# Wine industry: key domain of research on agriculture and climate change

#### **Economic and cultural importance of Wine in France**

- 15% of value of French agricultural production, 250 000 jobs
- € 11 billions in export (2013), second export item
- Externalities on tourism, contribution to French culture...

### Wine production is very sensitiv to climate

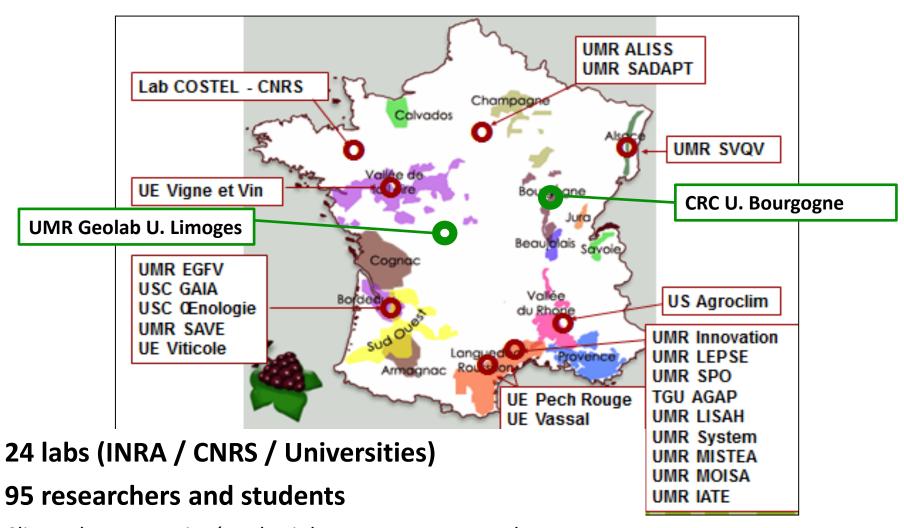

- Climate conditions affect both grape yield and wine quality
- wines are diferenciated by climate conditions (terroir, vintage)
- recognised as « witness of CC » (harvest dates...)

### Wine industry raises key scientific issues on adaptation

- Perennial crop: short and long term strategies
- Complex interactions in the value chain, numerous levers
- Institutions (GI) codify practices, innovation and location...

## LACCAVE project (2012-2016) (N. Ollat, J.-M.Touzard)

- Impacts of climate change on vine and wine
- solutions for adaptation in the wine industry

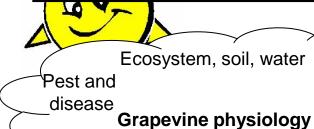

Climatology, genetic, écophysiology, agronomy, œnology, économics, sociology....

Rise in variability and extrem events

Rise in average temperature

Dryness, change in pluviometry distribution

Microflora

Different scales and combinations of impacts (regional climatic scenarios)

Viticultural agrosystems

Grape

Wine making processes

Wine

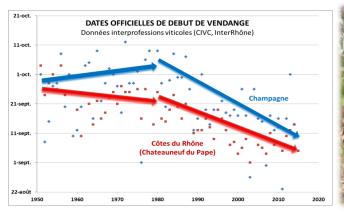

Wine marketing chains

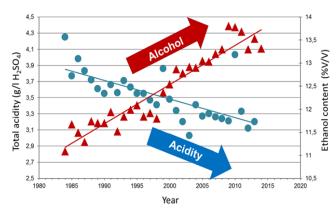

# Climate Change impacts on vine and wine

observed, simulated

(Van Leuwen, Ollat, Touzard, 2016)

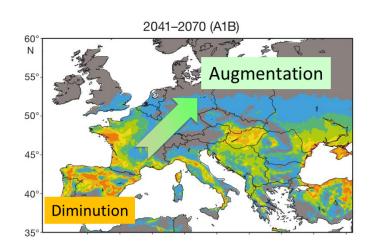

All development stages of vine are affected: earlier harvest

Water balance and stress Affect yield (and quality)

