Submitted on 5 Jun 2020

HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Training Course Programme

Livestock and Climate Change

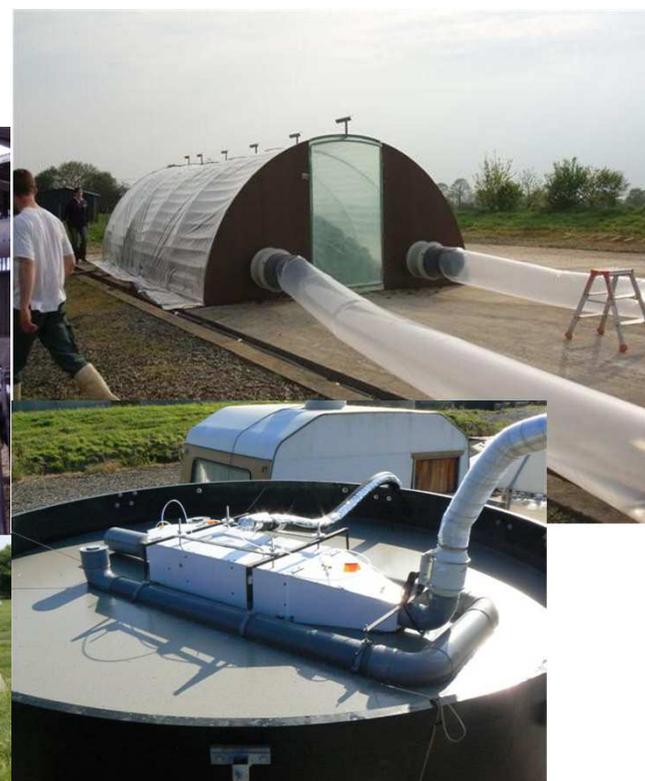

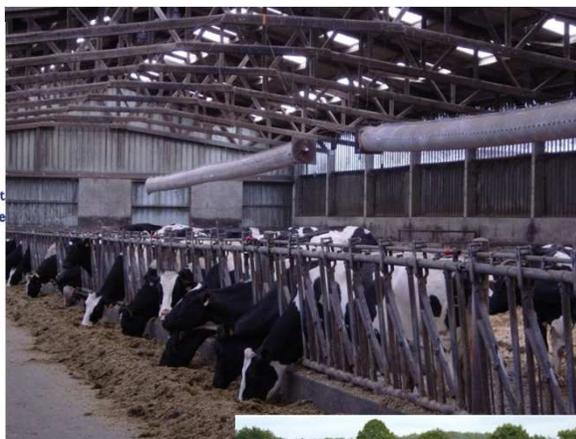

12th-14th January 2015, Dakar

Principles of emissions from housing, storage, spreading, grazing

Paul Robin, Mélynda Hassouna

Outlines

- **Introduction:** 3 basic questions (gas, system, trend)
- **Diversity of animal farms:** size, species, etc.
- **Emitting intensity:** activity, duration, interactions
- **Uncertainty evaluation**
- **Take home messages**

