HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

How to design healthy and sustainable Food Systems ?

Monique A.V. Axelos and Hugo de Vries
Inra, scientific direction, France

Content

- Where are we?
- What do we need?
- What is a food system?
- What does it mean for food?
- And for **food science and technology**
> radical innovations?
- Examples of potential solutions?
- A need for a **food systems approach**?

Where are we?

- An enormous challenge!

Earth overshoot day 2019 is July 29 !

And yet in some alarming zones

The nine Planetary Boundaries - 2015

<https://www.stockholmresilience.org/research/planetary-boundaries/planetary-boundaries/about-the-research.html>

And other major challenges?

Exponential curves

We are not heading towards a sustainable way of life

<http://www.worldometers.info/>

Challenge of climate changes:

Arctic region
Biodiversity loss

Atlantic region:
Increasing risk of heavy precipitation,
river and coastal flooding,

Mediterranean region

Large increase in heat extremes
Increasing risk of drought and forest fires
Decrease in crop yields, in precipitation
Increased competition between different water users
Increasing risks for livestock production
High vulnerability to spillover effects of climate change from outside Europe

Boreal region

Increase in heavy precipitation events
and river flows
Increasing potential for forest growth but risks
of forest pests and forest fires

Continental region

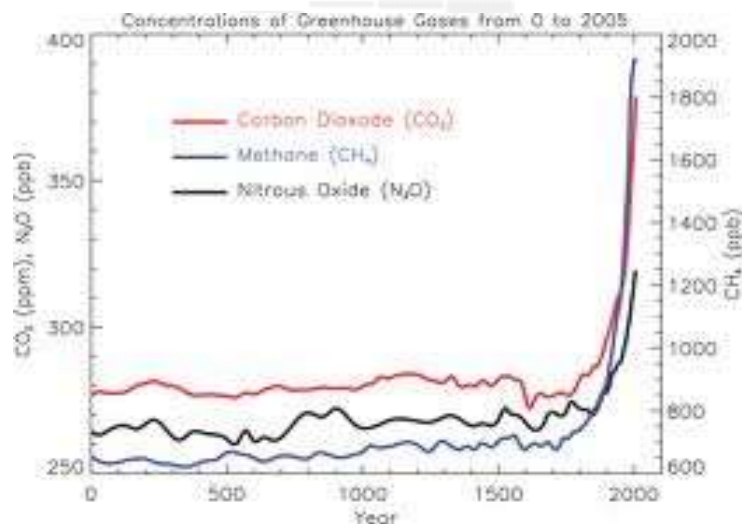

Increase in heat extremes
Decrease in summer precipitation
Increasing risks of river floods
Increasing risk of forest fires

Mountain region

Upward shift of plant and animal species
High risk of extinction species
Increasing risks of forest pests

Source: EEA, 2015

Challenges for Food:

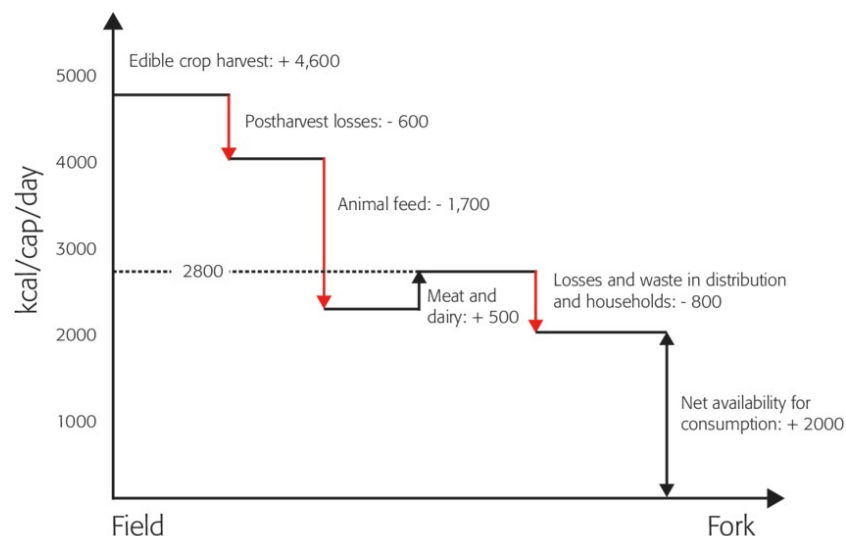

Food systems emissions : 20-30 % of total GHG emissions

Agriculture: the largest contributor of non-CO₂ GHGs

30% by weight of all food produced is lost in the food supply chain !

- In low income countries : storage - transport and processing levels
- high-income countries : retail and consumer levels

57 % of calories are not consumed

Challenge of malnutrition

Poor diets are associated with considerable health burdens and public expenditure in European countries.

What do we need?

