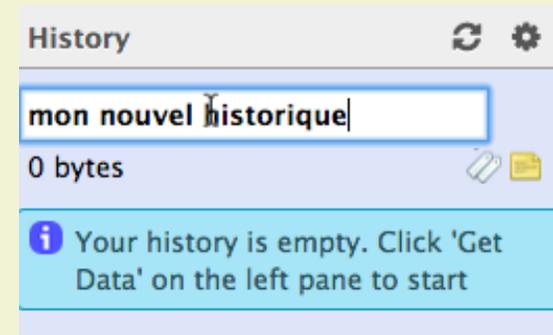

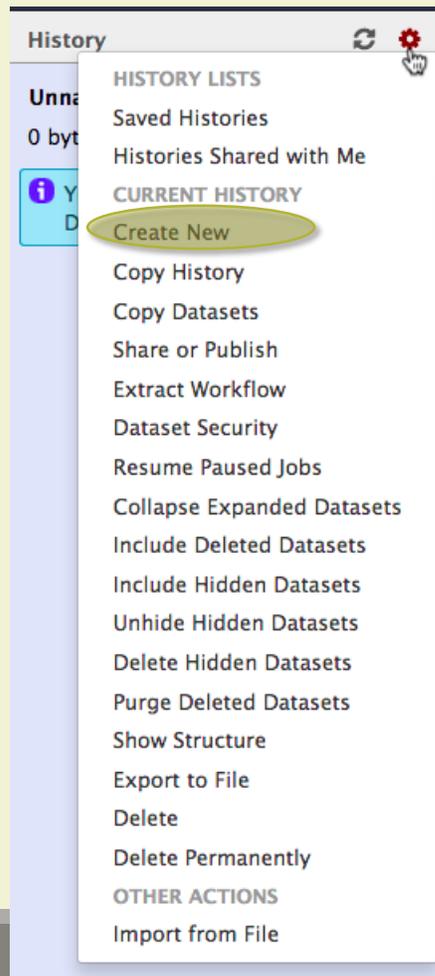

Upload data: different methods

Default method, your files are on **your** computer or accessible on the internet, they are copied on your Galaxy account

You can only upload one local file at a time → 10 samples ≥ 10 uploads
You can upload multiple files using URLs but only smaller than 2Go

Each uploaded file will consume your Galaxy's quota!

Upload data: different methods

Specific SIGENAE GENOTOUL method. It allows you to access to your files in **your work account** on the Genotoul **without consuming your Galaxy quota**.

And if you have multiple samples ?

See How_to_create_an_archiveTAR.ppt

How to transfer files on /work of Genotoul?

See How_to_transfert_to_genotoul.ppt

Upload data: different methods

If you have an archive on your own computer and smaller than 2Go, you may use this specific FROGS tool to upload your samples archive instead of the default « Upload File » of Galaxy.

Upload data: different methods

You can only upload multiple files at a time but only smaller than 2Go

New functionality in latest Galaxy version :
http://147.99.108.167/galaxy/

Exercise 2

In **multiplexed** history launch the demultiplex tool:

« The Patho-ID project, rodent and tick's pathobioms study, financed by the metaprogram INRA-MEM, studies zoonoses on rats and ticks from multiple places in the world, the co-infection systems and the interactions between pathogens. In this aim, thay have extracted hundreads of or rats and ticks samples from which they have extracted 16S DNA and sequenced them first time on Roche 454 plateform and in a second time on Illumina Miseq plateform. For this courses, they authorized us to publicly shared some parts of these samples. »

Parasites & Vectors (2015) 8:172 DOI 10.1186/s13071-015-0784-7. **Detection of Orientia sp. DNA in rodents from Asia, West Africa and Europe.** Jean François Cosson, Maxime Galan, Emilie Bard, Maria Razzauti, Maria Bernard, Serge Morand, Carine Brouat, Ambroise Dalecky, Khalilou Bâ, Nathalie Charbonnel and Muriel Vayssier-Taussat

Exercise 2

In **multiplexed** history launch the demultiplex tool:

Data are single end reads
→ only 1 fastq file

Samples are characterized by an association of two barcodes in forward and reverse strands
→ multiplexing « both ends »

👁 ✎ ✗

👁 ✎ ✗

2: /work/frogs
/Formation/multiplex.fastq 👁 ✎ ✗

1: /work/frogs
/Formation/barcode.txt 👁 ✎ ✗

Exercise 2

Demultiplex tool asks for 2 files: one « fastq » and one « tabular »

1. Play with pictograms

2. Observe how is built a fastq file.

3. Look at the stdout, stderr when available (in the ⓘ pictogram)

multiplexed

Advices

For your own data

- Do not forget to indicate barcode sequence as they are in the fastq sequence file, especially if you have data multiplexed via the reverse strand.

- For the mismatch threshold, we advised you to let the threshold to 0, and if you are not satisfied by the result, try with 1. The number of mismatch depends on the length of the barcode, but often those sequences are very short so 1 mismatch is already more than the sequencing error rate.

- If you have different barcode lengths, you must demultiplex your data in different times beginning by the longest barcode set and used the "unmatched" or "ambiguous" sequence with smaller barcode and so on.

- If you have Roche 454 sequences in sff format, you must convert them with some program like sff2fastq

Results

With barcode mismatches >1 sequence can corresponding to several samples.
So these sequences are non-affected to a sample.

9: FROGS Demultiplex reads: report 👁 ✏ ✖

8: FROGS Demultiplex reads: undemultiplexed.tar.gz 👁 ✏ ✖

7: FROGS Demultiplex reads: demultiplexed.tar.gz 👁 ✏ ✖

#sample	count
ambiguous	0
MgArd0009	65
MgArd0017	152
MgArd0038	1185
MgArd0029	172
unmatched	492
MgArd0001	85
MgArd0081	209
MgArd0046	373
MgArd0054	217
MgArd0073	454
MgArd0062	1109
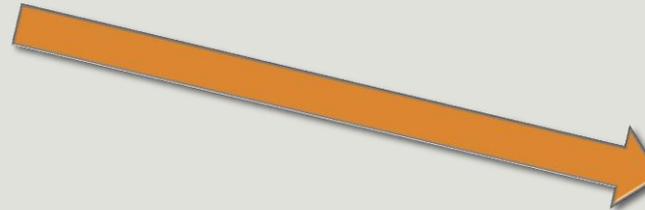

A tar archive is created by grouping one (or a pair of) fastq file per sample with the names indicated in the first column of the barcode tabular file

Sequences without known barcode.
So these sequences are non-affected to a sample.

Format: Barcode

BARCODE FILE is expected to be tabulated:
- first column corresponds to the sample name (unique, without space)
- second to the forward sequence barcode used (None if only reverse barcode)
- optional third is the reverse sequence barcode (optional)

Take care to indicate sequence barcode in the strand of the read, so you may need to reverse complement the reverse barcode sequence. Barcode sequence must have the same length.

Example of barcode file.
The last column is optional, like this, it describes sample multiplexed by both fragment ends.

MgArd00001	ACAGCGT	ACGTACA

Format : FastQ

FASTQ : Text file describing biological sequence in 4 lines format:

- first line start by "@" correspond to the sequence identifier and optionally the sequence description. "@Sequence_1 description1"
- second line is the sequence itself. "ACAGC"
- third line is a "+" following by the sequence identifier or not depending on the version
- fourth line is the quality sequence, one code per base. The code depends on the version and the sequencer

```
@HNHOSKD01ALD0H
ACAGCGTCAGAGGGGTACCAGTCAGCCATGACGTAGCACGTACA
+
CCCFFFFFFHHHHHJJIJJJHHFF@DEDDDDDD@CDDDDACDD
```

How it works ?

For each sequence or sequence pair the sequence fragment at the beginning (forward multiplexing) of the (first) read or at the end (reverse multiplexing) of the (second) read will be compare to all barcode sequence.

If this fragment is equal (with less or equal mismatch than the threshold) to one (and only one) barcode, the fragment is trimmed and the sequence will be attributed to the corresponding sample.

Finally fastq files (or pair of fastq files) for each sample are included in an archive, and a summary describes how many sequence are attributed for each sample.

The 5' primer sequence (wildcards are accepted). The orient...   ...rameters'.

Primer sequences

3' primer

AGGATTAGATACCCTGGTA

The 3' primer sequence (wildcards are accepted). The orientation is detailed below in 'Primers parameters'.

✔ Execute

Example for:

- Illumina MiSeq data
- 9 samples in 1 archive
- Joined
- Without sequenced PCR primers (Kozich protocol)

Pre-process example 3

Your turn! - 3

GO TO EXERCISES 3

Exercise 3.1

Go to « 454 » history

Launch the pre-process tool on that data set

→ objective : understand the parameters

1- Test different parameters for « minimum and maximum amplicon size »

2- Enter these primers: Forward: ACGGGAGGCAGCAG   Reverse: AGGATTAGATACCCTGGTA

Exercise 3.1

What do you understand about amplicon size, which file can help you ?

What is the length of your reads before preprocessing ?

Do you understand how enter your primers ?

What is the « FROGS Pre-process: dereplicated.fasta » file ?

What is the « FROGS Pre-process: count.tsv » file ?

Explore the file « FROGS Pre-process: report.html »

Who loose a lot of sequences ?

Samples	before process	with the two primers	with expected length	without N	without large homopolymer	without nearest poor quality
sample_454	28,009	20,227	6,806	6,677	6,675	6,672
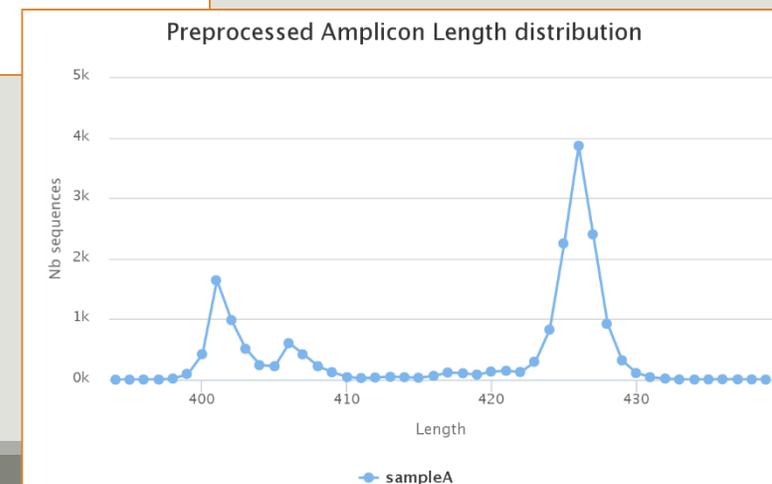

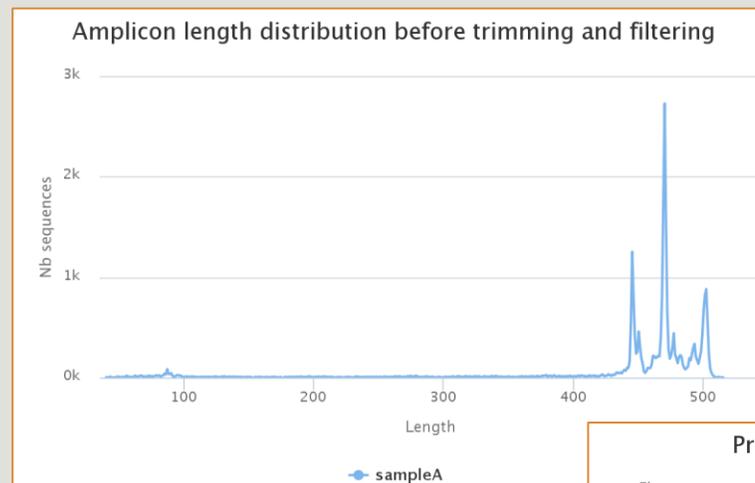

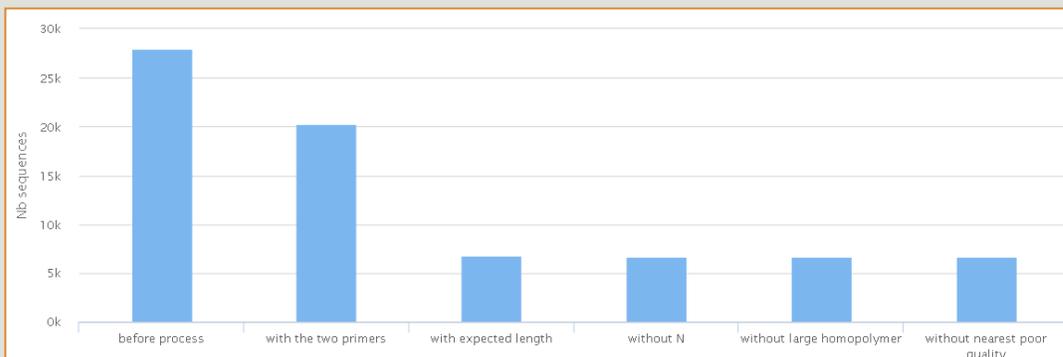

To be kept, sequences must have the 2 primers

Amplicon length distribution before trimming and filtering

To adjust your filtering, check the distribution of sequence lengths.

Preprocessed Amplicon Length distribution

454

Lengths distribution

Samples A only

Samples B only
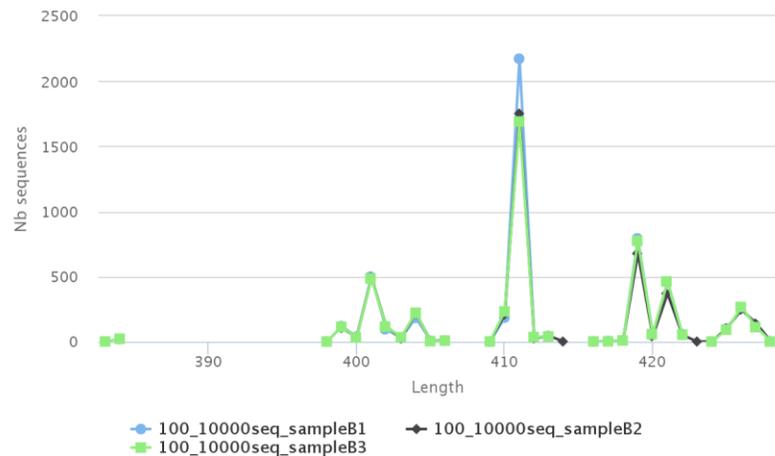

Samples C only
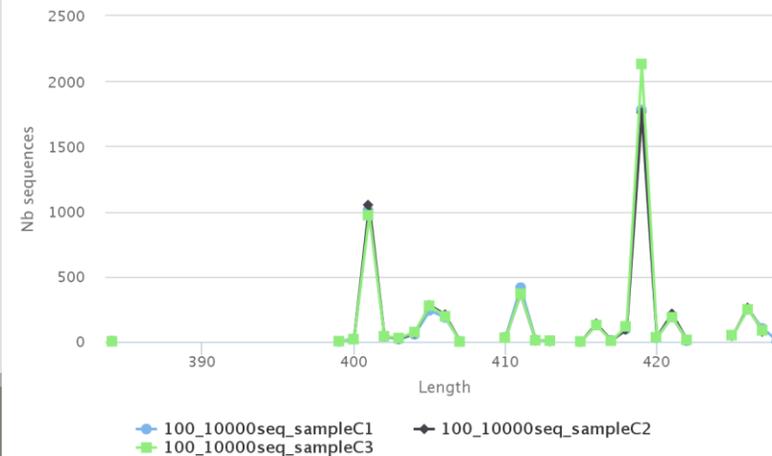

Cleaning, how it work ?

Filter contig sequence on its length which must be between min-amplicon-size and max-amplicon-size

Minimum amplicon size:

380

The minimum size for the amplicons.

Maximum amplicon size:

500

The maximum size for the amplicons.

use cutadapt to search and trim primers sequences with less than 10% differences

Cleaning, how it work ?

dereplicate sequences and return one uniq fasta file for all sample and a count table to indicate sequence abundances among sample.

In the HTML report file, you will find for each filter the number of sequences passing it, and a table that details these filters for each sample.

Exercise 3.2

Go to « MiSeq R1 R2 » history

Launch the pre-process tool on that data set

→ objective: understand flash software

FROGS Pre-process (version 1.4.2)

Sequencer:
Illumina
Select the sequencer family used to produce the sequences.

Input type:
Files by samples
Samples files can be provided in single archive or with two files (R1 and R2) by sample.

Reads already contiged ?:
No
The inputs contain 1 file by sample : Reads 1 and Reads 2 are already contiged by pair.

Samples

Samples 1

Name:
sampleA
The sample name.

Reads 1:
1: /work/formation/FROGS/sampleA_R1.fastq
R1 FASTQ file of paired-end reads.

reads 2:
2: /work/formation/FROGS/sampleA_R2.fastq
R2 FASTQ file of paired-end reads.

Add new Samples

Reads 1 size:
250
The read1 size.

Reads 2 size:
250
The read2 size.

Real 16S sequenced fragment

Expected amplicon size:
410
Maximum amplicon length expected in approximately 90% of the amplicons.

Minimum amplicon size:
340
The minimum size for the amplicons.

Size with primers

Maximum amplicon size:
450
The maximum size for the amplicons.

Sequencing protocol:
Illumina standard
The protocol used for sequencing step: standard or custom with PCR primers as sequencing primers.

5' primer:
CCGTCAATTC
The 5' primer sequence (wildcards are accepted). The orientation is detailed below in 'Primers parameters'.

3' primer:
CCGCNGCTGCT
The 3' primer sequence (wildcards are accepted). The orientation is detailed below in 'Primers parameters'.

Execute

MiSeq R1 R2

Primers used for this sequencing :
Forward: CCGTCAATTC
Reverse: CCGCNGCTGCT
Lecture 5' → 3'

88

Flash, how it works ?