12th-14th January 2015, Dakar

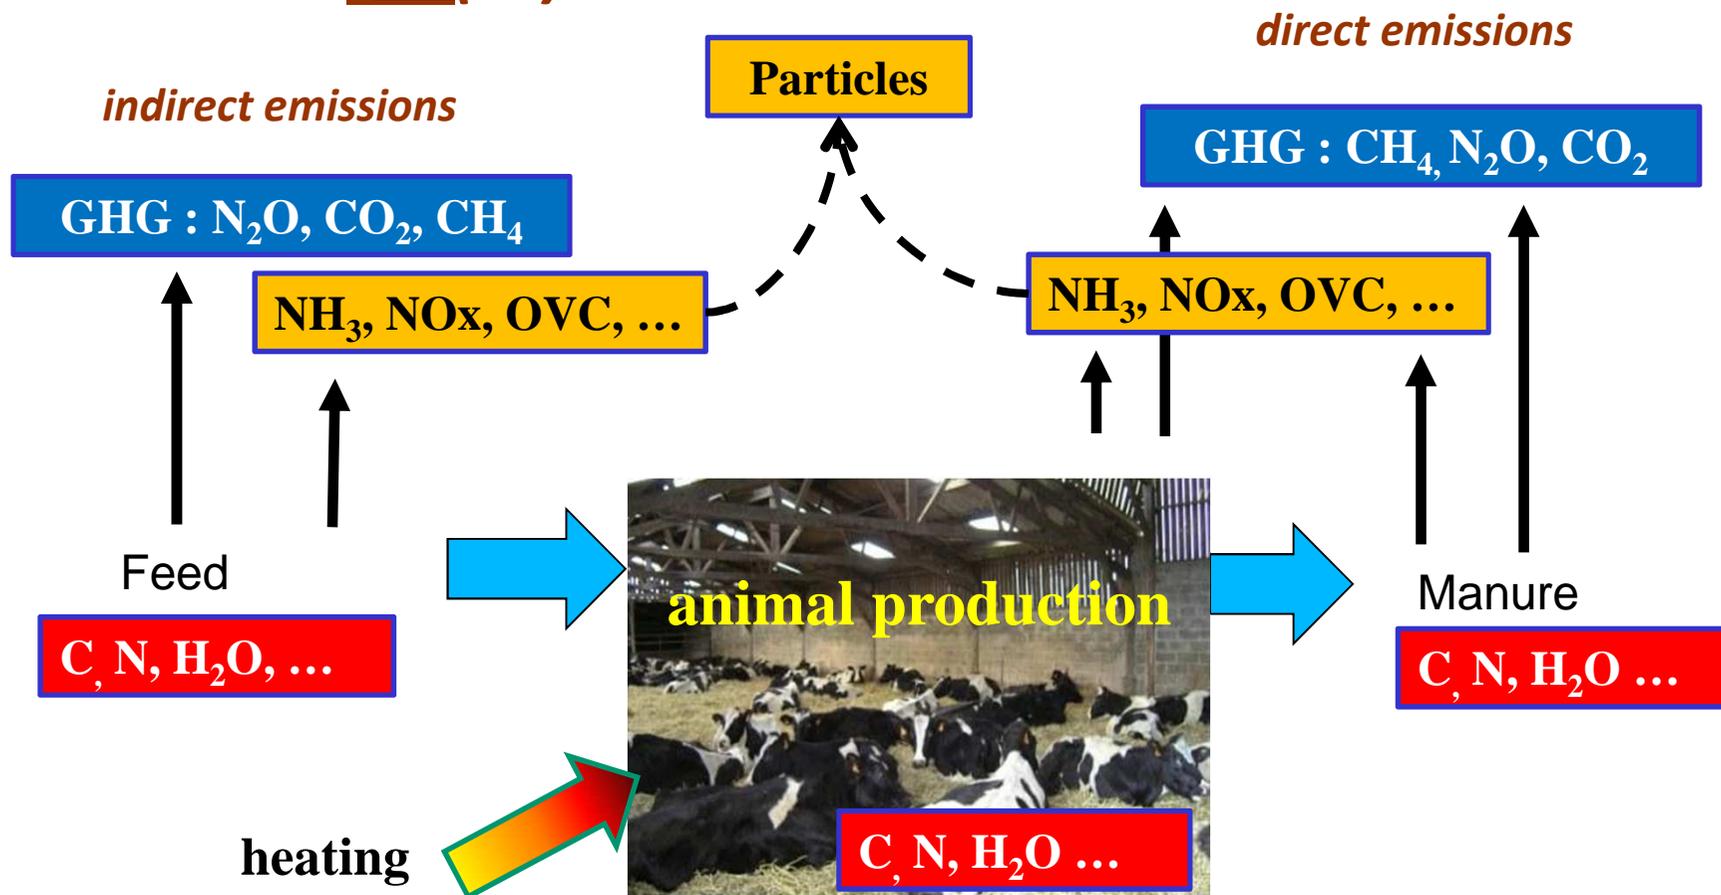

ALIMENTATION

ENVIRONMENT

Introduction

1. Which gas(es)?

Question 1 = input efficiency or polluting gases?

