(Received 13 March 1998; accepted 9 July 1998)

### Predicted variables

Seedbed temperature

Seedbed water content

2

## SIMPLE: A Model for SIMulation of PLant Emergence Predicting the Effects of Soil Tillage and Sowing Operations

C. Dürr,\* J.-N. Aubertot, G. Richard, P. Dubrulle, Y. Duval, and J. Boiffin

Reprinted from the *Soil Science Society of America Journal*

Volume 65, no. 2, Mar.-April 2001

677 South Segoe Rd., Madison, WI 53711 USA

### Predicted variables

% germination

% emergence,

Time to Germ-Emer

Causes of non emergence

% of bolting

3

# Simulation of sugar beet establishment

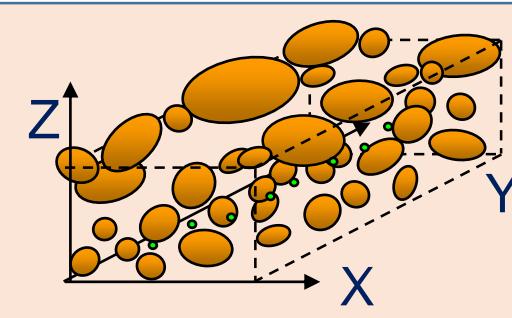

## 5 sowing dates

- Mid-February
- 1st March
- **Mid-March**
- 1st April
- Mid-April

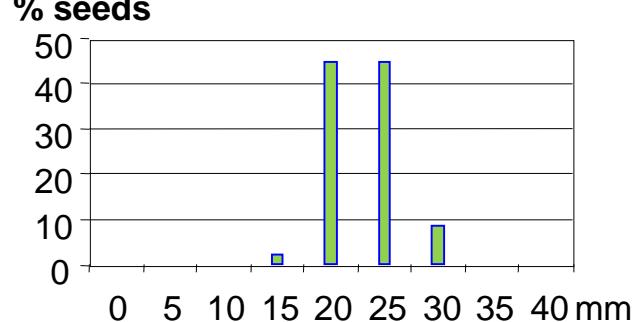

2020 -2100

- Seedbed temperatures
- Seedbed water content
- Daily rainfalls
- Air temperatures

## Seedbed structure

## Sowing depths

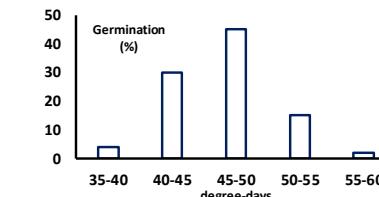

Total : 405 simulations  
(405 000 individual seeds)