To contig read1 and read2 with FLASh with :
a minimum overlap equals to

ex: minimum overlap (250+250) - 410 = 50
maximum overlap 450

[(R1-size + R2-size) - expected-amplicon-size]

and a maximum overlap equal to [expected-amplicon-size] with a maximum of 10% mismatch among this overlap

90% of the amplicon are smaller than [expected-amplicon-size]
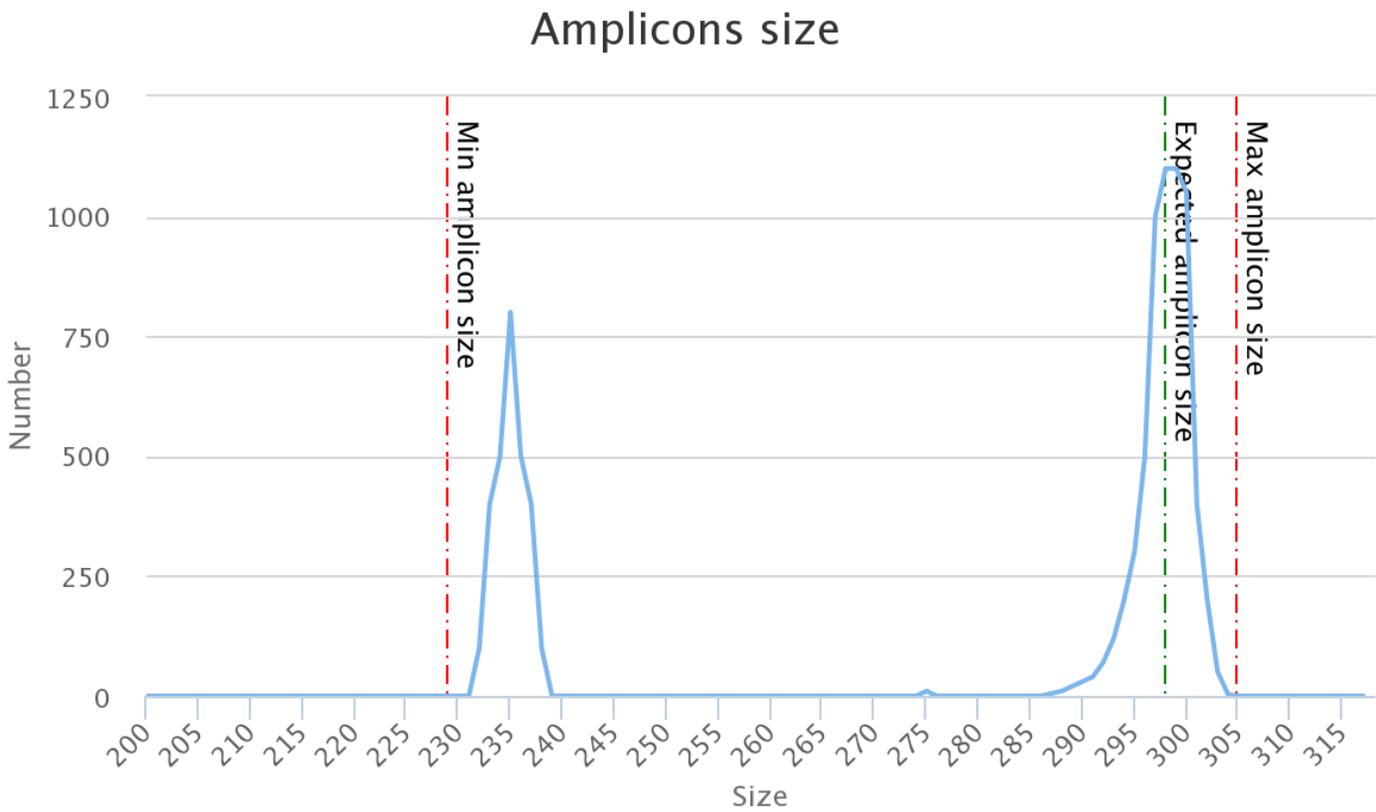

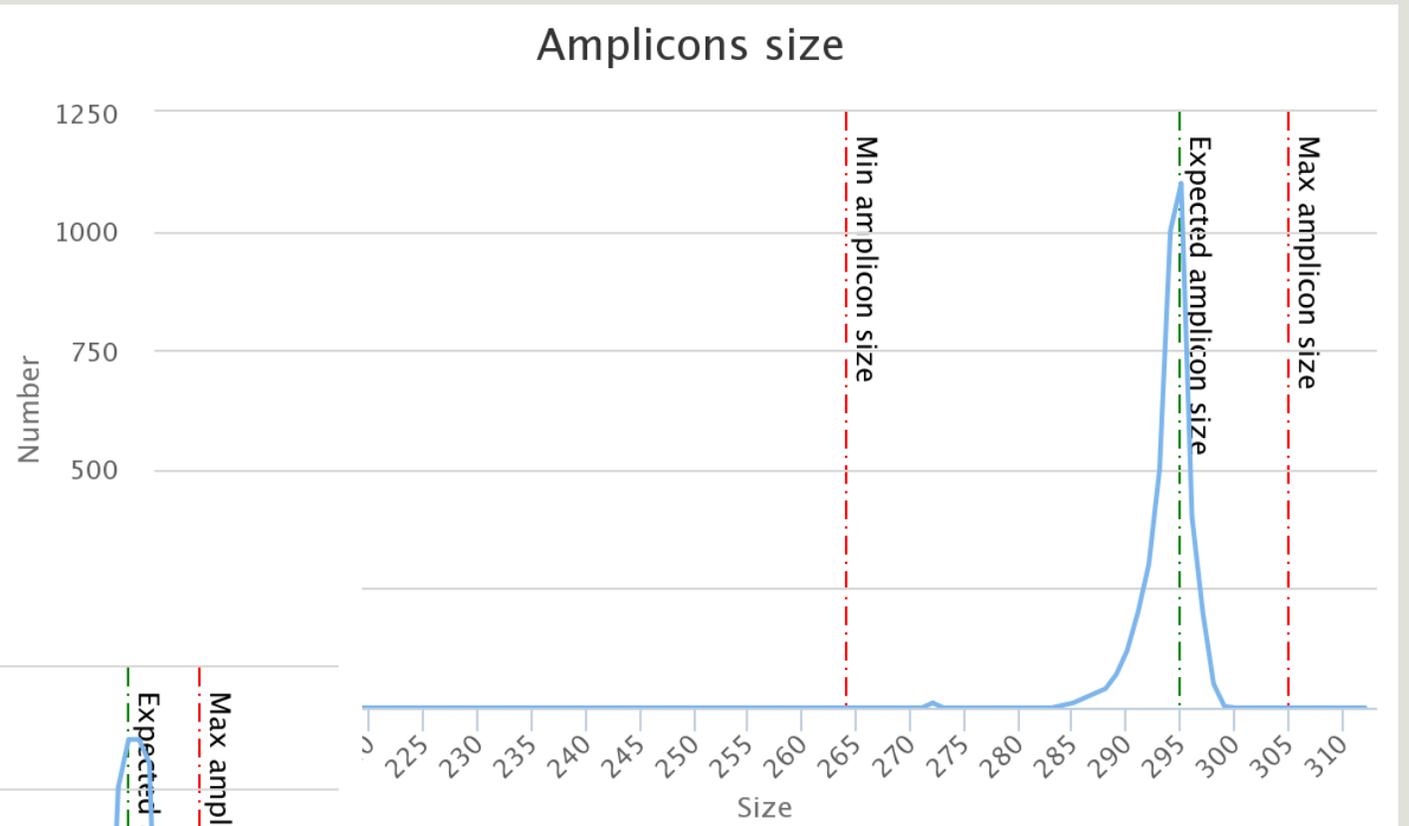

Exercise 3.2

Interpret « FROGS Pre-process: report.html » file.

Exercise 3.3

Go to« MiSeq contiged » history

Launch the pre-process tool on that data set

→ objective: understand output files

Exercise 3.3

3 samples are **technically replicated** 3 times : 9 samples of 10 000 sequences each.

100_10000seq_sampleA1.fastq   100_10000seq_sampleB1.fastq   100_10000seq_sampleC1.fastq

100_10000seq_sampleA2.fastq   100_10000seq_sampleB2.fastq   100_10000seq_sampleC2.fastq

100_10000seq_sampleA3.fastq   100_10000seq_sampleB3.fastq   100_10000seq_sampleC3.fastq

Exercise 3.3
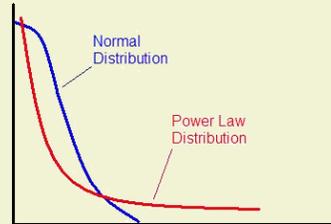

- 100 species, covering all bacterial phyla

- Power Law distribution of the species abundances

- Error rate calibrated with real sequencing runs

- 10% chimeras

- 9 samples of 10 000 sequences each (90 000 sequences)

Exercise 3.3

"Grinder (v 0.5.3) (Angly et al., 2012) was used to simulate the PCR amplification of full-length (V3-V4) sequences from reference databases. The reference database of size 100 were generated from the LTP SSU bank (version 115) (Yarza et al., 2008) by

(1) filtering out sequences with a N,

(2) keeping only type species

(3) with a match for the forward (ACGGRAGGCAGCAG) and reverse (TACCAGGGTATCTAATCCTA) primers in the V3-V4 region and

(4) maximizing the phylogenetic diversity (PD) for a given database size. The PD was computed from the NJ tree distributed with the LTP."

Exercise 3.3 - Questions

1. How many sequences are there in the input file ?

2. How many sequences did not have the 5' primer?

3. How many sequences still are after pre-processing the data?

4. How much time did it take to pre-process the data ?

5. What can you tell about the sample based on sequence length distributions ?

Clustering tool

Why do we need clustering ?

Amplication and sequencing and are not perfect processes

Expected

Results

Natural variability ?
Technical noise?
Contaminant?
Chimeras?
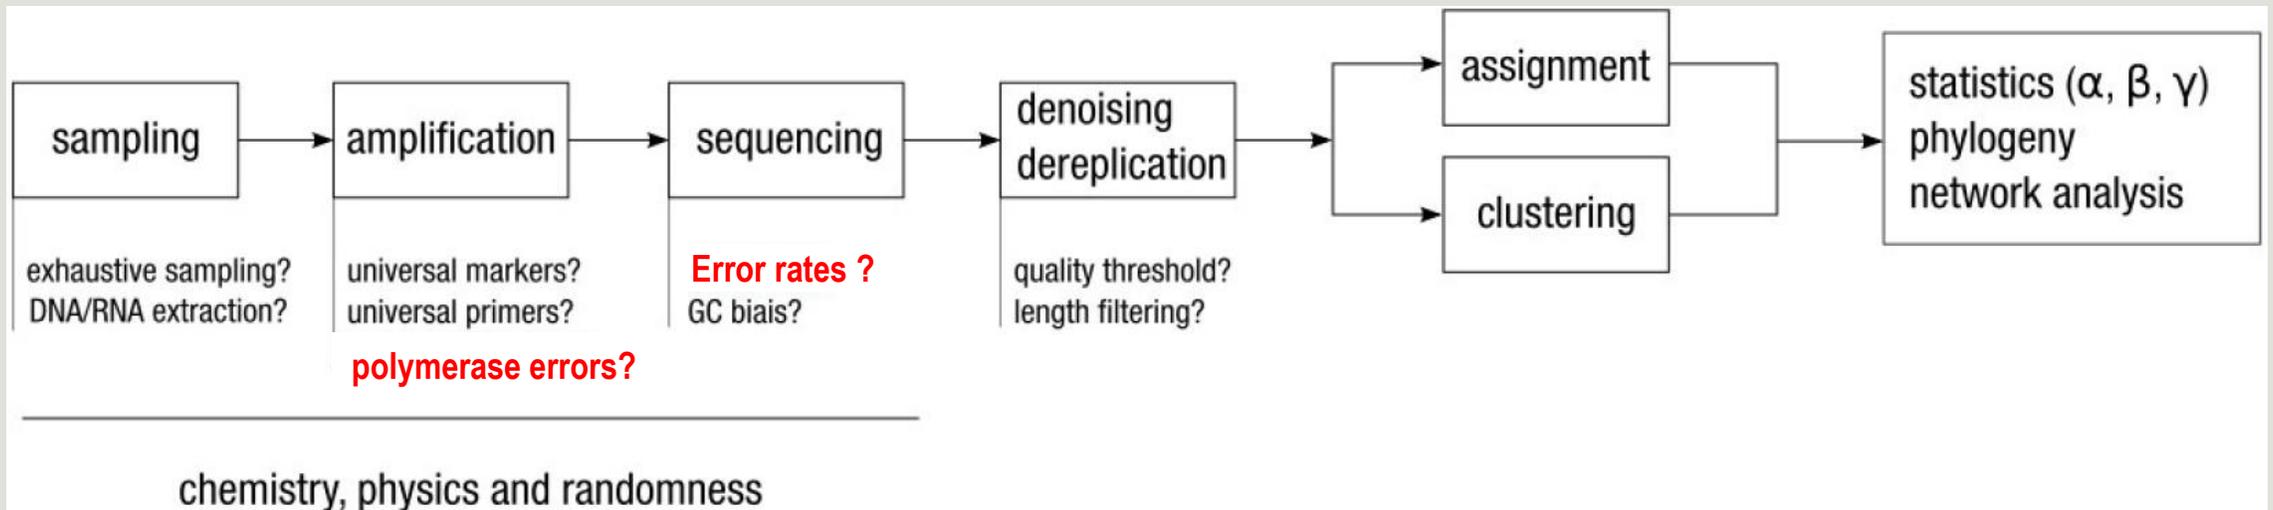

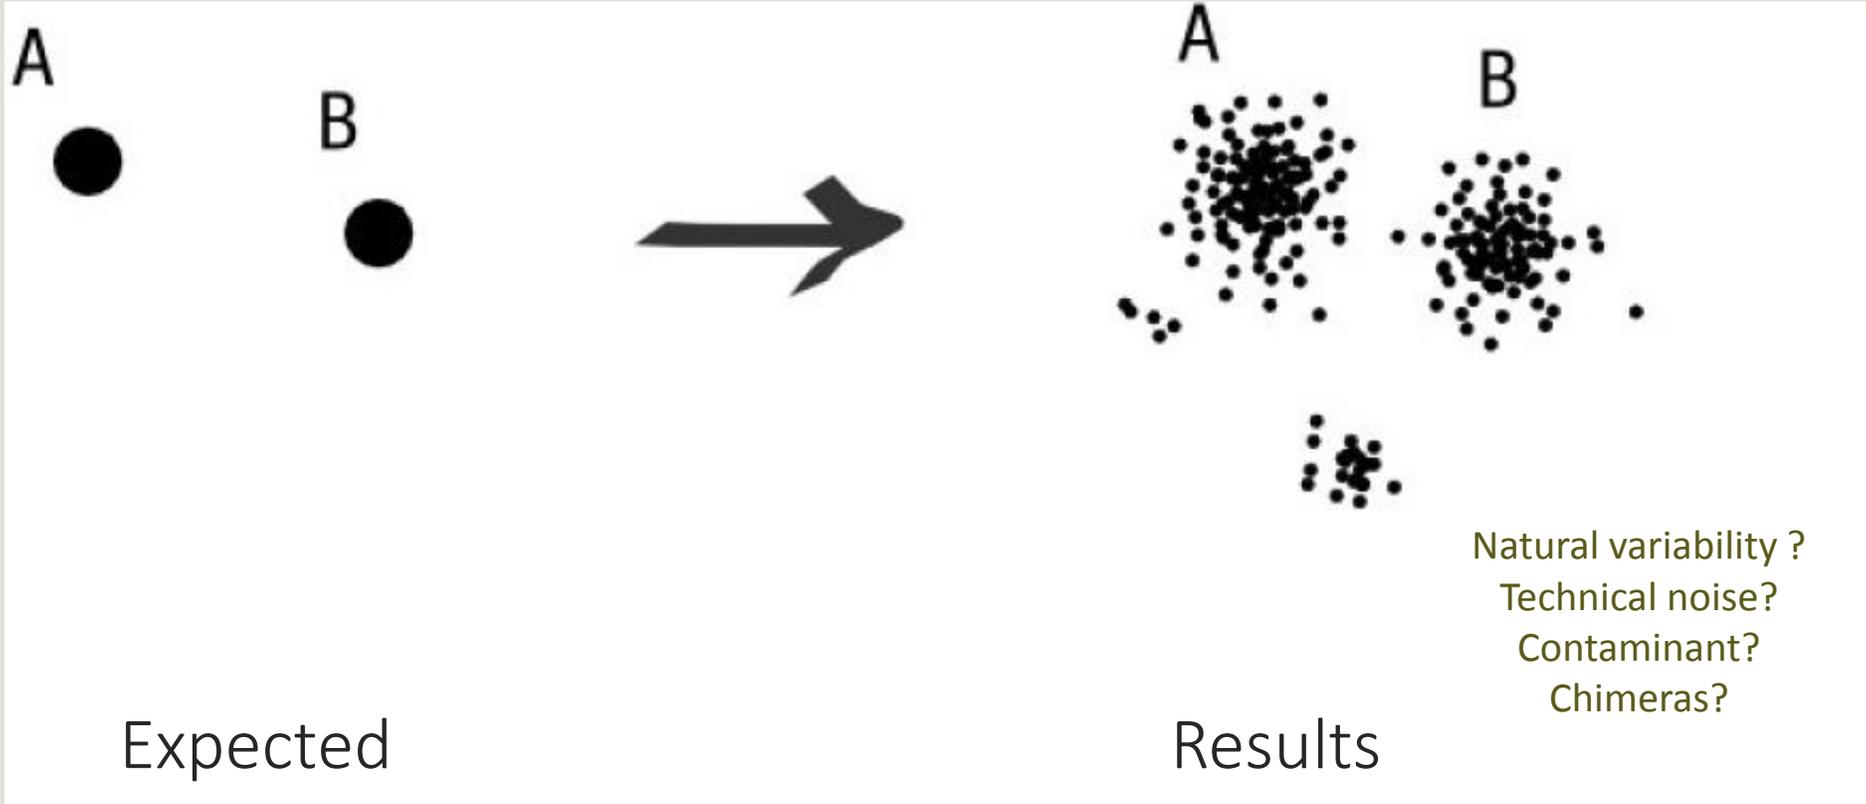

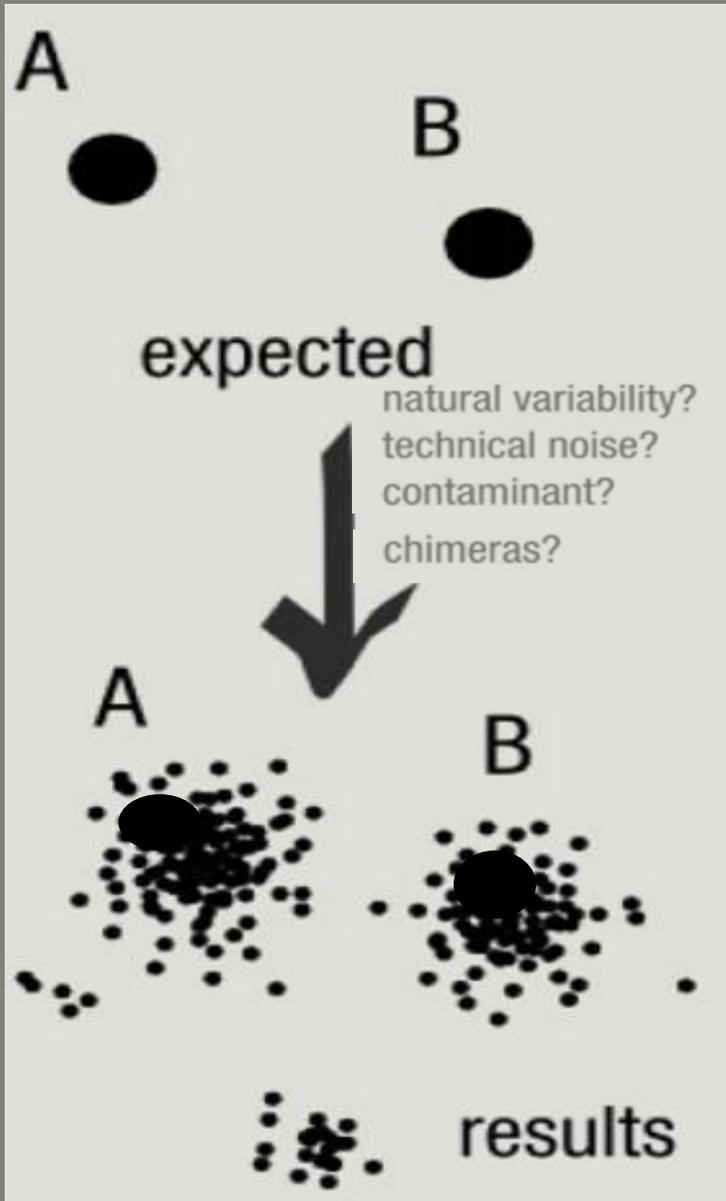

To have the best accuracy:

Method: All against all

- Very accurate

- Requires a lot of memory and/or time

> => Impossible on very large datasets without strong filtering or sampling

How traditional clustering works ?
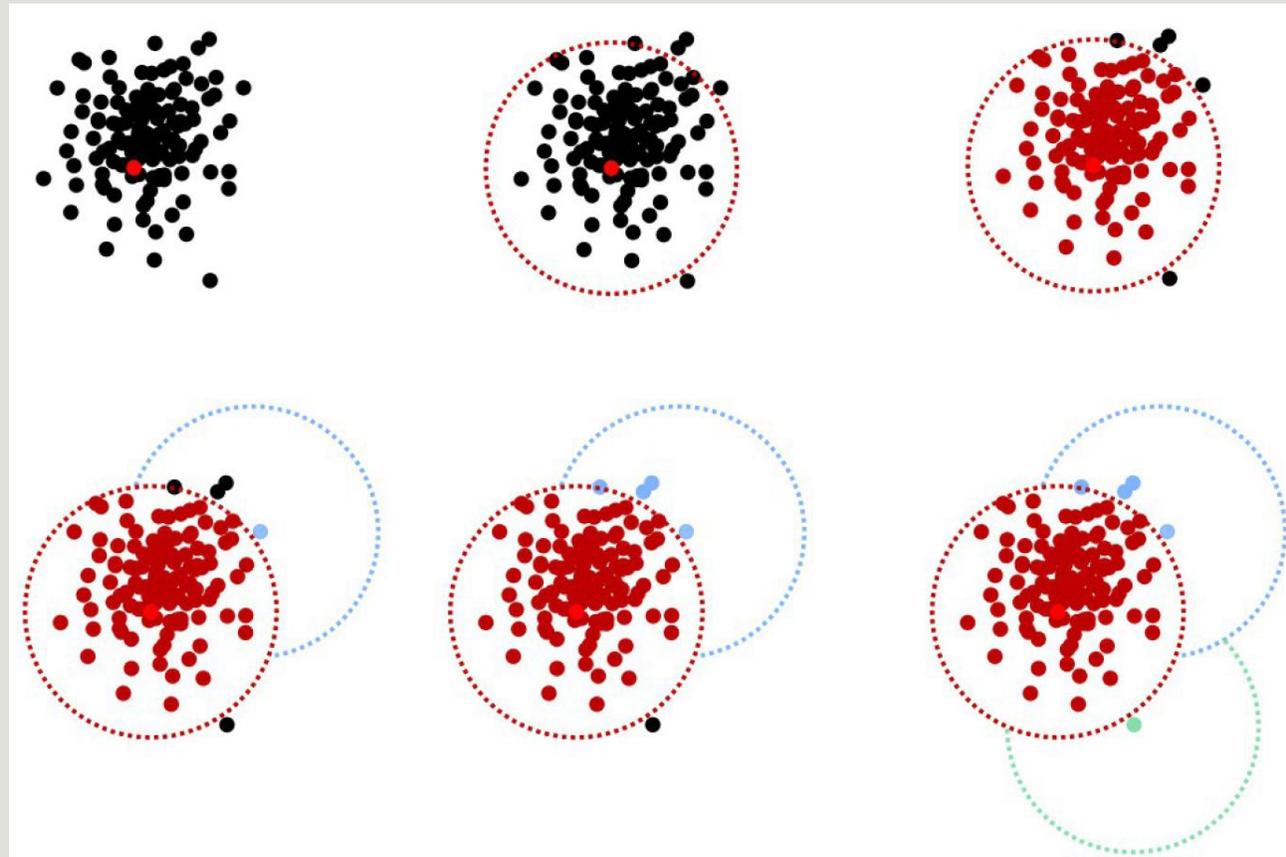

Input order dependent results
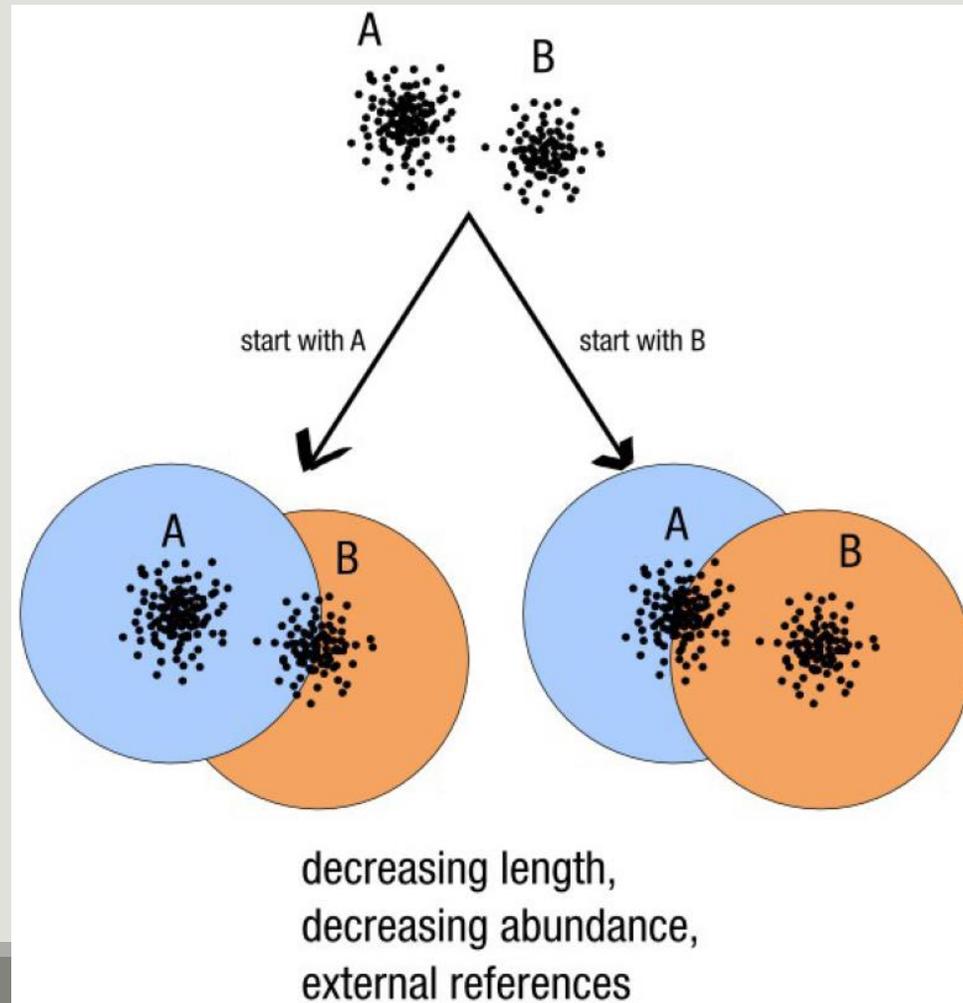

Single a priori clustering threshold

compromise threshold
unadapted threshold

natural limits of clusters
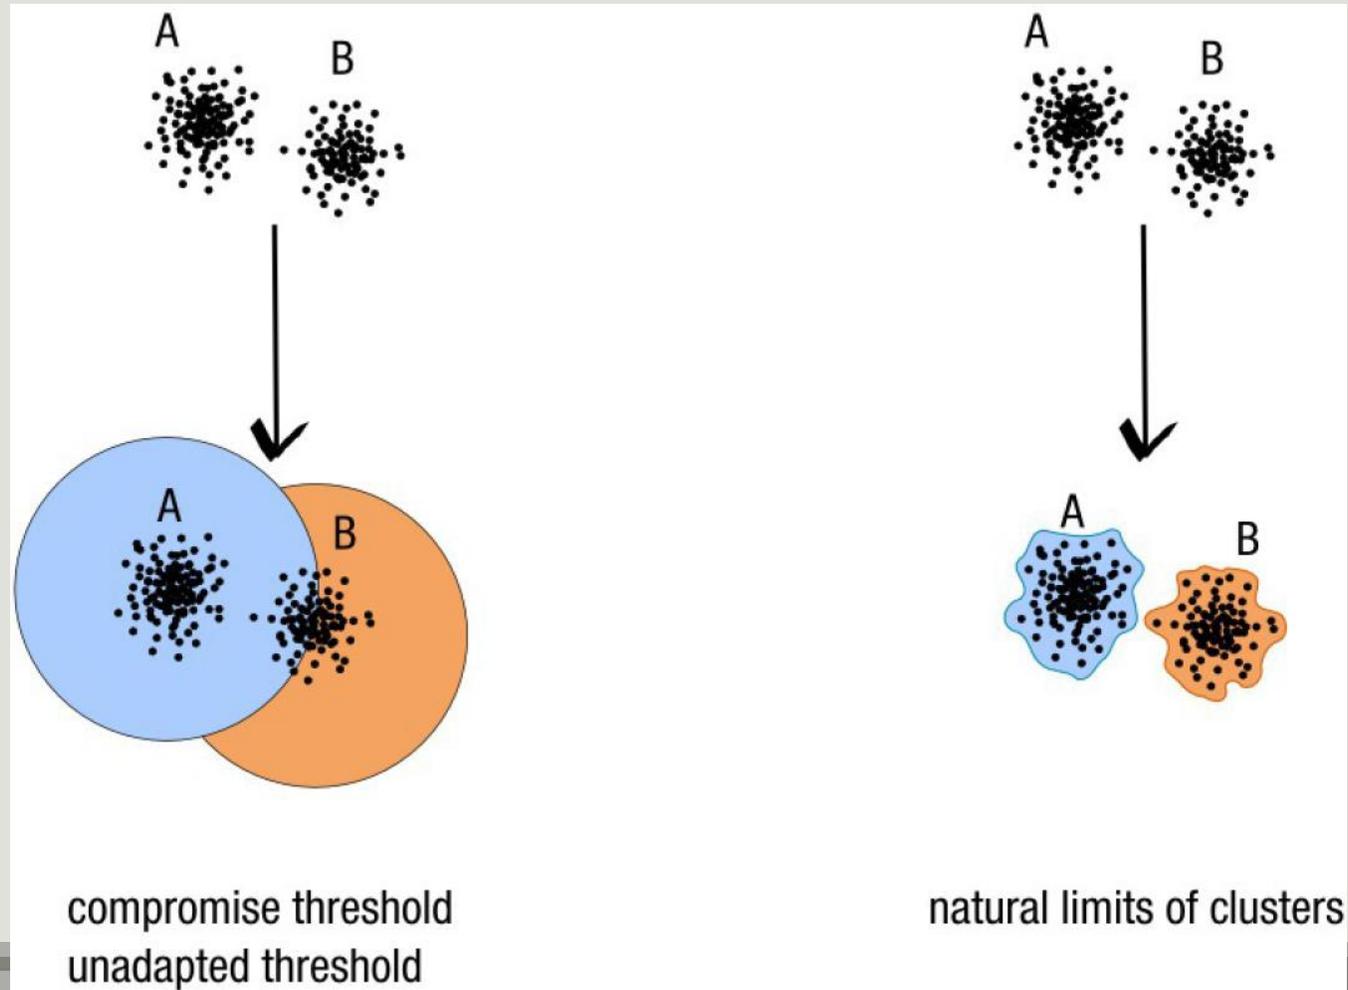

Swarm clustering method

Comparison Swarm and 3% clusterings

radius (97%)

Radius expressed as a percentage of identity with the central amplicon (97% is by far the most widely used clustering threshold)

Comparison Swarm and 3% clusterings

TARA V9 (264 samples)

TARA V9 (908 samples)

identity (%)
97
90

crown size (numbers of amplicons in the OTU)

seed abundance (numbers of copies)

clusters produced with swarm using d = 1
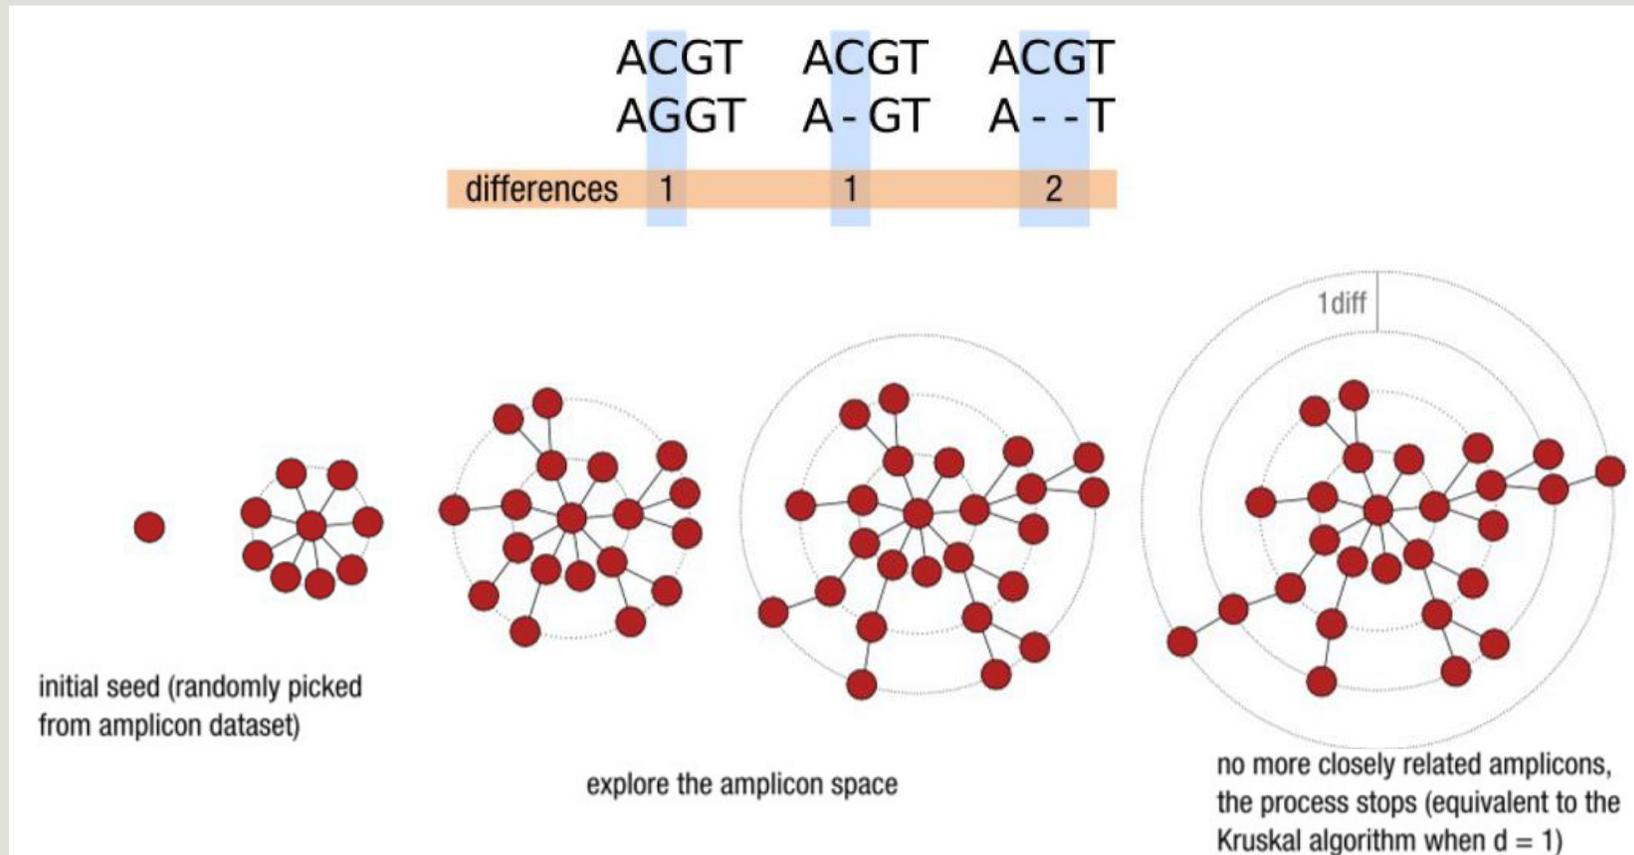