A viable planet!, in terms of:

- *Healthy inhabitants*
 - *A viable environment*
 - *A pleasant & respectful socio-economic context*
 - *An aesthetic image*
- *There is no one simple recipe !!*
- ➔ ***Systemic approach from the soil to the plate and back***

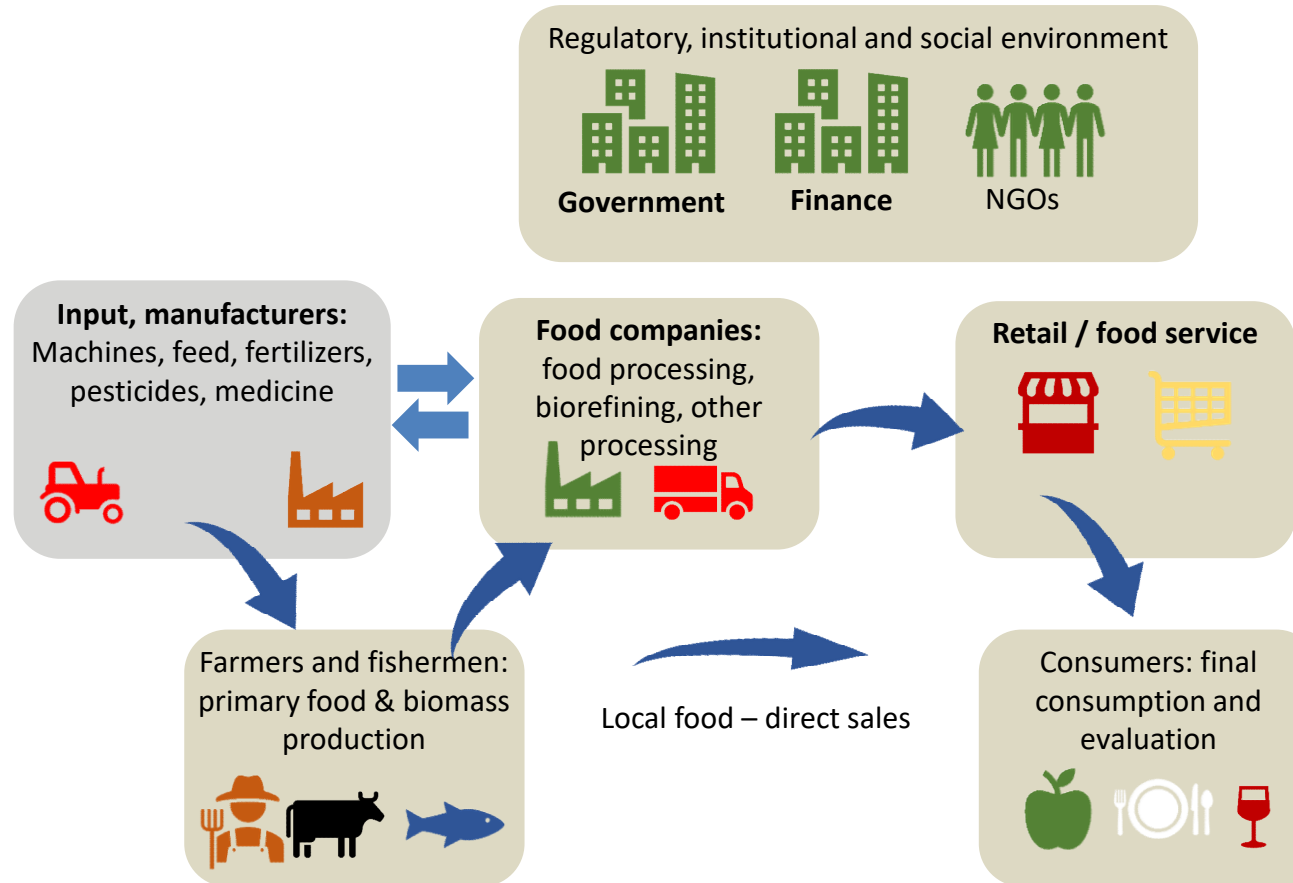

What is a food system?

A **food system** considers all the **elements** (environment, people, inputs, processes, infrastructures, institutions) and **activities** that relate to primary producing, processing, distributing, preparing and consuming food; and the **socio-economic and environmental outcomes** of these activities. (HLPE, 2014)

→ look in a more integrated way at biophysical flows (food) – economic and institutional setting and health, environmental and economic outcomes