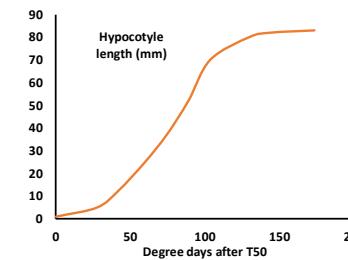

## Sugar beet parameter values

T<sub>b</sub> 3.5°C; ψ<sub>b</sub> 1. 96 MPa

Germination speed

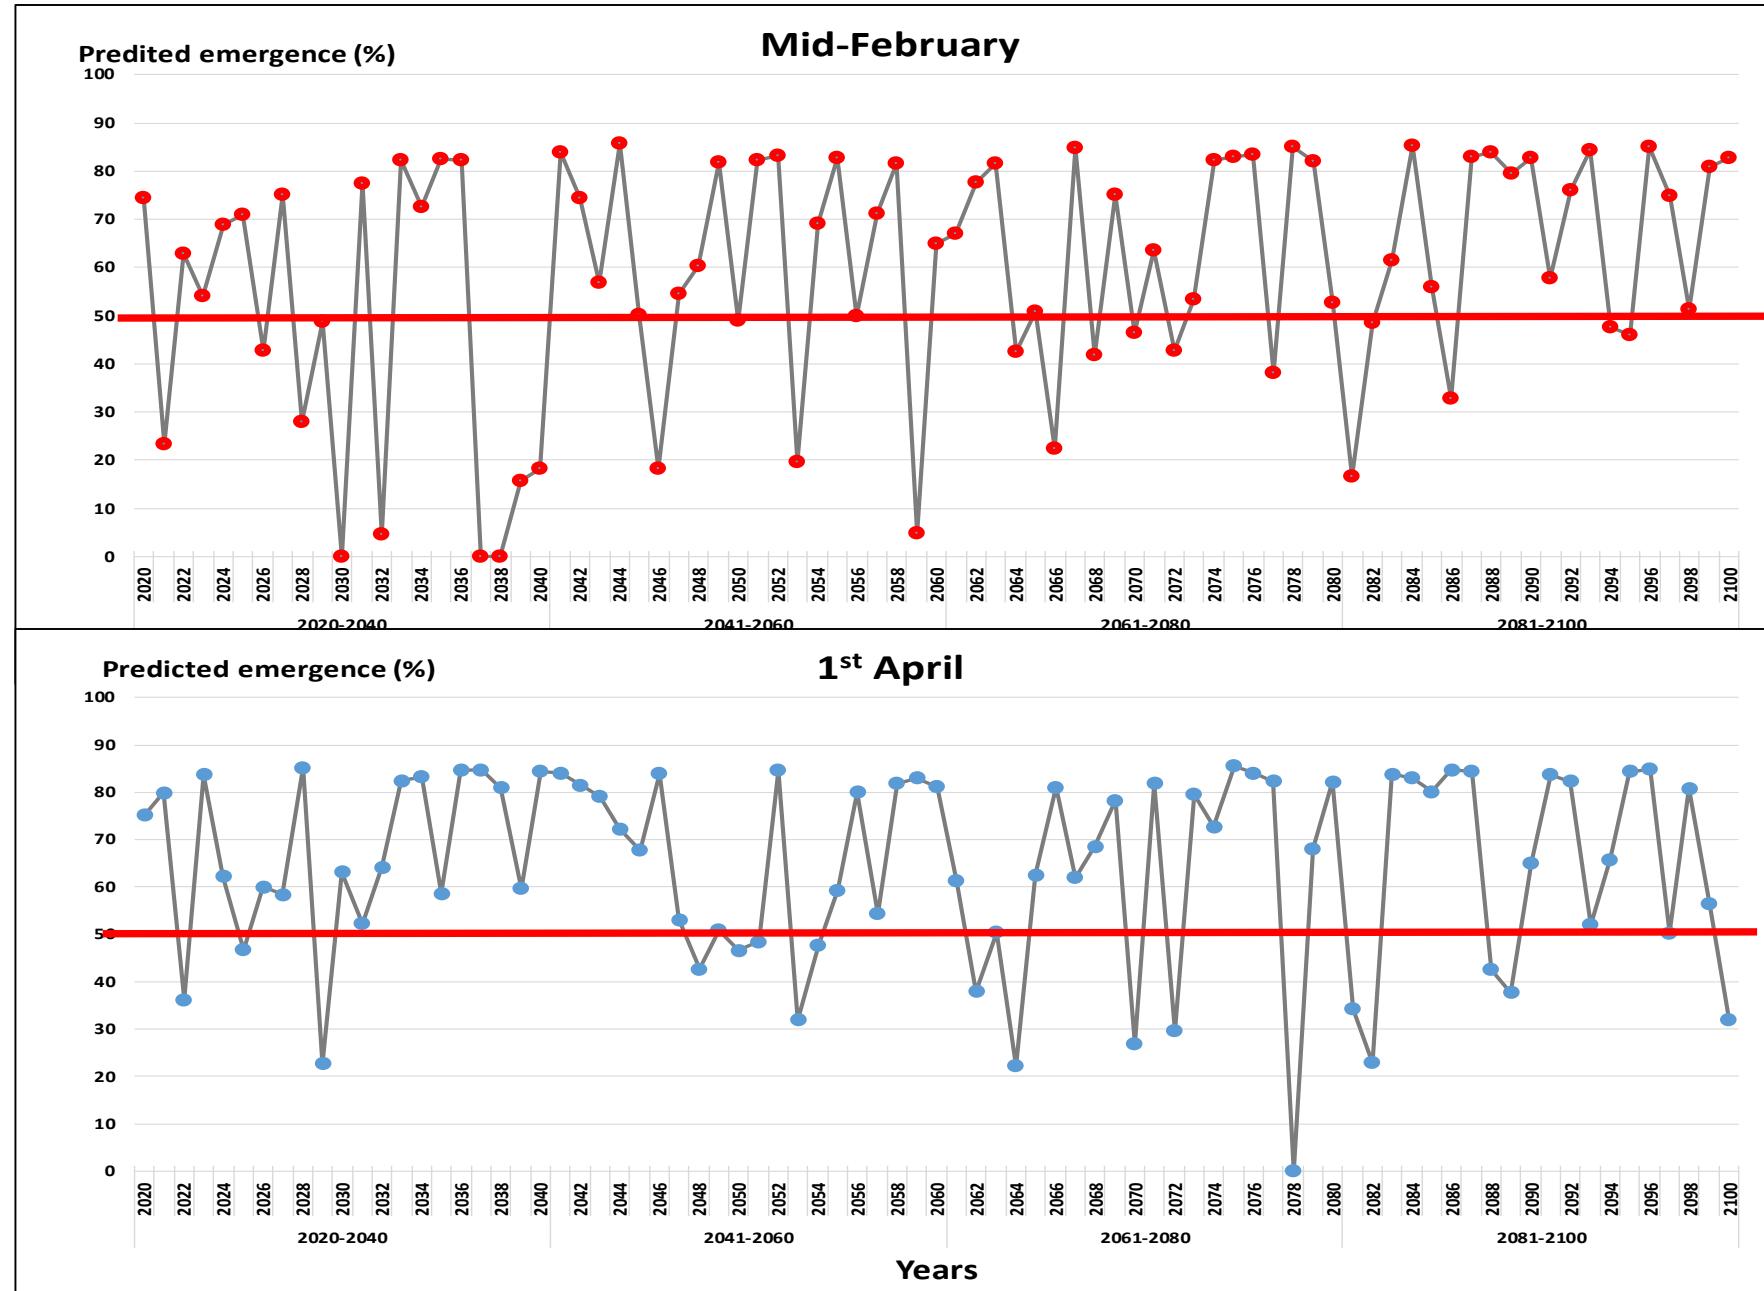