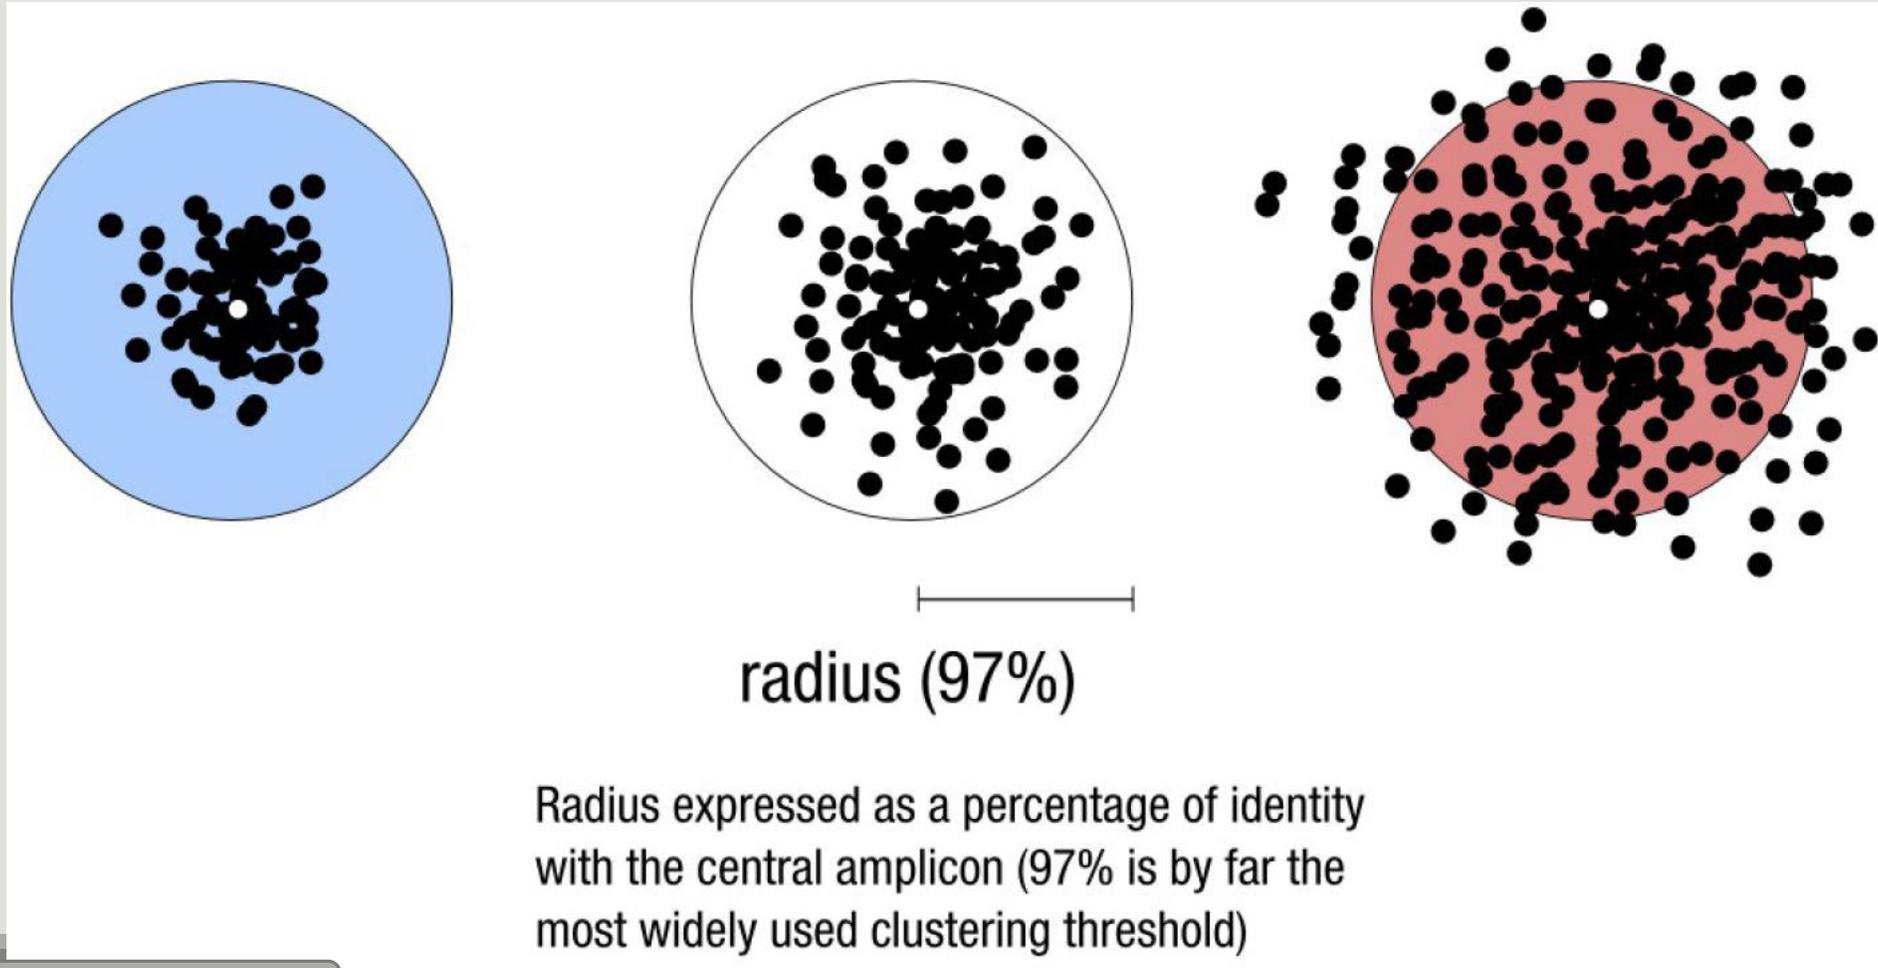

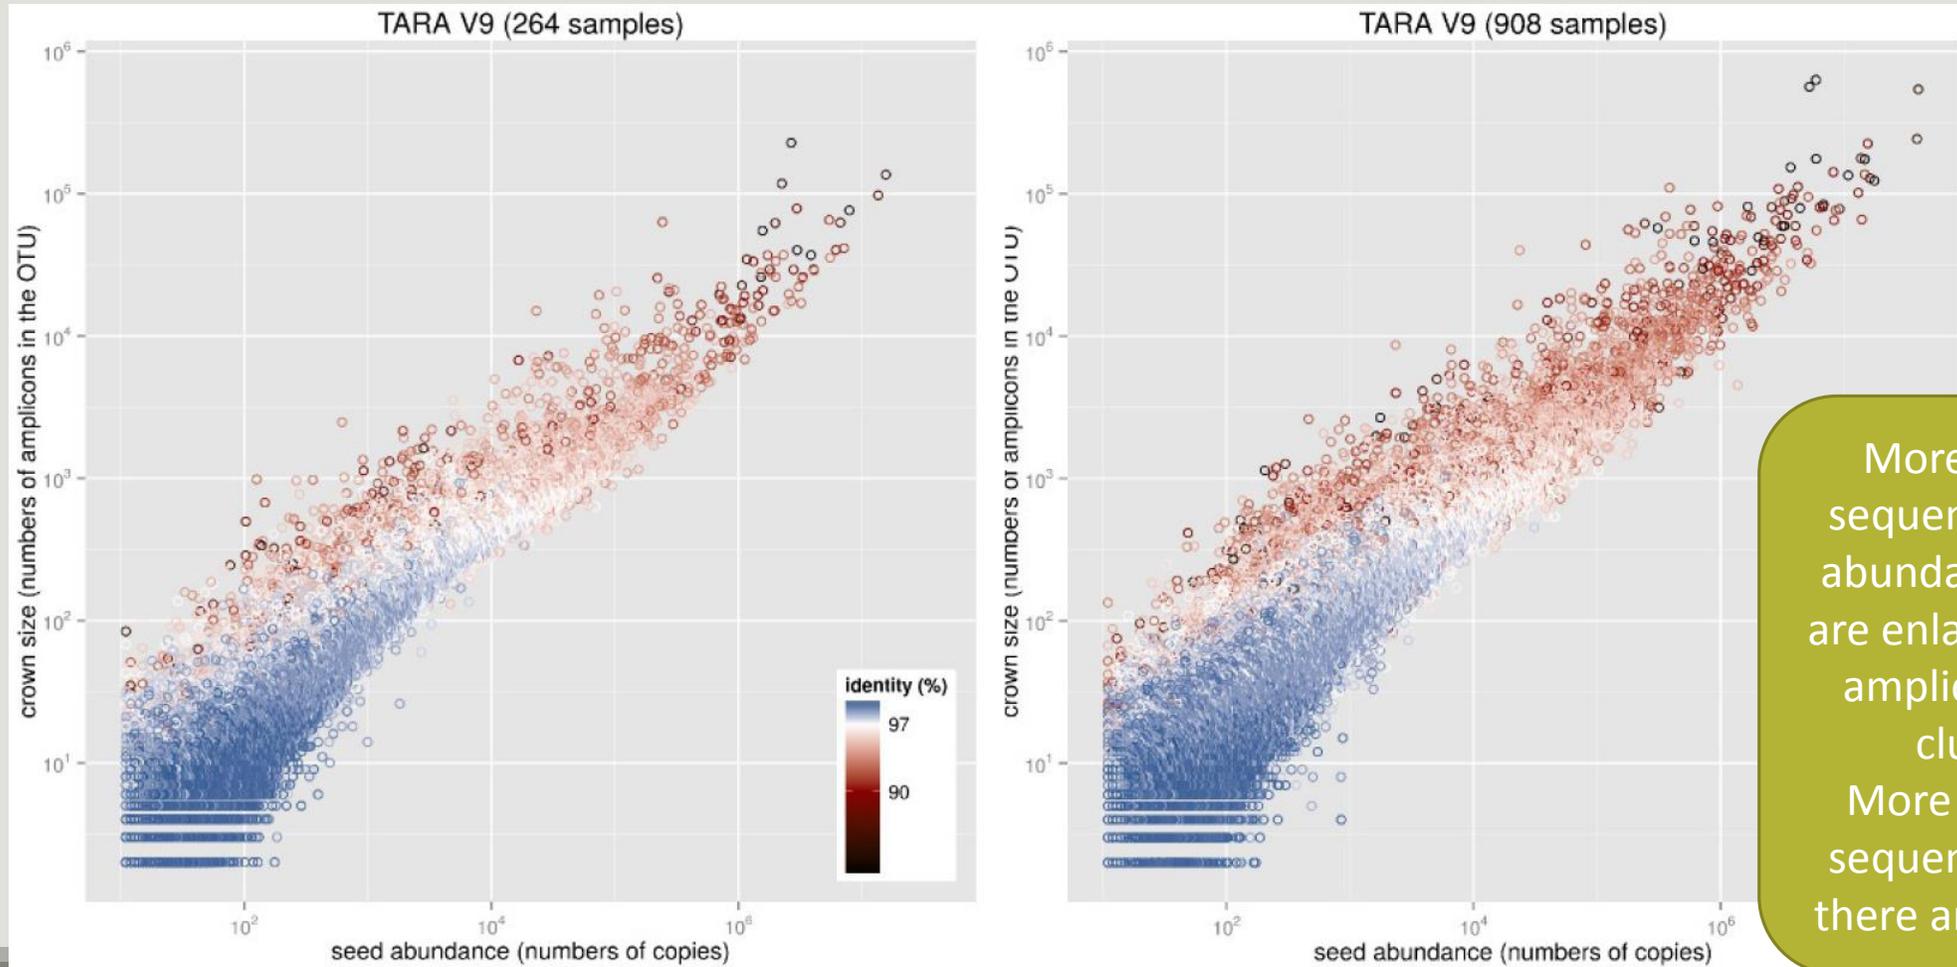

More there is sequences, more abundant clusters are enlarged (more amplicon in the cluster).
More there are sequences, more there are artefacts

SWARM

A robust and fast clustering method for amplicon-based studies.

The purpose of **swarm** is to provide a novel clustering algorithm to handle large sets of amplicons.

swarm results are resilient to input-order changes and rely on a small **local** linking threshold d, the maximum number of differences between two amplicons.

swarm forms stable high-resolution clusters, with a high yield of biological information.

Clustering

FROGS Clustering swarm Step 2 in metagenomics analysis : clustering. (Galaxy Version 2.3.0)

Sequences file

2: FROGS Pre-process: dereplicated.fasta

The sequences file (format: fasta).

Count file

3: FROGS Pre-process: count.tsv

It contains the count by sample for each sequence (format: TSV).

Aggregation distance

3

Maximum number of differences between sequences in each aggregation step.

Performe denoising clustering step?

Yes | No

If checked, clustering will be perform in two steps, first with distance = 1 and then with your input distance

Execute

1st run for denoising:
Swarm with d = 1 -> high clusters definition
linear complexity

2nd run for clustering:
Swarm with d = 3 on the seeds of first Swarm
quadratic complexity

Gain time !

Remove false positives !

Cluster stat tool
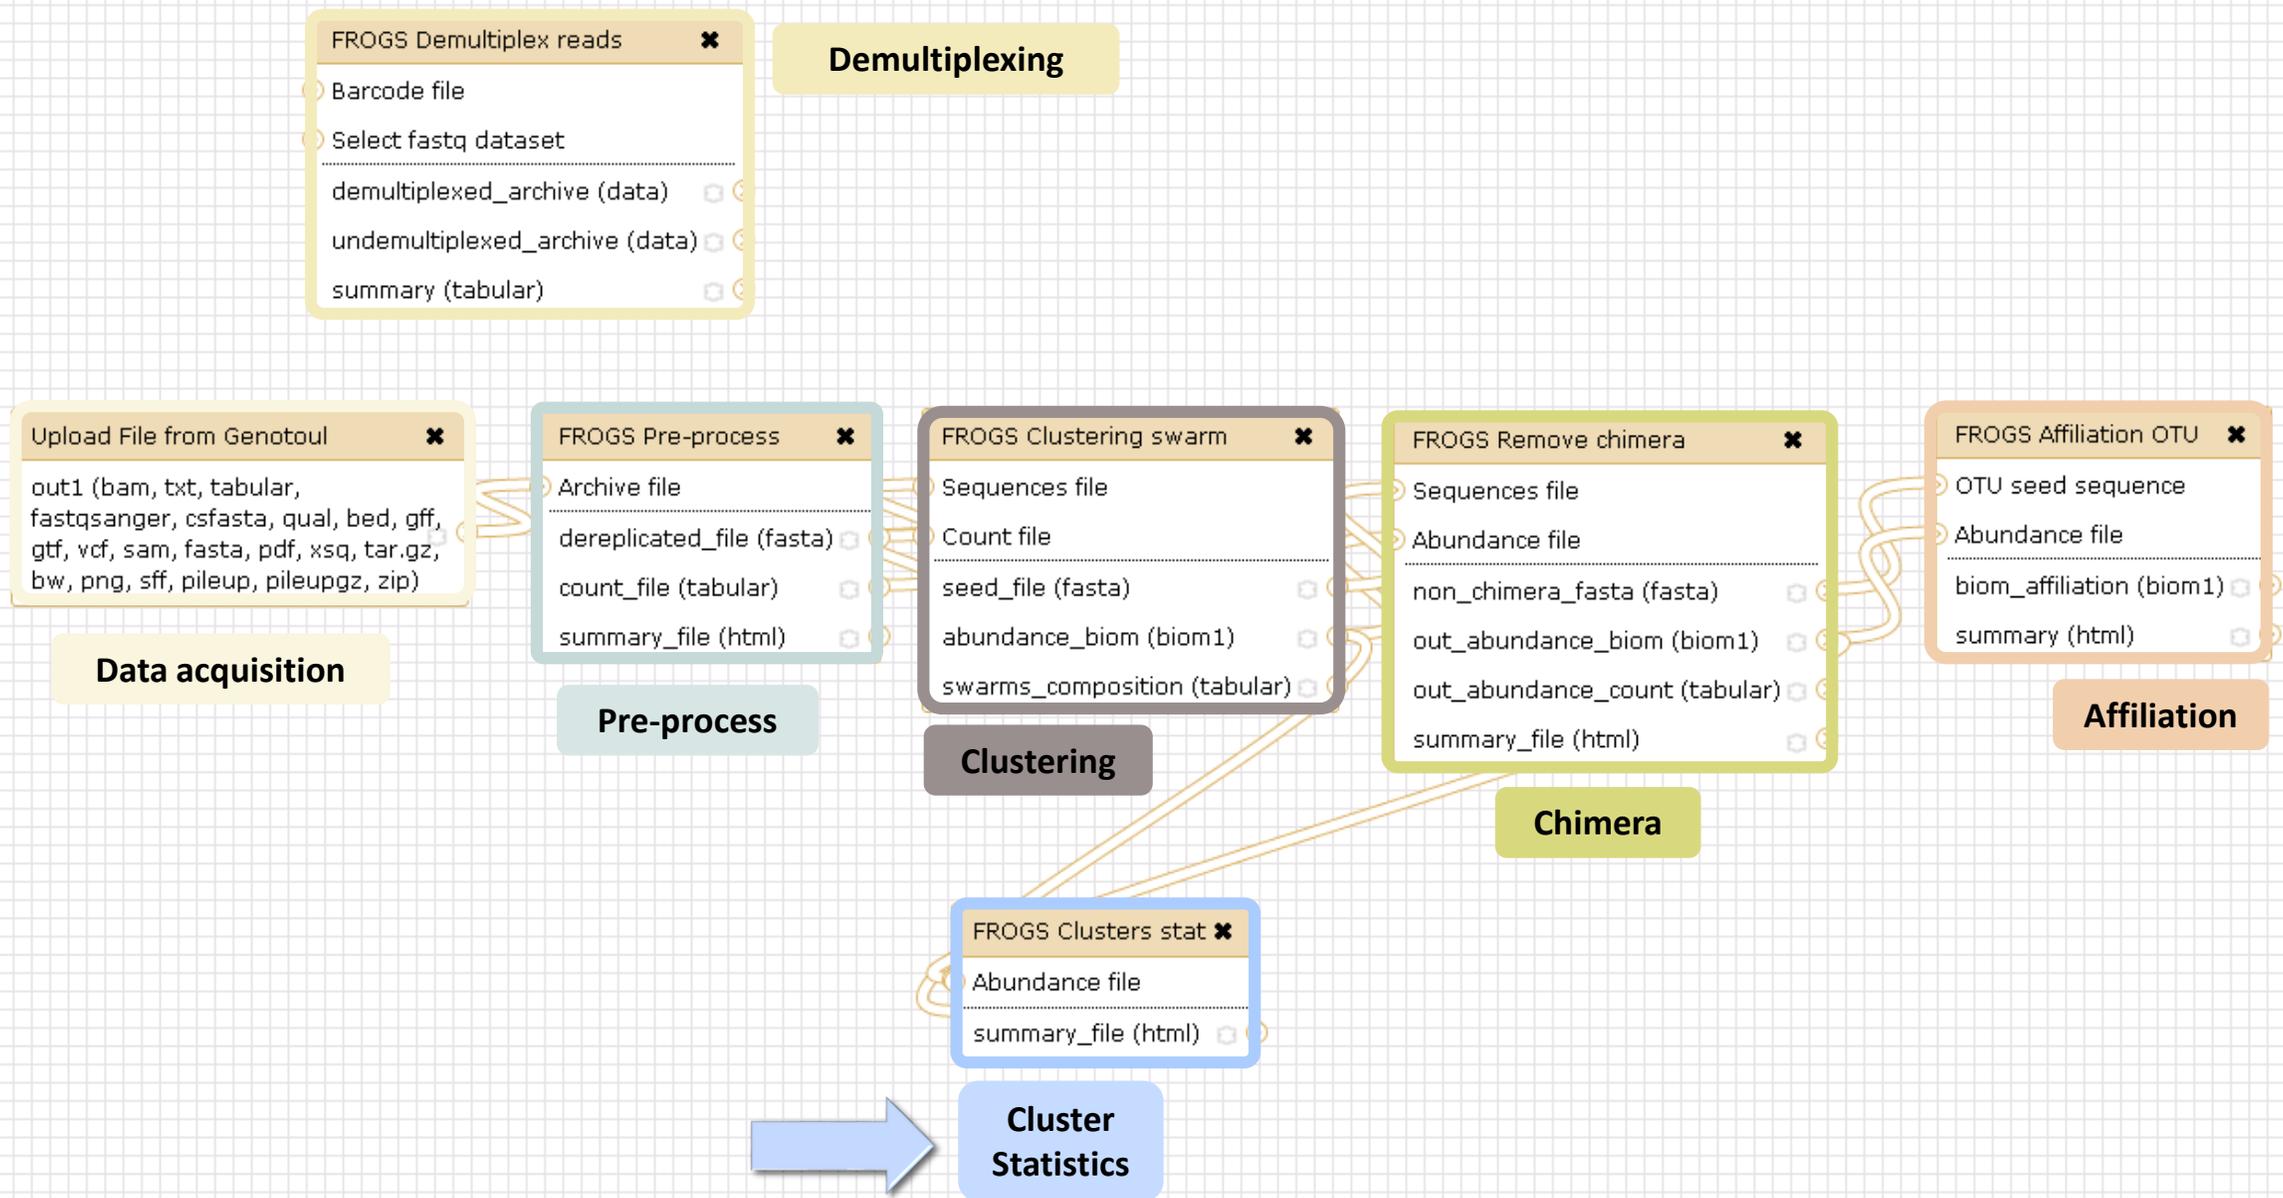

FROGS Clusters stat Process some metrics on clusters. (Galaxy Version 1.4.0)

Options ▾

Abundance file

6: FROGS Clustering swarm: abundance.biom

Clusters abundance (format: BIOM).

✔ Execute

Your Turn! – 4

LAUNCH CLUSTERING AND CLUSTERSTAT TOOLS

Exercise 4

Go to « MiSeq contiged » history

Launch the Clustering SWARM tool on that data set with aggregation distance = 3 and the denoising

→ objectives :
- understand the denoising efficiency
- understand the ClusterStat utility

Exercise 4

1. How much time does it take to finish?

2. How many clusters do you get ?

Exercise 4

3. Edit the biom and fasta output dataset by adding d1d3
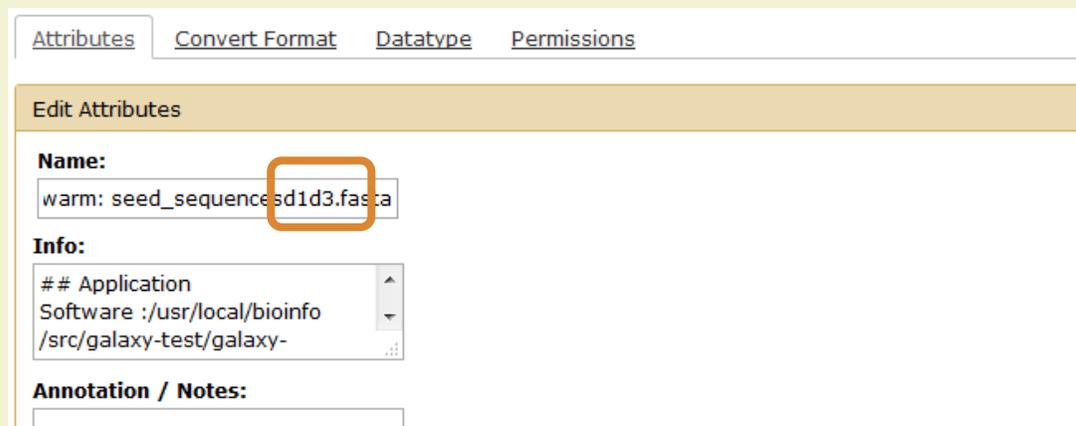

FROGS Clusters stat Process some metrics on clusters.

4. Launch FROGS Cluster Stat tools on the previous abundance biom file

Exercise 4

5. Interpret the boxplot: **Clusters size summary**

6. Interpret the table: **Clusters size details**

7. What can we say by observing the **sequence distribution**?

8. How many clusters share "sampleB3" with at least one other sample?

9. How many clusters could we expect to be shared ?

10. How many sequences represent the 550 specific clusters of "sampleC2"?

11. This represents what proportion of "sampleC2"?

12. What do you think about it?

13. How do you interpret the « Hierarchical clustering » ?

The « Hierachical clustering » is established with a Bray Curtis distance particularly well adapted to abundance table of very heterogenous values (very big and very small figures).

Cluster Statistics

Our advice:
Removing Chimera after
Swarm denoising + Swarm d=3, for
saving time without sensitivity loss

What is chimera ?

PCR-generated chimeras are typically created when an aborted amplicon acts as a primer for a heterologous template. Subsequent chimeras are about the same length as the non-chimeric amplicon and contain the forward (for.) and reverse (rev.) primer sequence at each end of the amplicon.

Chimera: from 5 to 45% of reads (Schloss 2011)
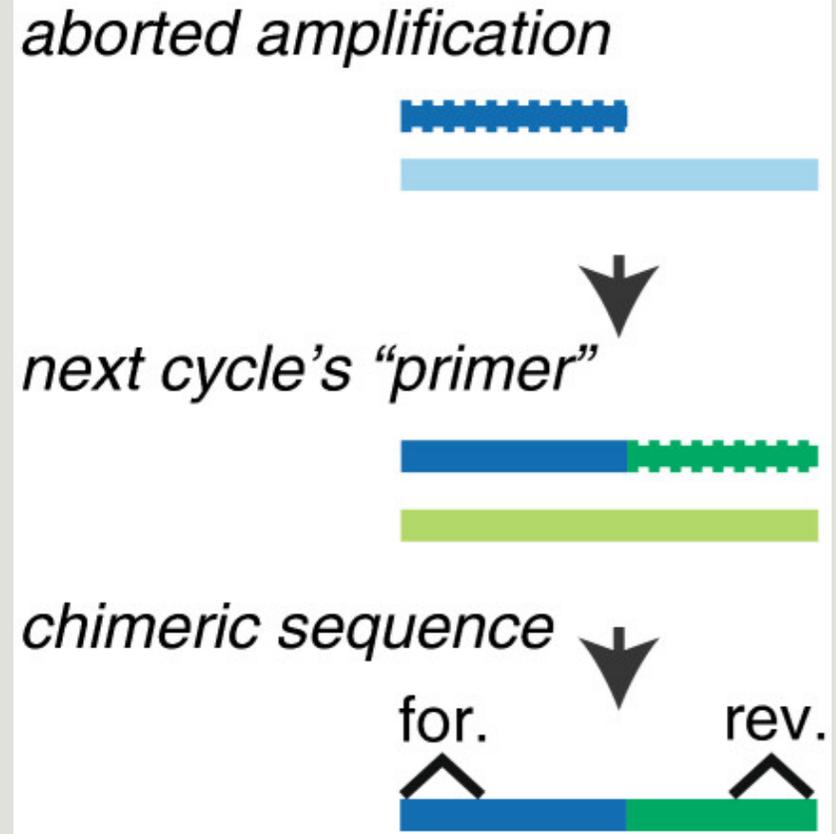

A smart removal chimera to be accurate

We use a sample cross-validation

Sample A

a		x1000
b		x500
c		x100
d		x50
e		x10
f		x10
g		x5

Sample B

b		x1000
d		x500
h		x100
i		x50
f		x10
e		x10
g		x5
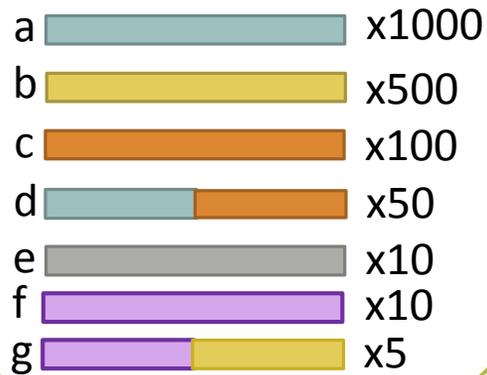

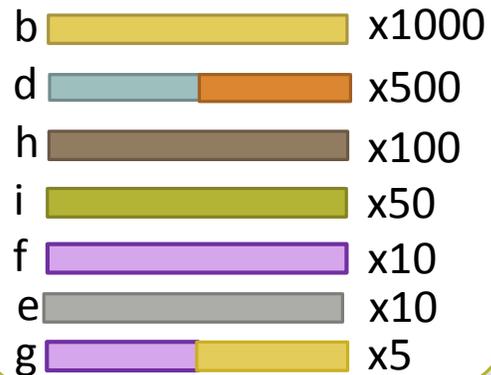

" **d** " is view as chimera by Vsearch
Its " parents " are presents

" **d** " is view as normal sequence by Vsearch
Its " parents " are absents

⇒ For FROGS "d" is not a chimera
⇒ For FROGS "g" is a chimera, "g" is removed
⇒ FROGS increases the detection specificity

Your Turn! – 5

LAUNCH THE REMOVE CHIMERA TOOL

Exercise 5

Go to « MiSeq contiged » history

Launch the « FROGS Remove Chimera » tool

Follow by the « FROGS ClusterStat » tool on the swarm d1d3 non chimera abundance biom

→ objectives :
- understand the efficiency of the chimera removal
- make links between small abundant OTUs and chimeras

Chimera

FROGS Remove chimera

- Abundance file
- non_chimera_fasta (fasta)
- out_abundance_biom (biom1)
- out_abundance_count (tabular)
- summary_file (html)

FROGS Remove chimera Step 3 in metagenomics analysis : Remove PCR chimera in each sample. (Galaxy Version 1.3.0) ▼ Options

Sequences file

5: FROGS Clustering swarm: seed_sequences.fasta

The sequences file (format: fasta).

