HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Investigating Synchrony Perception of Audiovisual Speech With a Continuous Carry-Over fMRI Design

Scott Love, Marianne Latinus, Phil McAleer, Frank E. Pollick

CCNi & Department of Psychology, University of Glasgow, Scotland

Aim:

- Add to a growing literature on the neural mechanisms involved in the perception of synchrony for audiovisual speech (Stevenson et al, 2010; Macaluso et al, 2004; Miller et al, 2005). Investigate parametrically modulated direct effects and carry-over neural responses to a large set of asynchronous audiovisual speech movies. Differentiate between orthogonal physical and perceptual carry-over effects (Charest et al, 2009).

Participants:

- 20 participants (10 male)
- Age range 20-30 (mean 25)
- Native English speakers

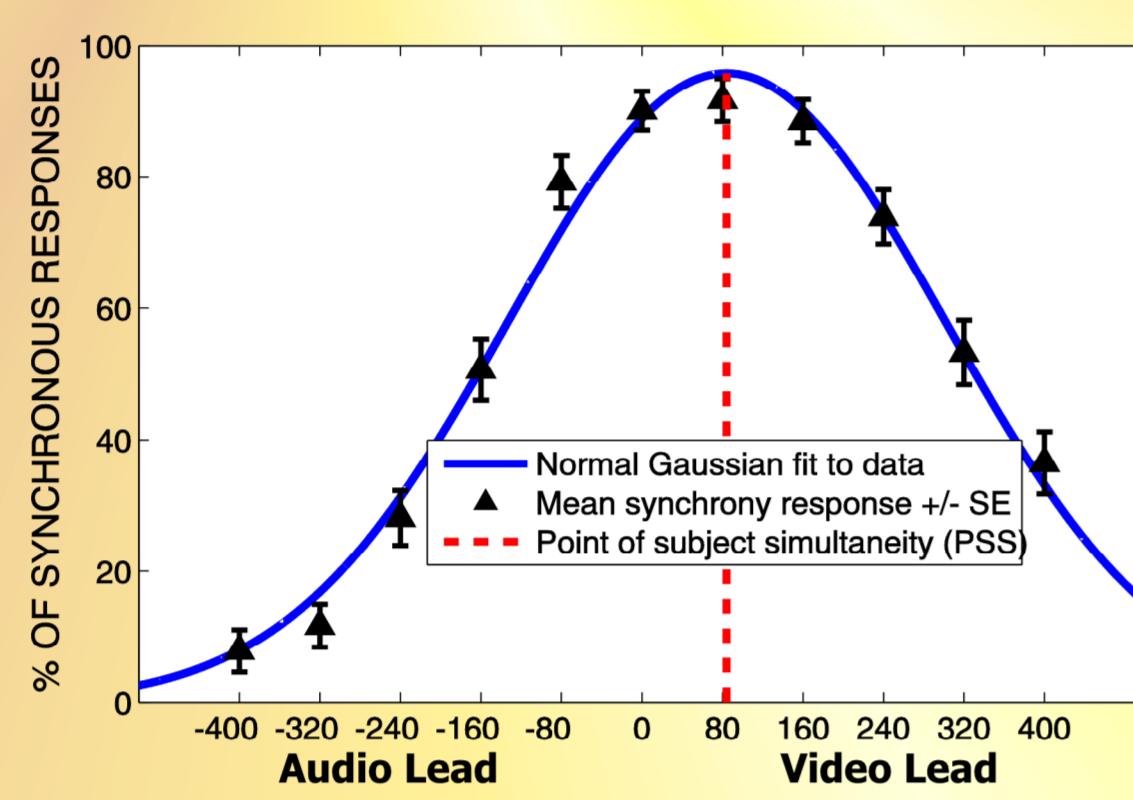

Stimuli:

- Dynamic audiovisual speech
- 1 synchronous & 10 asynchronous levels
- 1.8 - 2.2 sec duration
- 4.4 sec fixation duration

Behavioural Analysis:

- After each stimulus participants were required to respond whether the audio and visual information were "in or out of synch"

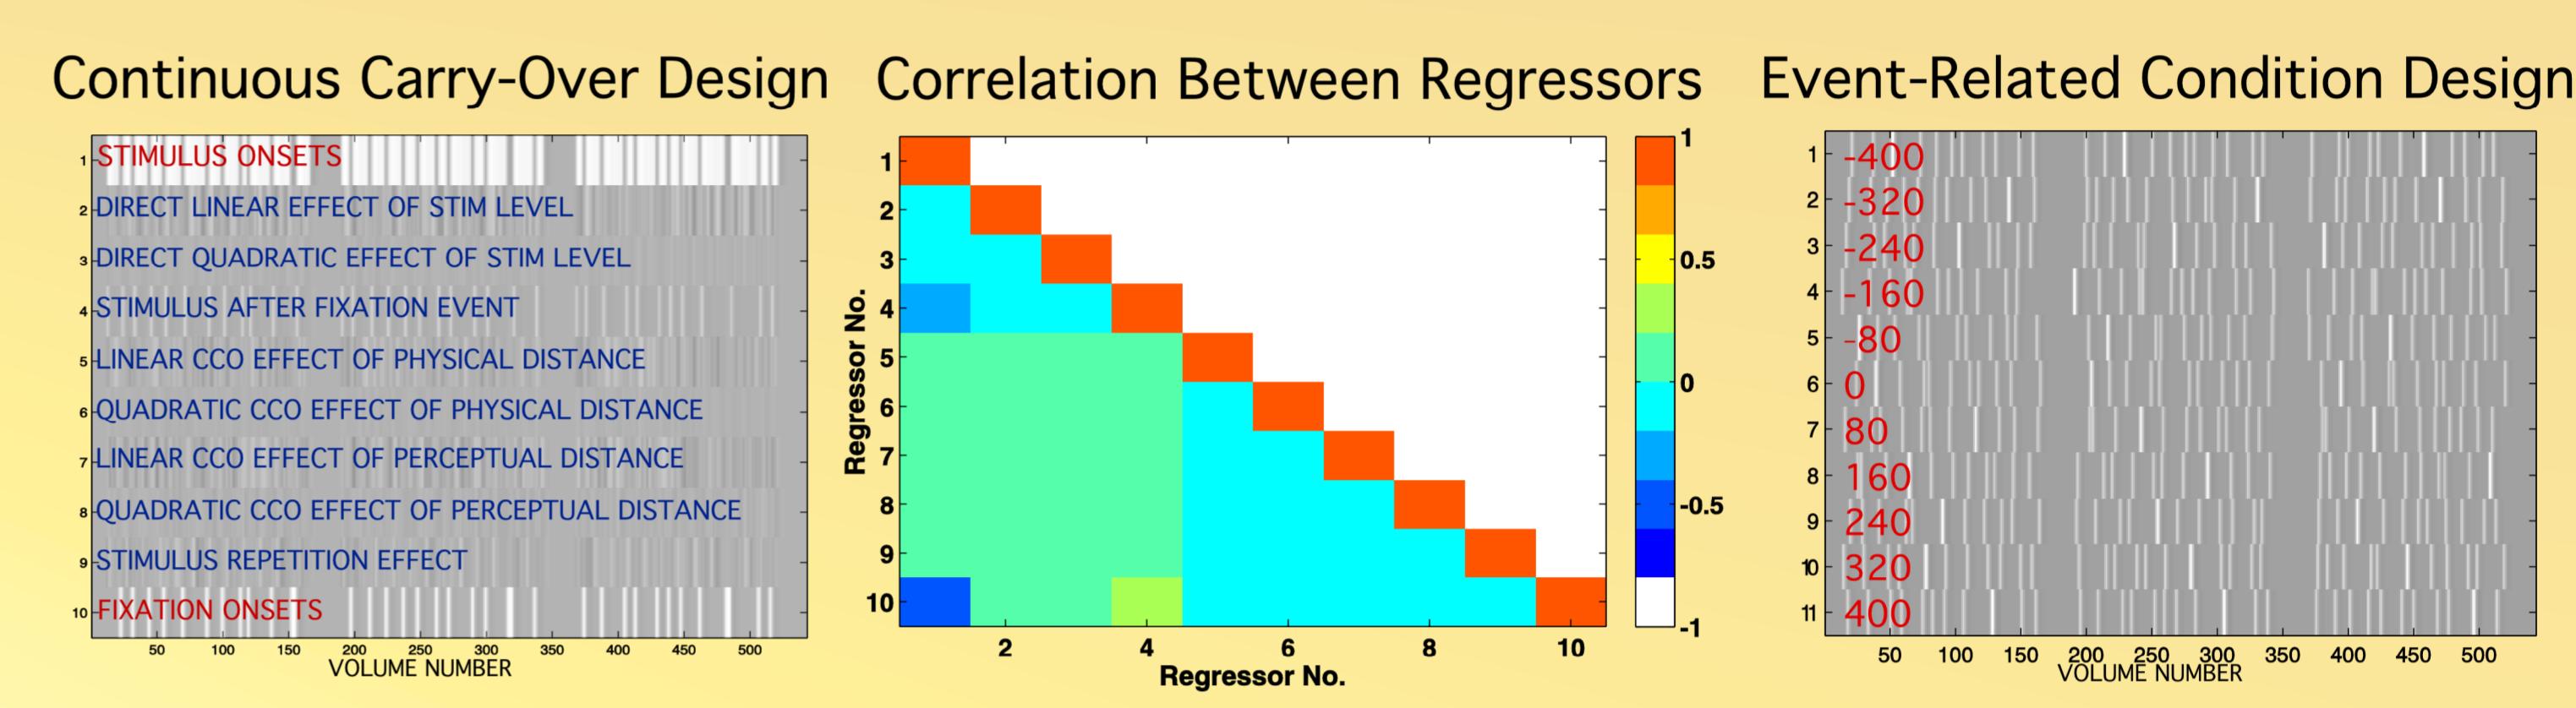

Functional Scan Parameters:

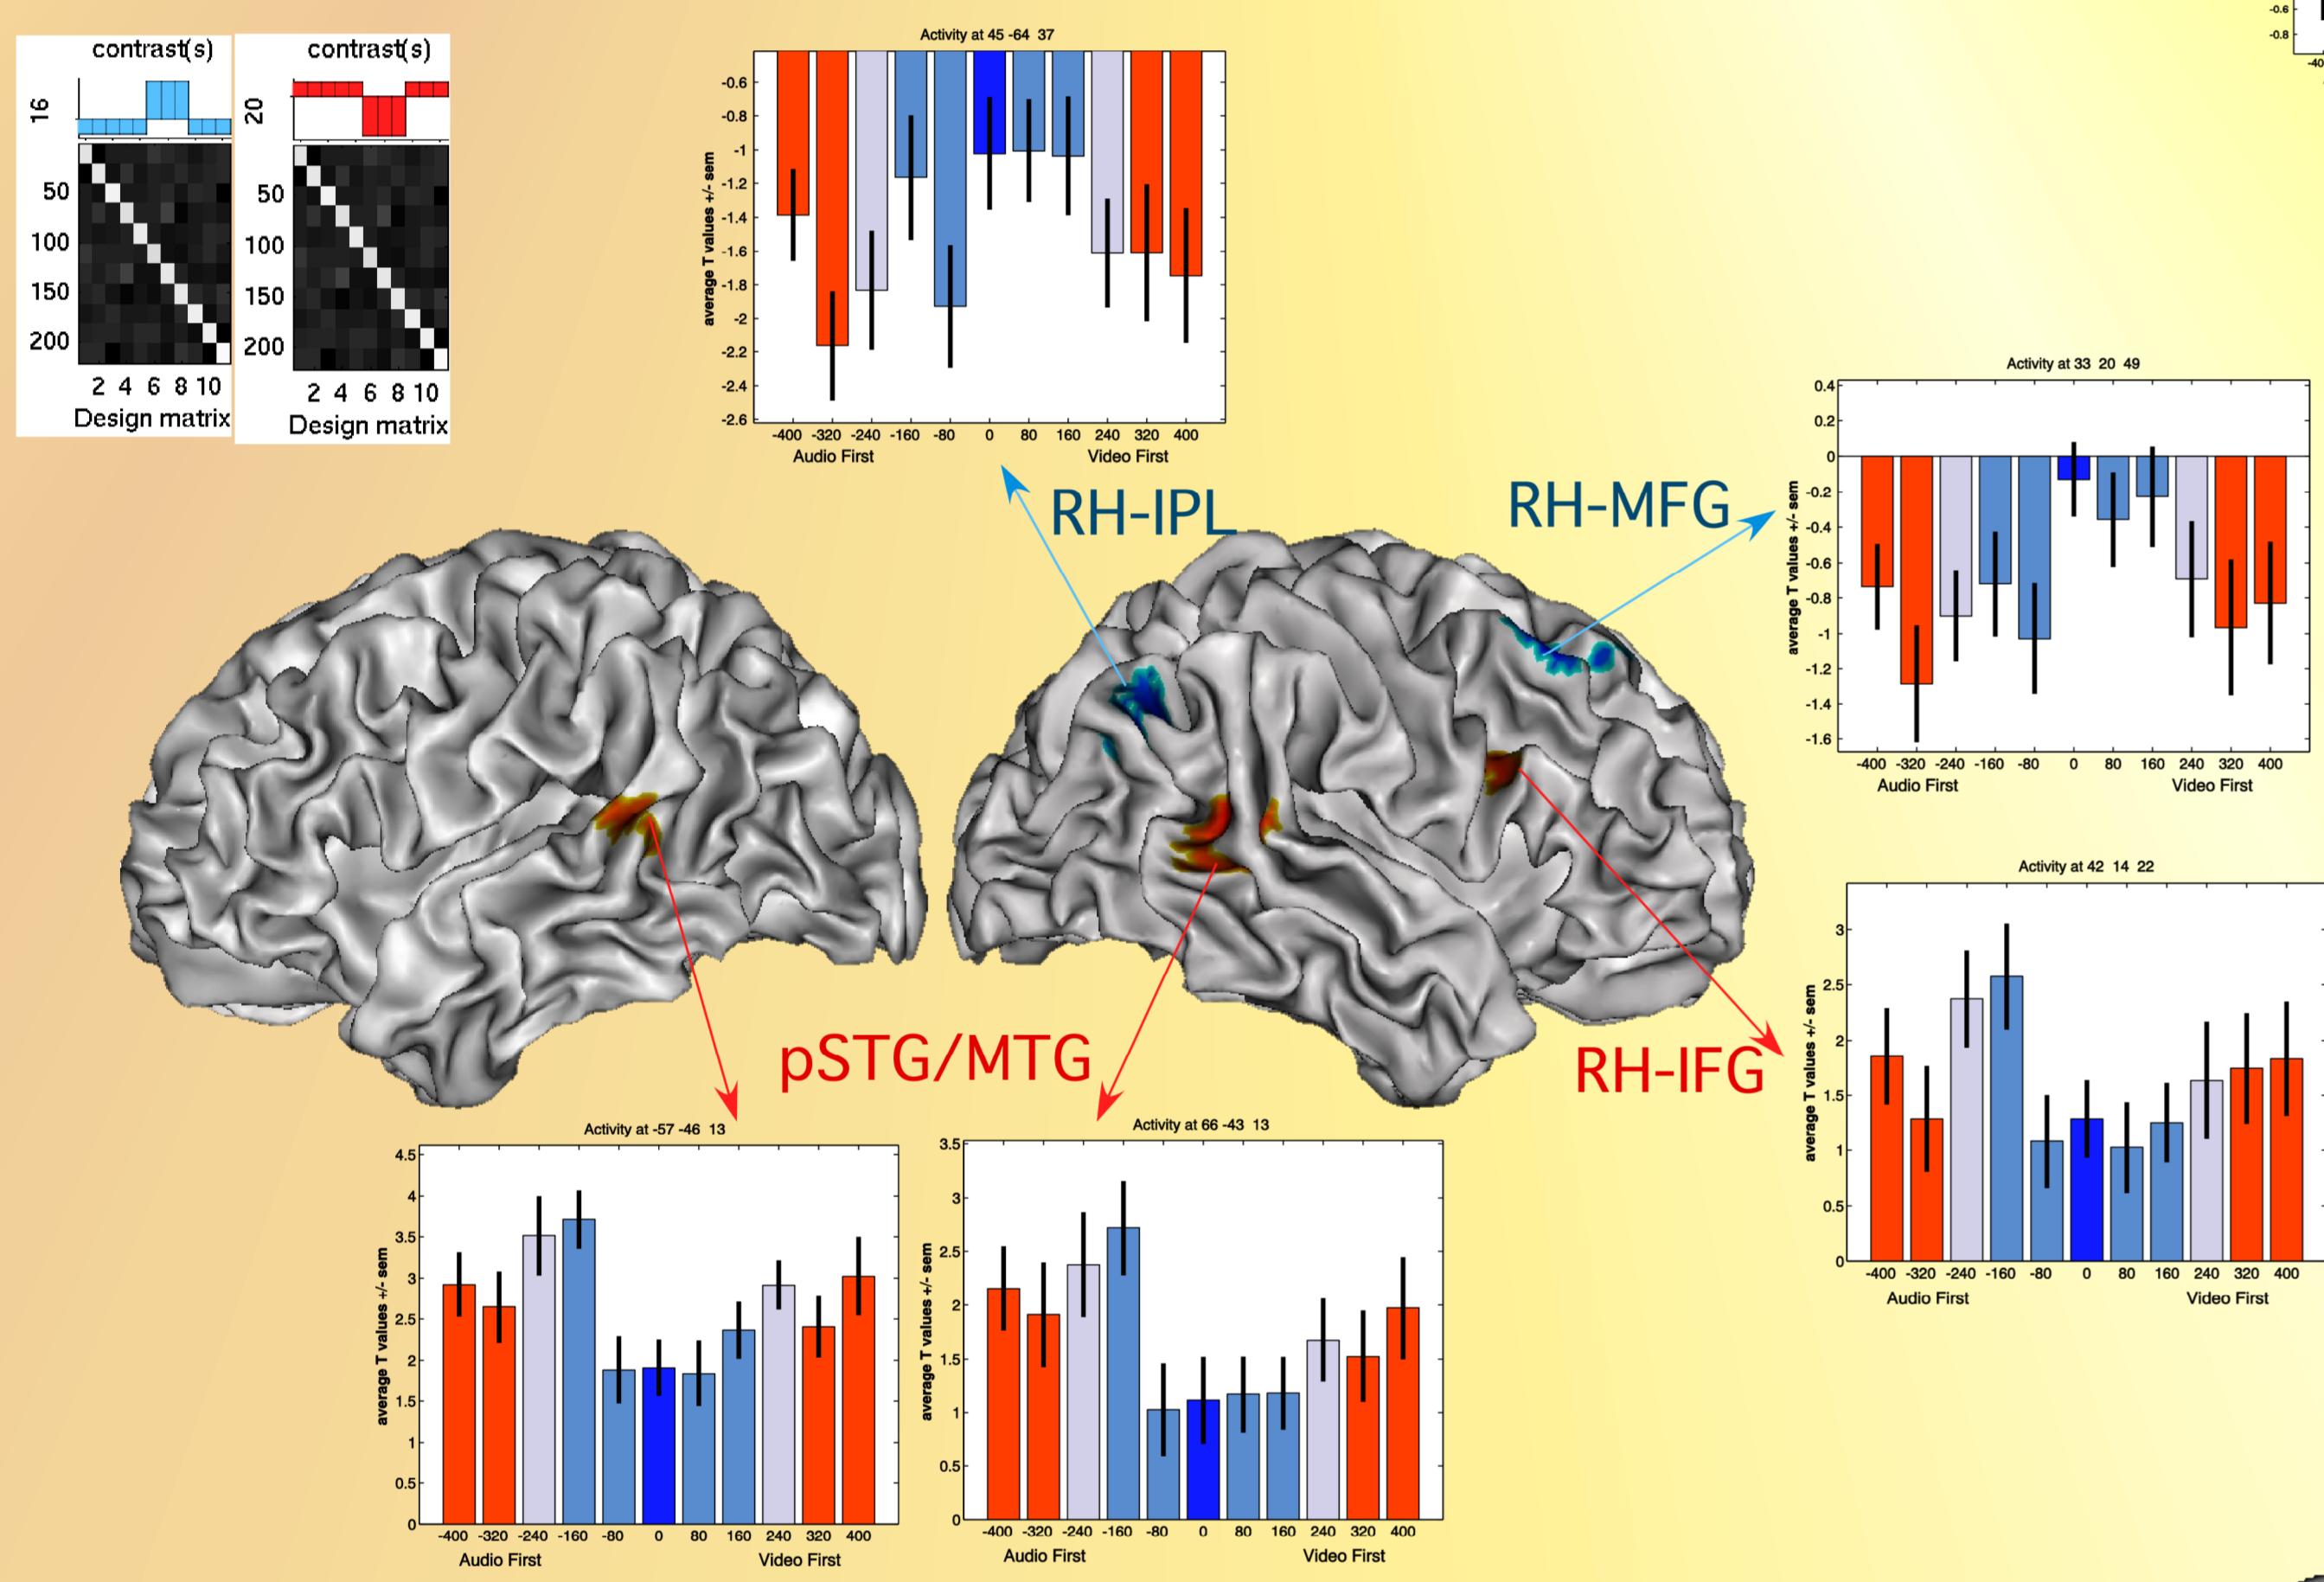

- 3T Tim Trio Siemens scanner
- TR = 2500ms
- TE = 30ms
- 3x3x3mm voxels
- 34 slices

Continuous carry-over fMRI Design (Aguirre, 2007):