Radicle and hypocotyl elongation

Clods and crust sensitivity

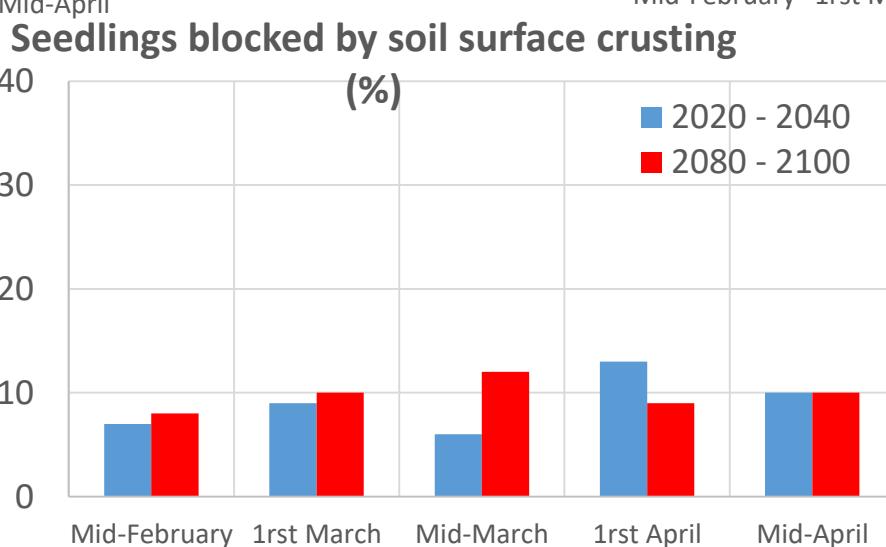

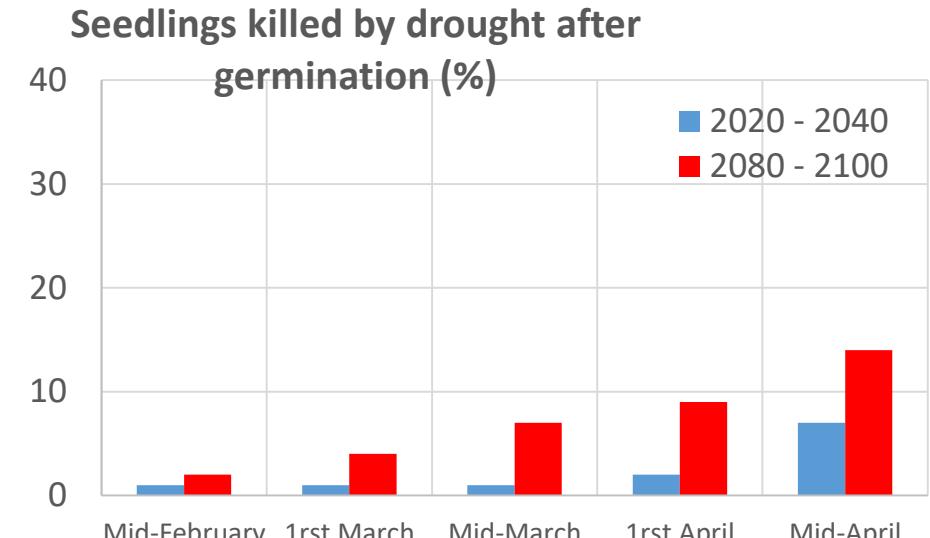

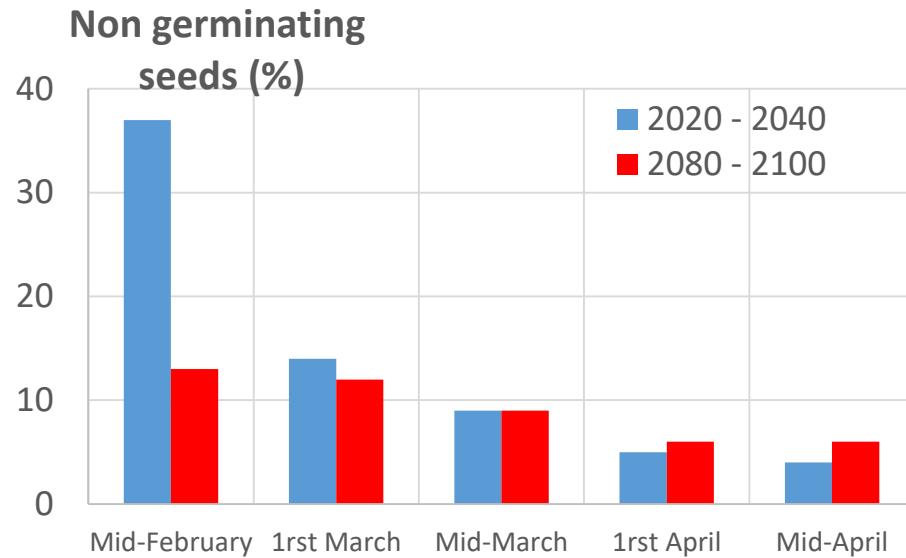

# Results

	2020	2080
	-2040	-2100
Emergence rate %	48	68
Nb days to max emergence	45	37
	± 32	± 20
	± 24	± 10

	2020	2080
	-2040	-2100
Emergence rate %	69	74
Nb days to max emergence	28	23
	± 15	± 8