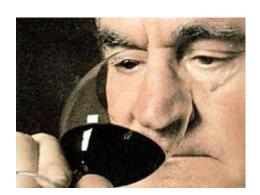

Change in berry composition

More sugar, less acidity

Modification of aromas

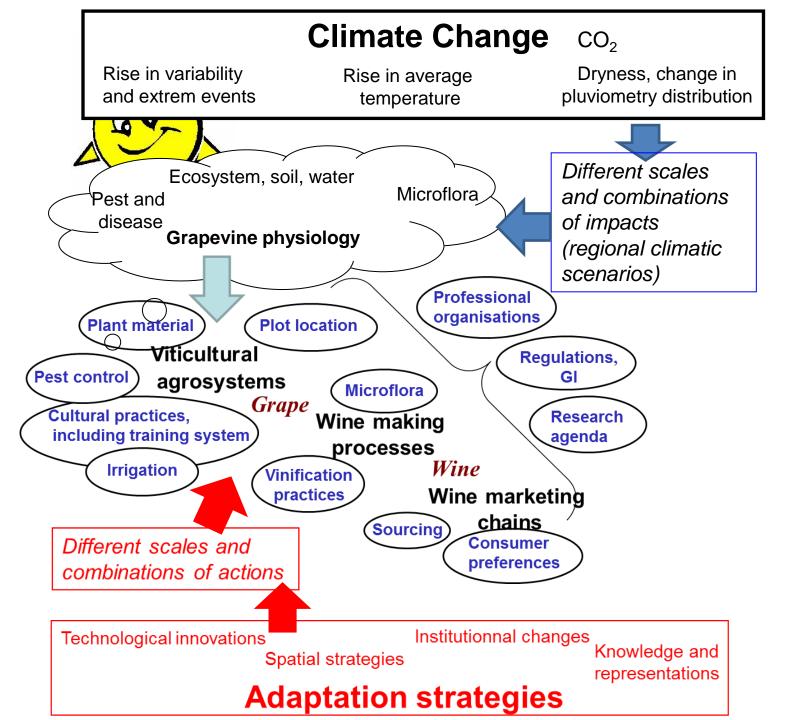

**Evolution of potential** planting areas

Economic impacts Incomes, assets, competitivness

Perception of actors Tensions on GI labels

# Focus on six main domains of adaptation

(Ollat, Touzard, Garcia de Cortazar, 2017)

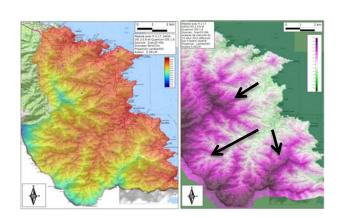

« New » vine varieties (old/foreign/created) late, resistant to drought...

Changing viticultural practices
Pruning, soil managment, irrigation
digital viticulture, agroecology

Enological innovations
To control acidity, alcohol,
temperatue, yeast

Changing the location of vine Moving up, new frontier creation of new vineyards...

Changing the institutions
Code of practices, insurance,
R&D policy

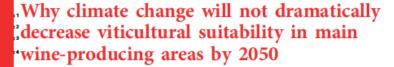

The role of consumers
Acceptance, involvement
(experimental economics)

# **Controversial simulation and PNAS publication:** geographical impact of CC on European vineyards

(Hann

areas worldwide will dramatically decrease odological flaws in ref. 1, mostly linked to (i) suitability index, (ii) underestimation of adaptations of viticulture to warmer conditions, and (iii) the inadequacy of the monthly time step in the suitability approach.