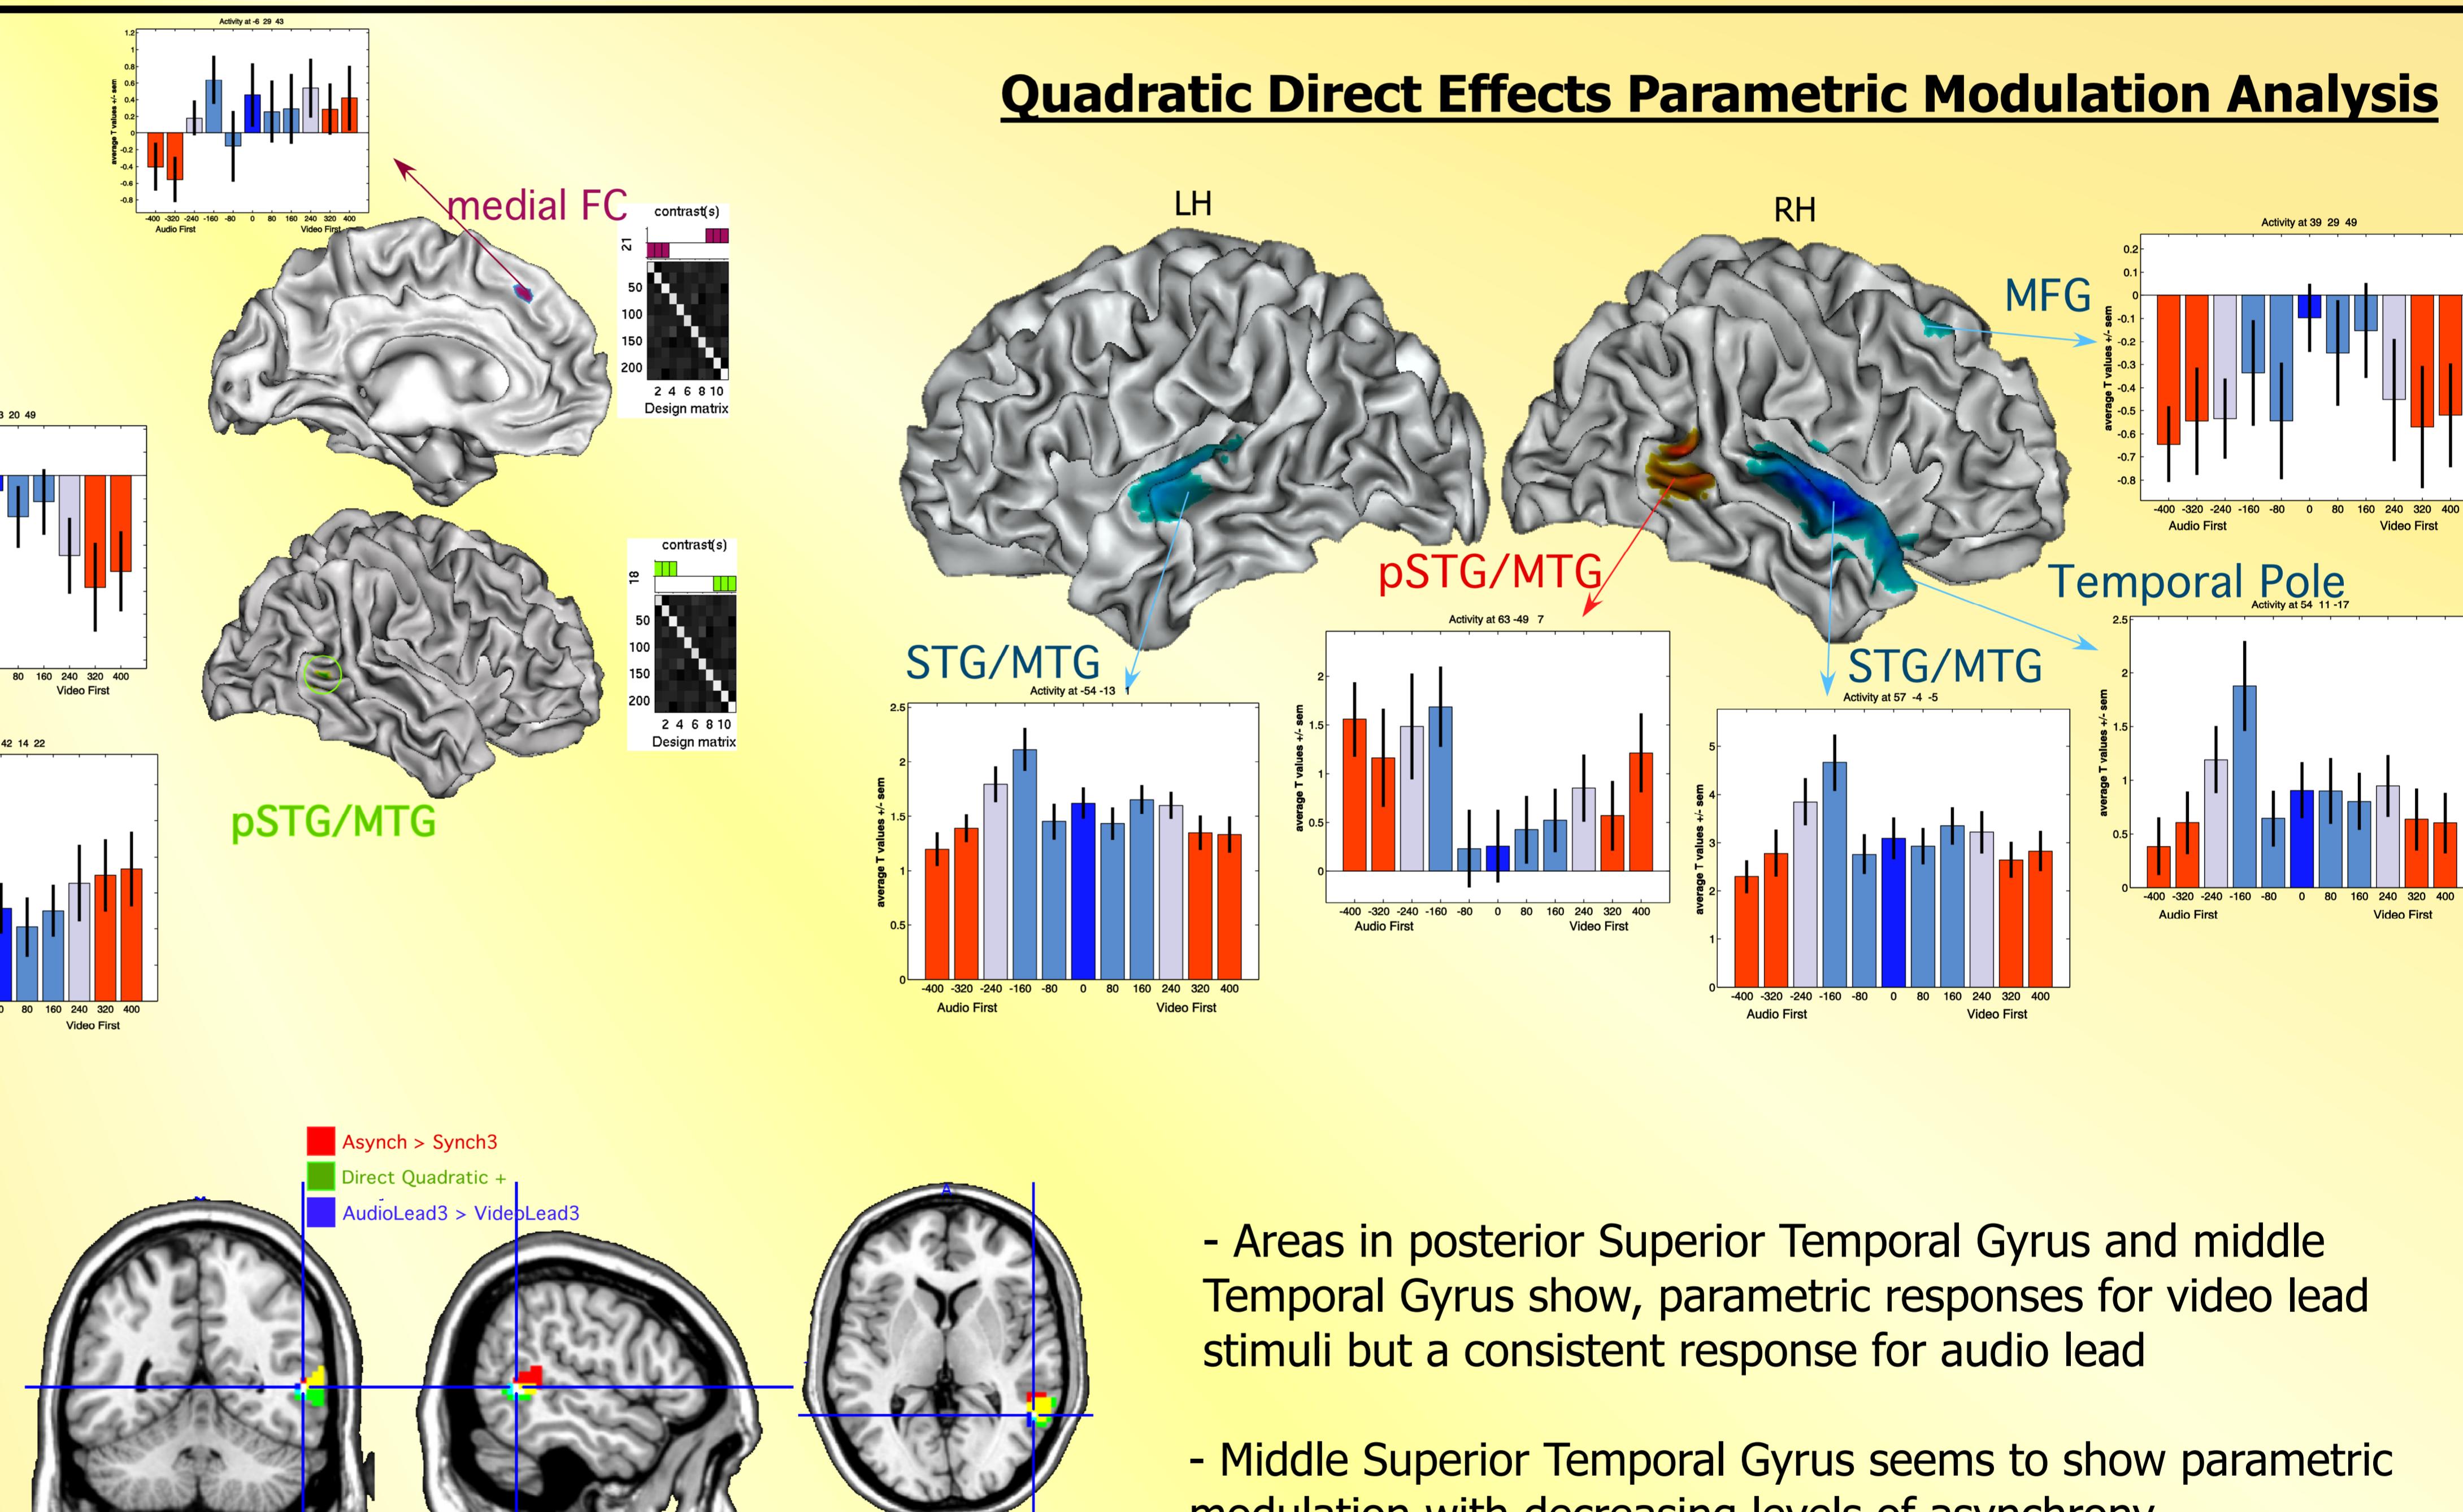

- Stimulus ordering of 1 run followed 3 n=12 T1|1 sequences e.g.
- 160, -160, 320, 80, -240, 400, -320, 240, -400, Fix, Fix, 0, 160, -80, -80, 160, 240, 320, Fix, Fix, 400, -160, -320, 80, -400, -240, 0
- 2 runs of 543 volumes
- 72 repetitions of each asynchrony level

