HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Impact of linked selection on demographic inference: insights from the Inverse Instantaneous Coalescence Rate (IICR)

Virtual conference *Probabilistic Modeling In Genomics*, April 14 - 16, 2021

CONTEXT

- Linked selection is pervasive (Elyashiv *et al*, 2016; Pouyet *et al*, 2018) and biases demographic inference (Ewing and Jensen, 2016; Schrider *et al*, 2016; Pouyet *et al*, 2018; Johri *et al* 2021).
- Can be modelled approximately by a local reduction (background selection & sweeps) or increase (balancing selection) of effective population size N_e (Hill and Robertson, 1966)
⇒ Variable levels of N_e genome-wide (Gossmann *et al*, 2011) reflecting the variations of recombination rate or gene density.
- Study the genome-wide distribution of pairwise coalescence times (T_2) for models with variable genomic N_e to predict the impact of linked selection on PSMC (Li and Durbin, 2011).

LINKED SELECTION UNDER PANMIXIA

- K genomic classes with relative proportion a_i .
- Class i evolves under the WF model with $\lambda_i N$ diploids.

$$IICR(t) = \frac{\sum_{i=1}^K a_i \mathbb{P}(T_2^i \geq t)}{\sum_{i=1}^K a_i d\mathbb{P}(T_2^i = t)} = \frac{\sum_{i=1}^K a_i e^{-\mu_i t}}{\sum_{i=1}^K a_i \mu_i e^{-\mu_i t}}, \quad \mu_i = \frac{1}{\lambda_i}$$

