HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

OpenFLUID is a software framework and an operational platform for integrative modelling and simulation of landscapes. It allows to build spatial simulations based on i) pluggable models which are coupled, ii) a digital representation of the landscapes.

Simulation execution

OpenFLUID simulations can be run either using the command line interface or the graphical user interface. During simulations, the plugged models compute and exchange variables and events, attached to every spatial graph node. The plugged observers can monitor the simulation continuously, for exporting data, controlling values, or for performing any non intrusive operation. The data storage and exchanges over the spatial graph for the model coupling is managed by the platform engine.

Input dataset
digital landscape representation, coupled model configuration, monitoring definition, ...

The input dataset can be built by hand using test files, or GIS environments, or using specific tools such as GeoWMS (Lagacherie et al. 2010).

Modelling application examples using OpenFLUID

Runoff pathways at field scale

Objectives: 1) studying the effect of intra-field variability on the runoff generation and flow pathways, 2) comparing different implementations of the same hydrological process.

Methods: A 1200 m² vineyard field (Roujan, France) is divided into more than 1000 surface units. The coupled model is made of a rainfall-runoff model and three surface transfer models which are interfaced for implementations comparison.

Hydrological network topology effects

Objectives: Studying the impact of hydrological network density on erosion and surface water accumulation.

Methods: 8000 simulations using a rainfall-runoff-transfer coupled model, with different hydrological networks densities and topologies (Levavasseur et al. 2012).

Risk analysis of water contamination by pesticides

Objectives: Studying the impact of agricultural practices changes and buffer zone implanting on pesticide transfer to surface water.

Methods: Puissalicon catchment (100ha, France) is divided into 190 surface units (fields, roads, banks, buffers) and 40 reach segments (ditches, pipes, rivers). The coupled model is made of hydrological models and fate-and-transfer pesticide models.

Simplified modelling of traffic on Manhattan streets

Objectives: Using OpenFLUID in a very different context of usual applications, demonstrating its abilities in modelling various types of spatial fluxes.

Methods: A simplified coupled model of road traffic, traffic lights switching, applied to a spatial representation of streets in a urban context.

An open-source layer cake with candies

OpenFLUID relies on many open-source libraries for the core architecture and functioning (Boost, GLib, libXML2, libCURL), the management of GIS data (GDAL, OGR), the spatial algorithms (GEOS) and the GUI features (GTK).

All of these libraries licenses allow a non-restrictive reuse.

OpenFLUID is licensed under the terms of the GPL license, with a special exception. This special exception allows to plug and distribute models which are not compliant with the standard GPL license.

OpenFLUID framework

The OpenFLUID framework can be embedded into the Python language using the PyOpenFLUID module, or into the GNU R statistical environment using the ROpenFLUID package.

OpenFLUID uses a collaborative approach either for its development and the scientific applications. OpenFLUID make the sharing of knowledge and source codes easier.

OpenFLUID software, documentation and collaborative support are available on the web site: http://www.openfluid-project.org

OpenFLUID source code is available on the GitHub open-source hosting platform: http://github.com/OpenFLUID/