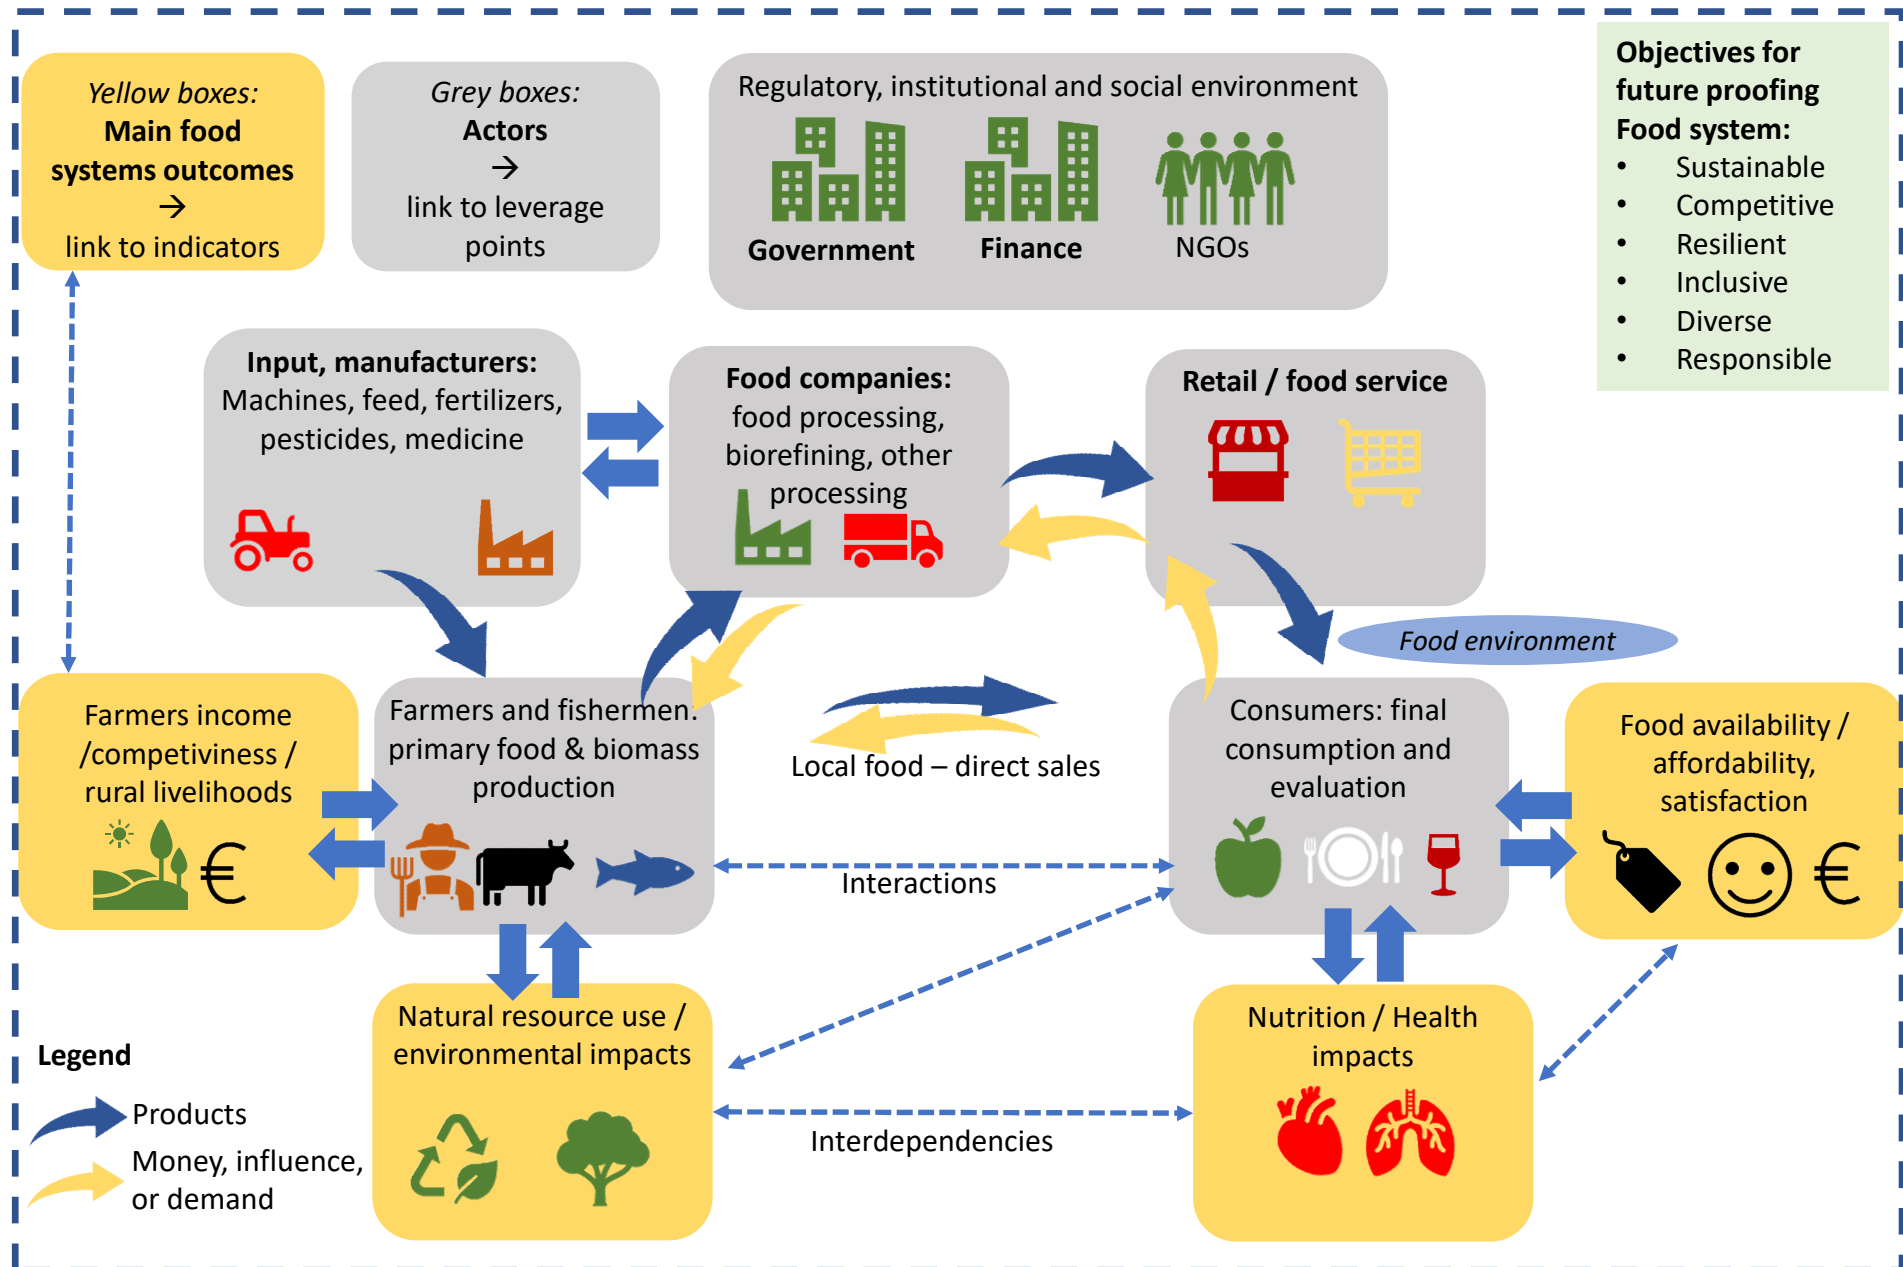

Actors in a food system

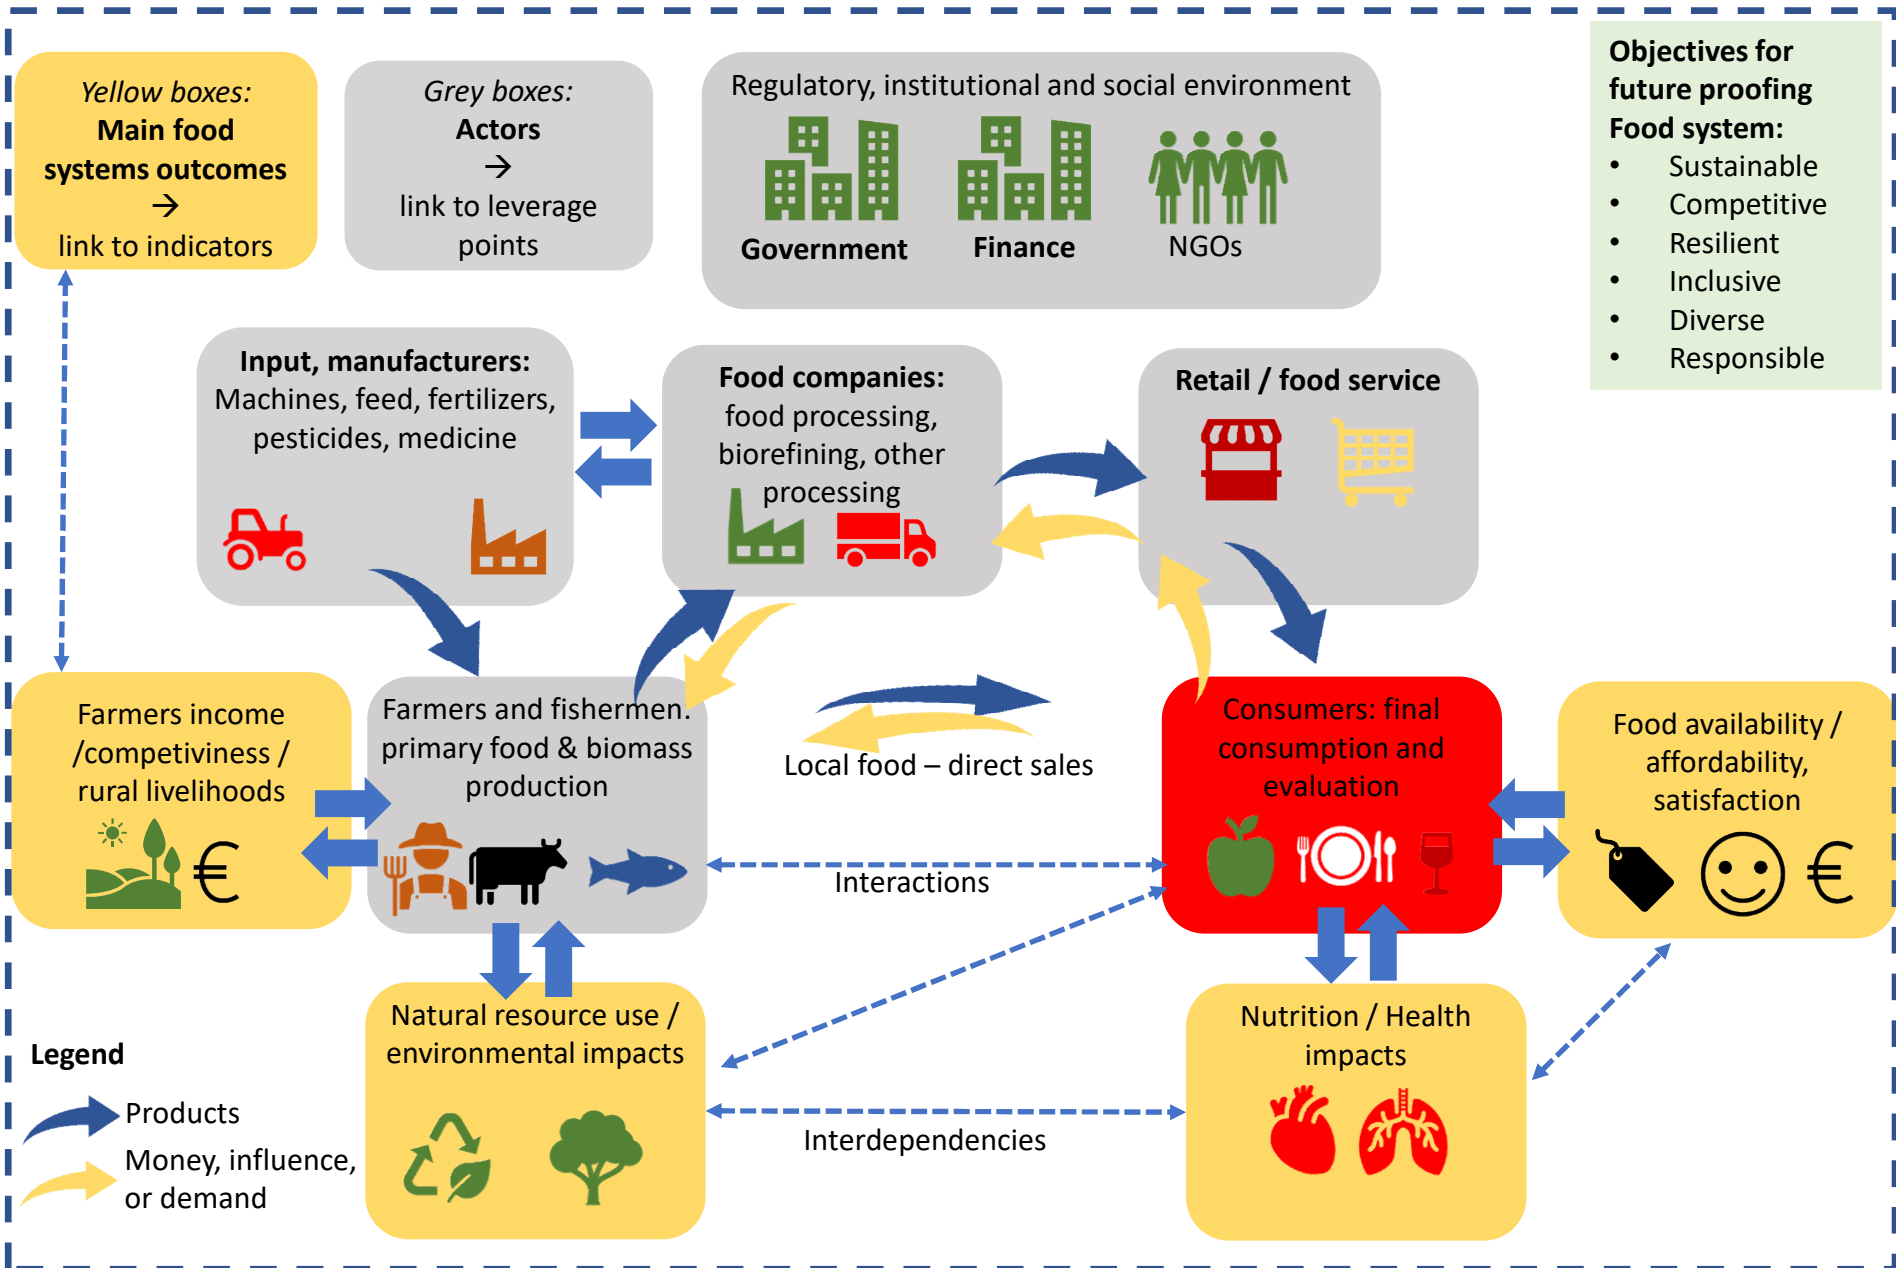

Legend

 Products

Food system research

Food system research

A future proof system needs:

- Involving citizen in food systems strategies : Understanding their perceptions and motivations to facilitate the transition: Diets can be a leverage point to a healthy and sustainable food system...
- ...but only if its combined with action in other sectors,
- Including the orientation of production priorities, cutting food loss an waste, and protecting nature
- Including cultural aspects, gastronomy – food as an art of eating and producing well, and something that connects people together

What does it mean for food?

> *we need to redefine the limits*

Despite these multiple threats , we have a lot of opportunities to adapt to change through innovations

1. *Avoiding unnecessary exploitation of resources*
2. *Efficiently transforming and using agro-resources*
3. *Valorizing new co-products and waste streams and re-valorizing all biomass to avoid waste*

Radical innovations needed in Food systems / ruptures (I)

1. Avoiding unnecessary exploitation of resources: **towards alternative consumption patterns**

- Eating low density – high **satiety** food,
- **Using alternative protein** sources to decrease meat consumption
- using the richness of nature's structures (**biomimetics**),
- *Moving* from products towards services & **de-materialization**,
- ..

