

## TWO MAIN GENETIC CLUSTERS WITH HIGH ADMIXTURE BETWEEN FOREST AND CULTIVATED CHESTNUT (*CASTANEA SATIVA* MILL.) IN FRANCE

### ESM\_2 PLOTS OF GENOTYPE ACCUMULATION CURVES FOR THE 18UNIK AND 10UNIK DATA SETS

Genotype accumulation curves are useful for determining the minimum number of loci necessary to discriminate between individuals in a population. This was performed by randomly sampling loci without replacement and counting the number of multilocus genotypes (MLGs).