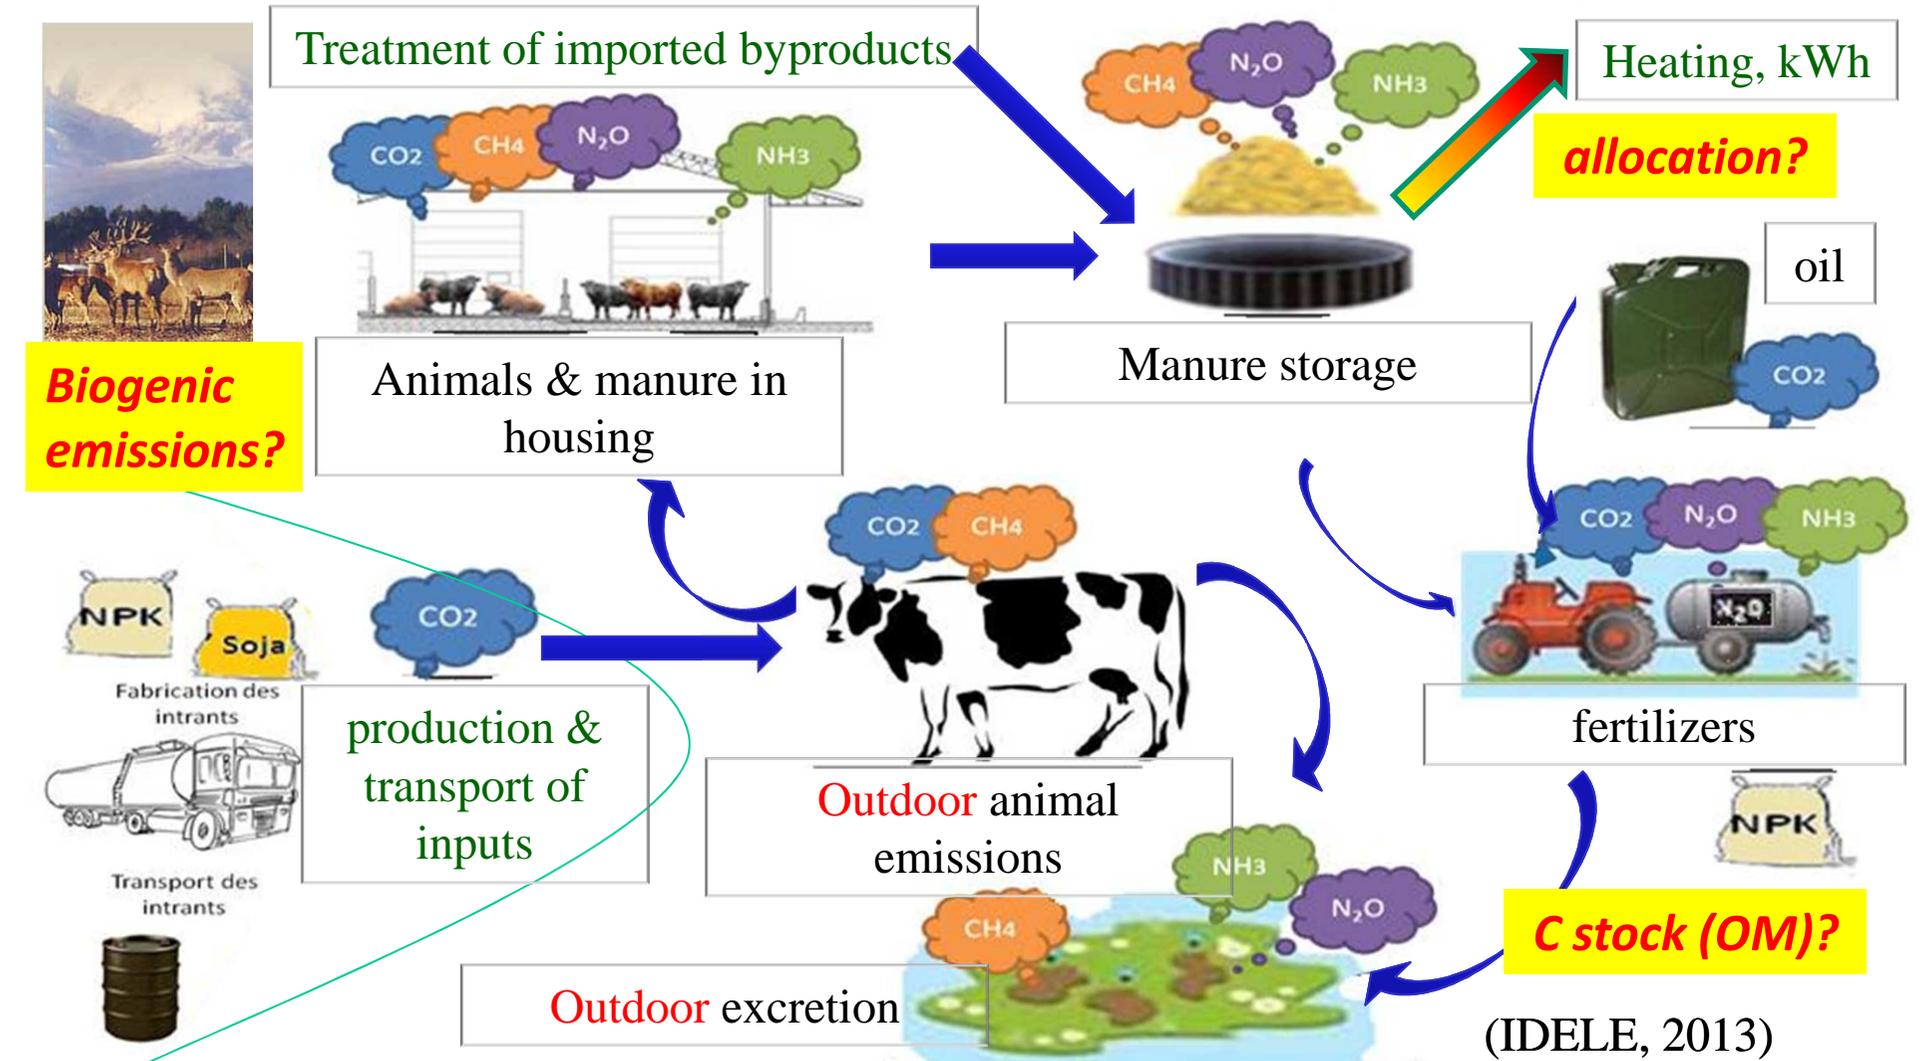

Question 2 = local or global use?