Radical innovations needed in Food technology / ruptures (II)

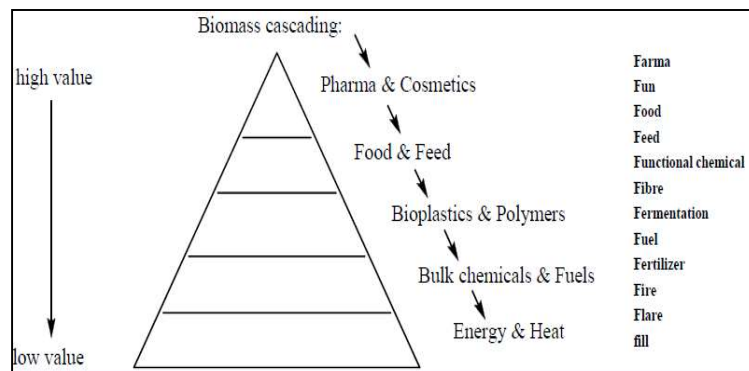

2. Efficiently transforming and using agro-resources :

- **targeted** processes (not over-dimensioned)
- process **intensification** ,
- new **ICT** driven processes (virtual design, domotics, 3D printing, ...),
- eco-efficient dynamic storage,
- **waterless** systems,
- *novel biomaterials & packaging concepts, etc.*

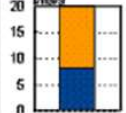

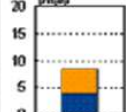

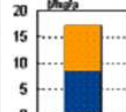

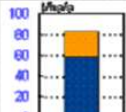

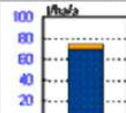

Radical innovations needed in Food systems / ruptures (III)

3. Valorizing new co-products and waste streams and re-valorizing all biomass:

➤ **eco-pyramid** valorization,

Food Science becomes more and more trans disciplinary
(management, economics, genetics,...)

Eco-efficiency as a driver

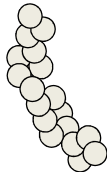

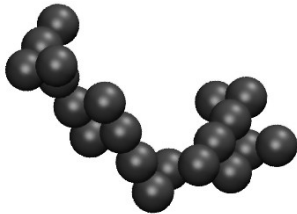

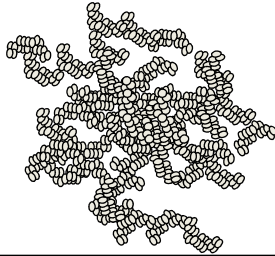

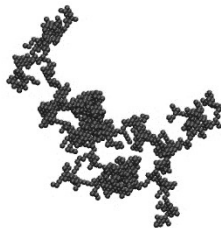

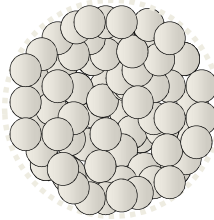

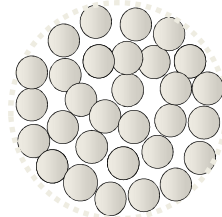

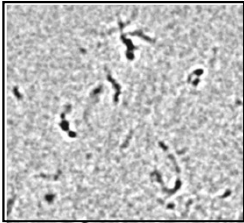

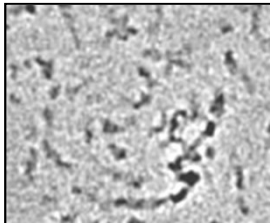

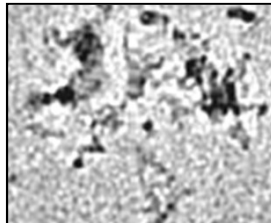

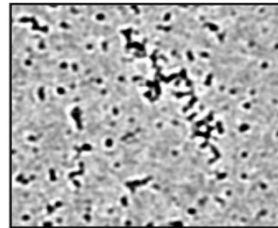

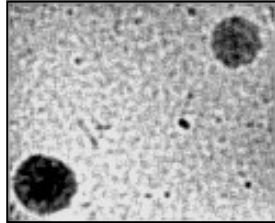

Ex. waterless system: dry fractionation

Abecassis et al., 2013,...

WHY RUPTURE? Integral use of biomass, no *water added* during processing (thus no drying), local applicability, avoiding water transport, local employment

Globular whey proteins: playing with t-T-shearing

Eco-efficient process					
Primary aggregates	Low branched aggregates	Fractal aggregates $d_f=2$	Fractal aggregates $d_f=2.2$	Globular dense aggregates	Globular porous aggregates
80 °C			80 °C	120 °C	
Static conditions (24 h)			Dynamic conditions (160 s)		
Building units : primary aggregates			Building units: native WPI		
0.003 M		0.1 M	0.003/ 0.1 M	0.003 M	0.1 M
					
					

Examples: Innovation from the field to the plate:

% wheat/legumes

ref: INRA « Flexiprocess » project
M.H. Jeuffroy & C Michon

French National strategy for protein
transition

Nutritional
advantages

Approval?