Hannah et al. (1) recently published a com- as defined by Jones (ref. 2 is the wrong cita- Syrah. High-quality viticulture is sustained in prehensive study showing substantial im- tion; this classification is given in ref. 3) and these regions despite increased temperatures pacts of climate change on viticultural suit- Gladstones [(4), not peer-reviewed]. In refs. 3 and dry farming, because of both the evolution ability, leading to potential ecological issues. and 4, groupings were constructed from em- of consumer's preferences and implementa-We agree that expansion of viticulture into pirical observations collected in premium tion of adaptative strategies by growers. new areas can lead to a decrease in biodiver- wine-growing areas and not based on grapesity and that an increase in water use for vinephysiological modeling. We argue that it growing degree days (GDDs) are computed irrigation might lead to major freshwater is very difficult to establish precise upper lim- and subsequently compared with varietal conservation impacts. However, we disagree its by variety for growing high-quality wines maturity groupings from ref. 4, wherein with the alarming statement that suitability and that those given in ref. 3 are underesti- GDDs are capped at 19 °C [called biologifor winegrowing of main wine-producing mated. To illustrate this aspect, we compare cally effective degree days (BEDDs)]. As average growing season temperature (AvGST) over the next 40 y. We point out major meth- from 1971 to 1999 and from 2000 to 2012 for difference between BEDDs and noncapped three major wine-growing regions: Rhein- GDDs increases up to several hundreds of the misuse of bibliographical data to compute gau (Germany), Burgundy (France), and DDs. Hence, projected ripeness in ref. 1 is Rhone Valley (France; Fig. 1). Burgundy weeks ahead of modeled ripeness, when que continues to grow great wines with Pinot ref. 4 would have been properly applied. noir since 2000, although AvGST is already This subsequently results in much higher above the upper temperature limit cited temperatures during the projected last The suitability index in ref. 1 is mainly in ref. 3. The same is true for Rheingau month before ripeness, which was the main

A major flaw in ref. 1 is that noncapped the climate becomes warmer, the seasonal compiled from grapevine maturity groupings with Pinot Gris and the Rhone Valley with criterion used in ref. 1 to consider a region suitable for viticulture or not.

> A monthly time step was used in ref. 1. One month accounts for up to 270 BEDDs. When varieties are compared in maturity groupings that are 50 DDs apart, this resolution is too crude to yield reliable maturity predictions.

Although Hannah et al. make an interesting point in predicting which regions worldwide may become suitable for viticulture by 2050 as a consequence of climate change, but in estimating related potential ecological impact, their conclusion that most of the present wine-growing regions will become un suitable for viticulture is er-

# A prospective study on the French Wine System

- To capitalise on the multidisciplinary LACCAVE project and to explore combinations of different levers of adaptation...
- To provide different scenarios for actors of the French wine industry by 2050, not only the catastrophic one
- To test a new prospective methodology focusing on adaptation pathways
- To build common vision and develop learning networks between researchers and stakeholders of the industry

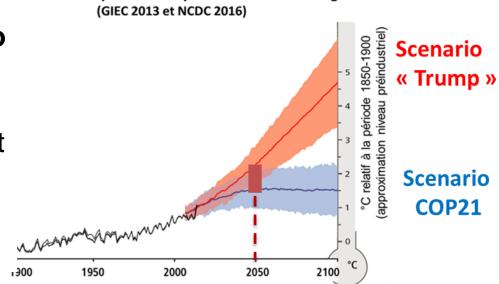

## A two steps approach

- 2014-16: top down approach driven by a group of experts
- 2016-18: bottom up participatory approach with stakeholders

# Choice of horizon 2050, assumptions on climatic context and impacts on vine and wine

- around + 2°C
- no radical change in rainfall but increasing water need for vine
- "moderate" increase of variability (extreme events)

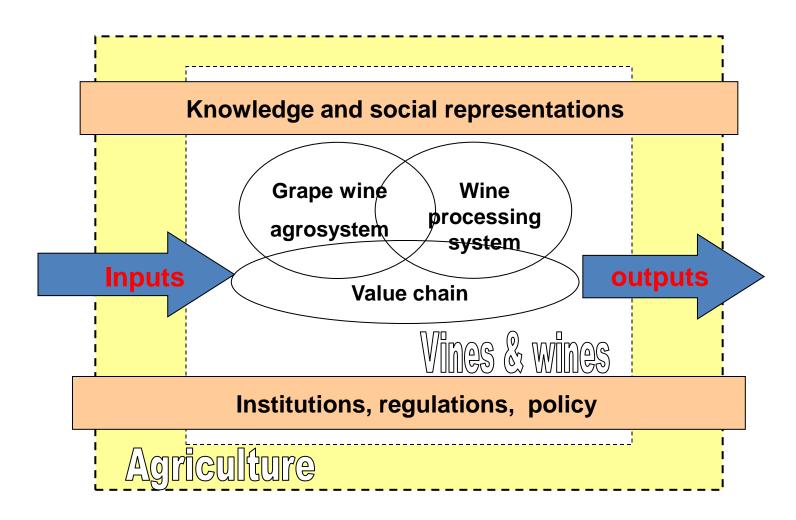

Evolution de la température moyenne de la surface du globe

## Different impacts of CC according to a north-south gradient:

- In the north: maturity and productivity often favored by CC potential changes in wine caracteristics (acidity) main problem: increased disease pressure
- In **the south**: drought and water balance deficit lack of freshness during maturity stage potential changes in wine (excess of alcohol degree)

