The context

- ❖ **VegDUD: the role of vegetation in sustainable urban development**
- ❖ **Funded by the French National Research Agency (2010-2013)**
- ❖ **Understanding and quantitatively assessing the impact of vegetation in present and future urban development projects**
- ❖ **Mixed urban areas (built, unbuilt, green surfaces)**
- ❖ **Climatology, hydrology, energy control, environment**
- ❖ **Location: city of Nantes, around the permanent observation site ofIRSTV ('Pin Sec' district)**
- ❖ **Two ground and airborne measurement 'FluxSAP' campaigns: 2010, 2012**

The objectives

- ❖ **FluxSAP objective: obtain reference data**
 - ❖ for evaluating urban hydrology and microclimate models
 - ❖ for assessing quantitatively the role of vegetation on urban climate
- ❖ **FluxSAP 2010 objective: test the methods allowing**
 - ❖ to measure sensible heat and water vapour fluxes over a heterogeneous urban district
 - ❖ to spatialize the measurements, taking into account landuse heterogeneity
 - ❖ to test footprint models over an urban area

Nantes region

Erdre river

Loire river

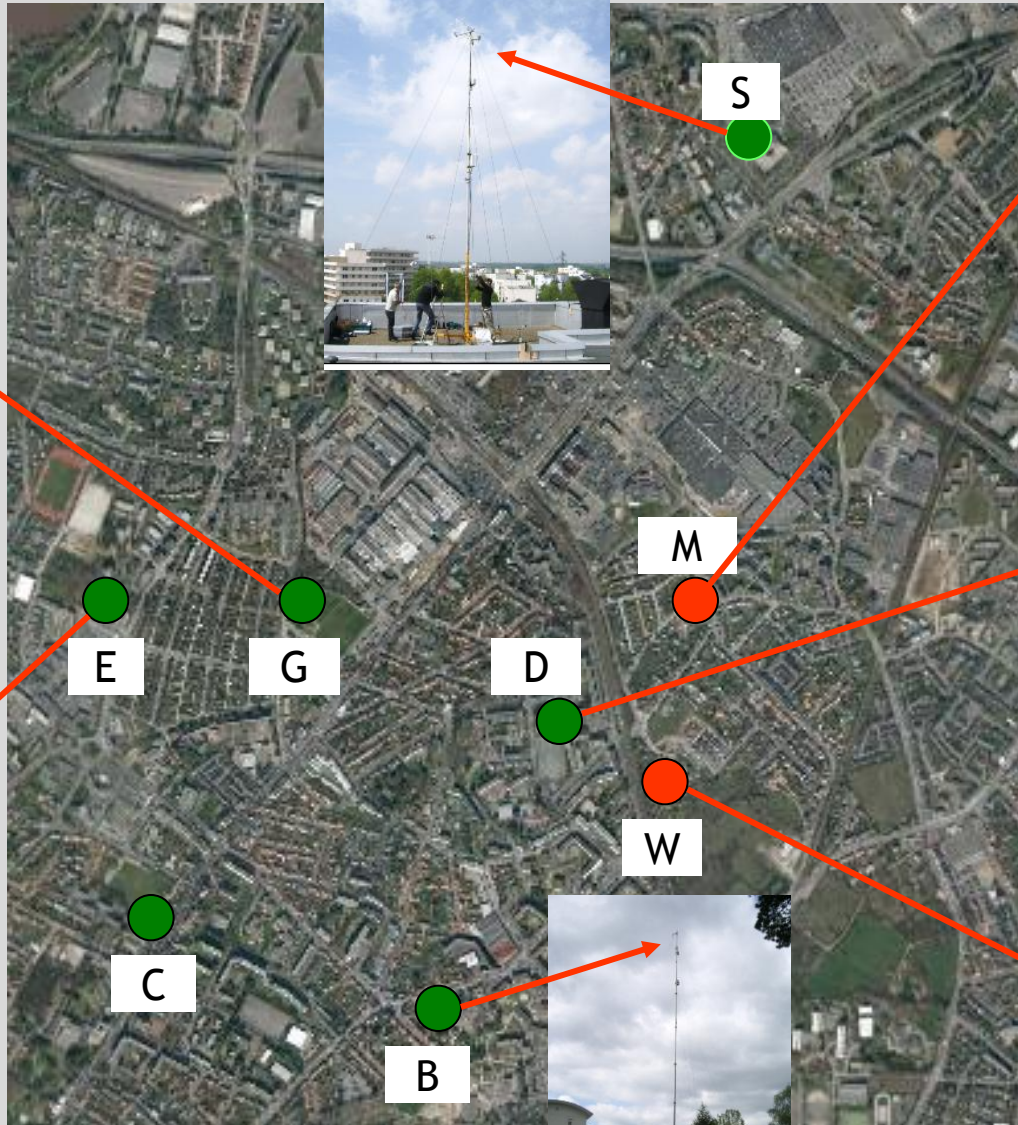

BY

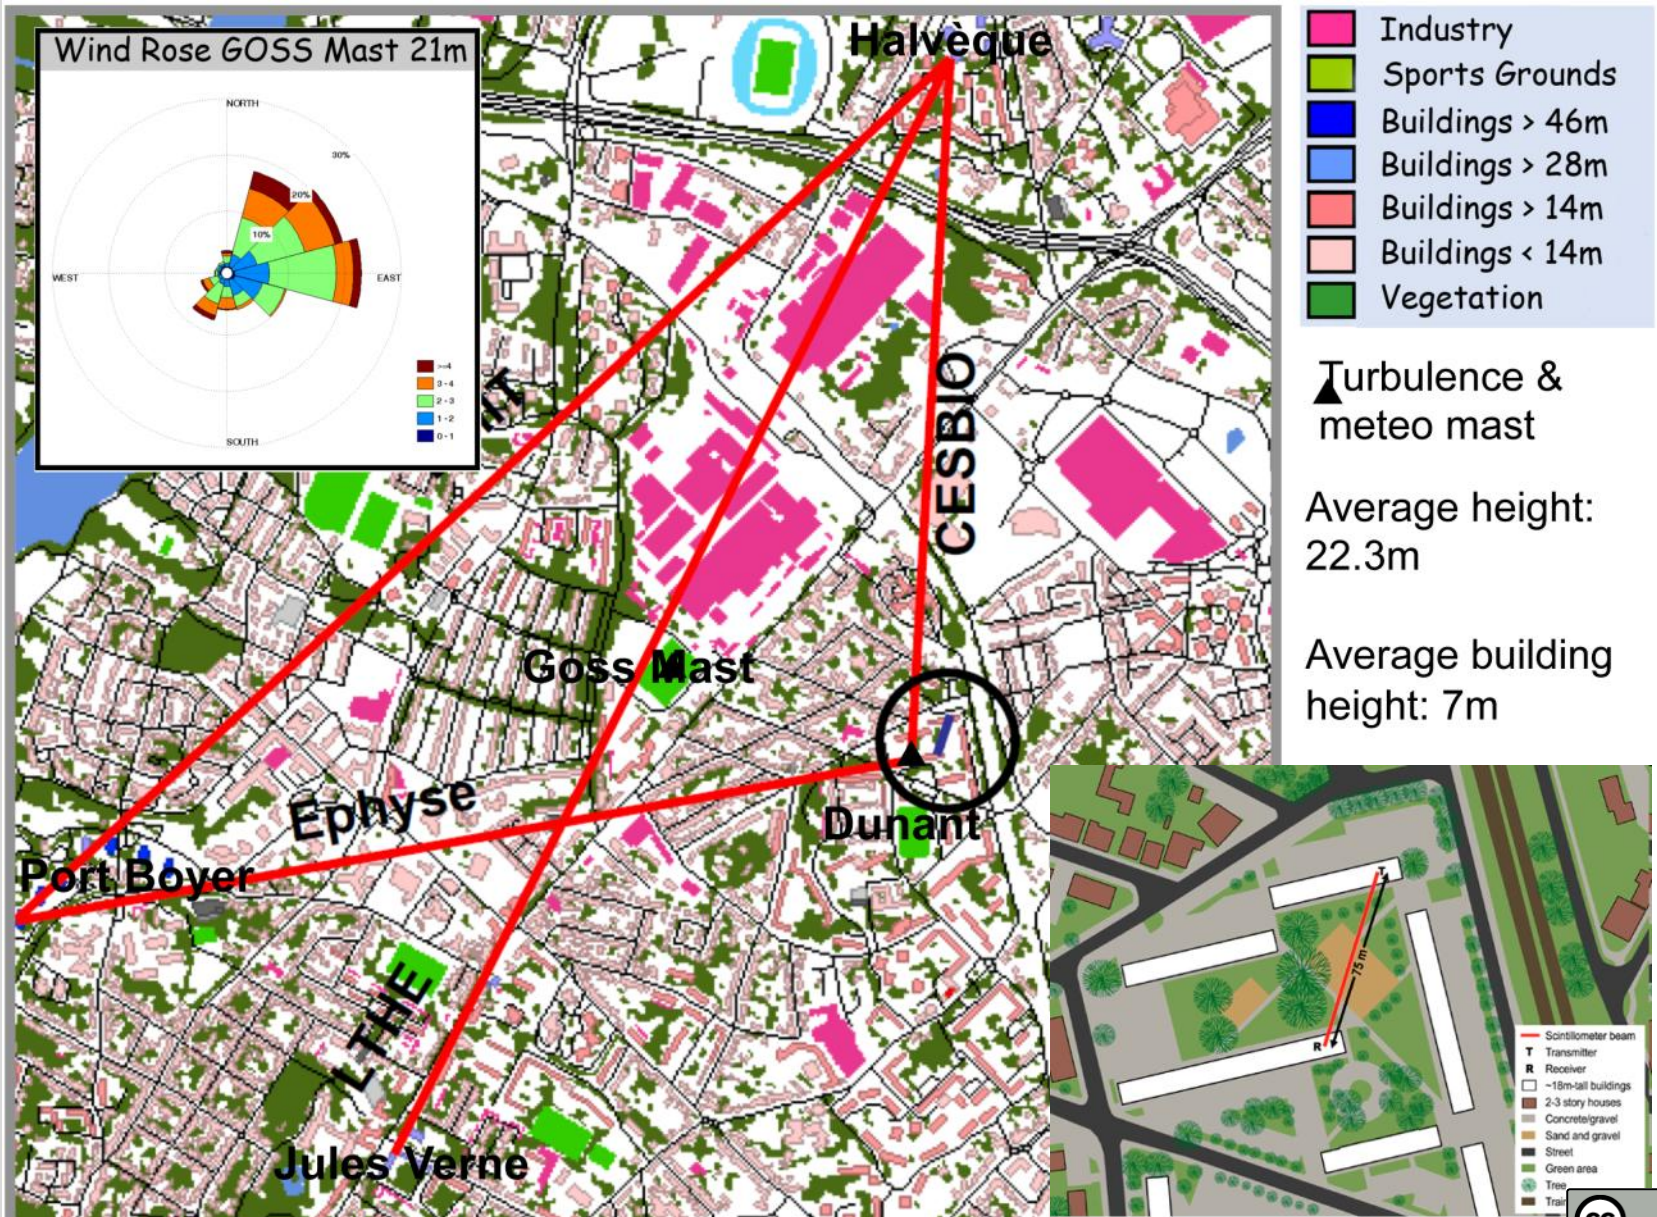

'Pin Sec' measurement area

10 eddy covariance sensor systems

5 LAS, 1 SAS

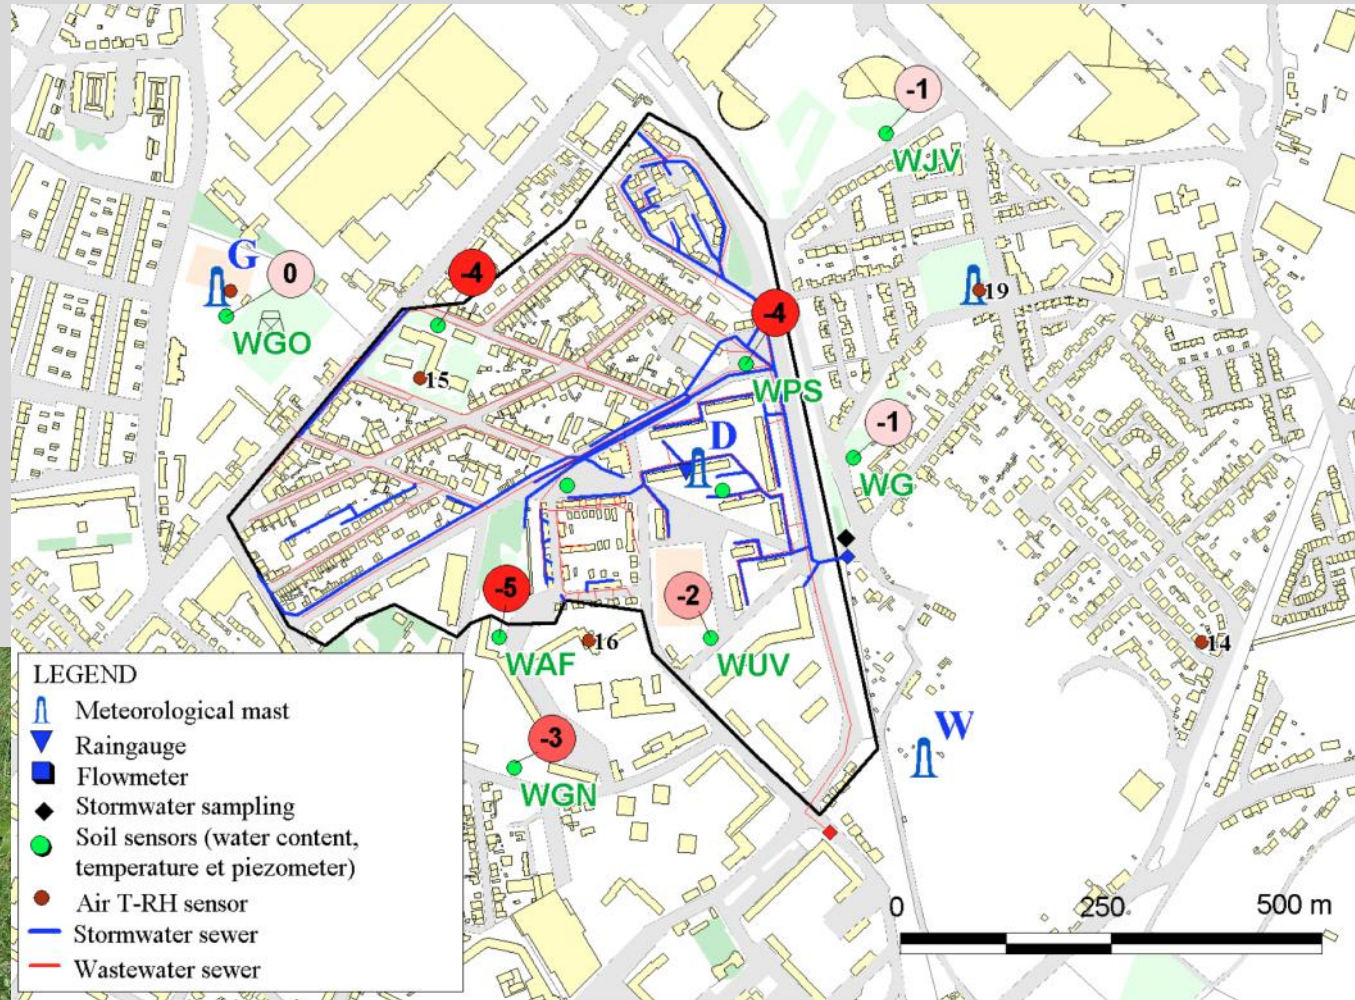