Abundance type

BIOM file

Select the type of file where the abundance of each sequence by sample is stored.

Abundance file

6: FROGS Clustering swarm: abundance.biom

It contains the count by sample for each sequence.

✔ Execute

Exercise 5

1. Understand the « FROGS remove chimera : report.html»
   a. How many clusters are kept after chimera removal?
   b. How many sequences that represent ? So what abundance?
   c. What do you conclude ?

Exercise 5

2. Launch « FROGS ClusterStat » tool on non_chimera_abundanced1d3.biom

3. Rename output in summary_nonchimera_d1d3.html

4. Compare the HTML files
   a. Of what are mainly composed singleton ? (compare with precedent summary.html)
   b. What are their abundance?
   c. What do you conclude ?

The weakly abundant OTUs are mainly false positives, our data would be much more exact if we remove them

Filters tool
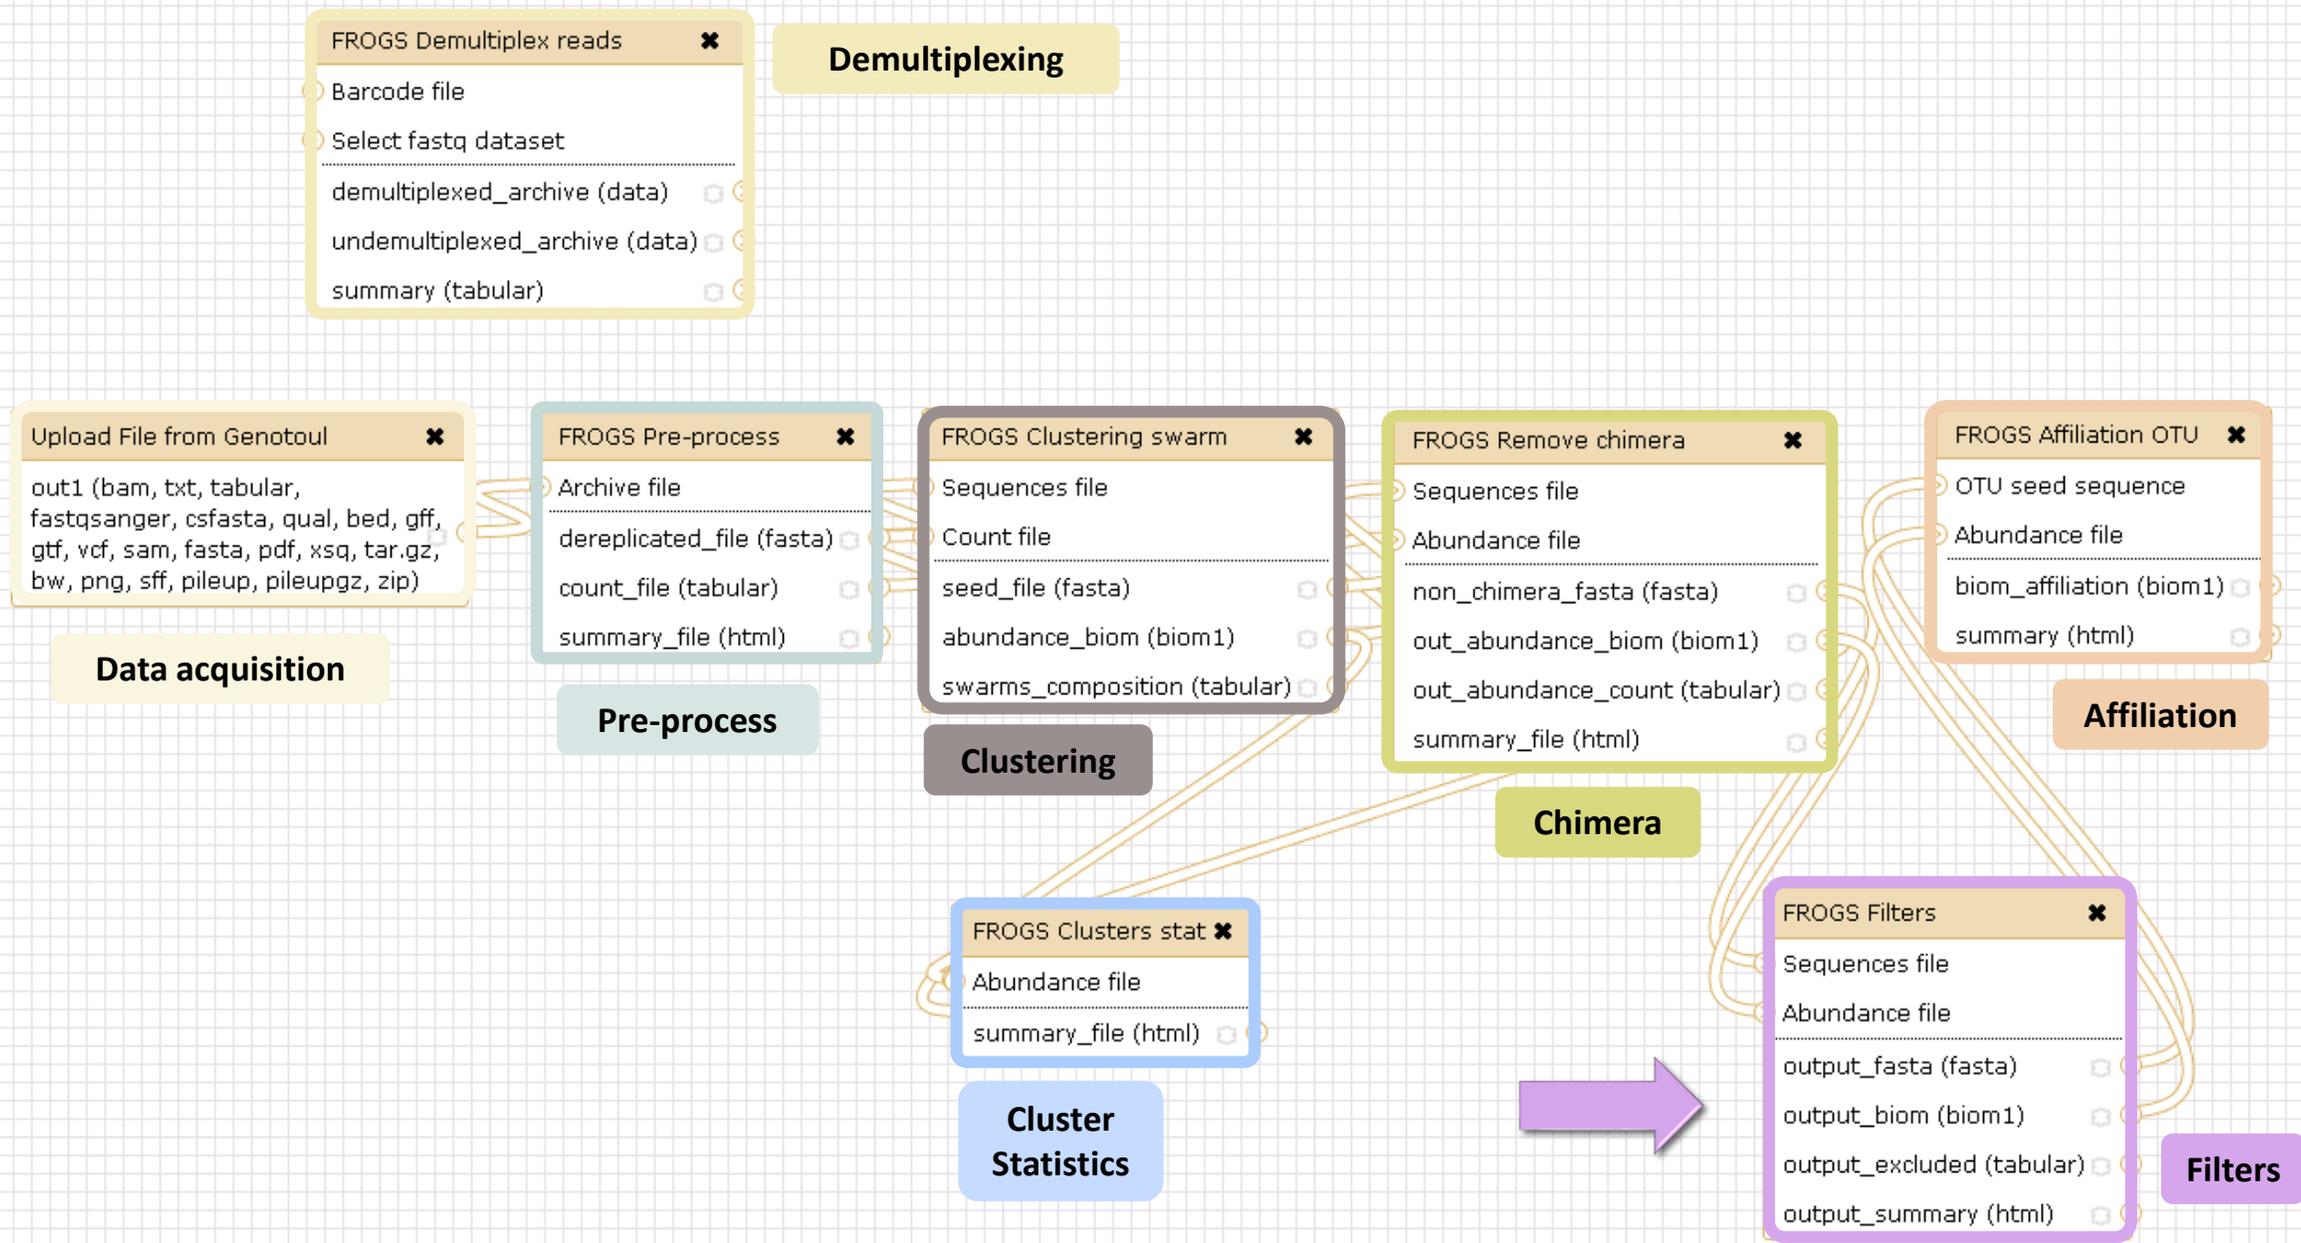

Affiliation runs long time

Advise:

Apply filters between "Chimera Removal " and "Affiliation".
Remove OTUs with weak abundance and non redundant before affiliation.

You will gain time !

Filters

Filters allows to filter the result thanks to different criteria et may be used after different steps of pipeline :

- On the abundance
- On RDP affiliation
- On Blast affiliation

After Affiliation tool

- On phix contaminant

Input

FROGS Filters Filters OTUs on several criteria. (Galaxy Version 1.2.0) ▼ Options

Sequences file

9: FROGS Remove chimera: non_chimera.fasta

The sequence file to filter (format: fasta).

Abundance file

10: FROGS Remove chimera: non_chimera_abundance.biom

The abundance file to filter (format: BIOM).

Fasta sequences and its corresponding abundance biom files

Filter 1 : abundance

*** THE FILTERS ON OTUS IN SAMPLES, OTUS SIZE and SEQUENCE PERCENTAGE

Apply filters

If you want to filter OTUs on their abundance and occurrence.

Minimum number of samples

3

Fill the field only if you want this treatment. Keep OTU present in at least this number of samples.

Minimum proportion/number of sequences to keep OTU

0.00005

Fill the field only if you want this treatment. Use decimal notation for proportion (example: 0.01 for keep OTU with at least 1% of all sequences) ; Use integer notation for number of sequence (example: 2 for keep OTU with at least 2 sequences, so remove single singleton).

N biggest OTU

100

Fill the fields only if you want this treatment. Keep the N biggest OTU.

*** THE FILTERS ON RDP

Apply filters ▼

If you want to filter OTUs on their taxonomic affiliation produced by RDP.

Rank with the bootstrap filter

Genus

Minimum bootstrap % (between 0 and 1)

0.8

Filter 2 & 3: affiliation

*** THE FILTERS ON BLAST

Apply filters ▼

If you want to filter OTUs on their taxonomic affiliation produced by Blast.

Maximum e-value (between 0 and 1)

Fill the field only if you want this treatment

Minimum identity % (between 0 and 1)

1

Fill the field only if you want this treatment

Minimum coverage % (between 0 and 1)

0.95

Fill the field only if you want this treatment

Minimum alignment length

Fill the field only if you want this treatment

Filter 4 : contamination

Cotaminant databank

phiX
The phiX databank (the phiX is a control added in Illumina sequencing technologies).

Soon, several contaminant banks

Your Turn! - 6

LAUNCH DE LA TOOL FILTERS

Exercise 6

Go to history « MiSeq contiged »

Launch « Filters » tool with non_chimera_abundanced1d3.biom, non_chimerad1d3.fasta

Apply 2 filters :

- Minimum proportion/number of sequences to keep OTU: 0.00005*
- Minimum number of samples: 3

→ objective : play with filters, understand their impacts on falses-positives OTUs

Exercise 6

1. What are the output files of "Filters" ?

2. Explore "FROGS Filter : report.html" file.

3. How many OTUs have you removed ?

4. Build the Venn diagram on the two filters.

5. How many OTUs have you removed with each filter "abundance > 0.005% ", "Remove OTUs that are not present at least in 3 samples"?

6. How many OTUs do they remain ?

7. Is there a sample more impacted than the others ?

8. To characterize these new OTUs, do not forget to launch "FROGS Cluster Stat" tool, and rename the output HTML file.

OTUs

Abundance

Kept: 516

Removed: 36 217

Removed
OTUs: **97.6%**

Kept
Sequences: **95.8%**

Removed: 20 946

Kept: 820 361
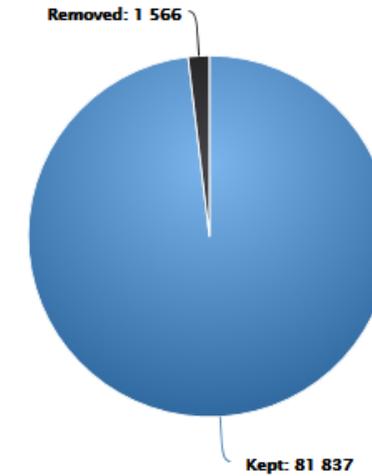

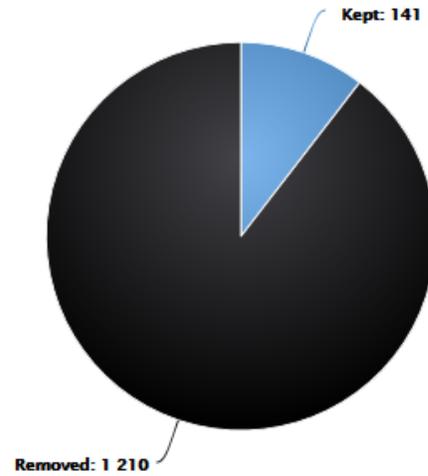

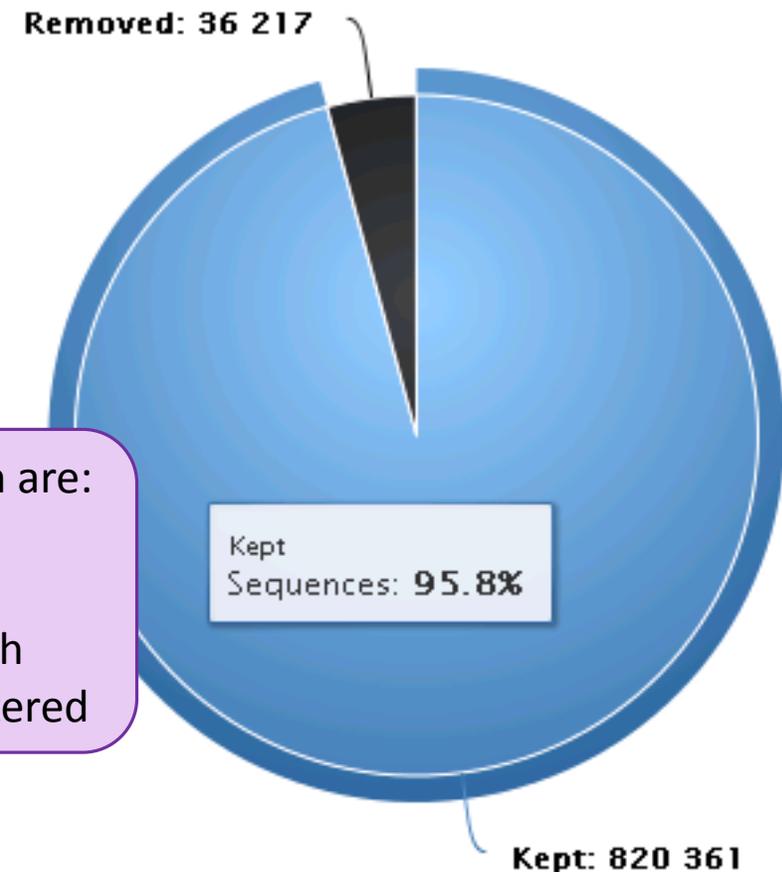

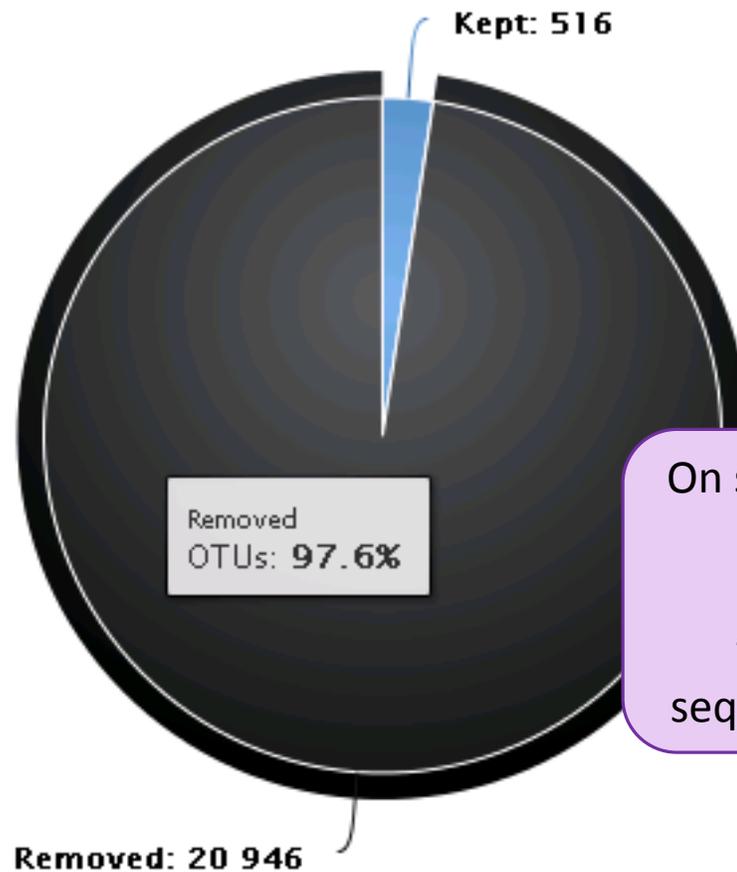

On simulated data, singleton are:
~99,9% are chimera
and
~0,1% are sequences with
sequencing errors, non clustered

Removing little OTUs (conservation rate =0.005%)
and non shared OTU (in less than 2 samples)

FROGS Affiliation:　　Bacteria\|Firmicutes\|Clostridia\|Clostridiales\|Lachnospiraceae\|Pseudobutyrivibrio\|**Multi-affiliation**

Your Turn! – 7

LAUNCH THE « FROGS AFFILIATION » TOOL

Exercise 7.1

Go to « MiSeq contiged » history

Launch the « FROGS Affiliation » tool with

- SILVA 123 or 128 16S database

- FROGS Filters abundance biom and fasta files (after swarm d1d3, remove chimera and filter low abundances)

→ objectives :
  - understand abundance tables columns
  - understand the BLAST affiliation

FROGS Affiliation OTU ✖

OTU seed sequence

Abundance file

biom_affiliation (biom1)

summary (html)

Affiliation

FROGS Affiliation OTU Step 4 in metagenomics analysis : Taxonomic affiliation of each OTU's seed by RDPtools and BLAST (Galaxy Version 0.8.0)

▼ Options

Using reference database

silva123 16S ▼

Select reference from the list

Also perform RDP assignation?