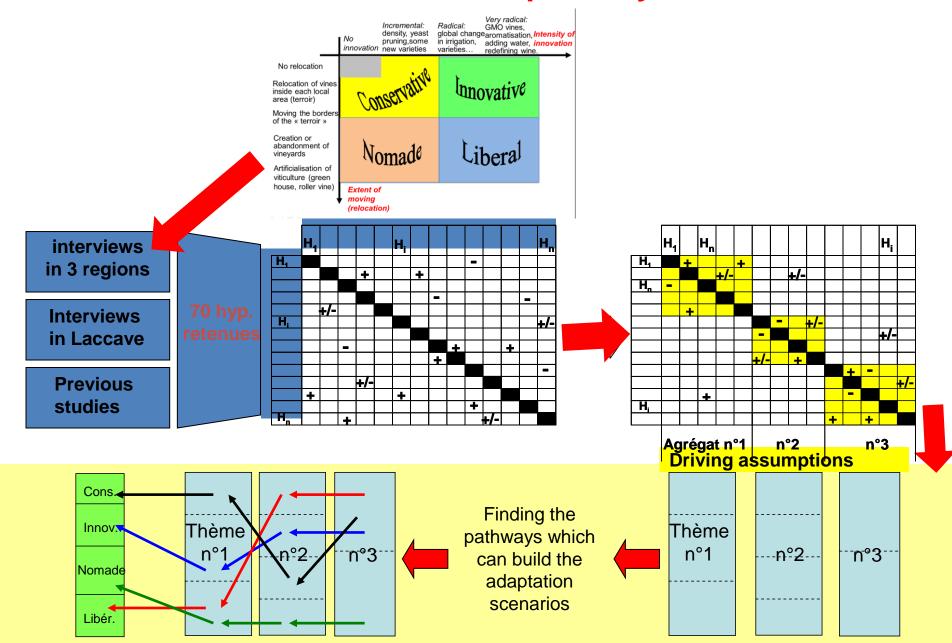

## Systemic representation of the French wine sector

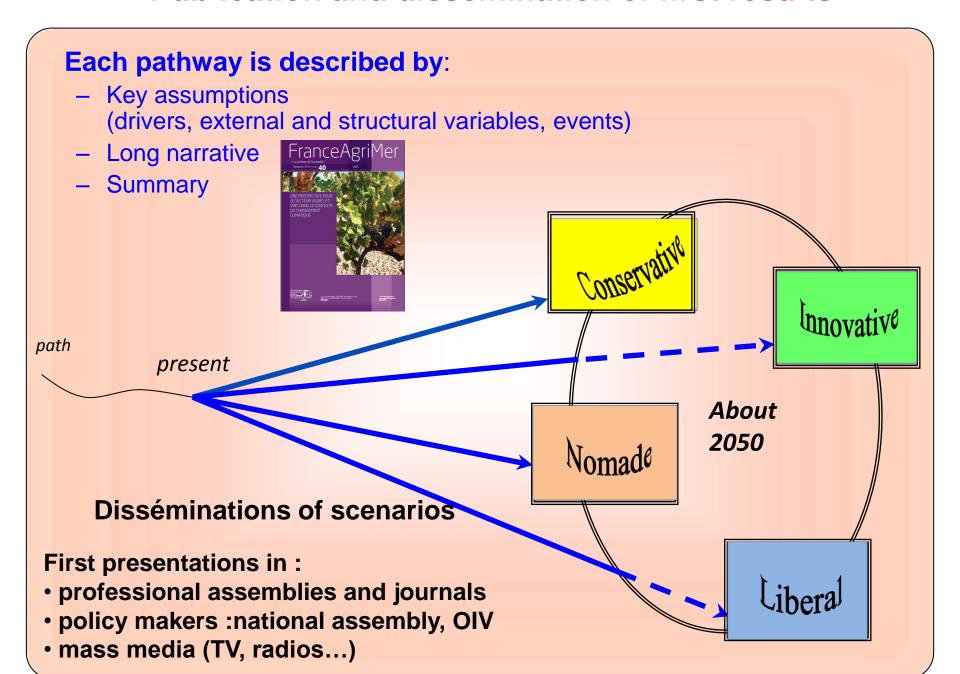

Actors, Technics and product, Flows

First construction of four scenarios by crossing two main dimensions of adaptation Very radical: Incremental: Radical: GMO vines, global changearomatisation, Intensity of density, yeast No pruning, some in irrigation, adding water, innovation innovation new varieties varieties... redefining wine. No relocation Relocation of vines Innovative inside each local area (terroir) Moving the borders of the « terroir » Creation or abandonment of Nomade Libera vineyards Artificialisation of viticulture (green house, roller vine) Institutional Extent of Change & moving knowledge (relocation)

# Collection of data, selection of assumptions, construction of pathways

## Publication and dissemination of first results

### Four pathways preferentially leading to the four adaptation scenarios.

#### ...Conservative

Facing pressure from i) health authorities on alcoholic drinks and ii) agricultural policy giving priority to land and water use to food crops, the wine industry, which is weakly linked to the research, perceives CC as a threat. Promoting the cultural and landscape image, the wine producers try to distinguish wine from other alcoholic drinks, but Gis wines and their regions become "island of resistance", for a viticulture which starts to decrease in volume, area and value. This strategy becomes difficult to follow as CC is more intense.

