How Computers Break (Serious) Puzzles

with logic and (a different breed of) learning

Thomas Schiex

February 2018

Académie des sciences, Paris, France

Human beings

- Easily rely on quick “intuitions” (ill-defined problems)
- Extreme rigor is painful and slow (logic/arithmetic)

Als (computers)

- Accessible to some “intuition” (problems defined by data)
- Fast and extreme rigor is the default (1 billion op./sec)

Human beings

- Easily rely on quick “intuitions” (ill-defined problems)
- Extreme rigor is painful and slow (logic/arithmetic)

Als (computers)

- Accessible to some “intuition” (problems defined by data)
- Fast and extreme rigor is the default (1 billion op./sec)

It was expected that machines would show superhuman “logical reasoning” performances

Human beings

- Easily rely on quick “intuitions” (ill-defined problems)
- Extreme rigor is painful and slow (logic/arithmetic)

Als (computers)

- Accessible to some “intuition” (problems defined by data)
- Fast and extreme rigor is the default (1 billion op./sec)

It was expected that machines would show superhuman “logical reasoning” performances

1955: Newell & Simon “Logic Theorist” proved 38 of the 52 theorems in the *Principia Mathematica* (Russel and Whitehead), and even corrected a proof in it.

NP-hard problems

(Cook-Levin, 1970s)

- Some problems seems intrisically hard (for AIs at least)
- *Worst case asymptotic* exponential time ($P \neq NP$)

NP-hard problems

(Cook-Levin, 1970s)

- Some problems seems intrisically hard (for AIs at least)
- *Worst case asymptotic* exponential time ($P \neq NP$)

$n^2 \times n^2$ Sudoku

- NP-complete, 9×9 : 10^{80} cases
- 10^{51} ages of the universe to examine them all
- Fast brute force will fail

Logic

- We have a set of variables

From a well defined problem to a solution
(Sudoku cells contain a number from 1 to 9)

x_1

x_2

x_3

x_4

x_5

x_6

Logic

- We have a set of variables
- We have a set of properties on these variables

From a well defined problem to a solution

(Sudoku cells contain a number from 1 to 9)

(all different rows, columns, super-cells)

Logic

From a well defined problem to a solution

- We have a set of variables (Sudoku cells contain a number from 1 to 9)
- We have a set of properties on these variables (all different rows, columns, super-cells)
- We want to find an input that satisfies all properties (or prove none exists: refutation).

Intuition (DL)

From examples to a classifier

- We have a set of digital inputs (in \mathbb{B}^n) and output (class: one bit).
- We want a function that best predicts seen (and unseen) data in most cases.

Intuition (DL)

From examples to a classifier

- We have a set of digital inputs (in \mathbb{B}^n) and output (class: one bit).
- We want a function that best predicts seen (and unseen) data in most cases.

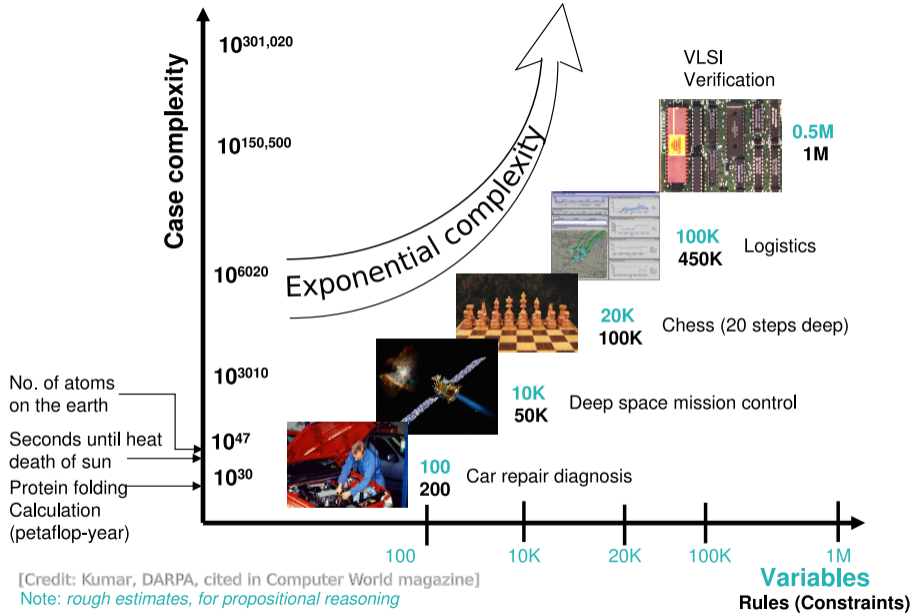

Technological progress

- Increasingly complex useful objects planes, computers, software, cars, Als
- That must be highly reliable (lives at stake)
- We cannot fully get them under control anymore