Ex. alternative proteins sources & products

Meat alternatives on basis of new plant, algae and insect protein sources

WHY RUPTURE? Substantial reduction of environmental pressure due to protein-conversion factors and greenhouse gas emissions (CH₄, etc.), **challenges with texture and nutritional profiles, ...**

24

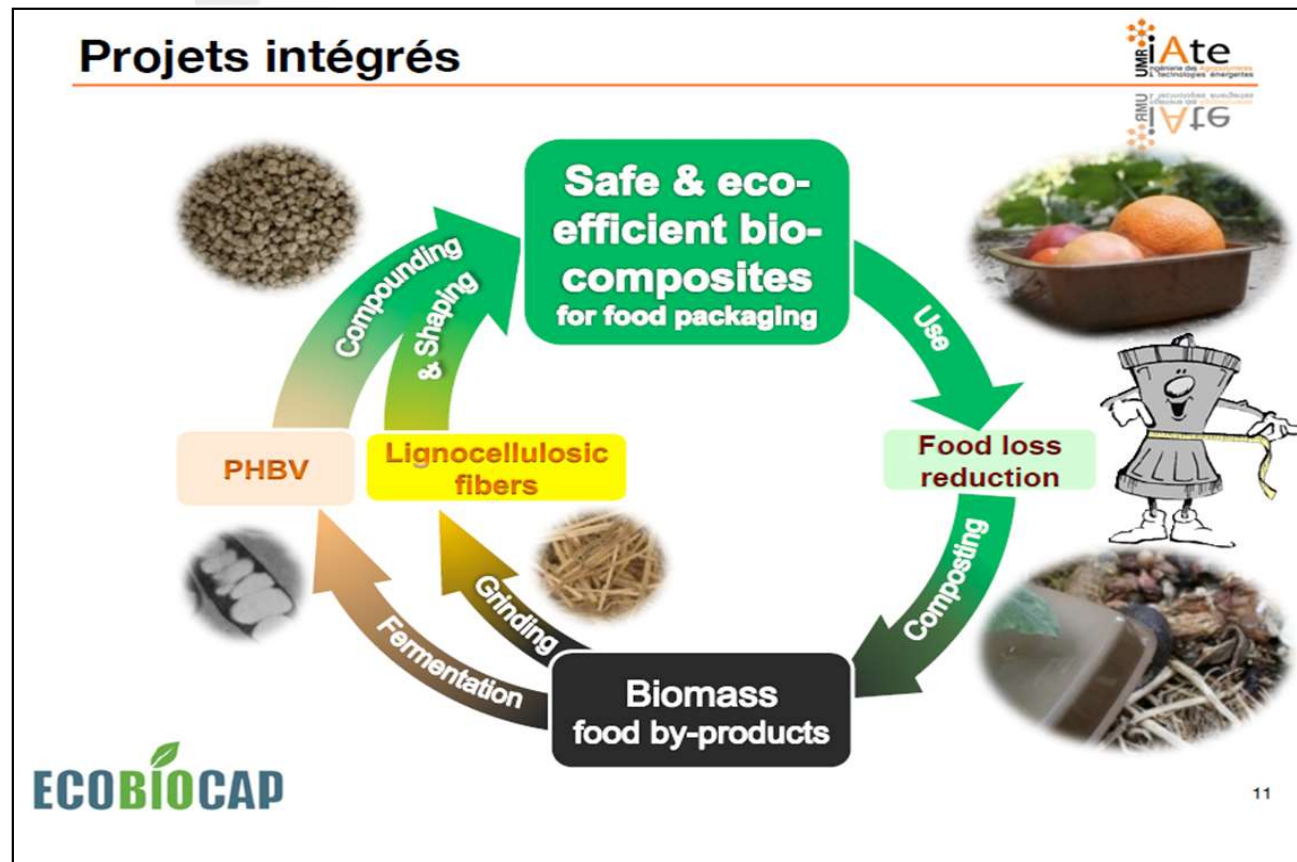

Why rupture? Adiabatic heating >> time for processing enormously reduced & No re-packing > treatment in the package itself

EU IP FP6 NovelQ: To develop and successfully demonstrate - eco-friendly - novel processing technologies (HPP, PEF, Plasma, microwave, radio frequency, ohmic heating and new packaging materials) for improved quality food and new products (fresh-like character, extended shelf-life)

