HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Talk Abstract for the Jesium Meeting in Marseille 2008

Understanding seasonal oxygen isotope signals of photosynthesis and respiration at the ecosystem scale using a chamber TDL system.

Studying the carbon and oxygen stable isotope signals from plants and soils can help us gain insight on mechanistic processes responsible for the net exchange of CO₂ and water cycled between terrestrial ecosystems and the atmosphere. Chamber field measurements of component fluxes and their isotopic composition have revealed that oxygen isotope signals of CO₂ are dynamic over relatively short time scales (hrs and days) for both branches and soils. Furthermore, precipitation inputs and prolonged dry periods can result in considerable intra- and inter-annual variability in the oxygen isotope signals of CO₂ exchanged with the atmosphere. In this study, we coupled automated chambers with tunable diode laser spectroscopy techniques in the field to continuously capture the oxygen isotope signals from the most important component fluxes (branch, stem and soil) contributing to the net ecosystem exchange of CO₂ in a *Pinus pinaster* forest in south-west France during a 6-month period in 2007. We present the diurnal and seasonal patterns from each component and investigate how each of these signals impact the oxygen isotope signal of CO₂ observed by the atmosphere over the season.
