HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
Pl@ntNet Services, a Contribution to the Monitoring and Sharing of Information on the World Flora

Abstract

Pl@ntNet is a scientific and citizen platform based on artificial intelligence techniques to help participants more easily identify plants with their smartphones. The identification of plant species is indeed an important step for many scientific, educational and land management activities (for natural or cultivated spaces). This step, which is integrated into various biology training courses, is difficult to develop on a large scale, even for professionals. This difficulty in naming plants by a very large part of the society limits the positive interactions between humans and their environment, and thus reduces awareness of the contribution of plants to the well-being of humanity. It is therefore essential to attempt to solve this problem on a large geographical, taxonomic and sociological scale in order to develop more responsible and environmentally precautionary societies.
In the framework of the European Cos4Cloud project (2019 - 2023), which involves several European citizen science platforms (such as iSpot in the UK, Natusfera in Spain or Artportalen in Sweden), Pl@ntNet is developing innovative digital services aimed at:

1. facilitating the integration of automated species identification into other citizen science portals and
2. enabling researchers to use Pl@ntNet data and tools for their own research.

The services implemented will be provided on the European Open Science Cloud (EOSC), to increase the capacity and interest of European scientists to implement citizen science projects aimed at contributing to the sustainable development goals identified by the United Nations.

The tools currently available on the Pl@ntNet monitoring platform, as well as the data extraction methodologies that have enabled the publication of two large datasets on the Global Biodiversity Information Facility (GBIF) portal, will be presented. In particular, we will present our latest advances allowing:

• the adaptation of Pl@ntNet services to nature reserves or botanical gardens,
• the monitoring of target species for a given geographical area,
• the prediction of species distribution at the national scale, based on high-resolution remote sensing imagery.

The results of the LifeCLEF campaign, an annual international scientific and technological benchmark based on Pl@ntNet data, will be presented to compare the latest machine-learning techniques used to enable automated species identification and species prediction based on geolocation. The fruit of this work, involving a large multi-disciplinary team will illustrate the benefits of working at the frontier between biological, digital and citizen sciences.