#### ...Nomade

In the context of i) restrictive policy on alcohol and ii) a research focusing on the reduction of inputs use (pesticides and water), the consumers are aware to find the taste of the origin of the wines. Without sufficient knowledge to develop at large scale a "precision viticulture", the wine producers find difficulty to reduce the variability of the wine quality. Some of them, joined by new investors, try to find "elsewhere" the reputation of the appellations, while others move to the plains where water is still available for irrigation.

#### ...Innovative

Environmental, health and CC issues become an opportunity for the wine industry by integrating more and more innovation from the vineyard to the cellar. This development is allowed by a favorable and cooperative context which allow to maintain a relative stability between the French wine regions. This innovative context also relies on i) a voluntary research and innovation policy (private/public partnerships), ii) a binding policy on agricultural land management in the EU (zoning) and iii) more liberal conditions in terms of winemaking.

#### ....Liberal

In a more liberal and relatively favorable context, new international investors, mainly in blending & trading, lead to the redistribution of viticulture towards three kinds of areas: irrigated areas, residual inherited terroirs, new vineyards benefiting from climate change. Some "Terroir wines" or "regional brands" are still marketed, but the supply is mainly composed of technological wines controlled by few wine merchants. Climatic instability, competition between vineyards, deregulation and the power of international traders weaken the wine producers which are disorganized and can not fully benefit from R&D

### Second step (2017-2018): towards a participatory approach

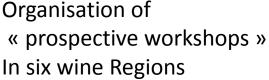

#### **Forum Prospective**

La filière Vigne et Vin dans le contexte du changement climatique **Jeudi 24 Novembre 2016** // **9:00** 