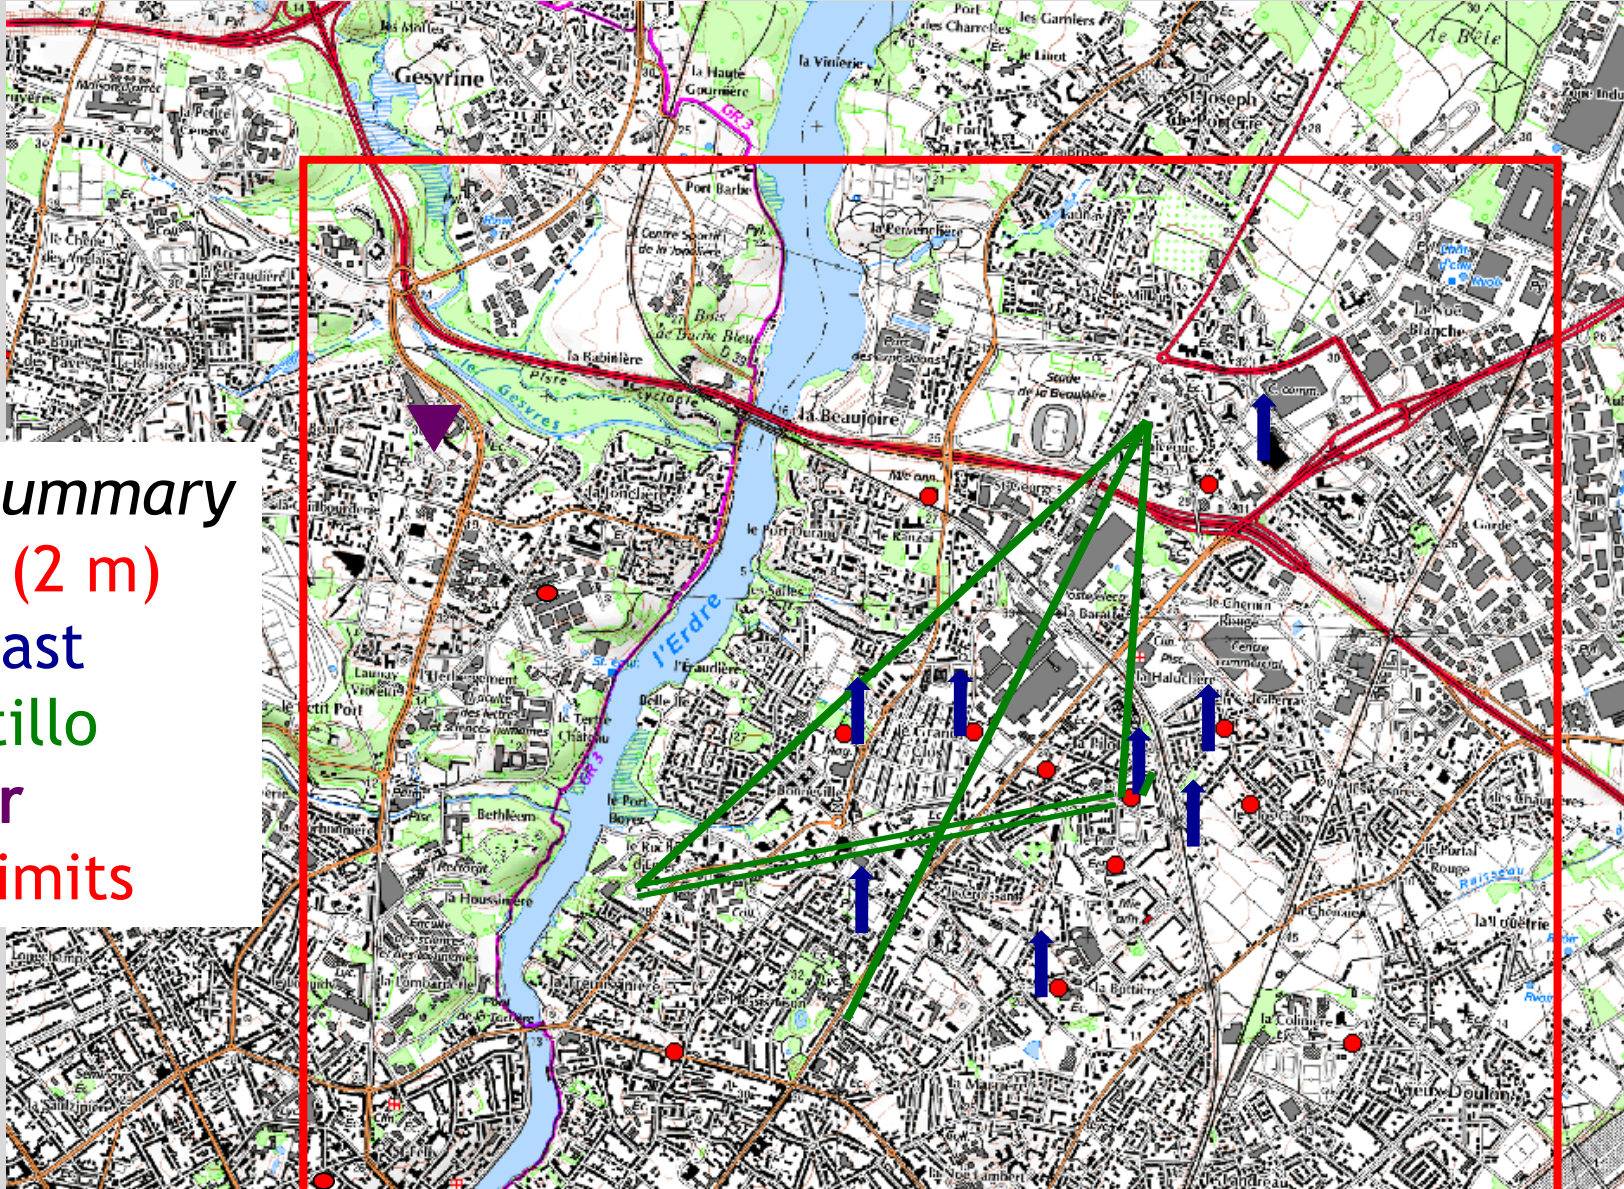

14 T-RH sensors at $z = 2-3$ m

10 piezometers, 8 T- θ profiles

Ground-based measurements

Set-up summary

- T-RH (2 m)
- ↑ EC mast
- Scintillo
- ▼ Sodar
- GIS limits

TIR measurements

Airborne (13 flights) and handheld (140 refs) TIR

Hyperspectral airborne measurements

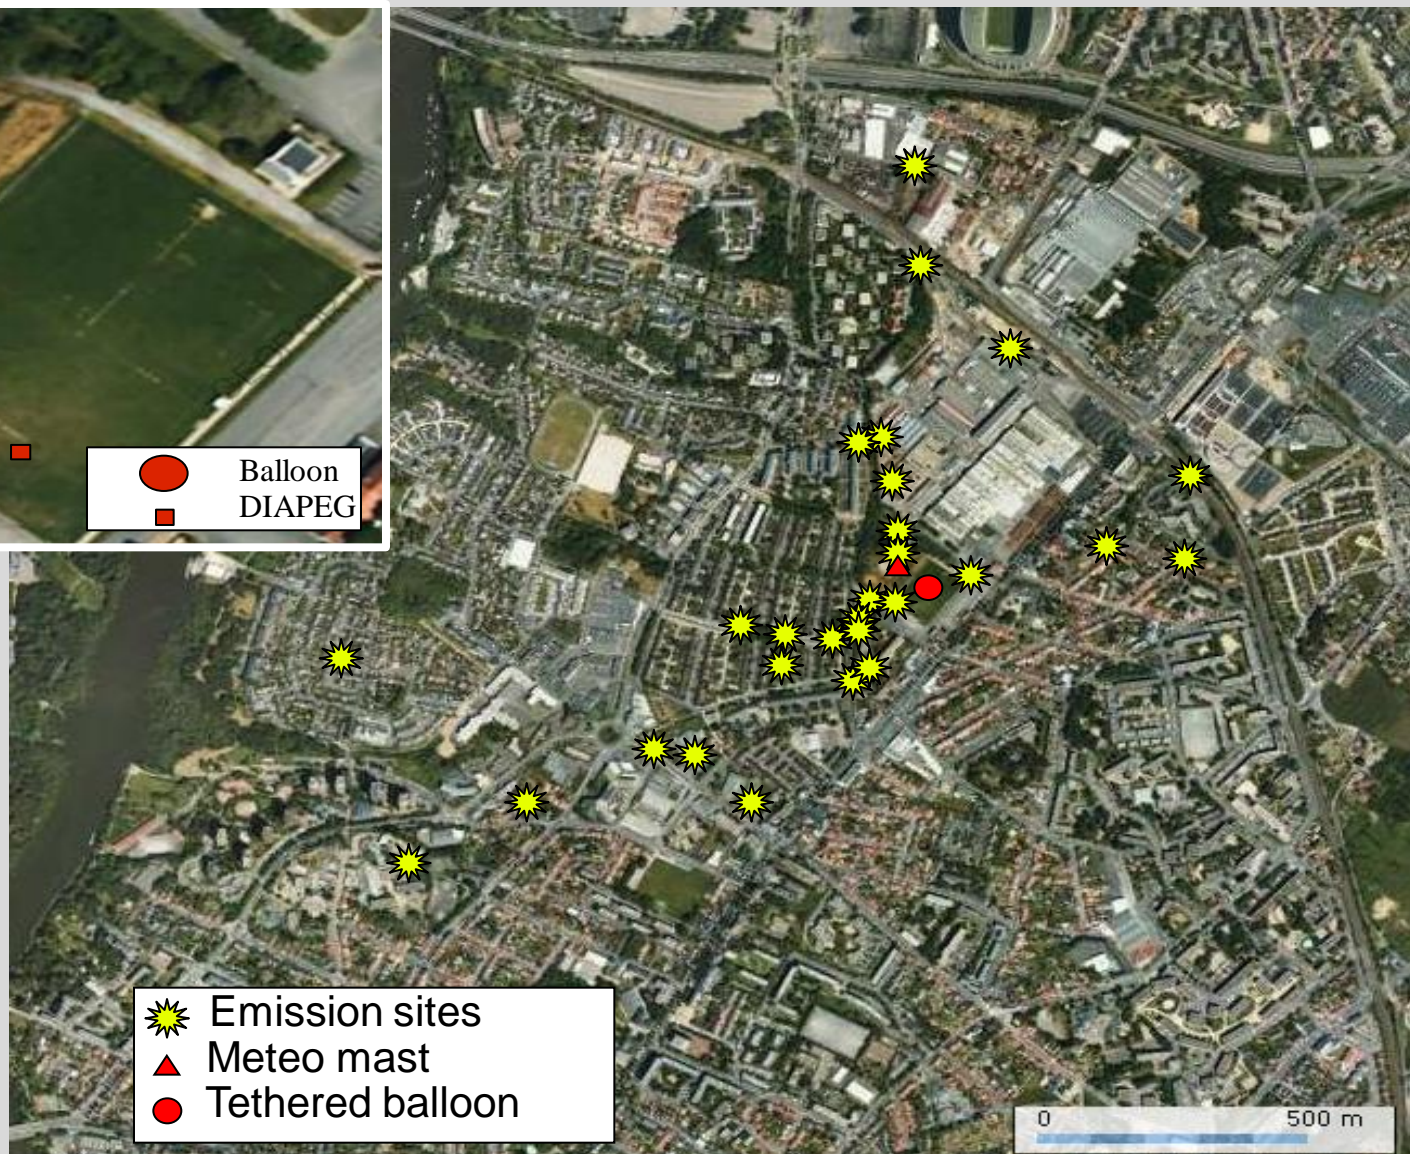

VNIR (400-1000 nm)
160 bands (4 nm)
0.6 m resolution

SWIR (1000-2500 nm)
256 bands (6 nm)