Introduction

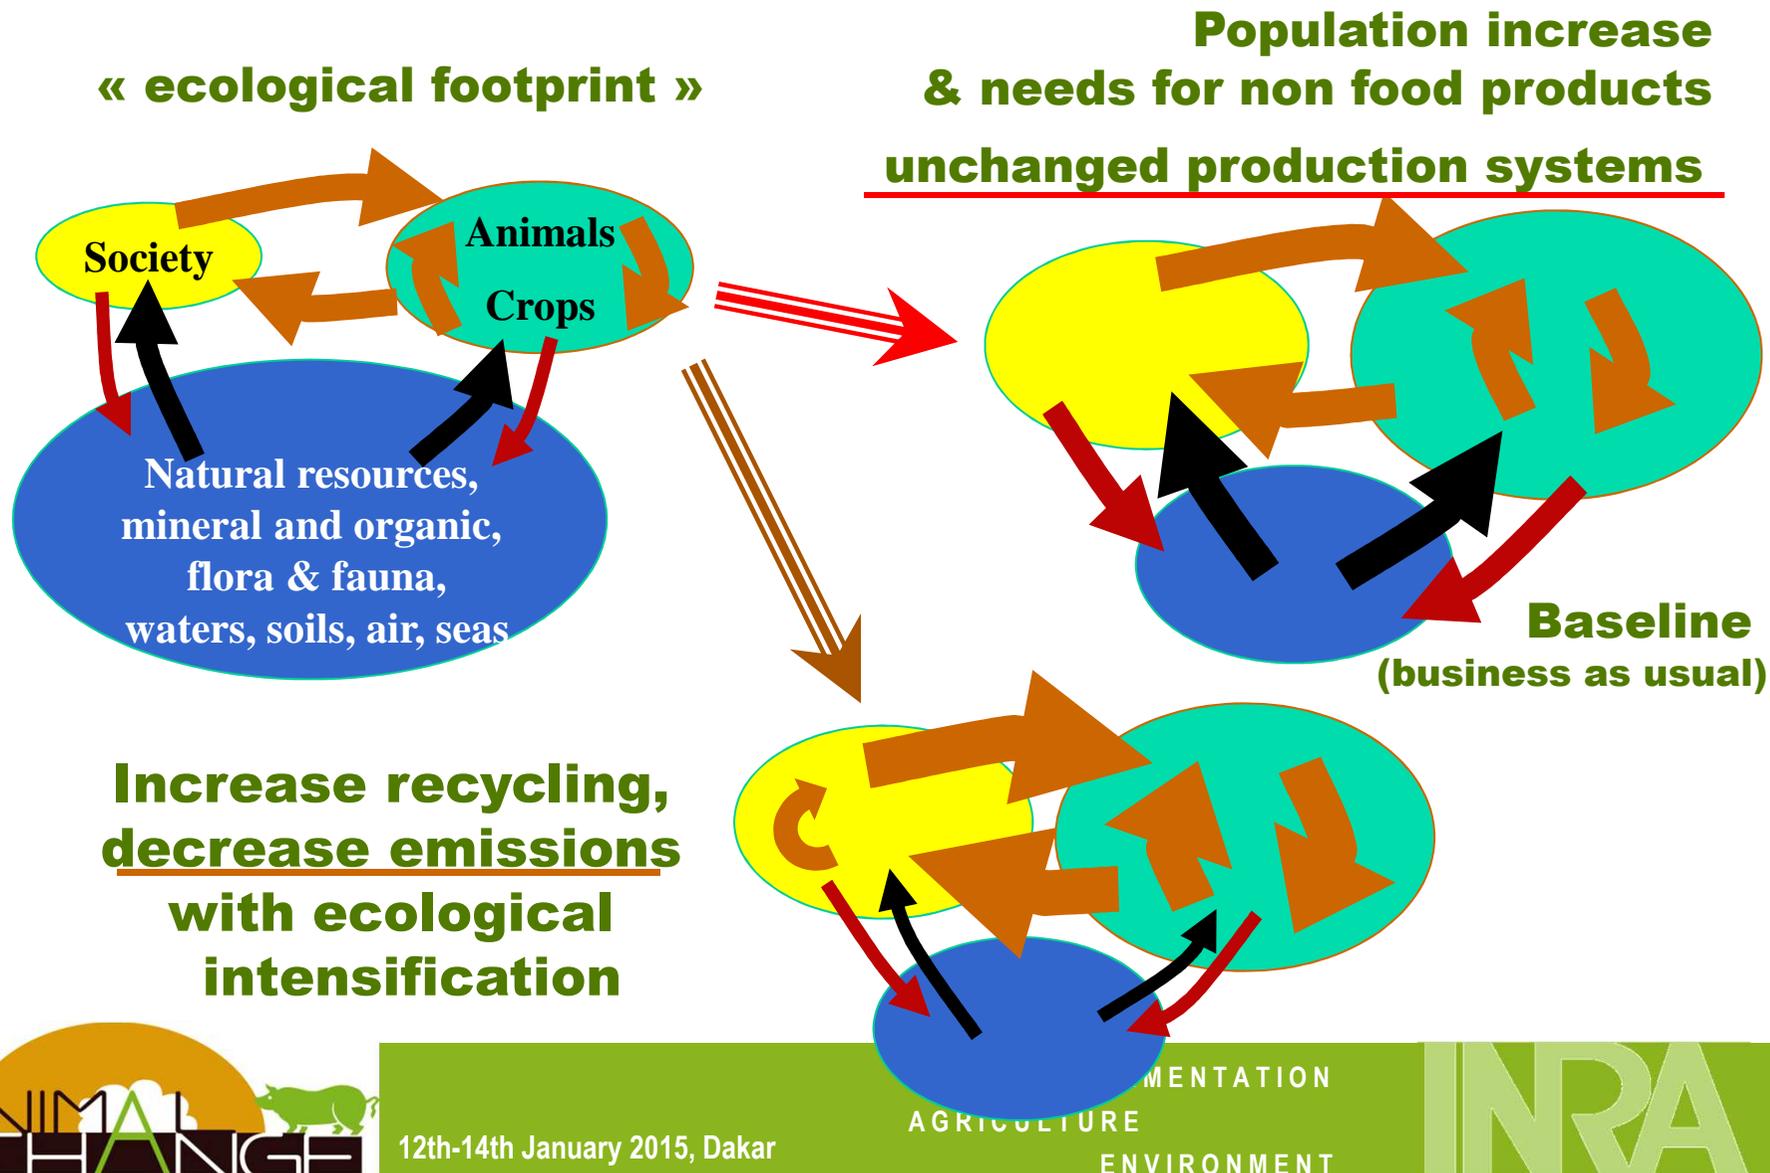

Thresholds for Life Cycle Assessment/multicriteria comparisons?

2. Pollution transfer/ complementarity: which system?

Introduction

3. Which trend per gas and per system?

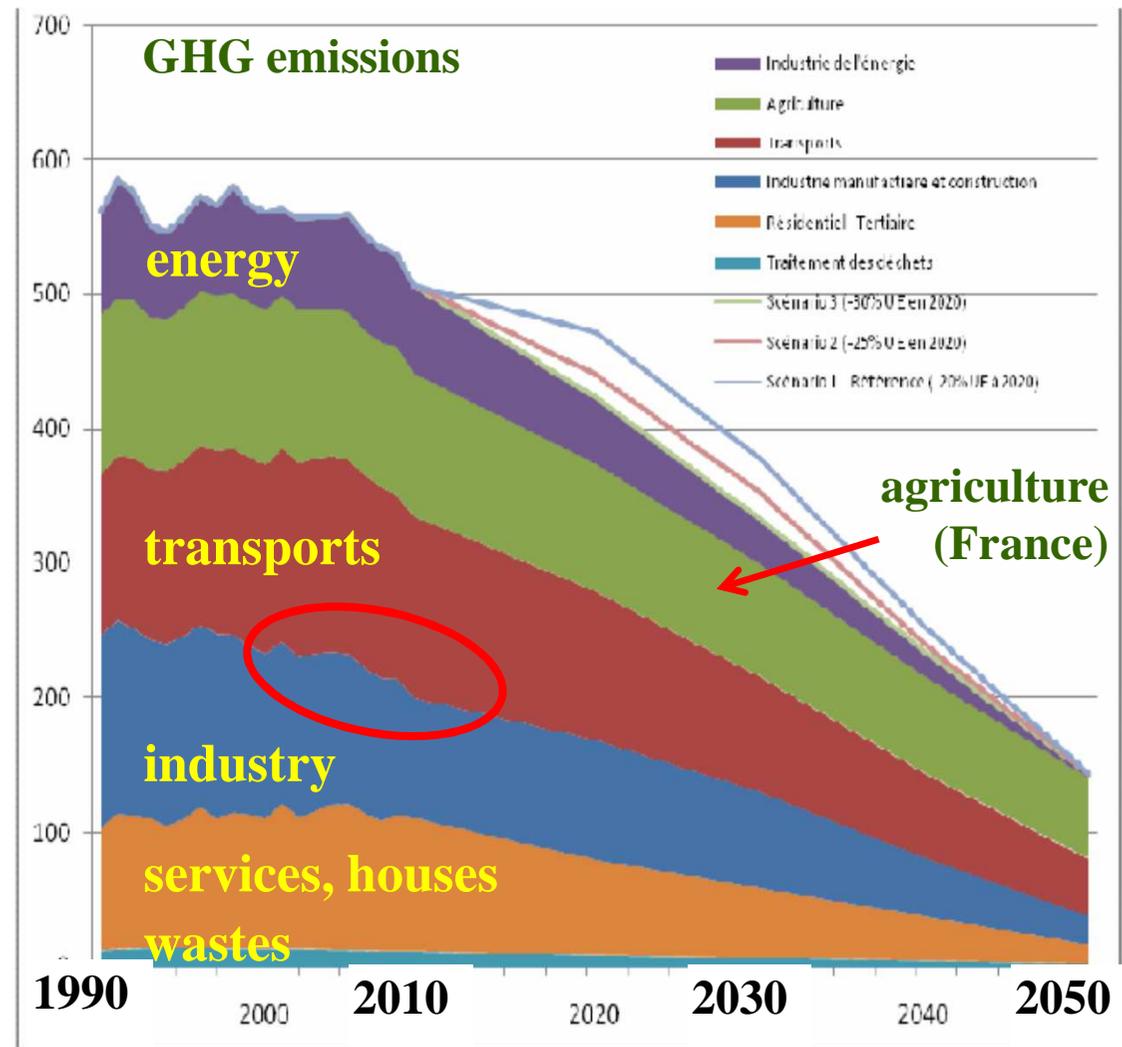

Introduction

3. Which trend per gas and per system?

- Expected decrease of the emissions of transports, industry, energy sectors

=> Increase in agricultural emissions: percentage (France); value (World)

Which trend compared to baseline and to the trend of other sectors?