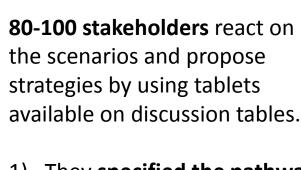

INRA, Château Couhins Villenave d'Ornon

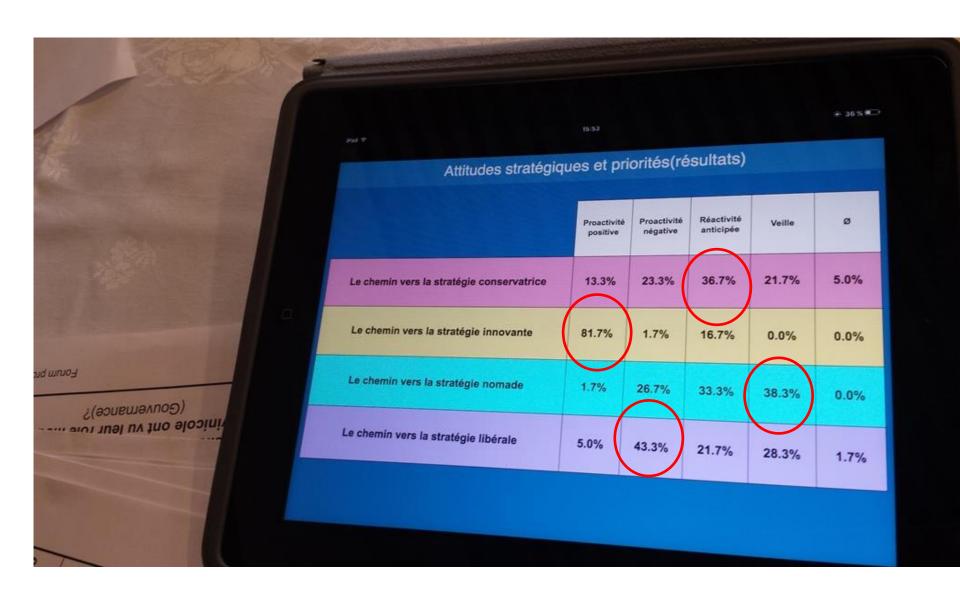

Bordeaux/Cognac Champagne Bourgundy Languedoc Rhône Valley Alsace

- They specified the pathways leading to the four scenarios and explore their impacts
- They constructed strategies to promote or avoid them

### Some results: strategic attitude on each scenario/pathway

#### ...Conservative

Positive proactivity: 10-23% negative proactivity: 15-32% anticipated reactivity: 21-37% Strategic watch: 17-28%

Continuation of current adaptation strategies, with diversity of strategic attitude, and questions

Available in many regions if climate remains under 2C, but decrease of competitiveness.

Consumers keep preference on terroir and accept impact of CC on wine quality

#### ...Nomade

Positive proactivity: 0-6% negative proactivity: 15-32% anticipated reactivity: 24-41% Strategic watch: 35-49%

Difficult to imagine, combination of threats and opportunities...

New actors investing in the wine production

New notions of « terroir » as principe of action

Consumers still purchasing specific and local wines

#### ...Innovative

Positive proactivity: 56-86 % negative proactivity: 1-17% anticipated reactivity: 9-24% Strategic watch: 0-14%

Innovating to stay in current wine areas, to protect multiple investments and specific assets

Alliance between producers, research, consumers questioning cost and orientation of investment

Need of climate stabilization (located investment).

Consumers may accept technologies

#### ....Liberal

Positive proactivity: 5-16% negative proactivity: 41-72% anticipated reactivity: 18-31%

Strategic watch: 12-22%

The end of current wine world, but a possible world!

Wine producers are excluded from the governance, dominated by wine merchants, blenders, retailers who are taking advantage from CC...

Consumers consider wine as industrial beverage

## Main outcomes and impacts of the prospective

- Sucessfull learning tool in each wine region leading to awareness, capacity building, collective action that help the co-construction of climate strategy in regional vineyards
- Political tool: creation of a « national group on wine and CC » including the main wine organisations and administrations, and presentation at OIV (international organisation of vine and wine)
- **Innovation booster**: promoted by UE as an innovation for climate smart agriculture (Climate KIC)
- Methodological outcomes: interest of food system approach and prospective focusing contribution to the prospective methods for adaptation to CC on pathways
- Contribution to the Inra research agenda: new topics (soil, innovative systems, landscaping...) and new participatory method (living lab)
- Impact on the society (TV documentaries, national and international medias)

# **Construction of shared messages**

- Adaptation strategies could be reasonably implemented in all French vineyards if global warming stays below 2°C
- Reduction of GHG emission is imperative, "if you like wine you must support Paris COP21 agreements"
- No single solution, but different combinations of technical innovations, spatial strategies and institutional changes.
- The integration of solutions must be elaborated considering the value chain, including the consumer preferences
- The adaptation strategies must be coordinated at local and regional levels where climate impacts are specific and where the use of resources can be optimized
- The best way to adapt is based on collaborative capacity between researchers and stakeholders, at regional and inter regional levels
- Prospective can be successful tool for climate smart agriculture