1.2 m resolution

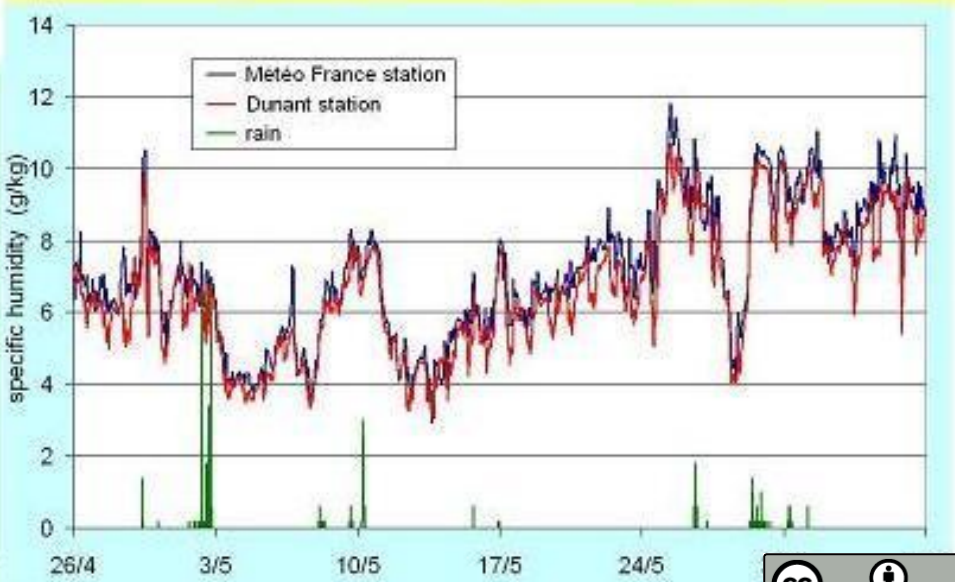

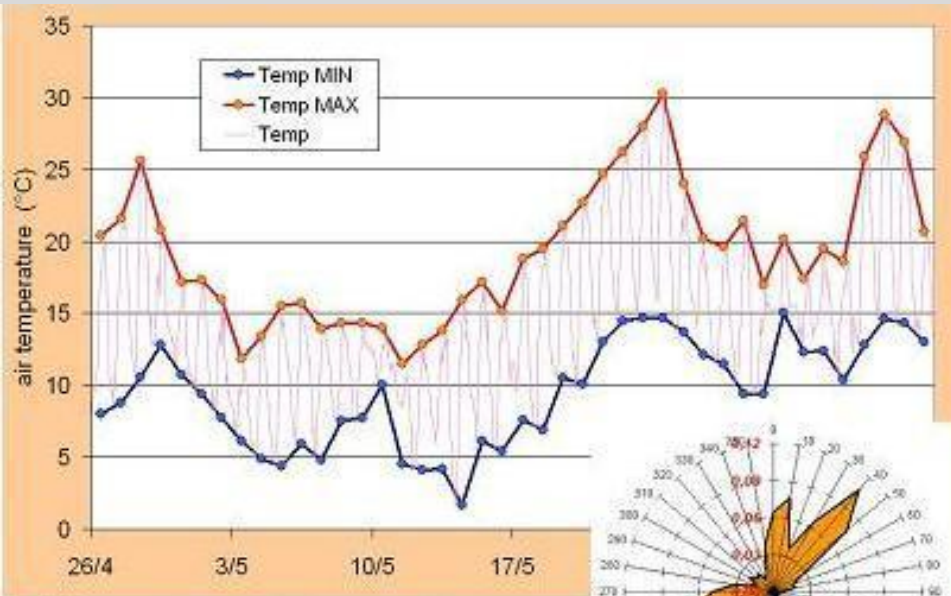

95 ground meas^{ts}
portable spectrometer

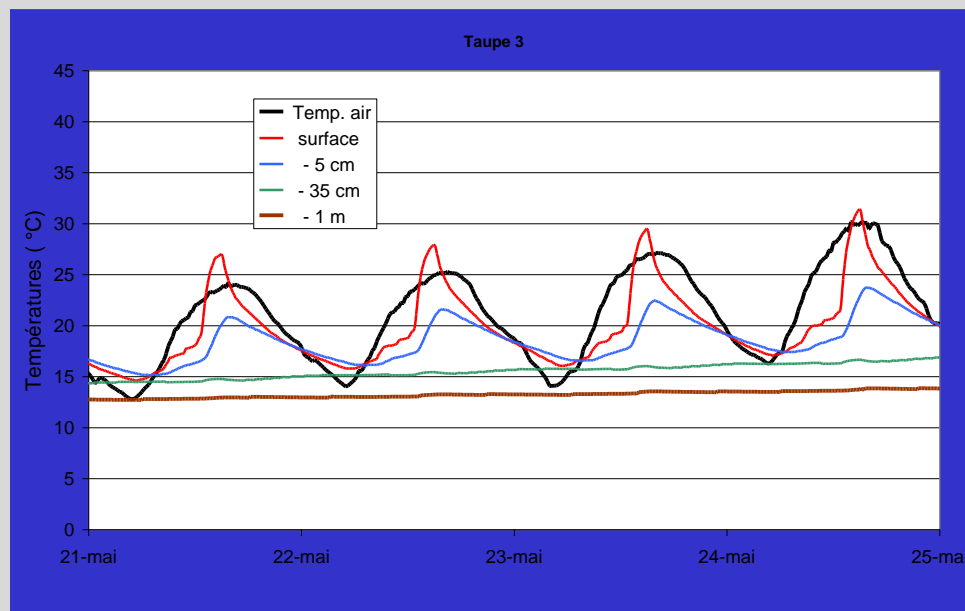

30 passive tracer dispersion experiments

The meteorology (26 April - 7 June)

Temperature and humidity gradients from T-RH and surface sensors

Heat flux measurements with EC turbulent sensors

Heat flux measurements with LAS scintillometers

Sensible Heat Flux during FluxSAP 2010

300 Wm⁻²

Preliminary conclusions

- Differences between measurement techniques but good coherence between sites
- Differences between sites linked with different distributions of land cover (buildings, pavement, bare soil, high and low vegetation)

Mestayer et al. (2011). *Urban Climate News*, 40:22-30 (www.urban-climate.org)
Mestayer et al. (2011). *La Météorologie*, 73:33-43 (www.smf.asso.fr)