Source Trajectoires 2020-2050 (De Perthuis, 2011)

Diversity of animal farms

Existing knowledge of GHG emissions from current animal farming systems?

 *Factors that may affect GHG emissions*

→ Environment

- Various climates
- Natural/urban landscape
- Different animal species/commercialization

ducks

turkeys

cattle

wild

etc...

ALIMENTATION
CULTURE
ENVIRONMENT

Diversity of animal farms

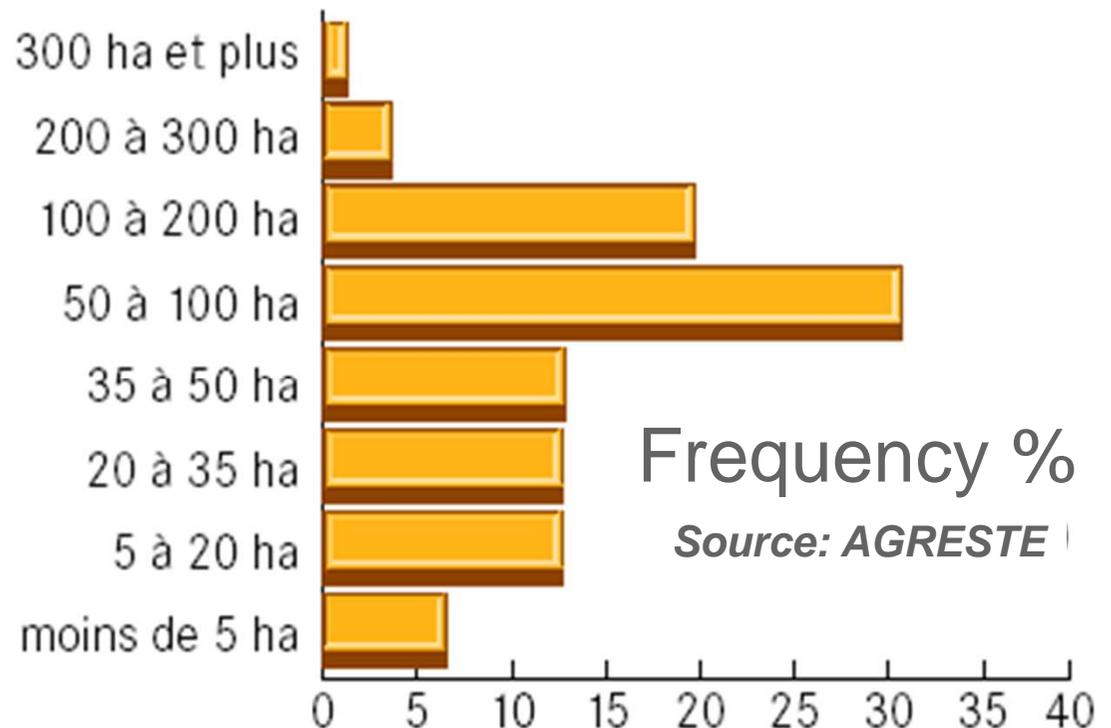

Existing knowledge of GHG emissions from current animal farming systems?

→ Environment

→ farm size:

- * 86,000 very small farms within 262,000 animal farms
- * varying crop area

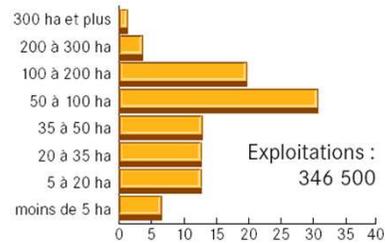

Diversity of animal farms

Existing knowledge of GHG emissions from current animal farming systems?

→ Environment

→ farm size

→ building / outdoor

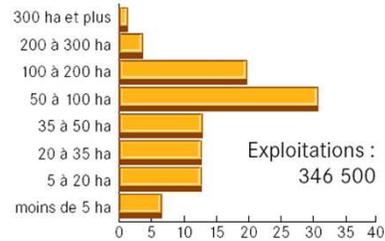

Diversity of animal farms

Existing knowledge of GHG emissions from current animal farming systems?

→ Environment

→ farm size

→ building / outdoor

→ manure management

Dried droplets

slurry

Solid manure

Diversity of animal farms

Existing knowledge of GHG emissions from current animal farming systems?

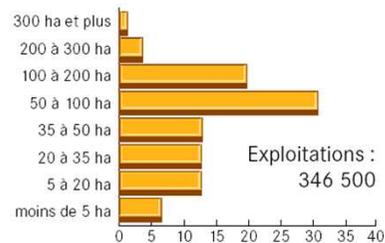

→ Environment

→ farm size

→ building / outdoor

→ manure management

→ **Animal house management: rearing, feeding, ventilation**

- **animal density: 7 – 26 birds/m²**
- **dry/wet feed, feed size**
- **natural / mechanical ventilation**

Diversity of animal farms

Existing knowledge of GHG emissions from current animal farming systems?

