HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Le transport de l'eau dans les plantes vu sous l'angle de la géochimie isotopique

Due to kinetic isotope effects water isotopologues (H_2^{16}O , H_2^{18}O , HDO) are not distributed evenly across the soil rooting depth or within a leaf. Progressive enrichment in heavy water isotopes are commonly observed when we move from deep to shallow soil layers or from the base to the tip of a leaf. This non-uniformity in water isotopologues can be exploited to study the transport of water in the soil-plant-atmosphere continuum. During this presentation, I will combine field and laboratory datasets and process-based models of water movement in the soil-plant system or inside a single monocot leaf in order to answer two questions: (1) what soil layers contribute the most to water uptake of a Maritime pine stand? and (2) is leaf water redistribution at night a purely diffusive process?