Yes | No

Taxonomy affiliation will be perform thanks to Blast. This option allow you to perform it also with RDP classifier (default No)

OTU seed sequence

17: FROGS Filters: sequences.fasta ▼

OTU sequences (format: fasta).

Abundance file

18: FROGS Filters: abundance.biom ▼

OTU abundances (format: BIOM).

✔ Execute

Exercise 7.1

1. What are the « FROGS Affiliation » output files ?

2. How many sequences are affiliated by BLAST ?

3. Click on the « eye » button on the BIOM output file, what do you understand ?

4. Use the Biom_to_TSV tool on this last file and click again on the "eye" on the new output generated.
   What do the columns ?
   What is the difference if we click on case or not ? What consequence about weight of your file ?

Tools

FROGS - FIND RAPIDLY OTU WITH GALAXY SOLUTION

FROGS pipeline

FROGS Upload archive from your computer

FROGS Demultiplex reads Split by samples the reads in function of inner barcode.

FROGS Pre-process Step 1 in metagenomics analysis: denoising and dereplication.

FROGS Clustering swarm Step 2 in metagenomics analysis : clustering.

FROGS Remove chimera Step 3 in metagenomics analysis : Remove PCR chimera in each sample.

FROGS Filters Filters OTUs on several criteria.

FROGS Affiliation OTU Step 4 in metagenomics analysis : Taxonomic affiliation of each OTU's seed by RDPtools and BLAST

FROGS BIOM to TSV Converts a BIOM file in TSV file.

FROGS Clusters stat Process some metrics on clusters.

FROGS Affiliations stat Process some metrics on taxonomies.

FROGS BIOM to std BIOM Converts a FROGS BIOM in fully compatible BIOM.

FROGS Abundance normalisation

FROGS BIOM to TSV Converts a BIOM file in TSV file. (Galaxy Version 2.1.0)   ▼ Options

Abundance file

22: FROGS Affiliation OTU: affiliation.biom

The BIOM file to convert (format: BIOM).

Sequences file

Nothing selected

The sequences file (format: fasta). If you use this option the sequences will be add in TSV.

Extract multi-alignments

Yes | No

If you have used FROGS affiliation on your data, you can extract information about multiple alignements in a second TSV.

✔ Execute

Exercise 7.1

5. Understand Blast affiliations - Cluster_2388 (affiliation from silva 123)

blast_subject	blast_evalue	blast_len	blast_perc_query_coverage	blast_perc_identity	blast_taxonomy
JN880417.1.1422	0.0	360	88.88	99.44	Bacteria;Planctomycetes;Planctomycetacia;Planctomycetales;Planctomycetaceae;Telmatocola;Telmatocola sphagniphila

Blast JN880417.1.1422 vs our OTU

OTU length : 405

Excellent blast but no matches at the beginning of OTU.

Blast columns

OTU_2 seed has a best BLAST hit with the reference sequence AJ496032.1.1410

The reference sequence taxonomic affiliation is this one.

#blast_taxonomy	blast_subject	blast_perc_identity	blast_perc_query_coverage	blast_evalue	blast_aln_length

Evaluation variables of BLAST

Blast variables : e-value

The Expect value (E) is a parameter that describes the number of hits one can "expect" to see by chance when searching a database of a particular size.

The lower the E-value, or the closer it is to zero, the more "significant" the match is.

Blast variables : blast_perc_identity

Identity percentage between the Query (OTU) and the subject in the alignment (length subject = 1455 bases)

Query length = 411
Alignment length = 411
0 mismatch
-> 100% identity

Blast variables : blast_perc_identity

Identity percentage between the Query (OTU) and the subject in the alignment
(length subject = 1455 bases)

Query length = 411
Alignment length = 411
26 mismatches (gaps included)
-> 94% identity

Blast variables : blast_perc_query_coverage

Coverage percentage of alignment on query (OTU)

Query length = 411
100% coverage

Blast variables : blast-length

Length of alignment between the OTUs = "Query" and "subject" sequence of database

	Coverage %	Identity %	Length alignment
OTU1	100	98	400
OTU2	100	98	500

← More mismatches/gaps

Filters

TSV to BIOM

After modifying your abundance TSV file you can again:

- generate rarefaction curve
- sunburst

Careful :

- <u>do not</u> modify column name
- <u>do not</u> remove column
- take care to choose a taxonomy available in your multi_hit TSV file
- if deleting line from multi_hit, take care to not remove a complete cluster without removing all "multi tags" in you abundance TSV file.
- if you want to rename a taxon level (ex : genus "Ruminiclostridium 5;" to genus "Ruminiclostridium;"), do not forget to modify also your multi_hit TSV file.

TSV to BIOM

Your Turn! – 8

PLAY WITH TSV_TO_BIOM

Exercise 8

→ objectives : Play with multi-affiliation and TSV_to_BIOM

1. Observe in Multi_hit.tsv and abundance.tsv cluster_8 annotation

#blast_taxonomy	blast_subject	observation_name	observation_sum

Exercise 8

3. How to change affiliation of cluster 8 ????

Exercise 8

4. Modify multi_hit.tsv and keep only :

Cluster_8   Bacteria;Proteobacteria;Deltaproteobacteria;Bdellovibrionales;Bdellovibrionaceae;Bdellovibrio;Bdellovibrio bacteriovorus   CP007656.1036900.1038415

Careful, no quotes around text !!!

5. Upload the new multihit file.

6. Create a new biom with a TSV_to_BIOM tool

7. Launch again the affilation_stat tool on this new biom

8. Observe the diversity diagram

Normalization

Normalization

Conserve a predefined number of sequence per sample:

- update Biom abundance file
- update seed fasta file

May be used when :

- Low sequencing sample
- Required for some statistical methods to compare the samples in pairs

Your Turn! – 9

LAUNCH NORMALIZATION TOOL

Exercise 9

Launch Normalization Tool

1. What is the smallest sequenced samples ?

2. Normalize your data from Affiliation based on this number of sequence

3. Explore the report HTML result.

4. Try other threshold and explore the report HTML result
   What do you remark ?

FROGS Abundance normalisation (Galaxy Version 1.1.1)   ▾ Options

Sequences file

🗎 🗇 🗀 │ 17: FROGS Filters: sequences.fasta   ▾

Sequences file to normalize (format: fasta).

Abundance file

🗎 🗇 🗀 │ 22: FROGS Affiliation OTU: affiliation.biom   ▾

Abundances file to normalize (format: BIOM).

Number of reads

2000

The final number ~~of rea~~ds per sample.

✔ Execute

Or, this number can be chosen according to the rarefaction curve. For example, we can choose the smallest number of sequences that still retain all the genus.

Fill the field only if you want this treatment

Minimum identity % (between 0 and 1)

| 1 | |

Fill the field only if you want this treatment

Minimum coverage % (between 0 and 1)

| 1 | |

Fill the field only if you want this treatment

Minimum alignment length

| |

Fill the field only if you want this treatment

Tool descriptions

What it does

FROGS Pre-process filters and dereplicates amplicons for use in diversity analysis.

Inputs/Outputs

Inputs

By sample your sequences and their qualities.

Illumina inputs

Usage:	The amplicons have been sequenced in paired-end. The amplicon expected length is inferior than the R1 and R2 length. R1 and R2 can be merge by the common region.
Files:	One R1 and R2 by sample (format FASTQ)
Example:	splA_R1.fastq.gz, splA_R2.fastq.gz, splB_R1.fastq.gz, splB_R2.fastq.gz

OR

Usage:	The single end sequencing cover all the amplicons or the R1 and R2 have already been overlaped.
Files:	One sequence file by sample (format FASTQ).
Example:	splA.fastq.gz, splB.fastq.gz

454 inputs

Files:	One sequence file by sample (format FASTQ)
Example:	splA.fastq.gz, splB.fastq.gz

These files must be added sample by sample or provide in an archive file (tar.gz).

Remark: In an archive if you use R1 and R2 files they names must end with _R1 and _R2.

Outputs

Sequence file (dereplicated.fasta):

Only one file with all samples sequences (format FASTA). These sequences are dereplicated: strictly identical sequence are represented only one and the initial count is kept in count file.

Count file (count.tsv):

This file contains the count of all uniq sequences in each sample (format TSV).

Summary file (excluded_data.html):

This file presents the ordered filters and the number of sequences passing these (format HTML).

Filtering summary

Filtering by sample

Sample ▲	before process	overlapped	with expected length	with 5' primer	with 3' primer	with expected length (2)	without N
sampleA	90,126	90,126	90,126	89,697	89,697	89,697	89,697
sampleB	213,043	209,801	0	0	0	0	0

Showing 1 to 2 of 2 entries   Previous 1 Next

ⓘ How it works

Steps	Illumina	454
1	For uncontiged data: contig read1 and read2 with a maximum of 10% mismatch in the overlaped region ([FLASh](#))	/
2	Filter contig sequence on its length which must be between Minimum amplicon size" and "Maximum amplicon size"	/
3	Remove sequences where the two primers are not persent and remove primers sequence ([cutadapt](#)). The primer search accept 10% of differences	Remove sequence where the two primers are not persent, remove primers sequence and reverse complement the sequences with strand - ([cutadapt](#)). The primer search accept 10% of differences
4	Filter sequences on its length and with ambiguous nucleotids	filter sequences on its length, with ambiguous nucleotids, with at least one homopolymer with size >7nt and with distance between two poor qualities ()< 10) of <= 10 nt
5	Dereplicate sequences	Dereplicate sequences

Advices/details on parameters

Primers parameters

The primers must provided in 5' to 3' orientation.

Example:

> 5' ATGCCC GTCGTCGTAAAATGC ATTTCAG 3'
>
> Value for parameter 5' primer: ATGCC
>
> Value for parameter 3' primer: ATTTCAG

Amplicons sizes parameters

The two following images shown two examples of perfect values fors sizes parameters.
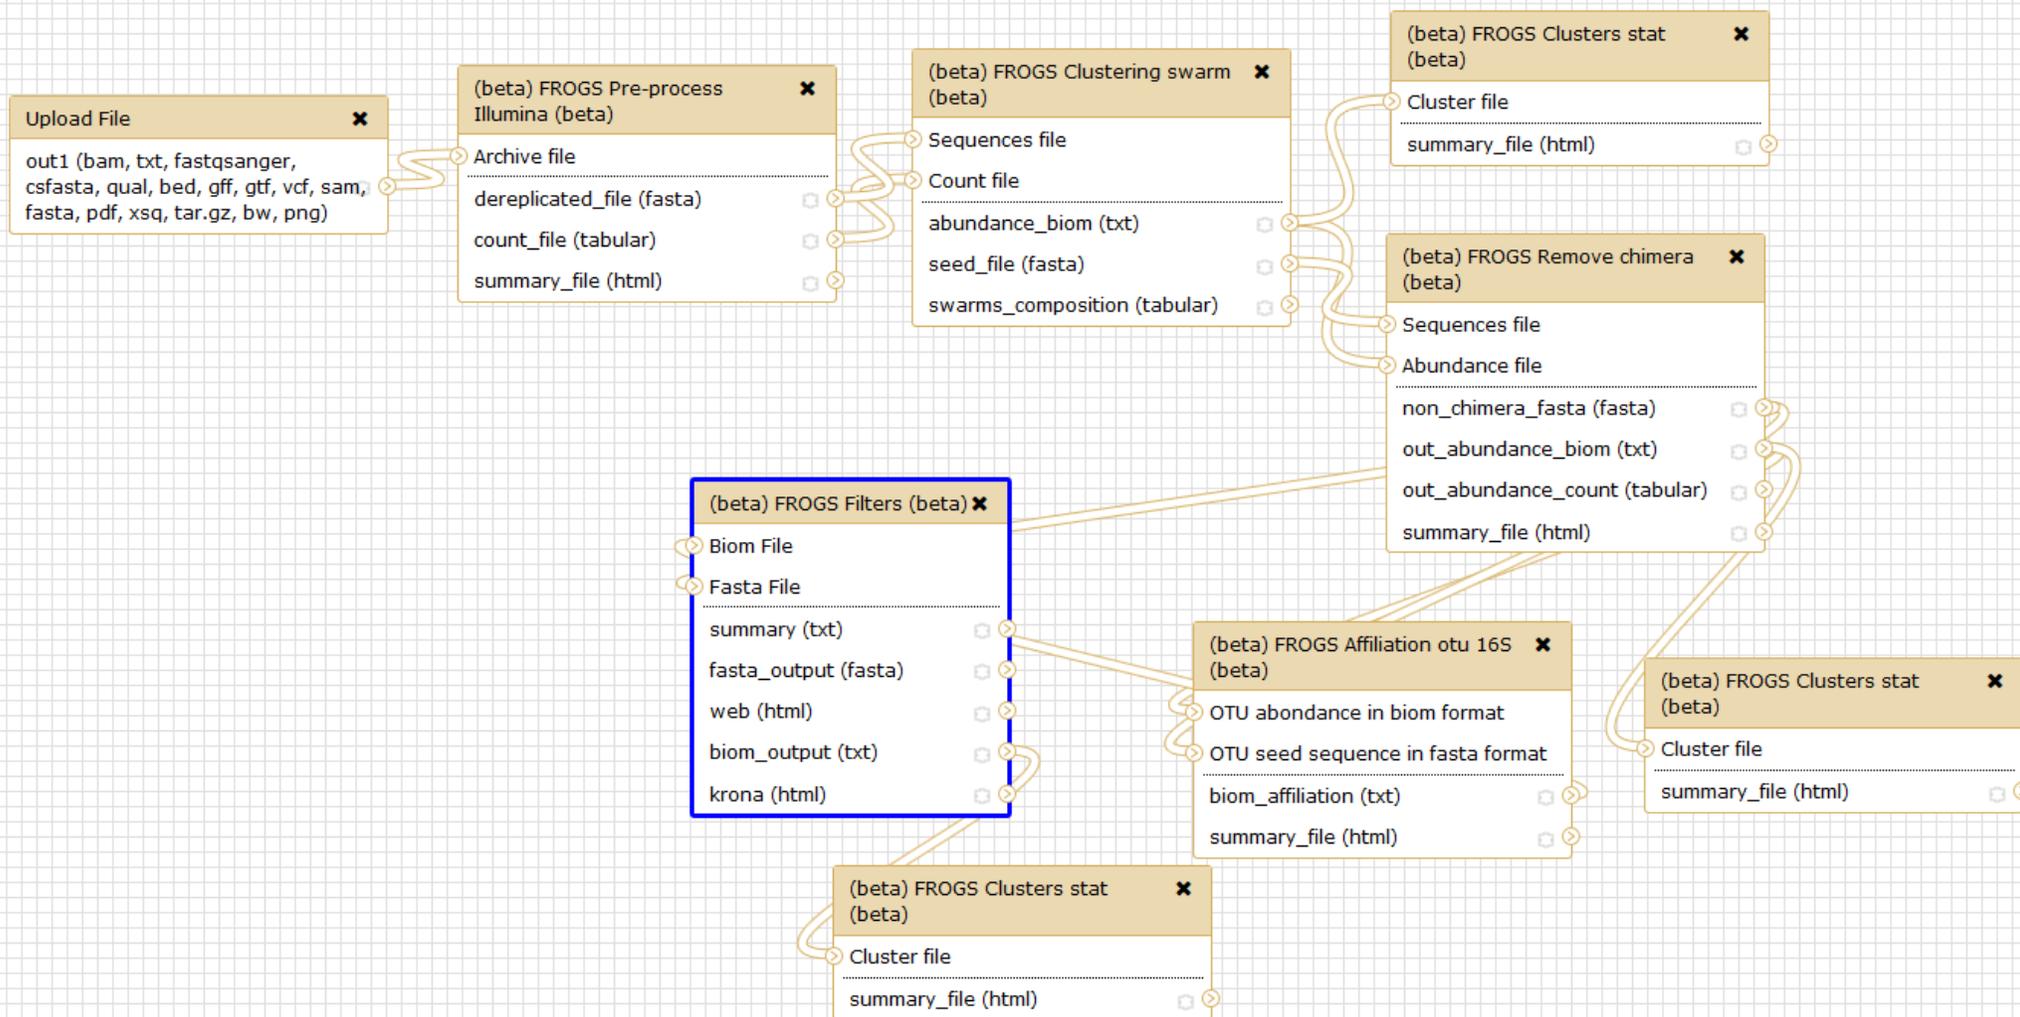

Amplicons size

FROGS BIOM to Standard BIOM

FROGS biom to standard Biom

This step is required to run R

Some figures

Some figures - Fast

NB SEQ	TIME with complete pipeline without Filters
50 000	40 min
400 000	4 hrs
3 500 000	2 days
10 000 000	5 days