# Causes of non emergence

# Bolting risks

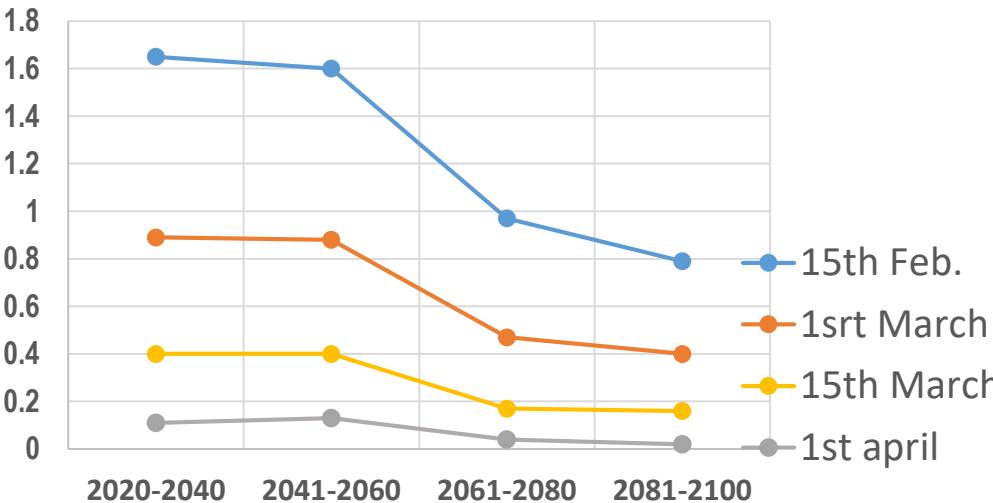

Source image IRBAB

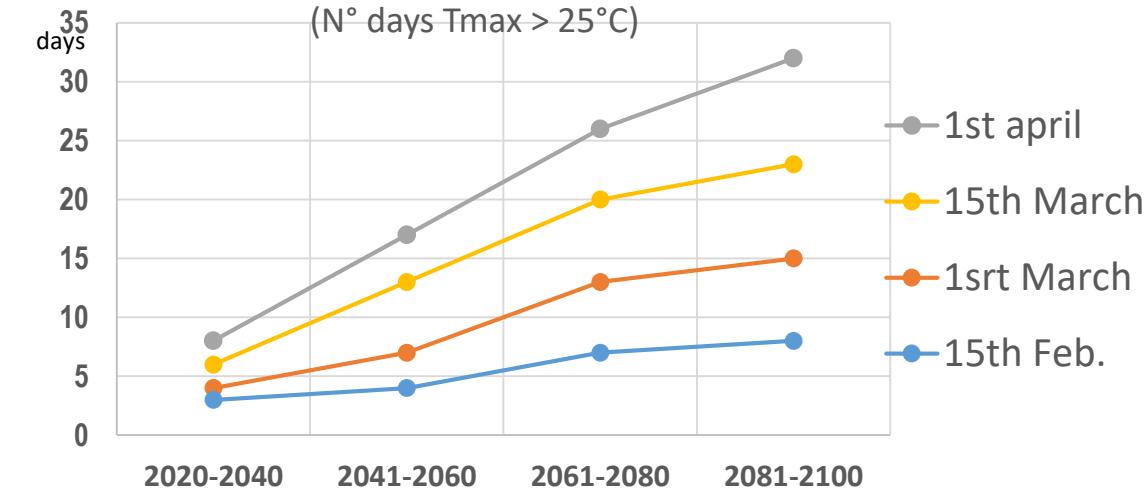

Bolting rate =  $f(T < 12^\circ\text{C} \text{ after sowing};$   
and  $\text{Tmax} > 25^\circ\text{C}$  60-120 days after sowing over 7 days)

