HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
Ecotoxicological studies need high quality measurements of chemical contamination within all compartments of the environment. In consequence, analytical laboratories must produce traceable analytical data with high level of confidence, in numerous matrices.

PLATINAAE (PLateforme d’Ingénierie en chimie Analytique pour l’Agriculture et l’Environnement) is the central platform for analytical chemistry of INRA (French National Institute for Agricultural Research) mainly dedicated to plant and soils analysis. This platform is supported by two laboratories located at Arras (LAS) and Bordeaux (USRAVE). Both are equipped with high-performance instrumentation and are accredited according to the standard ISO 17025.

PLATINAAE works essentially as a partner in research programs. The main themes investigated are environmental contamination, biogeochemical cycle of elements in various ecosystems (crops, lands, forests...), food chain or plant physiology. In these scopes, PLATINAAE participates then to numerous programs for environmental observations and experimentations, such as the ICOS Ecosystem project, the European program Biosoil, The RMQS network, the BRAMM network, or the RENECOFOR program (monitoring of French forests).