Increasing system complexity

- Hardware: Pentium FDIV bug (1994, 3.1 million transistors)
- Software: the Therac-25 (radiation-therapy) kills 6 patients
- Tesla cars: said to carry 100 millions lines of codes
- Convolutional NN: may have billions of parameters

SAT

- 1 A set of Boolean variables x_i
- 2 A set of clauses (*disjunction* of variables or negation of) $(\neg x_1 \vee x_7)$
- 3 Must satisfy all clauses (or prove impossible)
- 4 Semantics: defines a function from \mathbb{B}^n to \mathbb{B}

SAT

- ① A set of Boolean variables x_i
- ② A set of clauses (*disjunction* of variables or negation of) $(\neg x_1 \vee x_7)$
- ③ Must satisfy all clauses (or prove impossible)
- ④ Semantics: defines a function from \mathbb{B}^n to \mathbb{B}

Sudoku

- ① cell (i, j) contains k x_{ijk} true
- ② At least one number per cell i, j $(x_{ij1} \vee \dots \vee x_{ij9})$
- ③ At most one number per cell i, j $(\forall k > k' \neg x_{ijk} \vee \neg x_{ijk'})$
- ④ Cell (i, j) and (i, j') must be different $(\neg x_{ijk} \vee \neg x_{ij'k})$

More sophisticated/practical function description

- propositions over theories
- non Boolean variables
- numerical output

SAT Modulo Theory⁹

Constraint Satisfaction, Constraint Programming³⁰

Weighted MaxSAT²⁵/CSP,⁵ Graphical models¹⁸

SAT is the simplest

More sophisticated/practical function description

SAT Modulo Theory⁹

Constraint Satisfaction, Constraint Programming³⁰

Weighted MaxSAT²⁵/CSP,⁵ Graphical models¹⁸

NP-complete: can express all NP-complete problems

- the logical puzzles you like (Sudoku, Nonograms...)
- or not (configuration, scheduling, test pattern generation...)
- robot planning
- digital circuit verification (Bounded Model Checking)
- or software verification (FOL, grounding, abstraction)

NP-complete: can express all NP-complete problems

- the logical puzzles you like (Sudoku, Nonograms...)
- or not (configuration, scheduling, test pattern generation...)
- robot planning
- digital circuit verification (Bounded Model Checking)
- or software verification (FOL, grounding, abstraction)

NP-complete, so intractable

Standard argument for less realistic problem reformulation, heuristics or stochastic search

NP-complete: can express all NP-complete problems

- the logical puzzles you like (Sudoku, Nonograms...) 
- or not (configuration, scheduling, test pattern generation...)   
- robot planning (Rosetta-Philae probe plan, CP, LAAS/Toulouse) 
- digital circuit verification (Bounded Model Checking)  
- or software verification (FOL, grounding, abstraction)   

NP-complete, so intractable

Standard argument for less realistic problem reformulation, heuristics or stochastic search

Real SAT instances with millions of variables/clauses can be solved (with a proof)

How does it work?

Consensus/Resolution (1960's)^{8,29}

$$\frac{(x_1 \vee \overbrace{l_1 \vee \dots \vee l_n}^L) \quad (\neg x_1 \vee \overbrace{r_1 \vee \dots \vee r_m}^R)}{(L \vee R)}$$

Boolean Constraint Propagation (BCP): unit clauses⁷

(L or R empty)

$$\frac{(x_1) \quad (\neg x_1 \vee \overbrace{r_1 \vee \cdots \vee r_m}^R)}{(R)}$$

Boolean Constraint Propagation (BCP): unit clauses⁷

(L or R empty)

$$\frac{(x_1) \quad (\neg x_1 \vee \overbrace{r_1 \vee \cdots \vee r_m}^R)}{(R)}$$

- A clause is shortened by one literal

Boolean Constraint Propagation (BCP): unit clauses⁷

(L or R empty)

$$\frac{(x_1) \quad (\neg x_1 \vee \overbrace{r_1 \vee \cdots \vee r_m}^R)}{(R)}$$