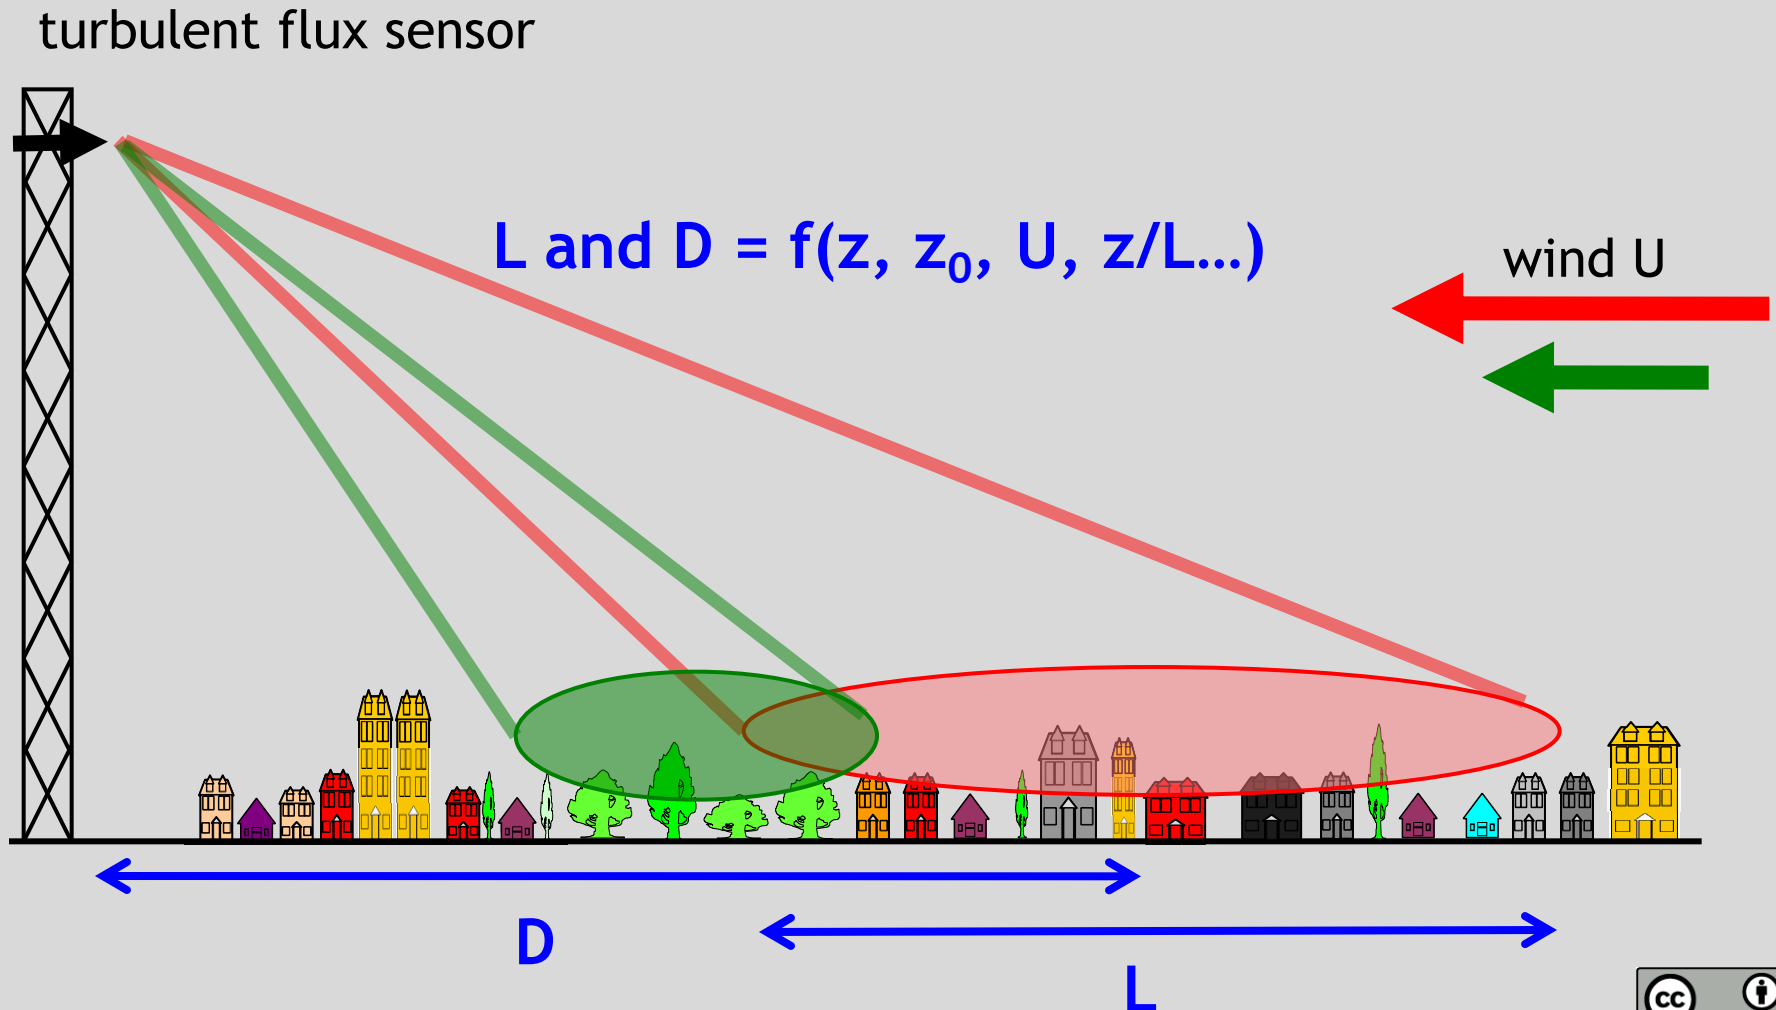

- Footprint analysis should allow us to identify the various flux contributions and quantify the influence of vegetation