Event-Related Factorial Analysis

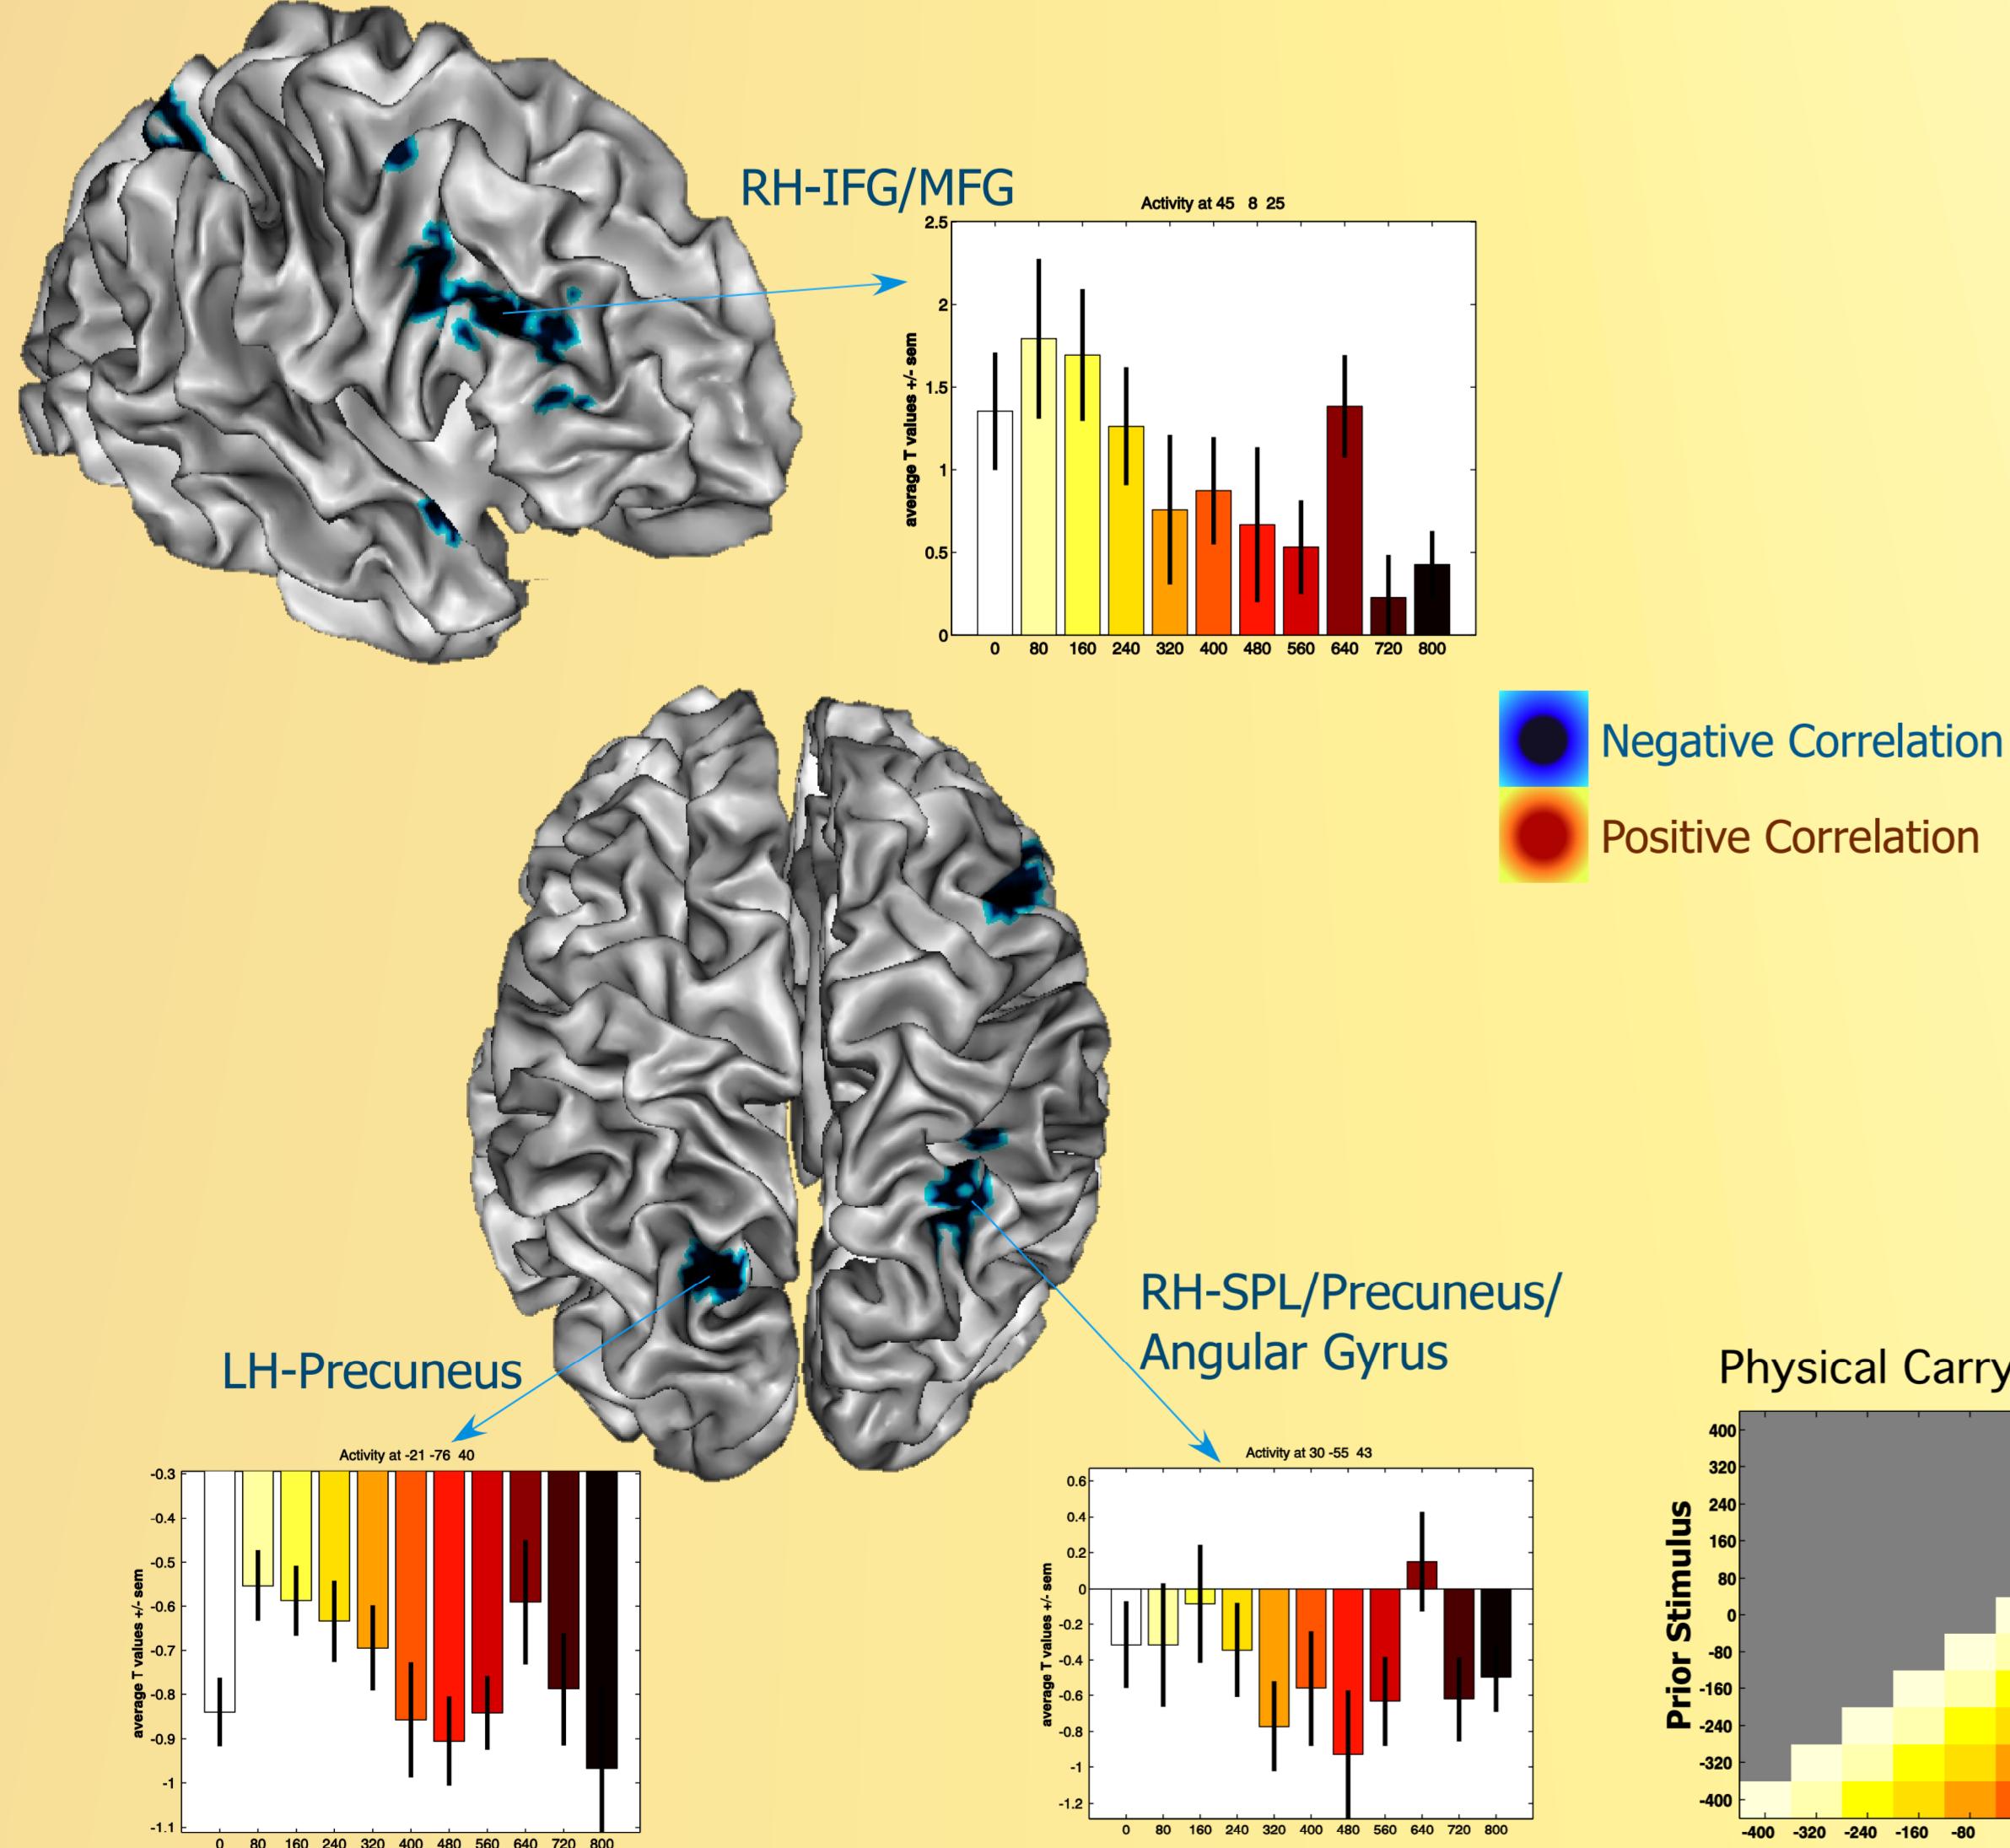

- No area showed a larger positive activation for synchronous than asynchronous stimuli.
- However, several areas showed less negative activation for synchronous compared to asynchronous stimuli.

