HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

For many plants, including citrus (**Figure 1**), reticulate evolution results in admixed mosaics of large genomic fragments from the ancestral taxa. For those plants, we developed a pipeline called **TraceAncestor** in order to infer phylogenomic karyotypes from GBS or re-sequencing sequence data and diagnostic SNPs (DSNPs) of the ancestral taxa.

**TraceAncestor** is based on the relative read numbers of ancestral alleles in successive genomic windows (**Figure 2**). It allows the user to define the number of DSNPs per window, the sequencing error rate and the threshold for LOD values of the maximum likelihood test. There is no limit to the number of ancestral taxa considered (which is automatically defined by the reference matrix of DSNPs).

**TraceAncestor** allowed revealing for the first time the origin and phylogenomic karyotypes of several cultivated Citrus (Ahmed et al. 2019) such as diploid bergamot Citrus bergamia, and triploid ‘Tahiti’ lime, C. latifolia (**Figure 3**). This work was supported by the FEDER Guadeloupe ‘CAVALBIO’ project and the Agropolis Fondation ‘GenomeHarvest’ project (ID 1504-006, ‘Investissements d’avenir’ programme, Labex Agro:ANR-10-LABX-0001-01).

**Figure 1**: The Citrus genus, an example of reticulate evolution coupled with reproductive features, limiting further interspecific recombinations.

**Figure 2**: Example of local ancestor allele dose estimation for a triploid accession. (**A**) Definition of non-overlapping windows of ten DSNPs for each ancestral taxon: **w**, window of ten DSNPs. (**B**) Number of reads of the ancestor allele / number of reads of the other allele. (**C**) Estimation of allelic dosage of each ancestor per window of ten DSNPs. (**D**) Division of the chromosome into non-overlapping windows of 100 kb. (**E**) If the sum of allelic dosage of the four classes of DSNPs is different from the expected ploidy (here 3) → indeterminacy (grey). (**F**) Unphased karyotype automatic drawings.

**Figure 3**: Triploid ‘Tahiti’ lime and diploid Bergamot Karyotypes.

This pipeline is available as a Galaxy workflow at: [http://galaxy.southgreen.fr/galaxy/](http://galaxy.southgreen.fr/galaxy/) and for download at: [https://github.com/SouthGreenPlatform/galaxy-swappers/tree/master/Galaxy_SouthGreen/traceancestor](https://github.com/SouthGreenPlatform/galaxy-swappers/tree/master/Galaxy_SouthGreen/traceancestor)