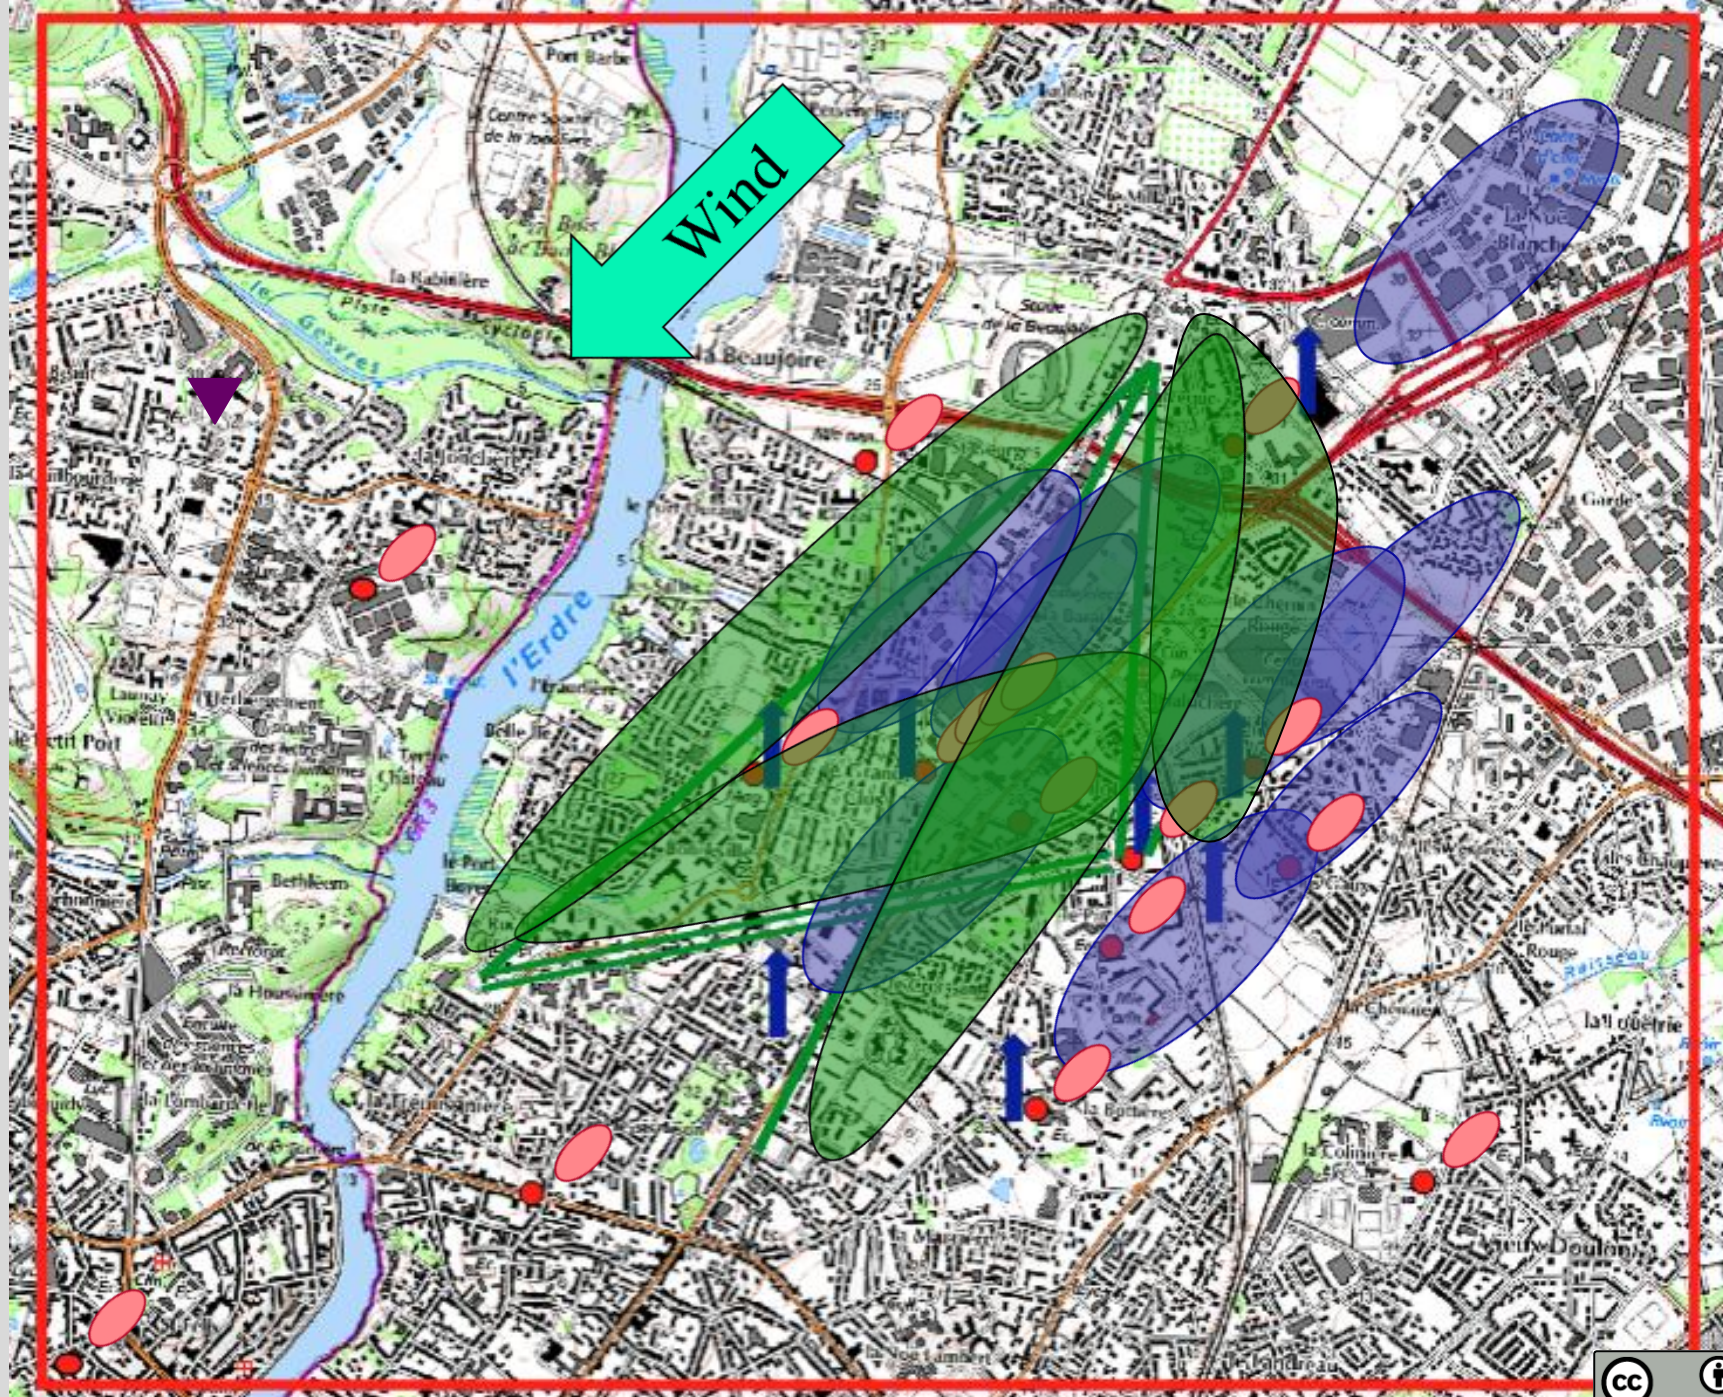

Further analysis : the footprint issue

turbulent flux sensor

Further analysis : the footprint issue

Preparation for May-June 2012 campaign

- ❖ More variable land cover within footprint
- ❖ More EC masts over vegetated urban areas
- ❖ More H₂O turbulent sensors (Li-Cor)
- ❖ More differentiated LAS paths (mineral, vegetal, mixed)
- ❖ 1 or 2 water vapour scintillometers?
- ❖ Measure PTUV profile (0-150 m) with tethered balloon
- ❖ Monitor water table (soil moisture profile)

Thank you