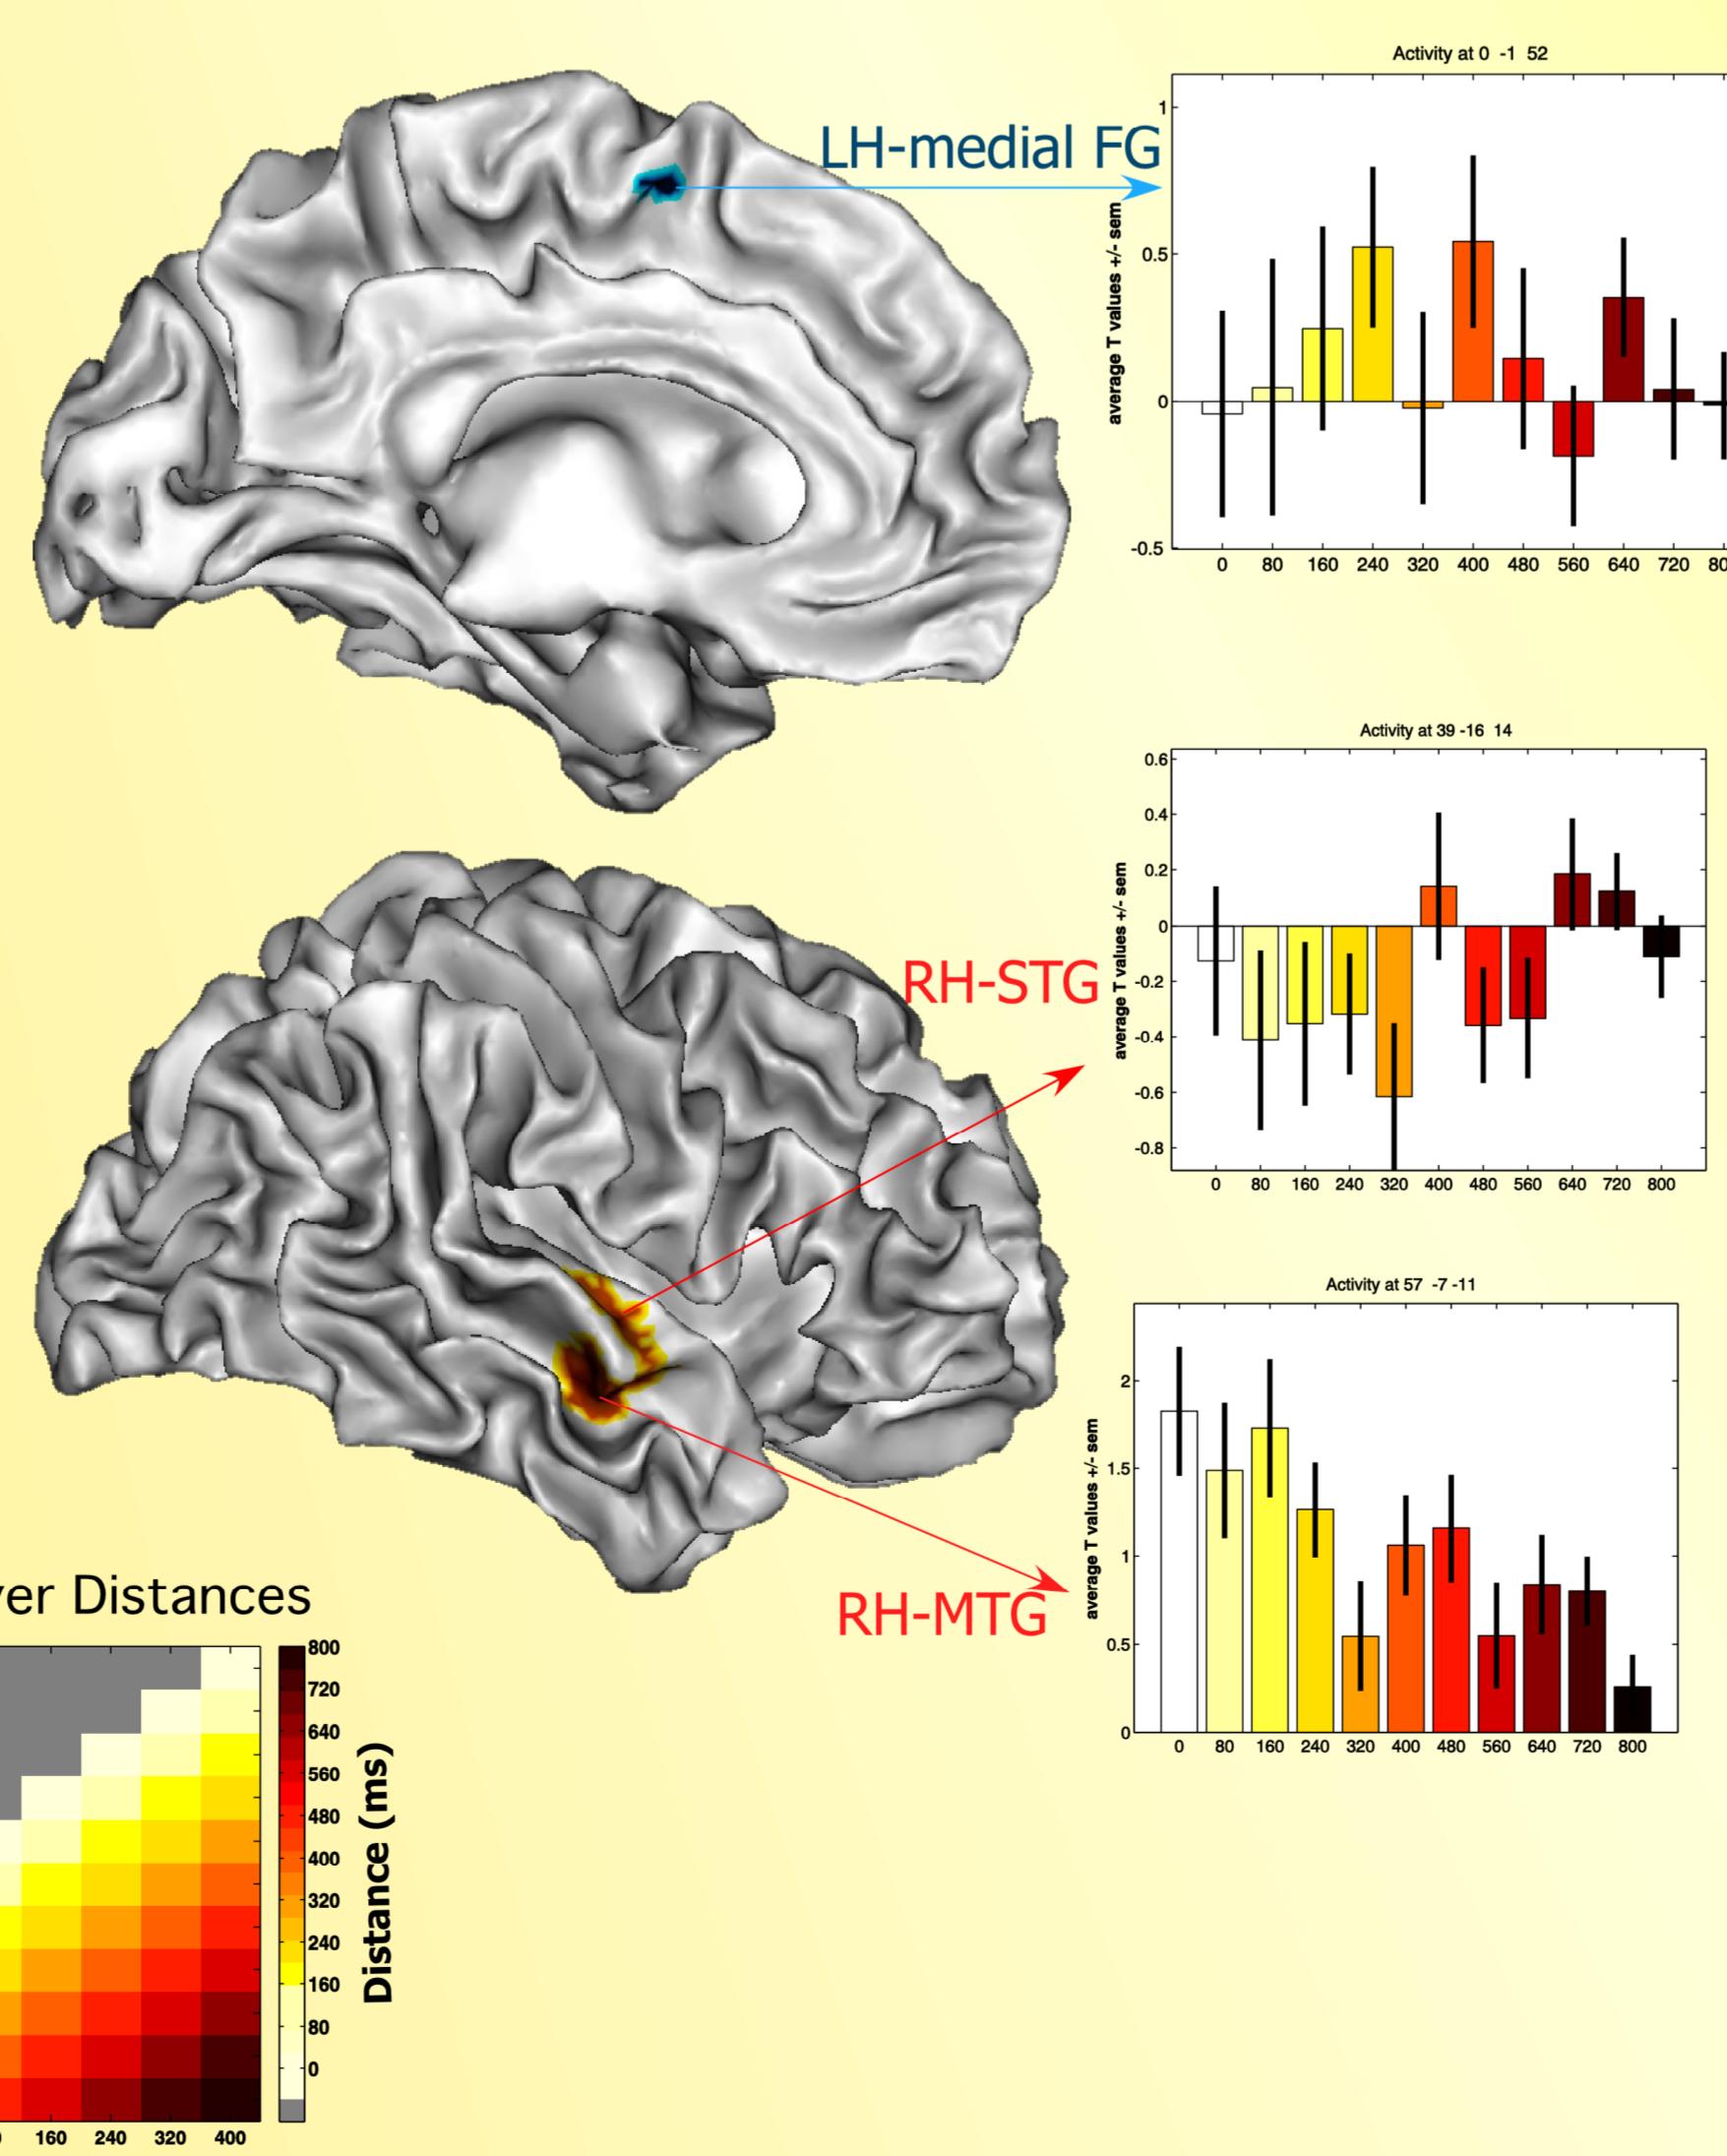

- Areas in posterior Superior Temporal Gyrus and middle Temporal Gyrus show parametric responses for video lead stimuli but a consistent response for audio lead

- Middle Superior Temporal Gyrus seems to show parametric modulation with decreasing levels of asynchrony