Longden et al, 1975; Fauchère et al, 2003

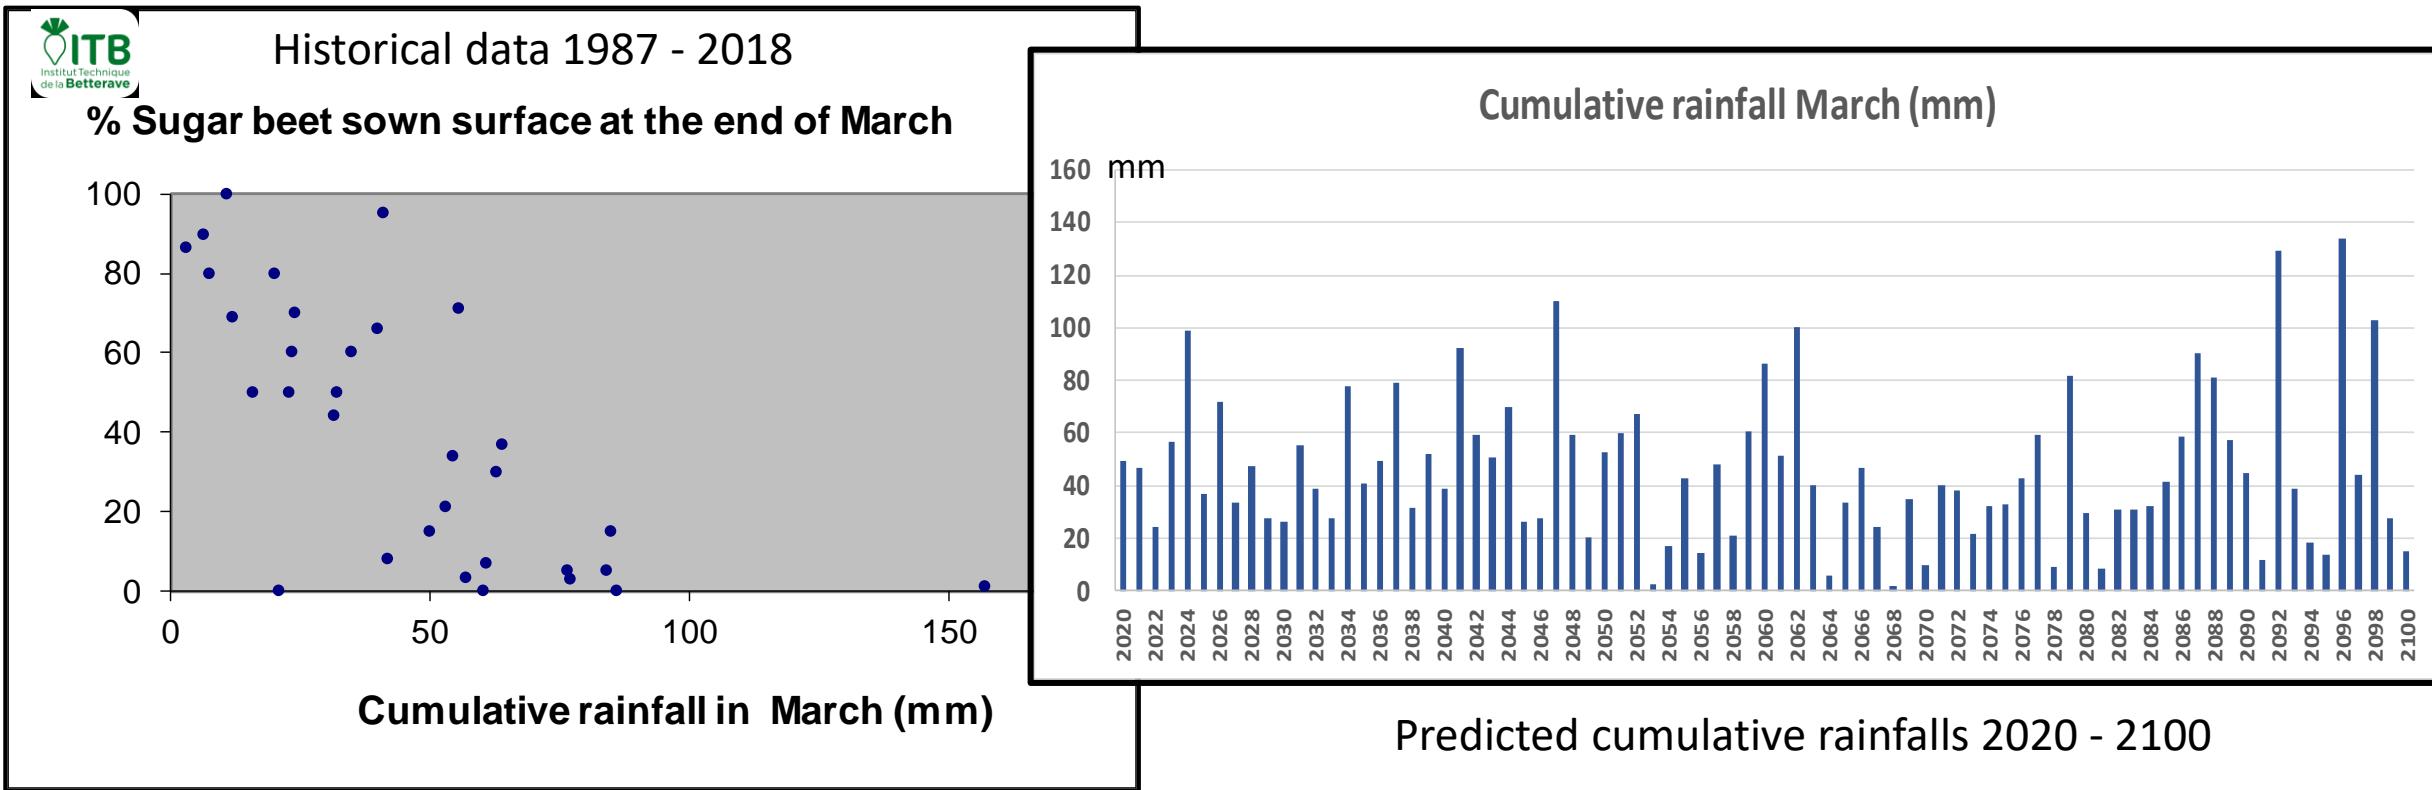

Predicted bolting rate (%)

Probability of devernaliization

# Field access during the sowing period

# Conclusions

**An insight into the future has been possible** with the help of

- Precise geolocalized climatic scenario
- Detailed crop models for simulation

## Main results

- Main changes will occur **after 2060**
- An **increase in temperatures** will favor **crop establishment** and decrease **bolting risk**
- **Rainfalls will be a main limit preventing field access**

## Limits

- Quality of models and hypothesis
- Biotic stresses