Speed on real datasets

9 600 000 sequences of a complete MiSeq run

Preprocess : 9 300 000 sequences — ~ 15 min

Swarm clustering : 680 000 clusters — ~ 10 hrs

Chimera removal : 556 700 non-chimeric cl. — ~ 15 min

Filtering*: 556 200 OTUs
*Filter OTU abundances at 0.005%

PhiX removal — ~ 8 min

RDP affiliation — ~ 25 min

Blast affiliation — ~ 5 min

FROGS : 500 OTUs

~ 11 hours
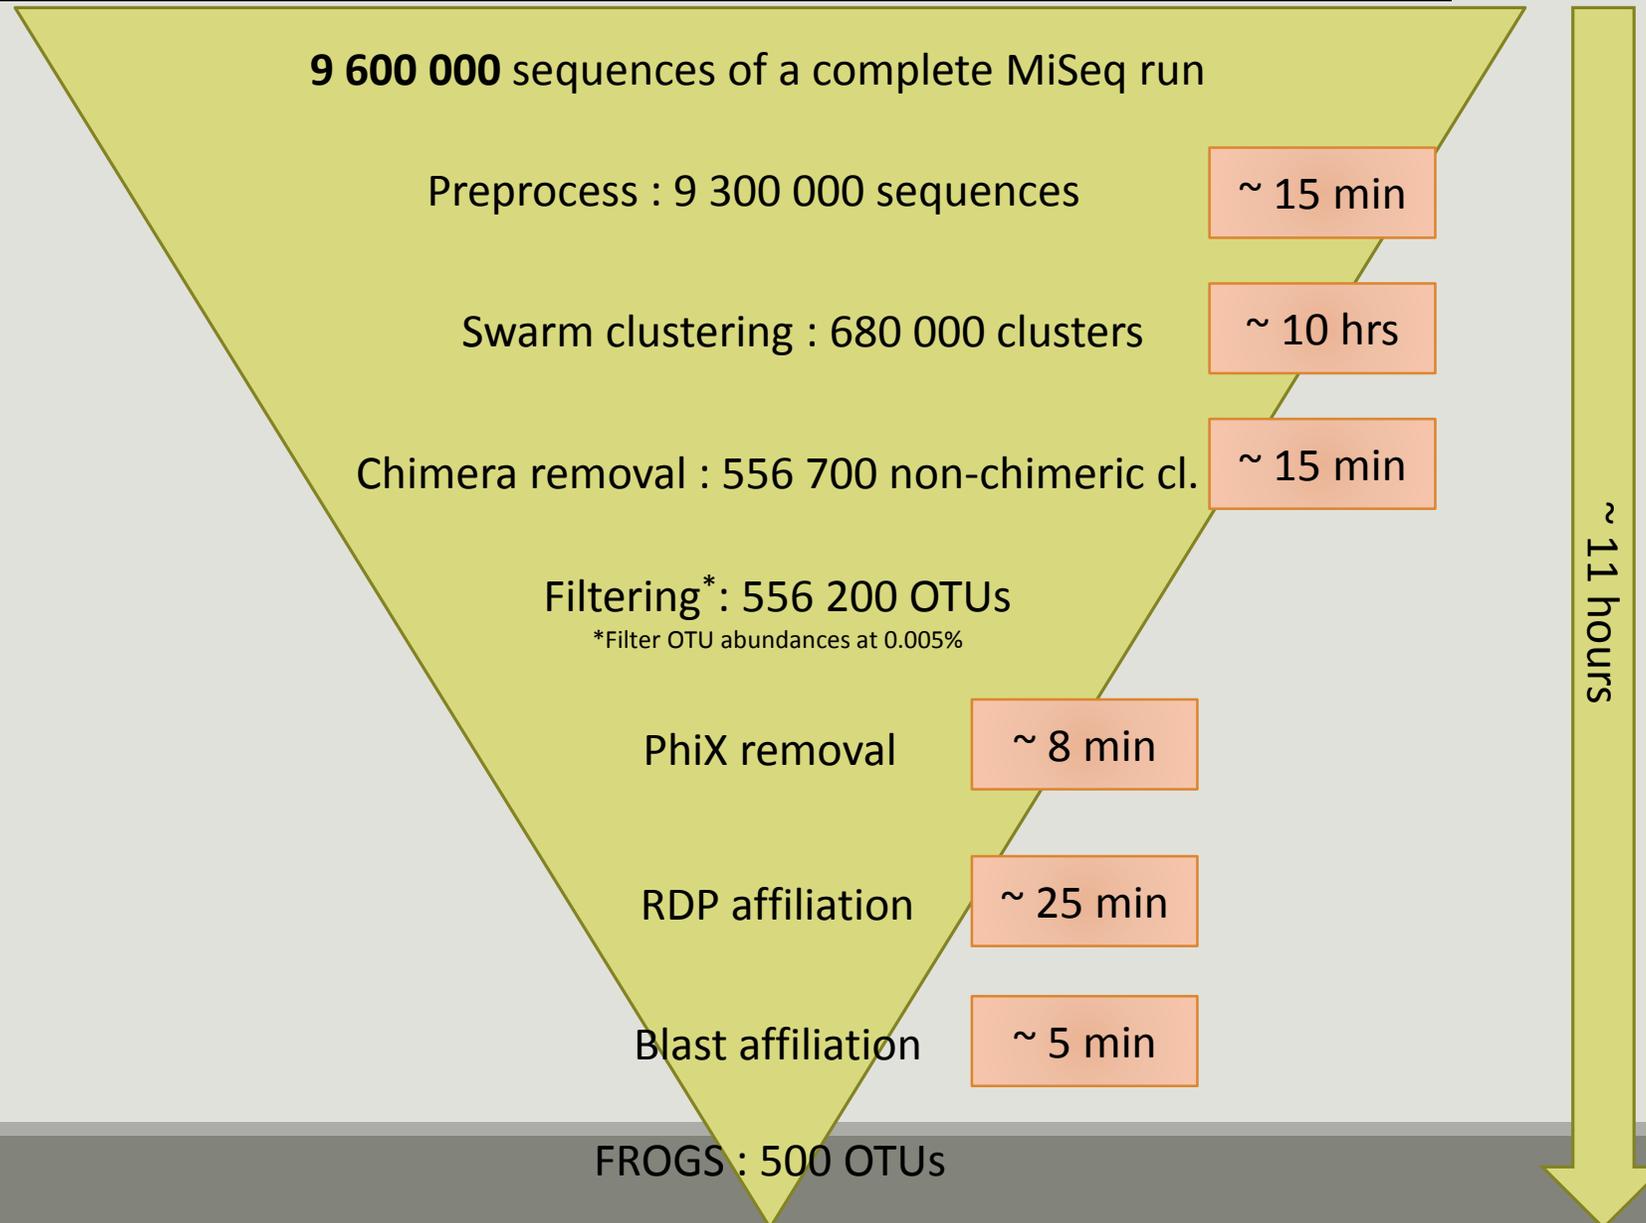

Simulated datasets, for testing FROGS' Accuracy

- 500 species, covering all bacterial phyla

- Power Law distribution of the species abundances

- Error rate calibrated with real sequencing runs

- 20% chimeras

- 10 samples of 100 000 sequences each (1M sequences)

Simulated dataset : 1M sequences

↓

SWARM : 109 000 clusters

↓

VSEARCH: 21 000 clusters

↓

505 OTUs

filters : 0.005%
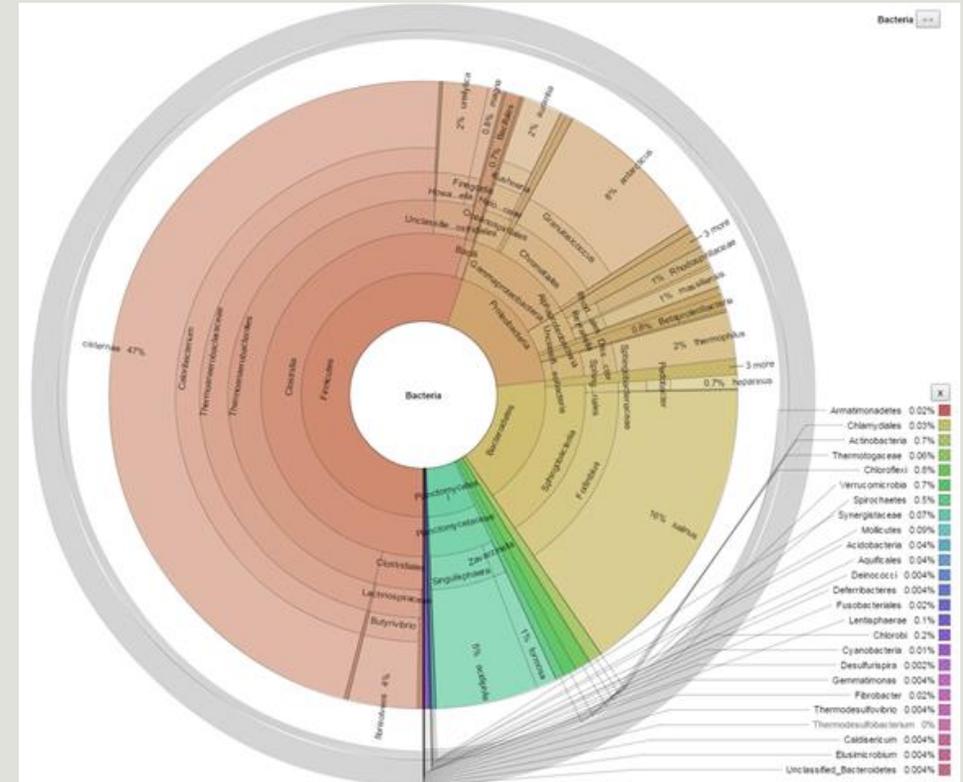

FROGS' Accuracy

- 1.10^{+8} synthetic sequences were treated with FROGS, UPARSE and MOTHUR, QIIME, with their guidelines, to compare their performances

- 20, 100, 200, 500 or 1000 different species

- power law or a uniform distribution

- 5 to 20% of chimera

→ Divergence on the composition of microbial communities at the different taxonomic ranks

V3V4 Power Law

Affiliations divergence

Divergence on the composition of microbial communities at genus rank

V3V4 Uniform

Affiliations divergence

Divergence on the composition of microbial communities at genus rank

frogs   uparse (SOP)   mothur (SOP)   qiime (SOP)