- A clause is shortened by one literal
- This may create new unit clauses (propagation)

Boolean Constraint Propagation (BCP): unit clauses⁷

(L or R empty)

$$\frac{(x_1) \quad (\neg x_1 \vee \overbrace{r_1 \vee \dots \vee r_m}^R)}{(R)}$$

- A clause is shortened by one literal
- This may create new unit clauses (propagation)
- If the empty clause \square appears: no solution

Logic: Try to guess and reconsider (DPLL⁷)

SAT state-of-the-art in 1990
Hundreds of variables
Thousands of clauses

Long line of research in “symbolic” Artificial Intelligence^{3,10,23,24,32}

- Trace back failure to guesses through propagation^a
- Do backward resolution from conflict
- Add a new implied clause to the set of clauses

^aRichard M Stallman and Gerald J Sussman. “Forward reasoning and dependency-directed backtracking in a system for computer-aided circuit analysis”. In: *Artificial intelligence* 9.2 (1977), pp. 135–196.

- Forces to reconsider an earlier guess
- Prevents refailing for a related reason (safe generalization)

Learns a more effective formulation of the problem as it solves it

Intuition: Choose a variable and try to guess its value

Learning by “Activity based heuristics”²⁶

- On-line estimation of how often a variable is involved in recent clauses/failures
- Try guessing this variable first

Learns weak spots in the problem as it is solved

(safe)

A lot of free data and free code...

- International competitions (> 50,000 benchmarks with many real problems)
- Open source solvers (autocatalytic)

A lot of free data and free code...

- International competitions (> 50,000 benchmarks with many real problems)
- Open source solvers (autocatalytic)

Strong French presence

- Award winning solvers (Glucose,² toulbar2¹⁵)
- Constraint programming solver/startup (Choco)
- Strong presence in international conferences (# of accepted papers in CP⁴)

A conjecture in combinatorics

∞

When one splits \mathbb{N} in 2, one part must contain a Pythagorean triple

$$(a^2 = b^2 + c^2)$$

A conjecture in combinatorics

∞

When one splits \mathbb{N} in 2, one part must contain a Pythagorean triple

$$(a^2 = b^2 + c^2)$$

No known proof, puzzled mathematicians for decades (one offered a 100 \$ reward)

A conjecture in combinatorics

∞

When one splits \mathbb{N} in 2, one part must contain a Pythagorean triple

$$(a^2 = b^2 + c^2)$$

No known proof, puzzled mathematicians for decades (one offered a 100 \$ reward)

SAT solver proof^{14,22}

200TB proof, compressed to 86GB (stronger proof system)^a

^aOliver Kullmann. “The Science of Brute Force”. In: *Communications of the ACM* (2017).

Whether it's maths or not...

Size matters!

- Not only there exists true unprovable statements (in powerful enough consistent sets of axioms¹²)
- There may be true provable statements we will never be able to prove because of their extremely long proofs²⁰

Biology

- Many discrete object ($\{A, T/U, G, C\}$, amino acids, genes, alleles, enzymes...)
- Lots of experimental data

Is it bio-compatible?

Biology

- Many discrete object ($\{A, T/U, G, C\}$, amino acids, genes, alleles, enzymes...)
- Lots of experimental data

Exploiting Data + knowledge: Machine Learning

- (Stochastic) models can be built from knowledge and data
- And used to predict a “Most Likely/Optimal State” \Rightarrow easily NP-hard

Is it bio-compatible?

Biology

- Many discrete object ($\{A, T/U, G, C\}$, amino acids, genes, alleles, enzymes...)
- Lots of experimental data

Most active molecules of life

Sequence of “amino-acids”, each chosen among a set of 20 natural ones

Folding

Transporter, binder, regulator, motor, catalyst...

Hemoglobine, TAL effector, ATPase, dehydrogenases...

Most active molecules of life

Sequence of “amino-acids”, each chosen among a set of 20 natural ones

Inverse folding

Transporter, binder, regulator, motor, catalyst...

Hemoglobine, TAL effector, ATPase, dehydrogenases...