→ Environment

→ farm size

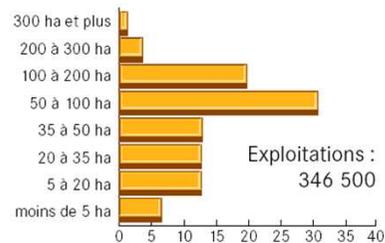

→ building / outdoor

→ manure management

→ Animal house management

→ feed inputs / produced

→ industry integrated

→ For all systems, if “organic”:

- small size
- low animal density
- no chemicals
- local organic feed production

Diversity of animal farms

Existing knowledge of GHG emissions from current animal farming systems?

→ Environment

→ farm size

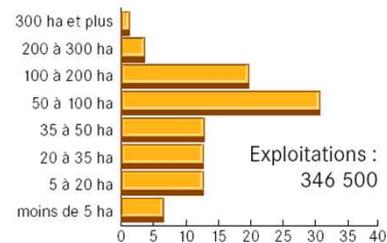

→ building / outdoor

→ manure management

→ Animal house management

→ feed inputs / produced

→ industry integrated

Challenge:

improve knowledge transfer between farmers to accelerate adaptation and limit errors

Conclusions:

- **Difficulties to have BMP that will achieve the same results in all animal production systems**
- **Difficulties to decrease emissions/improve recycling in all systems**

Emitting intensity

1. Increase in biological activity increases gas losses: recycling or pollution?

- ❖ Increase in aerobic activity: CO₂, H₂O losses (N₂ ?)
- ❖ Increase in anaerobic activity: CH₄ increase => collected?
- ❖ Decrease in biological activity or size of the system increase the climate influence (température, precipitations) on the emissions

- ❖ e.g. stocking density (or daily gain) increase heat production and water input per m² => litter more anaerobic
- ❖ e.g. compost stabilization induce emission decrease

Emitting intensity

2. Increase of process duration increases gas losses and climate interactions

- ❖ Short term operations have usually a small impact on overall GHG emissions
- ❖ During long term processes special attention must be given to GHG emissions

- ❖ Compost turning itself has a small impact on emission, induced processes should be considered
- ❖ Long term compost stabilization can induce emission of N_2O or CH_4 when C and H_2O (moisture) are not adequate
- ❖ Litter accumulation for several poultry batches increase emissions (idem for cattle manure)
- ❖ Excretion removal from animal house reduce emissions

Emitting intensity

3. Dilution of nutrients and increase in biological interactions/diversity reduce emissions

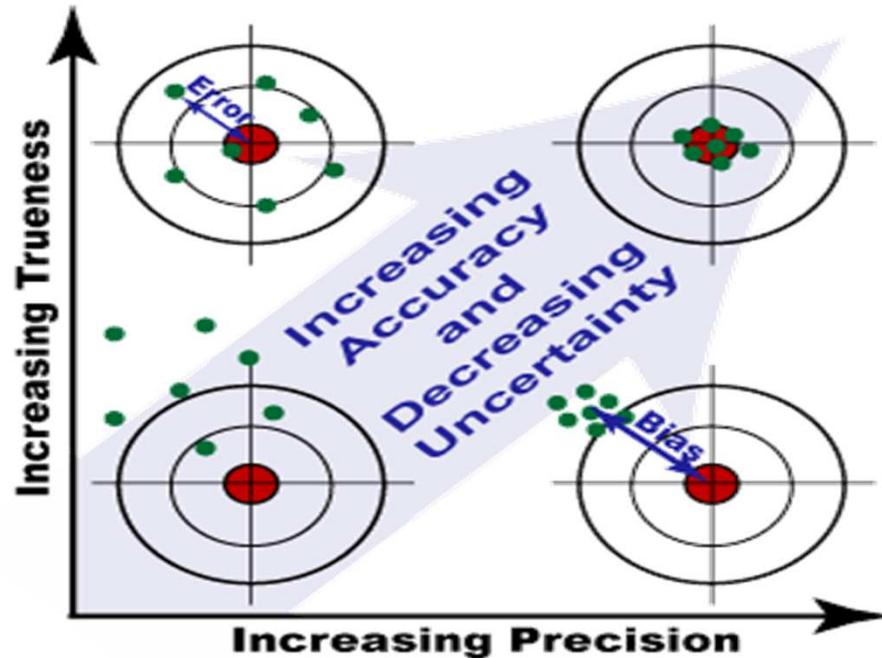

- ❖ Emitting processes are not governed in the same way for extensive/intensive animal groups (e.g. house/grazing)
- ❖ Increasing biological interactions in concentrated substrates can help to decrease emissions but increases the risk

- ❖ Grazing/outdoor animals have different impact depending on local concentration: increase in stocking density and duration increase emissions
- ❖ Increasing interactions assumes that moisture-temperature-organisms are controlled by the farmer: improved skill is important to ensure reduced emissions