248
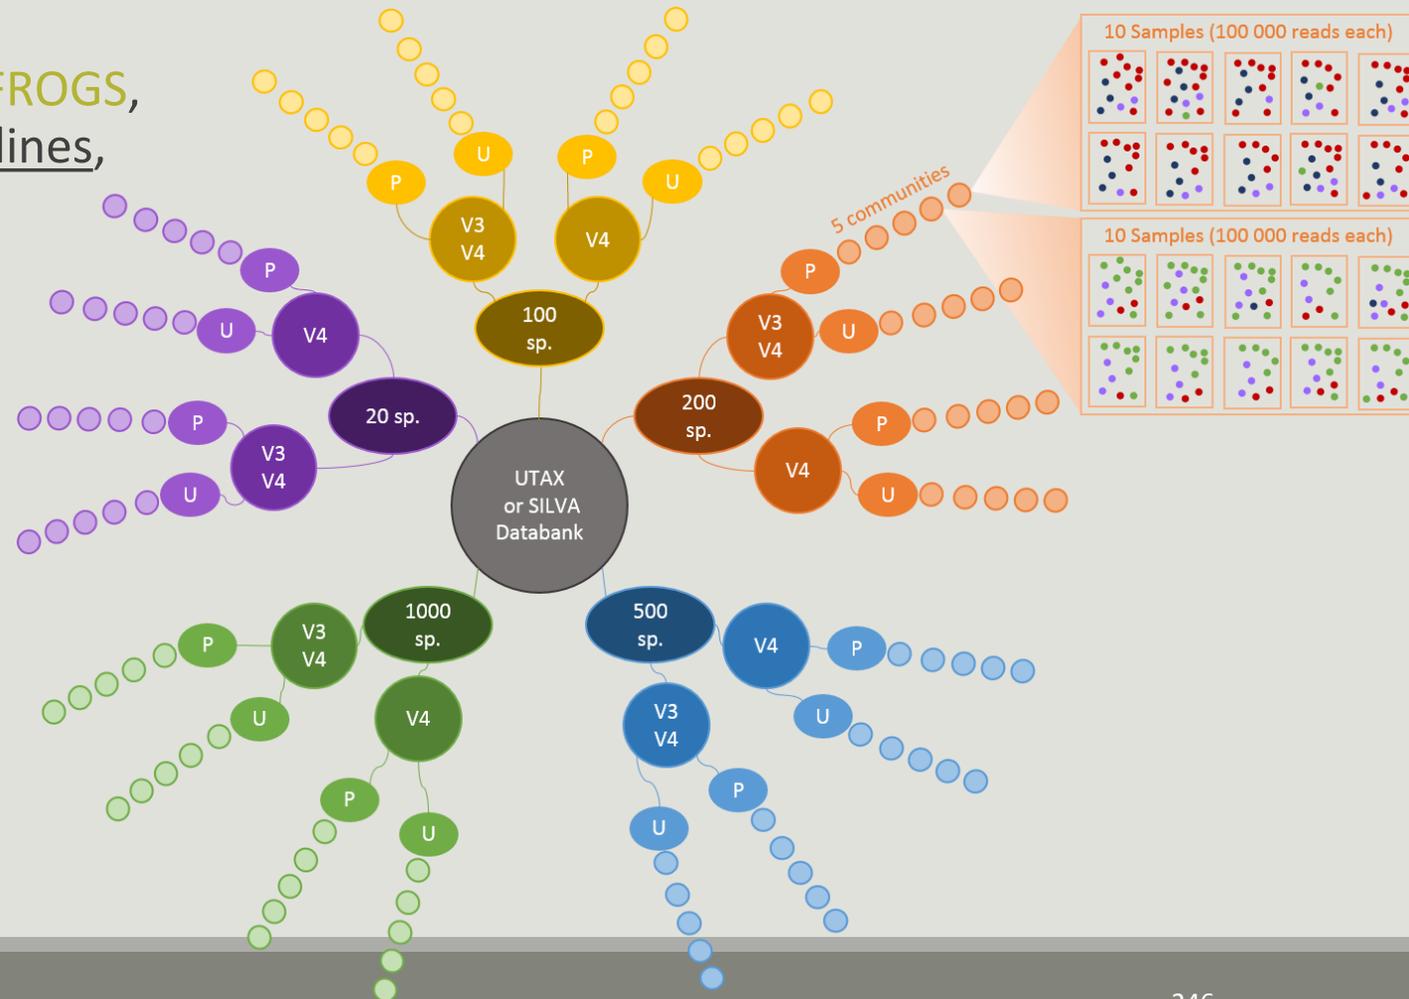

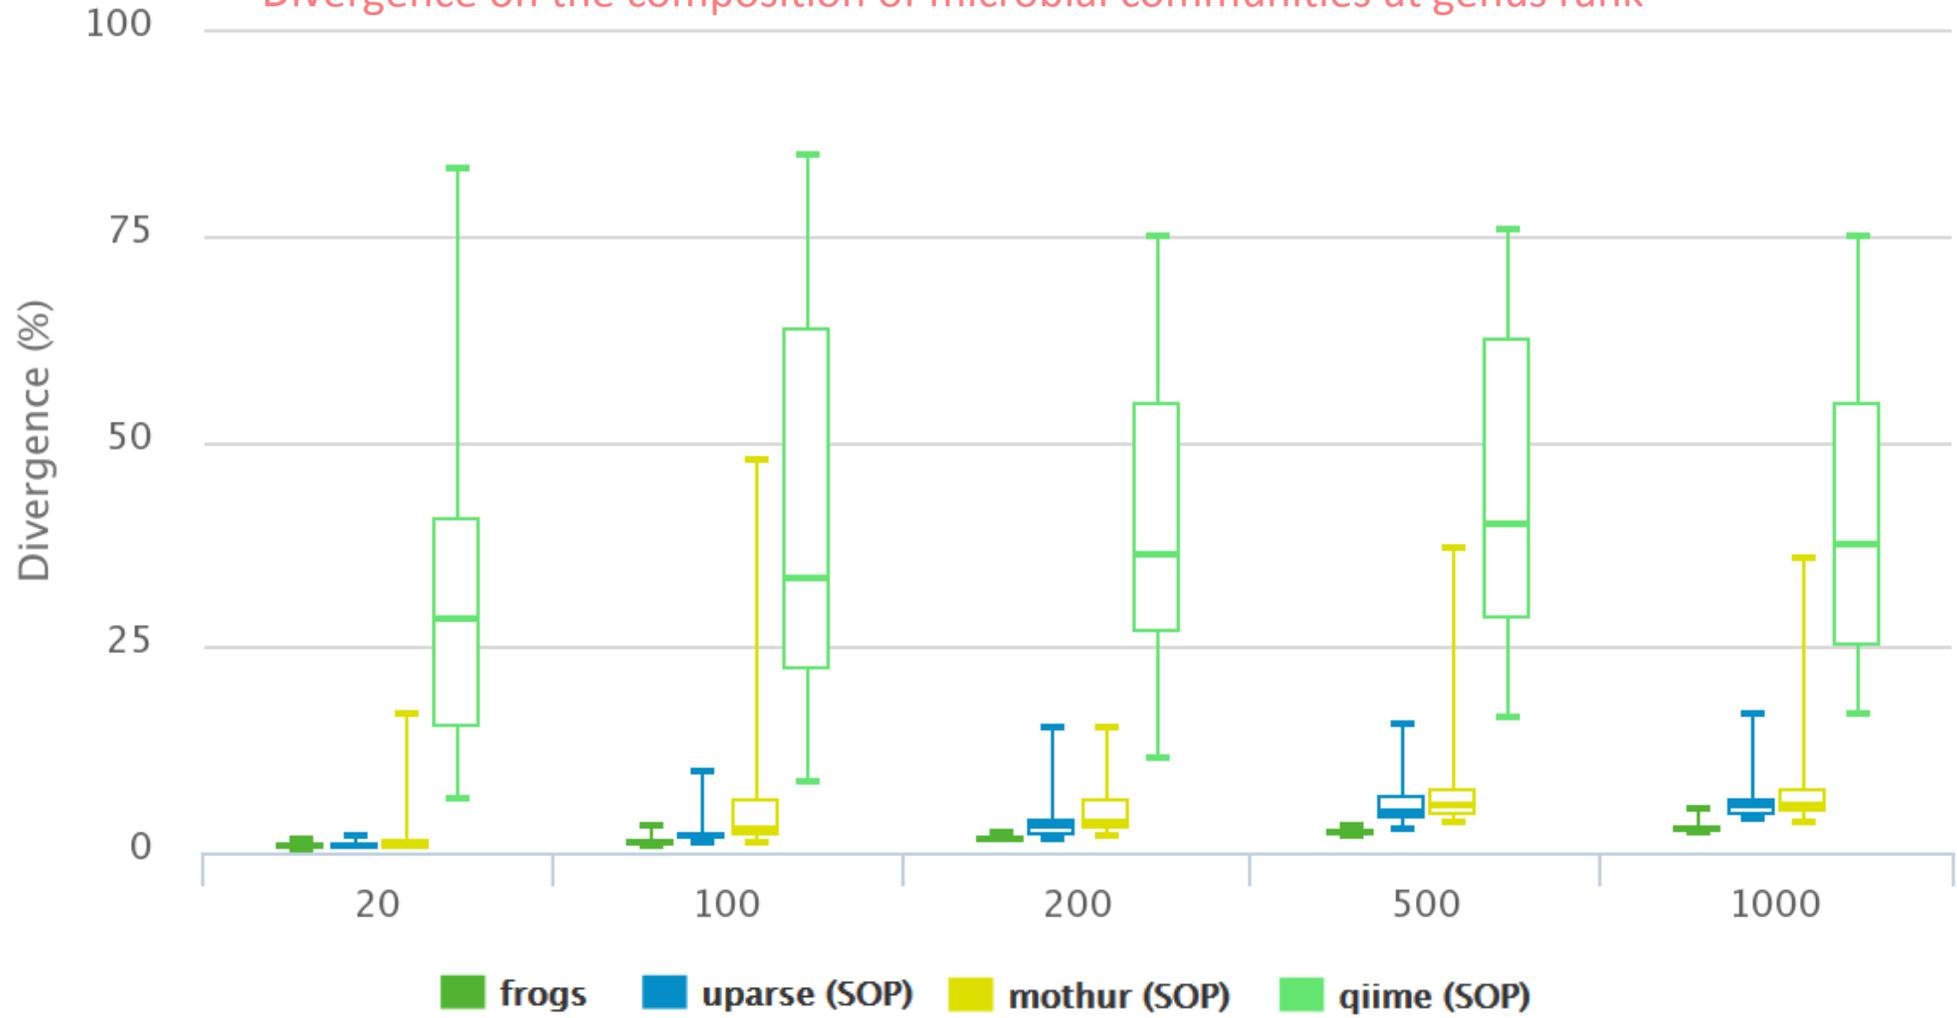

The results of non-parametric paired tests (signed rank test) of Affiliation divergence on simulated data from UTAX
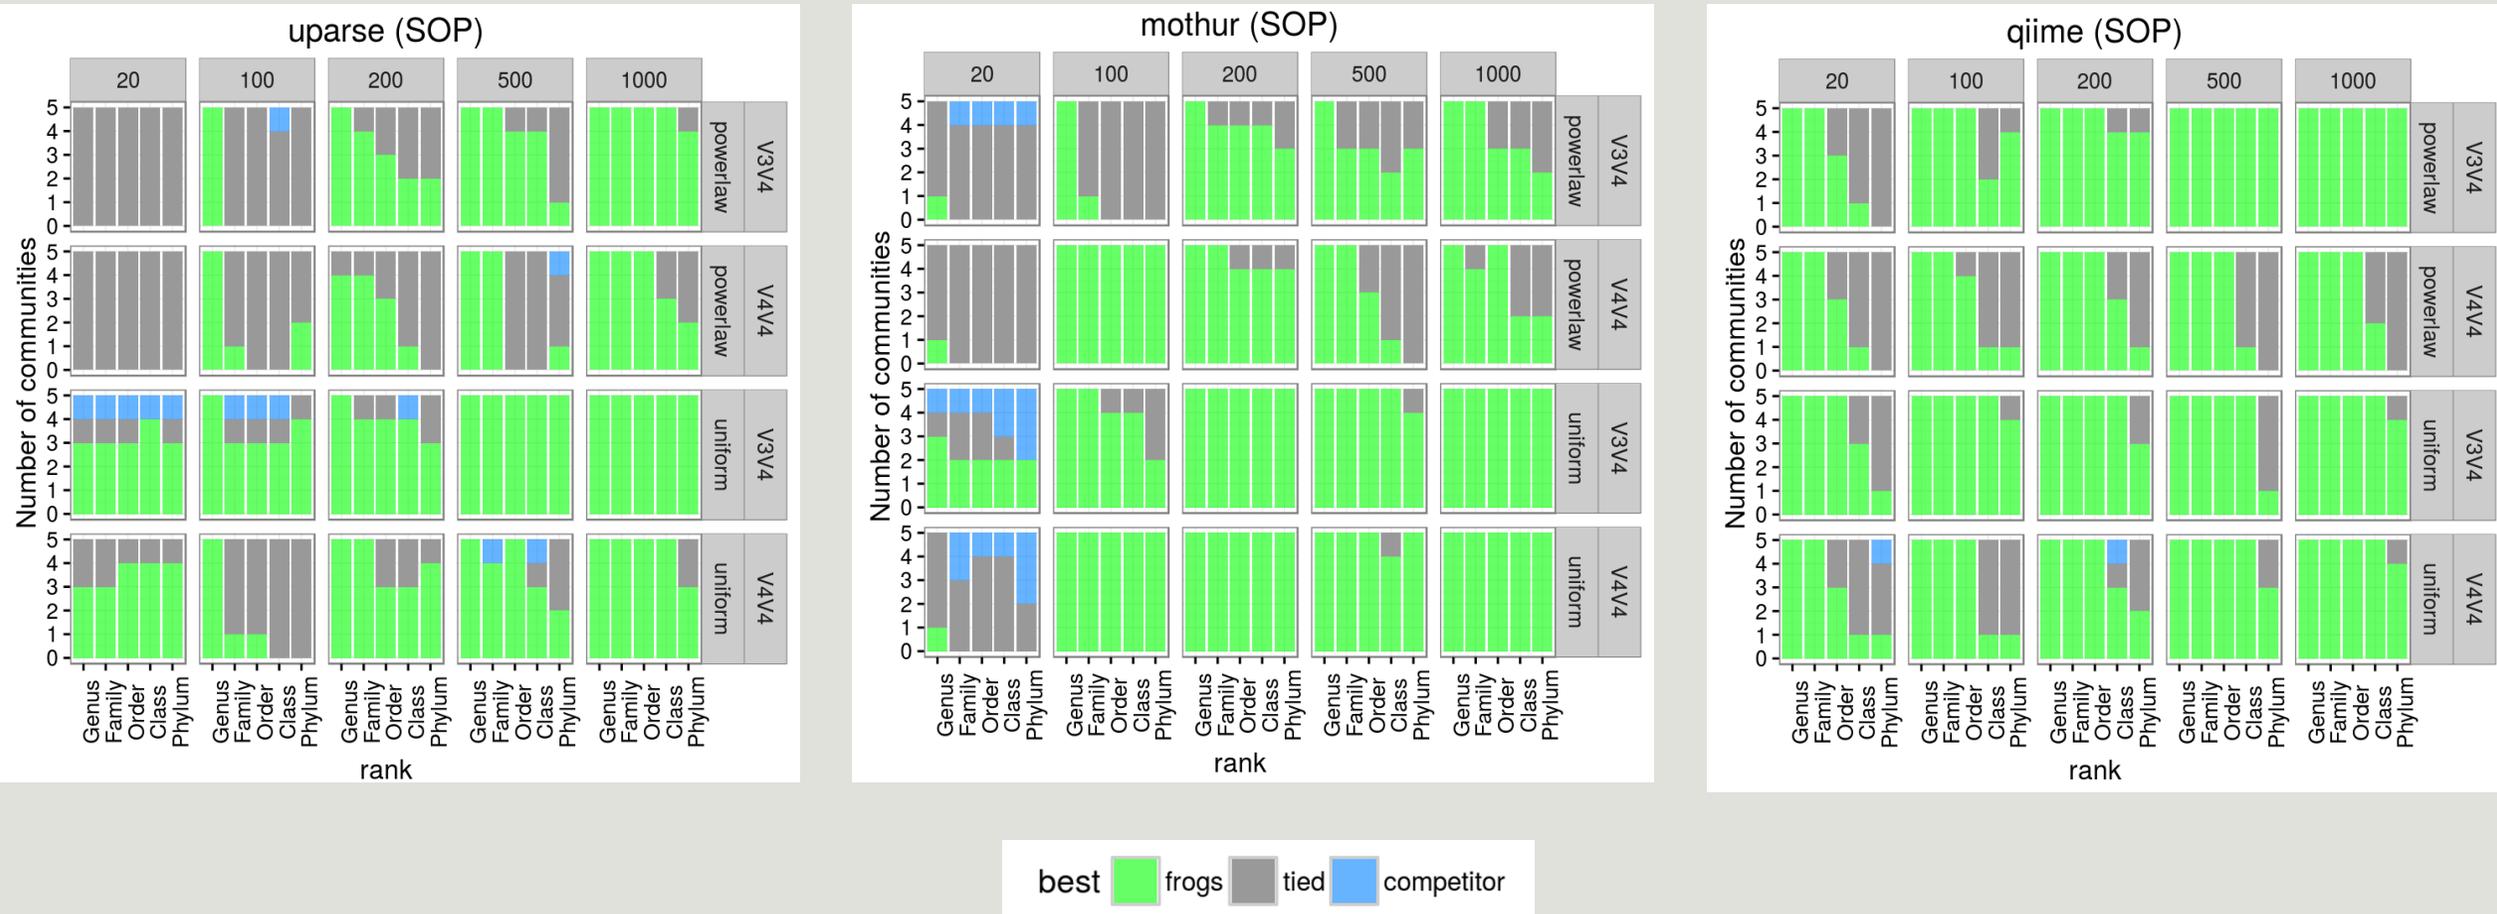

FROGS performs as well as or better than UPARSE, MOTHUR and QIIME in most settings. The only condition in which FROGS does worse than UPARSE and MOTHUR is small community size (20).

The results of non-parametric paired tests (signed rank test) of Affiliation divergence on simulated data from UTAX

With FROGS multi-Affiliation
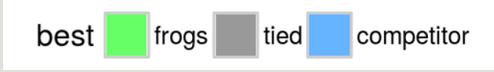

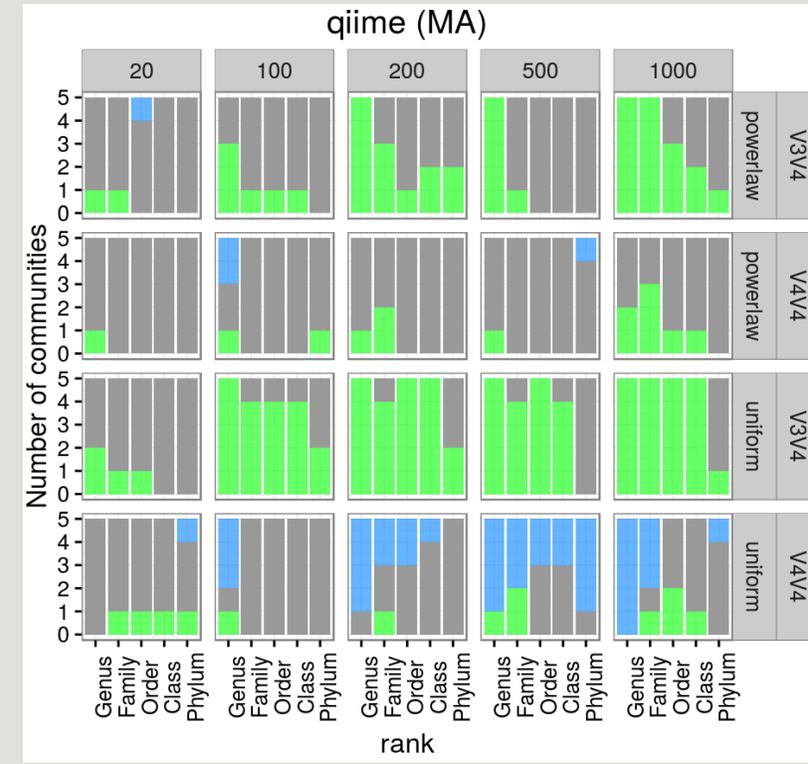

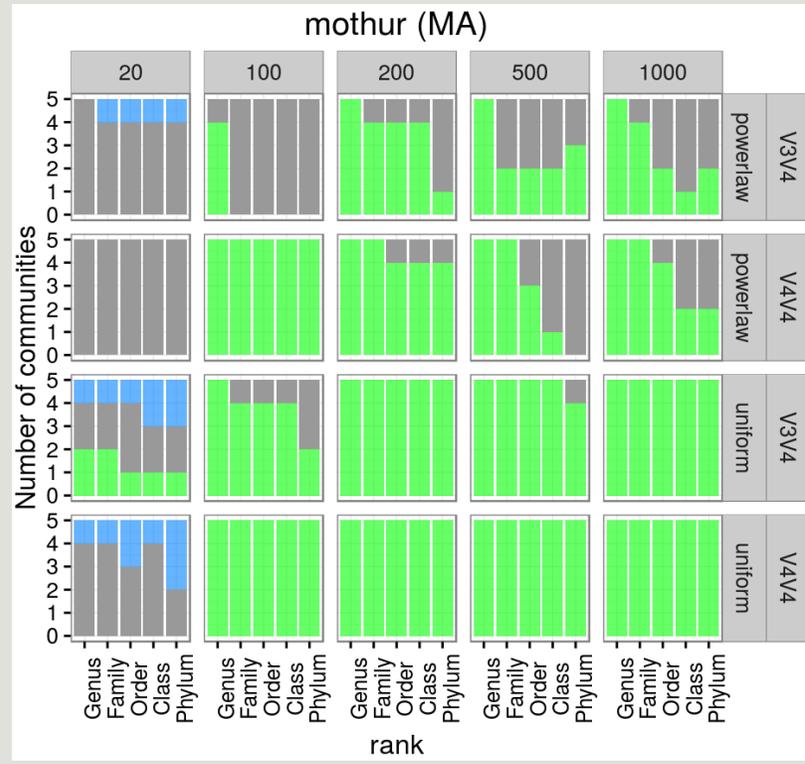

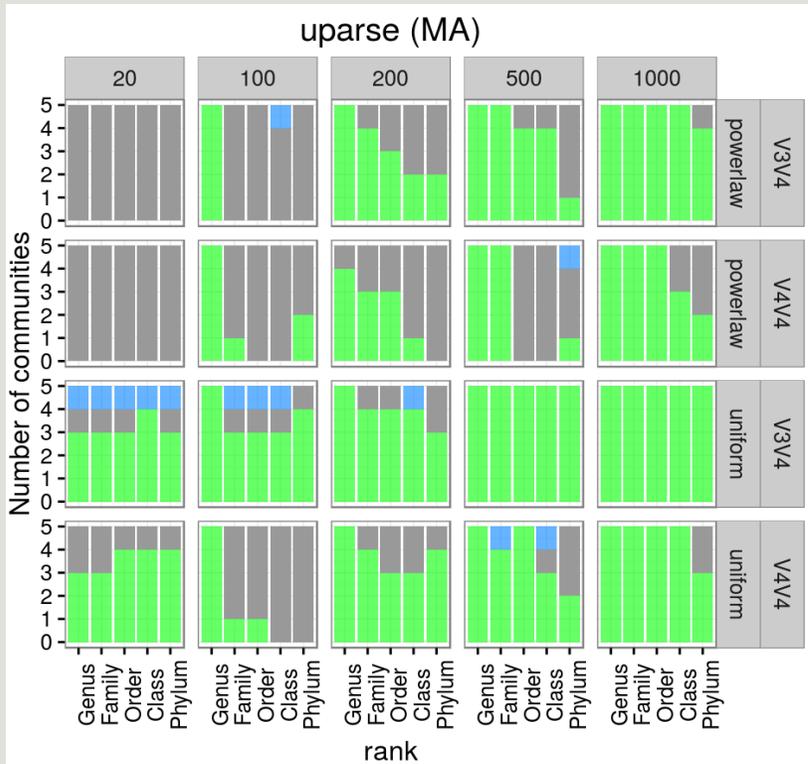

QIIME (MA) with large communities (size > 200) with uniform abundance using the V4 region is better than FROGS. The differences, although significant, are small in that case: less than 2 percentage points in all cases and most marked at the Genus level where the divergences of both FROGS and QIIME (MA) are already quite moderate (6~10%).
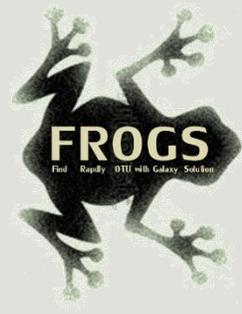

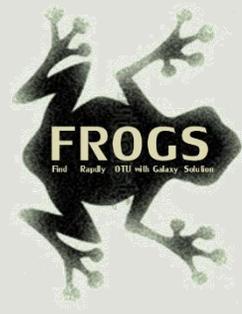

False Positive OTUs
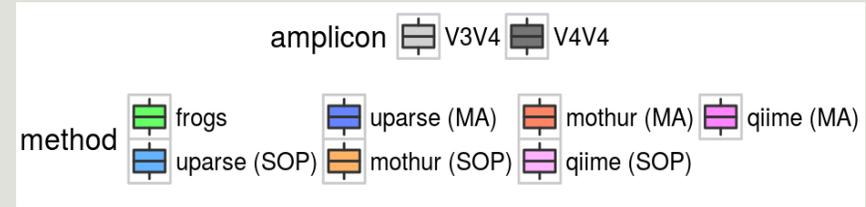

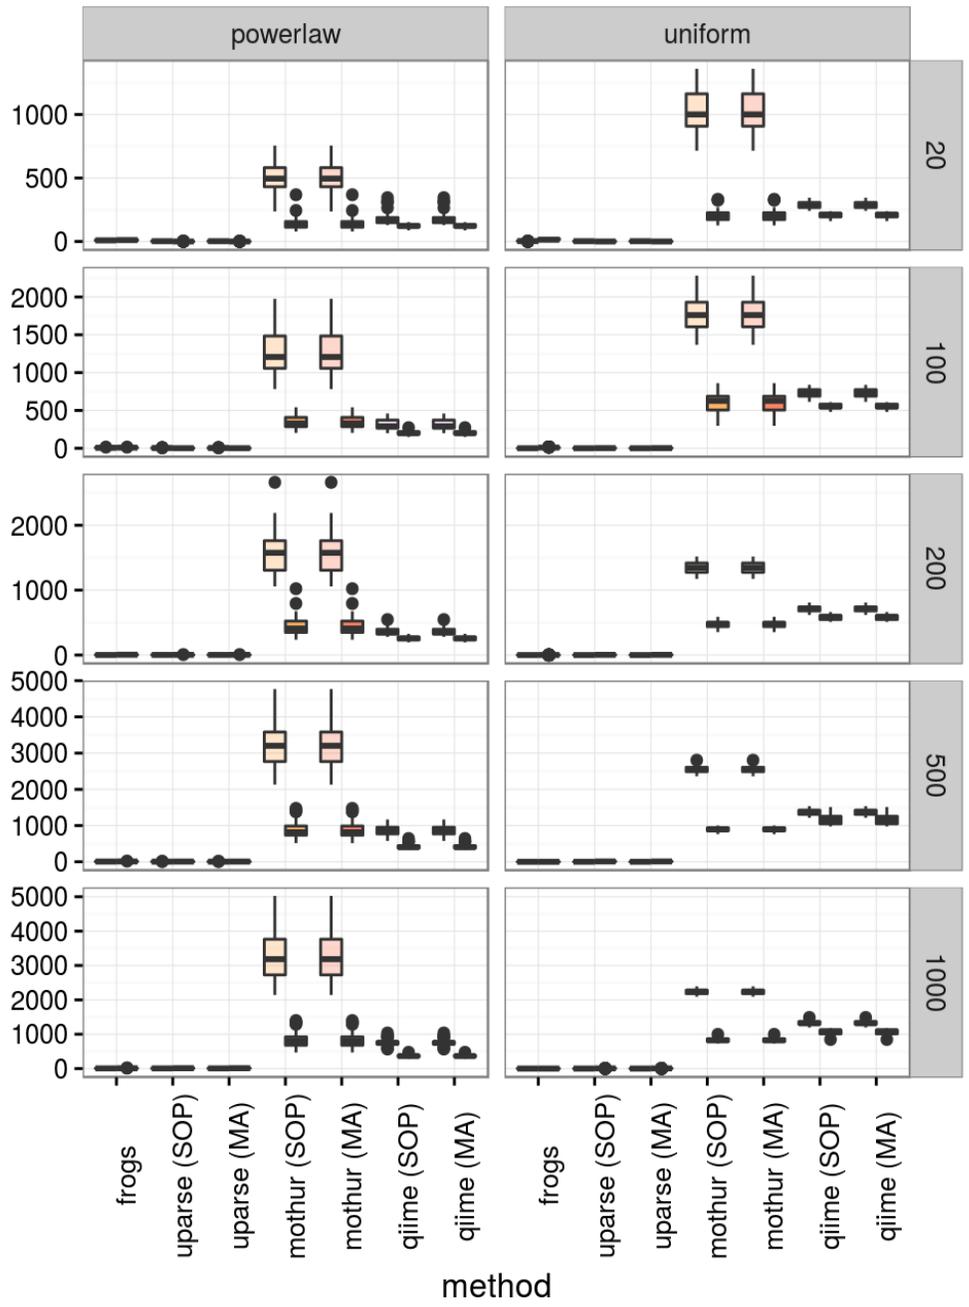

False Negative OTUs
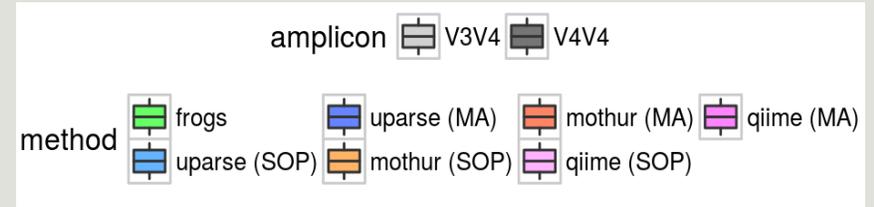

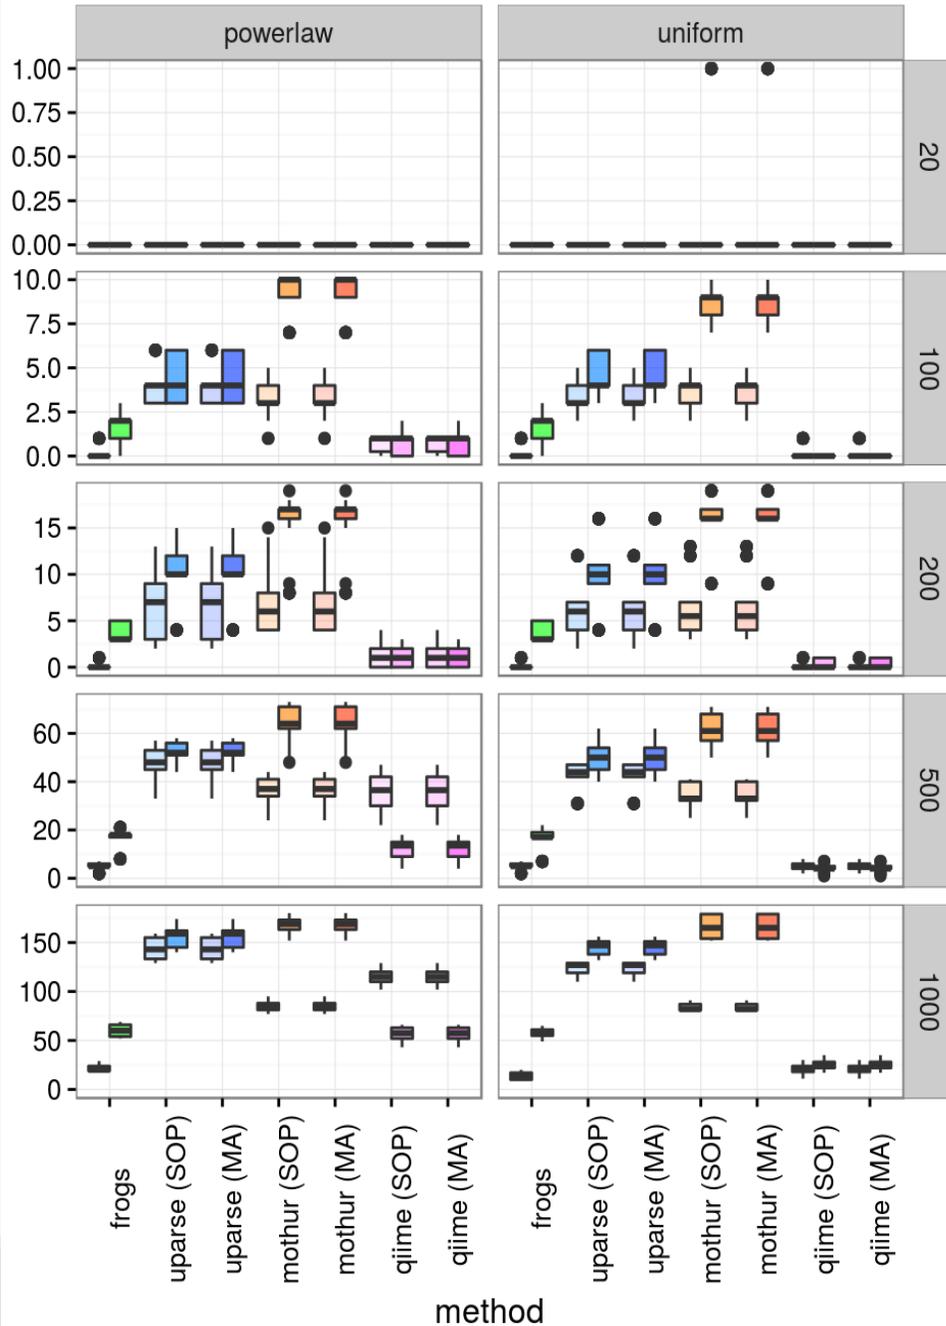

Conclusions

Why Use FROGS ?

- User-friendly

- Fast

- 454 data and Illumina data

  - sequencing methods change but same tool

  - easier for comparisons

- Clustering without global threshold and independent of sequence order

- New chimera removal method (Vsearch + cross-validation)

- Filters tool

- Multi-affiliation with 2 taxonomy affiliation procedures

- Cluster Stat and Affiliation Stat tools

- A lot of graphics

- Independant tools