Eco-friendly chemical/structural nano-agents

- New catalysts for biomass transformation (biofuels, food and feed, cosmetics...),
- New drugs for medicine
- New components for nanotechnologies

Eco-friendly chemical/structural nano-agents

- New catalysts for biomass transformation (biofuels, food and feed, cosmetics...),
- New drugs for medicine
- New components for nanotechnologies

20^n sequences!

intractable for experimental techniques

Eco-friendly chemical/structural nano-agents

- New catalysts for biomass transformation (biofuels, food and feed, cosmetics...),
- New drugs for medicine
- New components for nanotechnologies

20^n sequences!

intractable for experimental techniques

CPD: From bits to atoms

From information to functional matter

- mind blowing mass 3d printing-like capacities at atomic level (bacterias)
- structural and functional purposes (powerful origami)
- produced new folds,¹⁹ catalysts,³¹ nano-components³⁶

Ingredients

- Full atom model of a protein backbone (assumed to be rigid)
- Catalog of all 20 amino acids in different conformations (≈ 400 overall)
- Full atom energy function (bonds, electrostatics, solvent, statistics...)
- Maximum stability \equiv Minimum energy NP-hard²⁸

Large input (> 1GB)

NP-hard problem

Toulbar2 is able to...

- provide a proven minimum energy solution
- exhaustively enumerate sequences close to it
- in spaces of size $> 10^{200}$

Showed that an highly tuned biased Monte Carlo increasingly fails to find the optimal sequence^a

^aDavid Simoncini et al. "Guaranteed Discrete Energy Optimization on Large Protein Design Problems". In: *Journal of Chemical Theory and Computation* 11.12 (2015), pp. 5980–5989. DOI: 10.1021/acs.jctc.5b00594.

Asymptote: **Size matters!**

Asymptotic convergence can be arbitrarily slow...

- Chemical denaturation

Asymptotes: size matters

NP is not exactly as we tend to think

- AIs have made drastic progress in their logical capacities
- This progress also comes from (gradient-free) learning
- More progress is needed to supplement our limited human capacities

Synergies between Logic and Intuition

- Logic can analyze and exploit learnt models (not only Neural Nets)
- Intuition can help logic without tainting it (guidance)

We do not understand the sources of their efficiency

CDCL solvers have an expected polynomial $O(n^k)$ runtime on SAT instances whose primal (Gaifman) graph has treewidth k .

Without ever trying to compute a treewidth/decomposition (NP hard).

Go on a $n \times n$ goban is PSPACE-hard

- PSPACE-hard to decide if there is a winning strategy
- AlphaGo 0 does not solve 19×19 Go
- It plays better than humans (and that's amazing!)

Results of the SAT competition/race winners on the SAT 2009 application benchmarks, 20mn timeout

Additional ingredients (patented for some)

- (I) stops, restarts with a better understanding of the problem¹³
 - (I) forgets learnt information predicted as “useless” (Glue clauses²)
 - Lazy data structures²⁶
-
- Absolutely reliable combination of logic and intuition
 - but we don't really understand why it can be so efficient^{1,16}

Neural nets and safety critical settings

It doesn't seem too hard to fool a standard Convolutional Neural Net^a

Binarized Deep NN: ± 1 activations/weights⁶

- Lin: affine transformation with learnt binary weights (float bias).
- Bn: (Batch normalization) rescaling with learnt floats.
- Bin: binarization using the *Sign* function.

Binarized Deep NN: ± 1 activations/weights⁶

- Lin: affine transformation with learnt binary weights (float bias).
- Bn: (Batch normalization) rescaling with learnt floats.
- Bin: binarization using the *Sign* function.

A learnt block can be described as a SAT^a formula

(SMT(LI)¹⁷ for ReLU)

Adversarial Robustness of a classifier

A positive test input cannot be slightly modified to change class

Adversarial Robustness of a classifier

A positive test input cannot be slightly modified to change class

Certified robustness by SAT

As a SAT formula: Neural Net + input + bounded perturbation + missclassification

Adversarial Robustness of a classifier

A positive test input cannot be slightly modified to change class

Certified robustness by SAT

As a SAT formula: Neural Net + input + bounded perturbation + missclassification

- MNIST dataset, 4 blocks BNN with 100 to 200 neurons per layer, L_∞ norm
- Millions of clauses: Glucose² certifies (non) robustness for most input in $< 5'$ CPU time

SVM
Neural nets

Optimization + decomposable probability distribution

(Semi-CRF)²¹

- Derived from an actual human processor (S. Rumbauts, PhD)^a
- Discriminative learning (don't try to model evidence!)
- Optimizes an empirical loss function (performance on a testing set: quality is crucial)