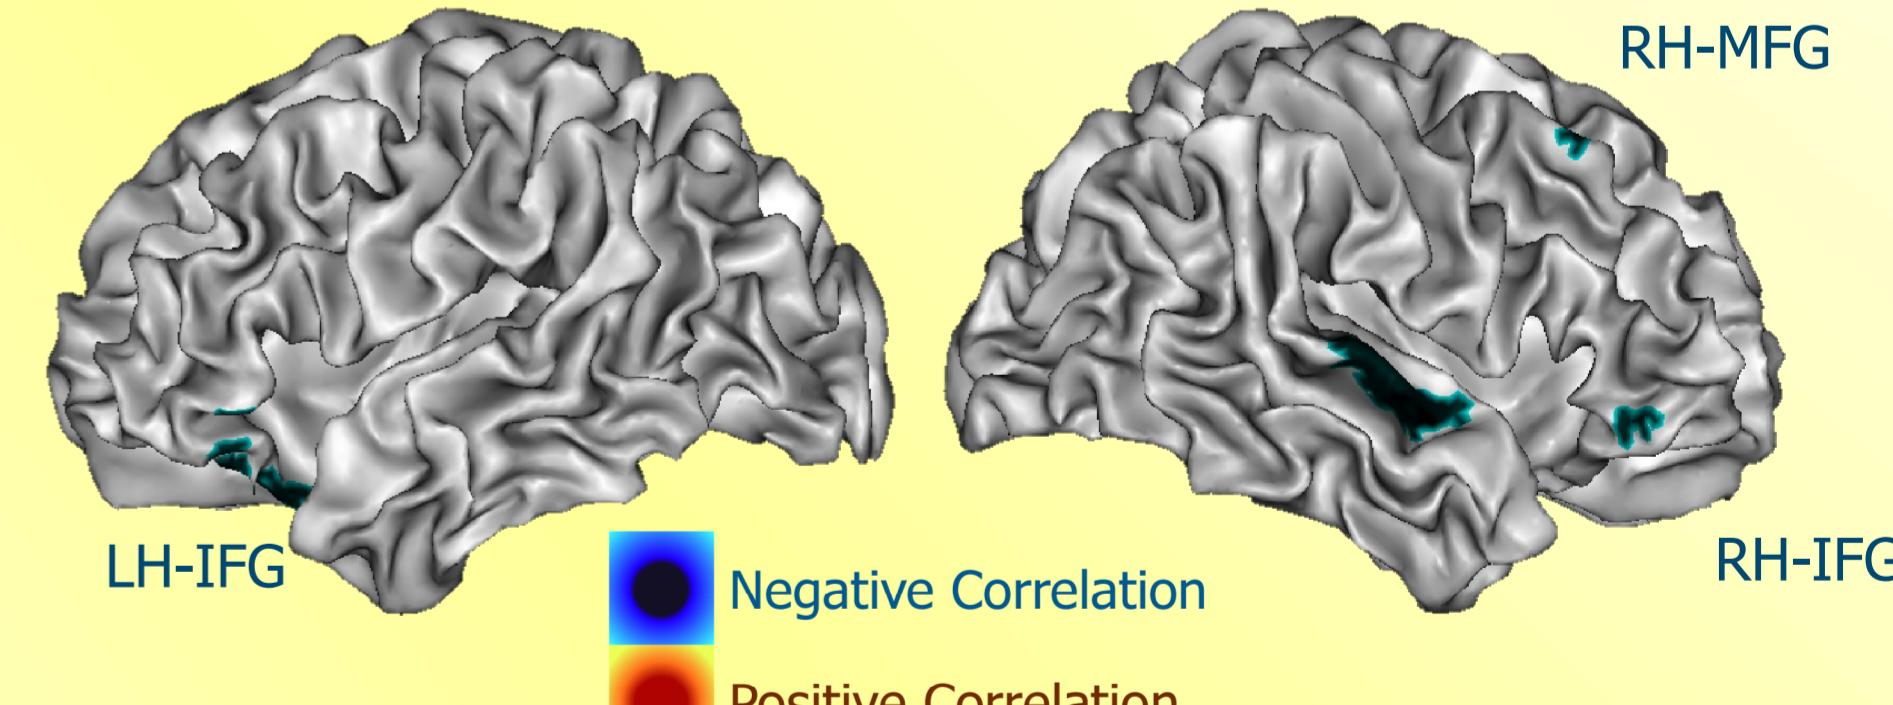

Linear Carry-over Physical Effects

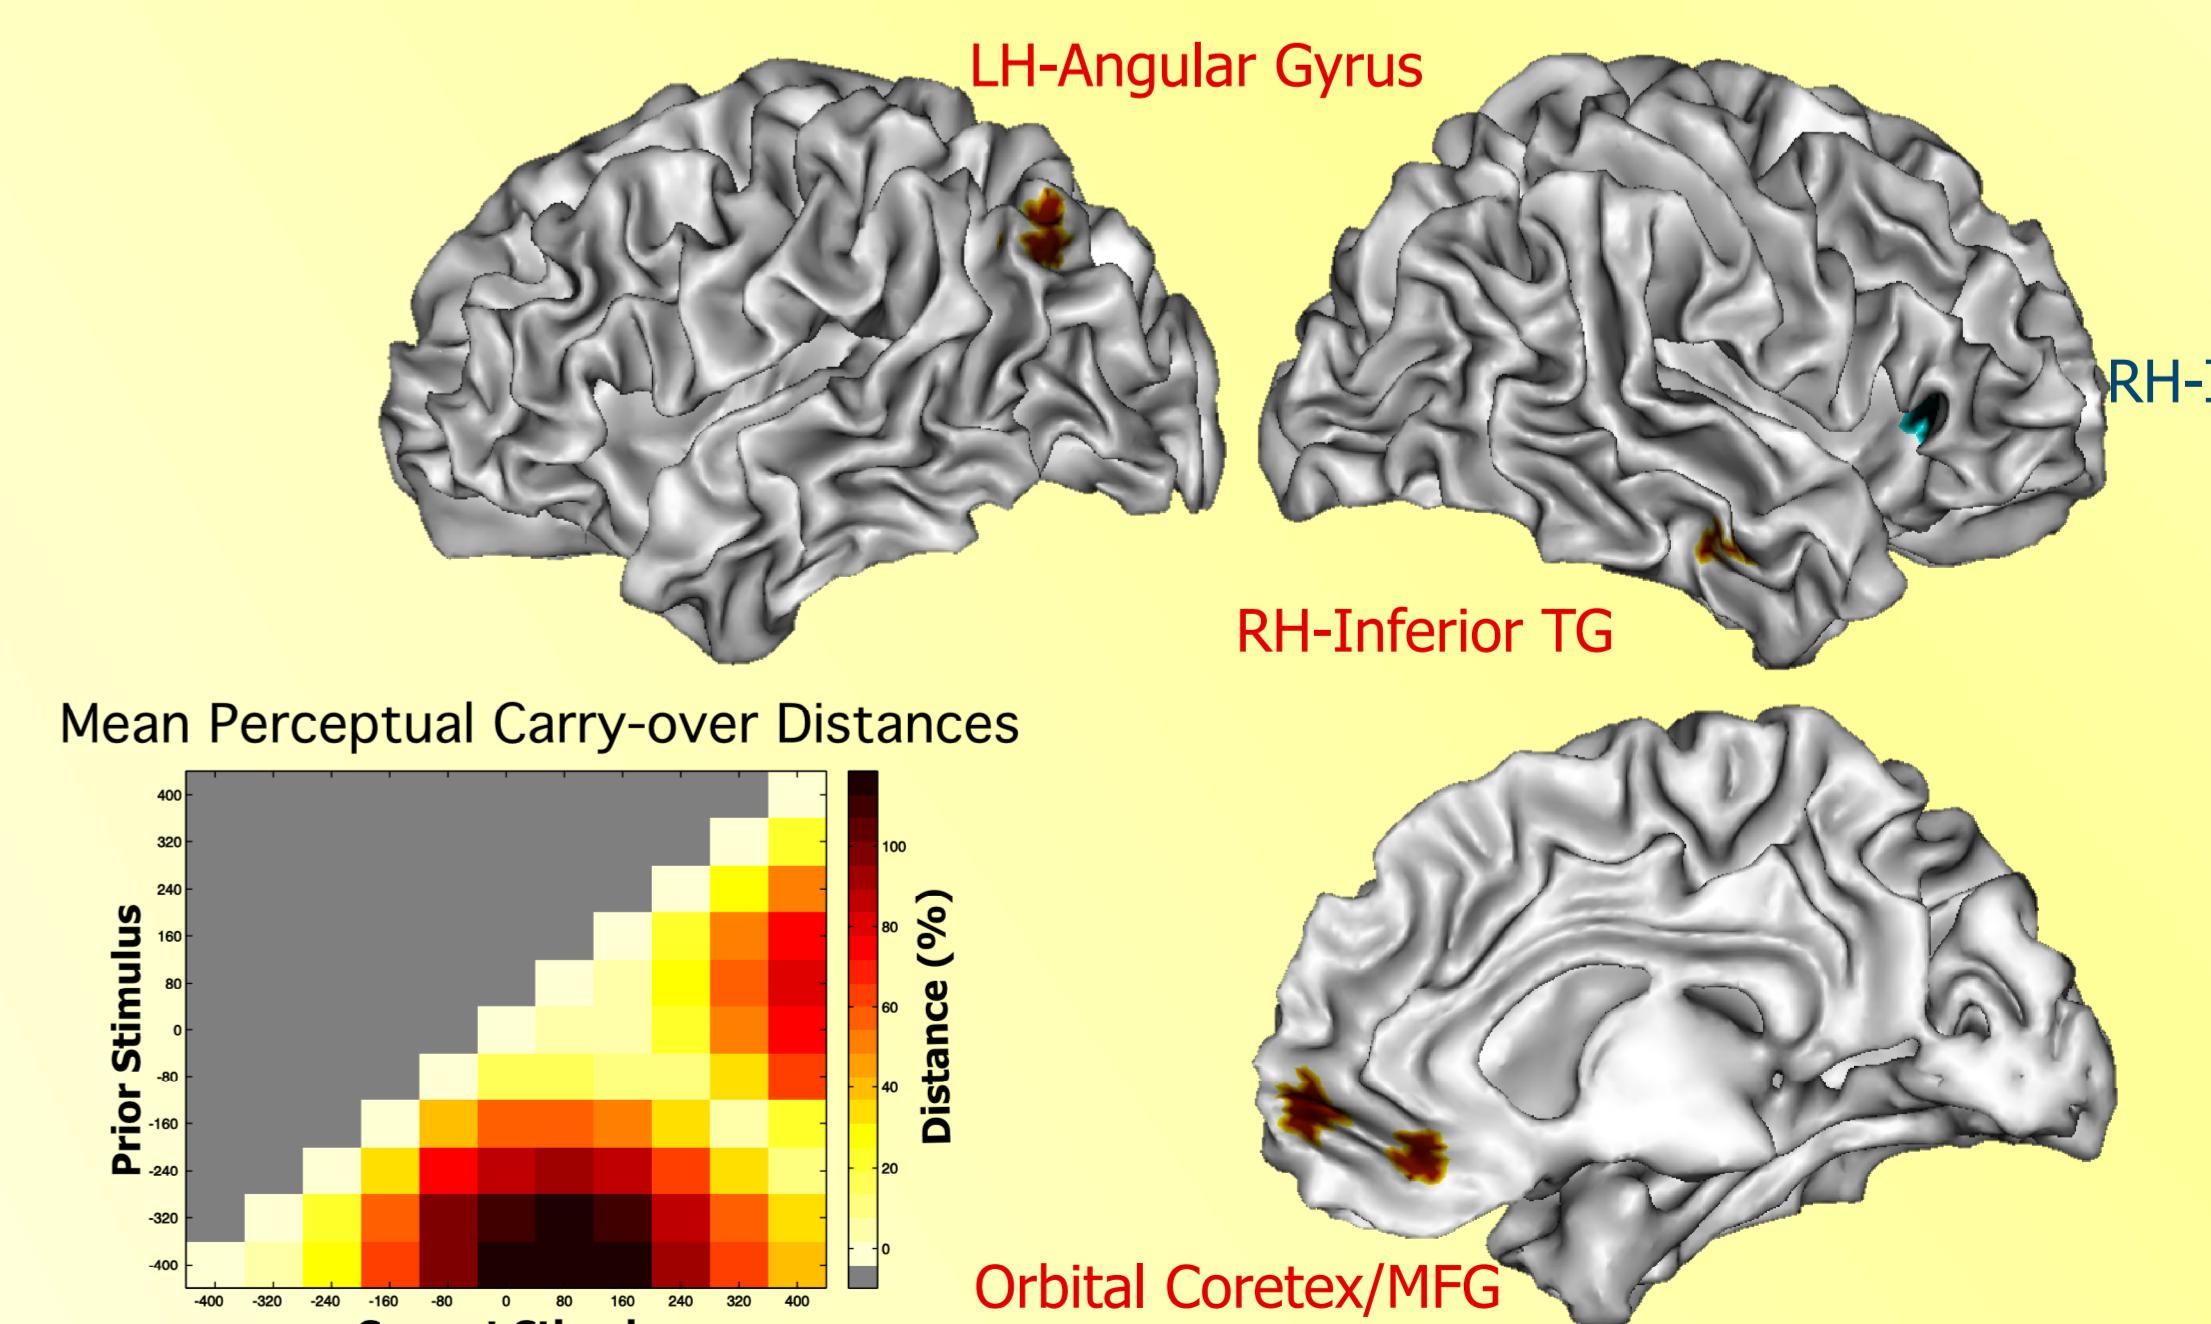

Quadratic Carry-over Physical Effects

Linear Carry-over Perceptual Effects

Quadratic Carry-over Perceptual Effects