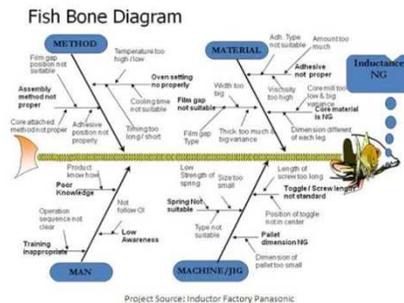

Improve uncertainty knowledge

GUM, 2008: Guide for Uncertainty Measurement

VIM : International vocabulary of metrology

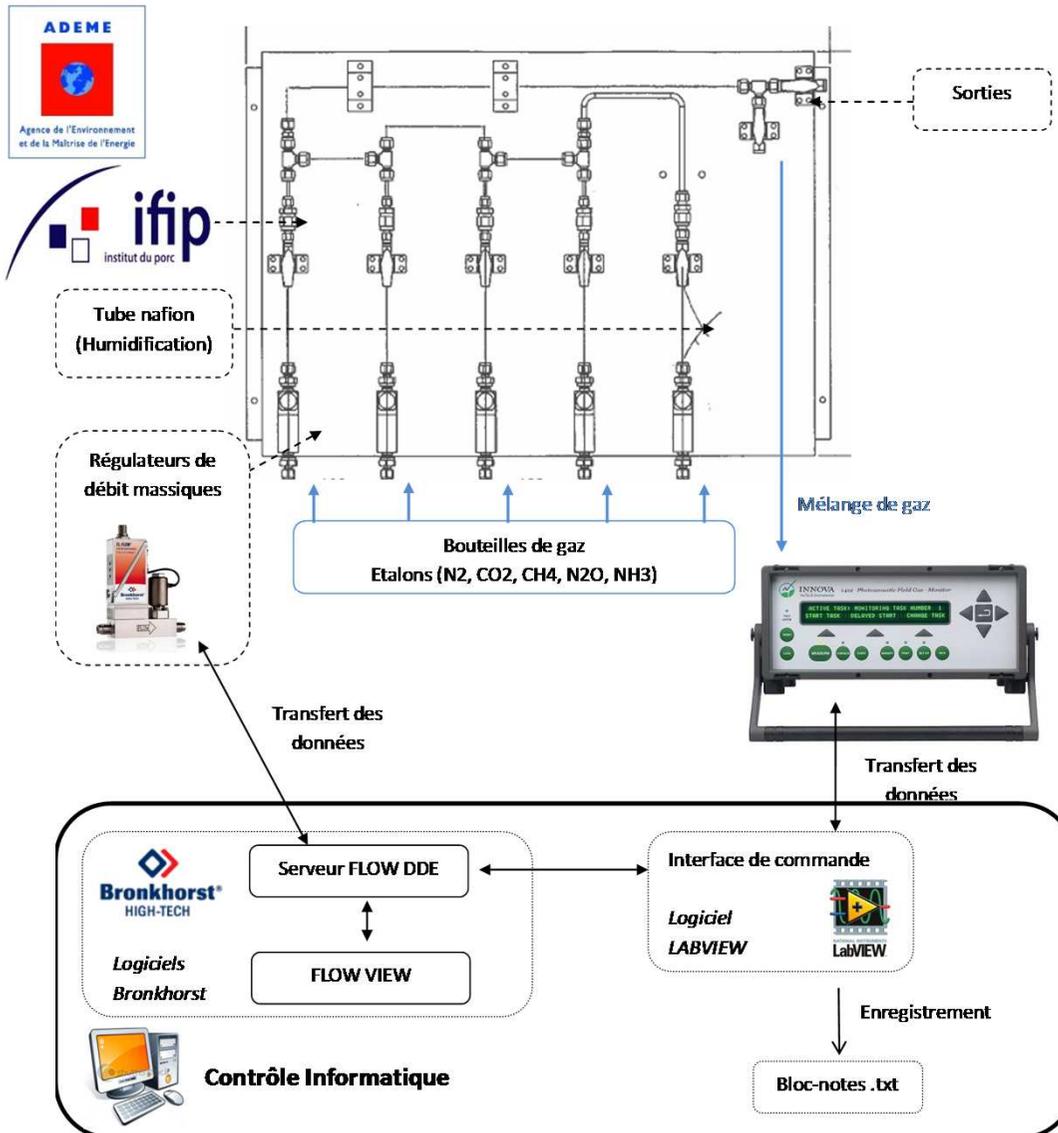

Fish bones analysis

- Uncertainty is difficult to estimate, it depends on several measuring details
- Improved description of measuring procedure can help to improve uncertainty calculations; repeated controls are necessary
- general procedures for uncertainty estimates need further work

Reduce uncertainty

Contribute to reference method and reference system

Laboratory conditions not real conditions (complex gas mixture)

Reference source

Comparison and calibration

12th-14th January 2015, Dakar

 AGRICULTURE
 ENVIRONMENT

Take back home

- Define specific objectives: which gas(es)? Which system(s)? Which trend(s)?
- Describe existing variability of chosen systems
- Identify the main factors governing **emission variability** IN FARMS (from process knowledge & observations)
- Always remember to improve uncertainty knowledge
