HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Summary. With the aim to develop a 20K genotyping chip for the international community, 43 *Vitis vinifera ssp vinifera*, 4 *V. vinifera ssp sylvestris*, 3 *V. cinerea*, 3 *V. berlandieri*, 3 *V. aestivalis*, 3 *V. labrusca*, 1 *V. lincecumii*, 5 *M. rotundifolia* genotypes were paired end re-sequenced using Illumina platforms. An average of 4.3 and of 3.4 millions SNP were detected respectively per *V. vinifera* and per other *Vitis* species genotypes. SNPs were first filtered upon technical criteria: Illumina score >0.9 and class I type. The project aimed at developing two subsets of SNPs for the chip: a *V. vinifera* specific subset and a general *Vitis* species subset. For the *V. vinifera* subset, SNPs in regions involved in structural variations and repetitions were filtered out and the remaining SNPs were then selected based on their even physical repartition along the genome together with their MAF (Minimum Allele Frequency). For the *Vitis* species subset, SNPs in repeated regions were filtered out and the remaining SNPs were chosen based on their level of heterozygosity and evenly distributed along the genome. In the end, 14,817 *Vitis vinifera* SNPs and 4,978 *Vitis* species SNPs were selected along with 205 control SNPs to design a 20K grapevine Infinium genotyping chip (http://urgi.versailles.inra.fr/Species/Vitis/GrapeReSeq_Illumina_20K). Illumina designed an 18,071 SNP chip.