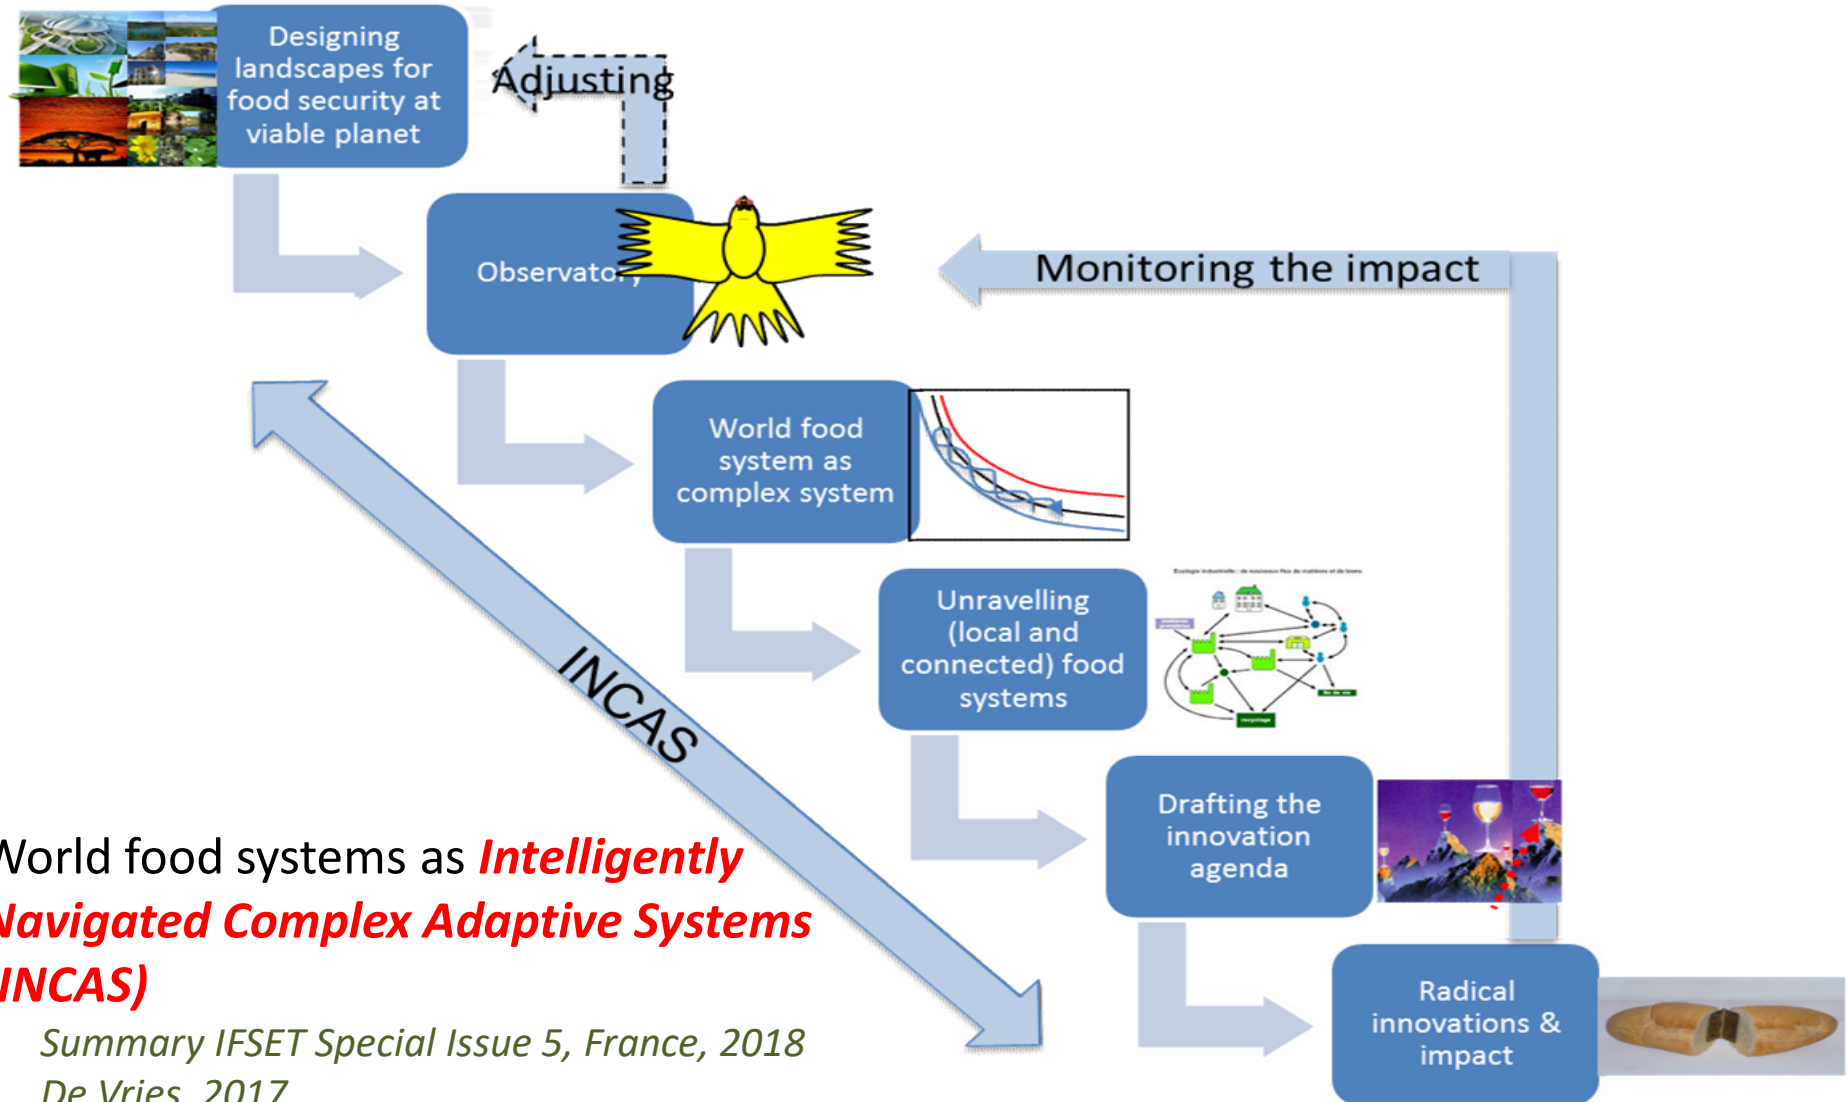

Ex. biodegradable packaging materials

WHY RUPTURE? Valorization of largely unused co-products (approx 50% of all biomass) and waste (plus replacing synthetic materials, potential benefits due to biodegradability, ...)

Need for food systems approach

We need inspiration & creativity

Diversity interconnected

Thinking in spirals, not in circles

Changing the landscapes & melting zones

Creating ruptures

Many thanks for your attention