General results

- $IICR'(t) > 0$

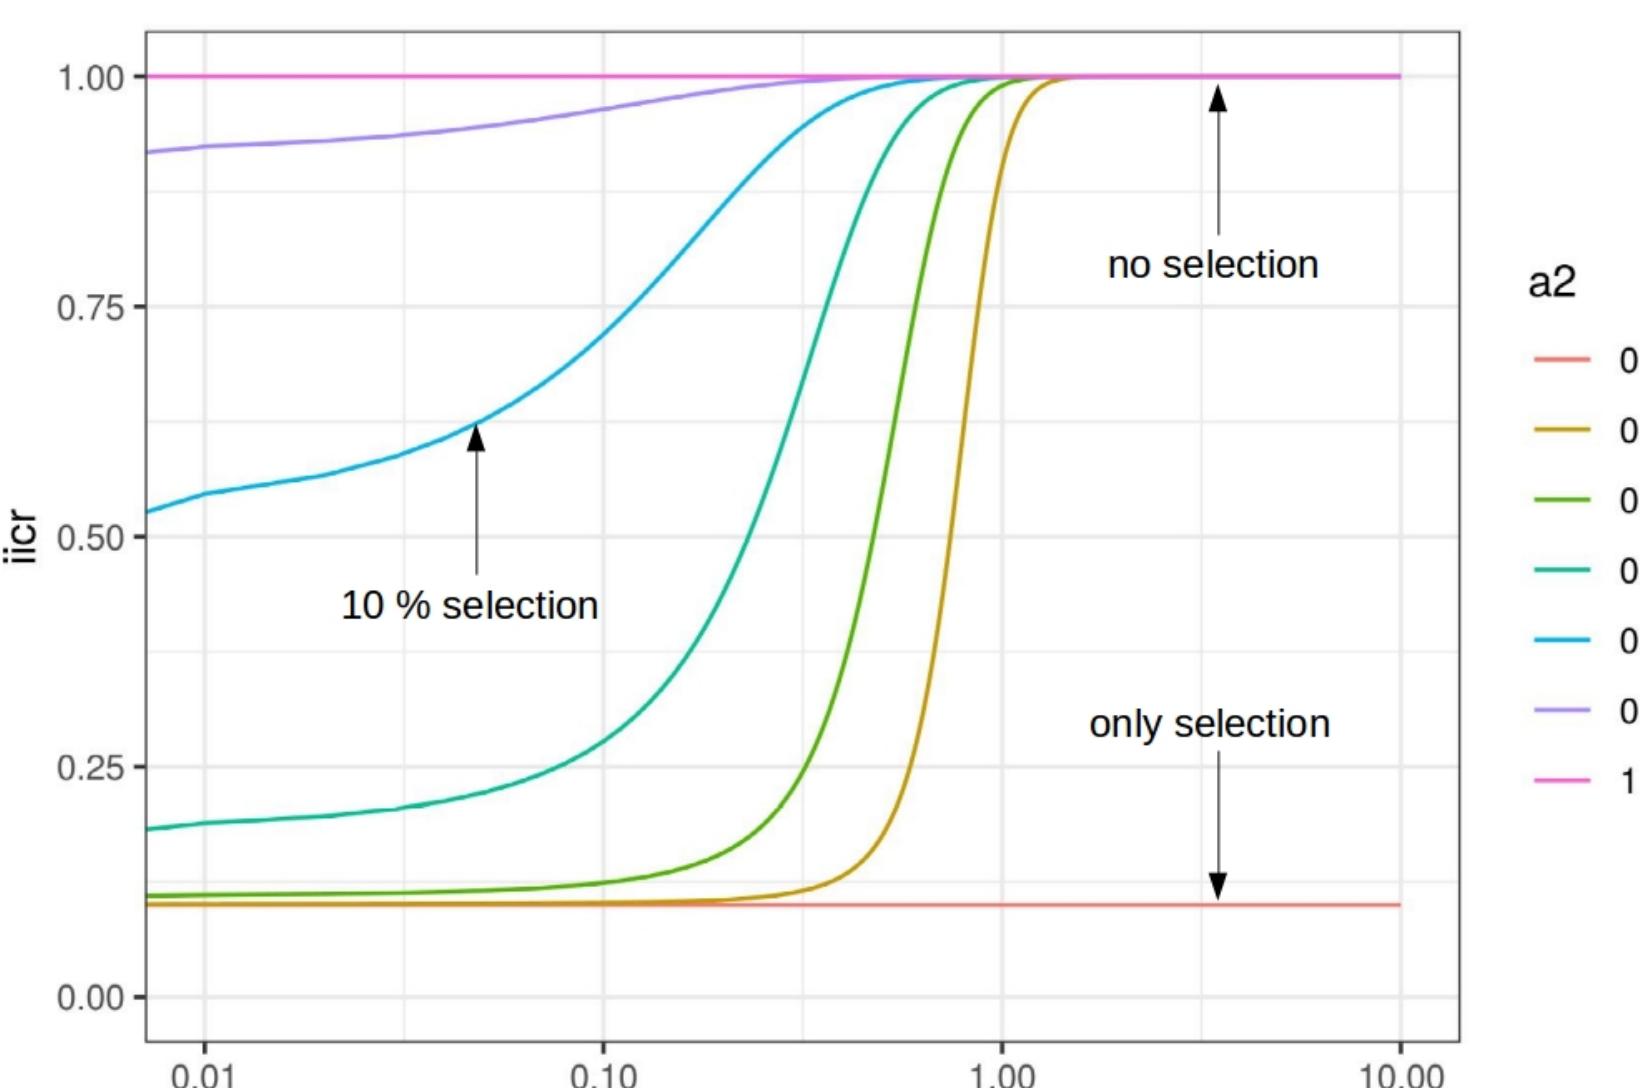

spurious signal of N_e decline

-

$$IICR(0) = \frac{1}{\sum_{i=1}^K \frac{a_i}{\lambda_i}}$$

- $IICR(t) \rightarrow \lambda_{max}$ as $t \rightarrow +\infty$

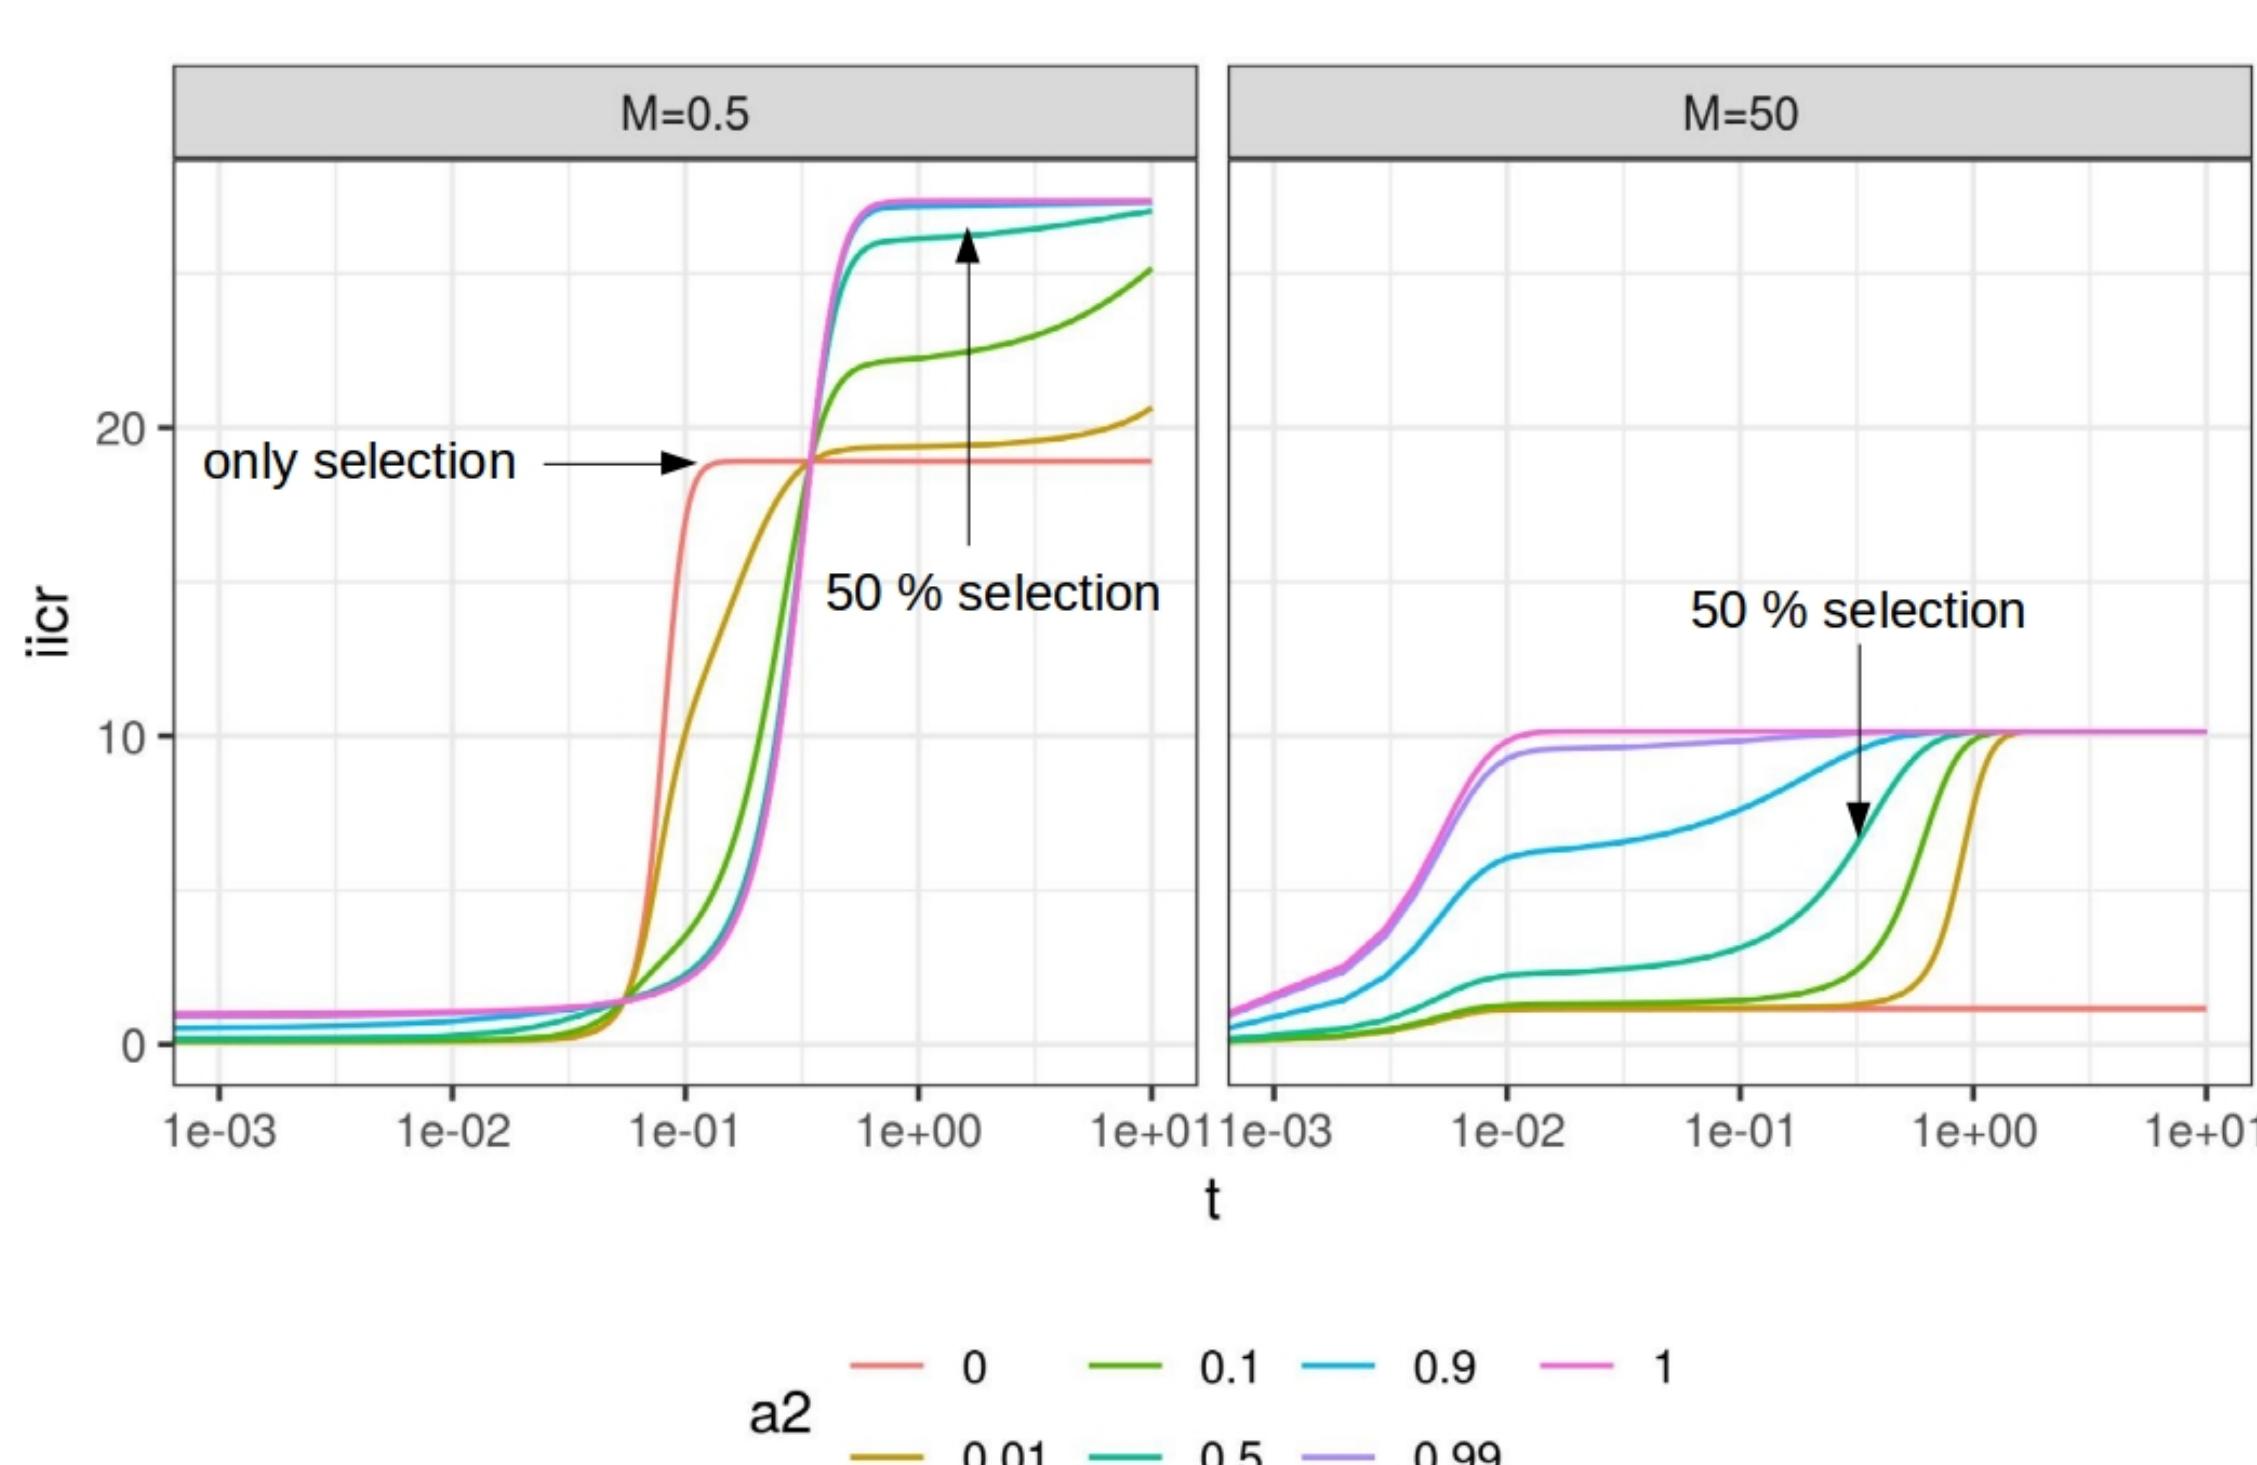

Example: $K = 2, \lambda_1 = 0.1, \lambda_2 = 1$ (neutral)

LINKED SELECTION AND STRUCTURE

Class i evolves under an **island model** with n demes, scaled migration rate $M = 4Nm$ (not affected by selection) and **deme size** $\lambda_i N$.

Example for $n = 10, K = 2, \lambda_1 = 0.1, \lambda_2 = 1$:

- Close to panmixia (see poster left column) for large M .
- IICR plateau ↑ as $M \downarrow$ (general property of structured models).
- Selection effect weaker than under panmixia for $M \leq 1$.
- Counter-intuitive effects: IICR sometimes ↑ as selection proportion ↑.

THE IICR (MAZET *et al*, 2016)

- For a given evolution model, the IICR is a function $\lambda()$ defined by

$$\frac{1}{\lambda(t)} = \frac{d\mathbb{P}(T_2 = t)}{\mathbb{P}(T_2 \geq t)}, \quad t \geq 0 \text{ in } 2N_e \text{ units}$$

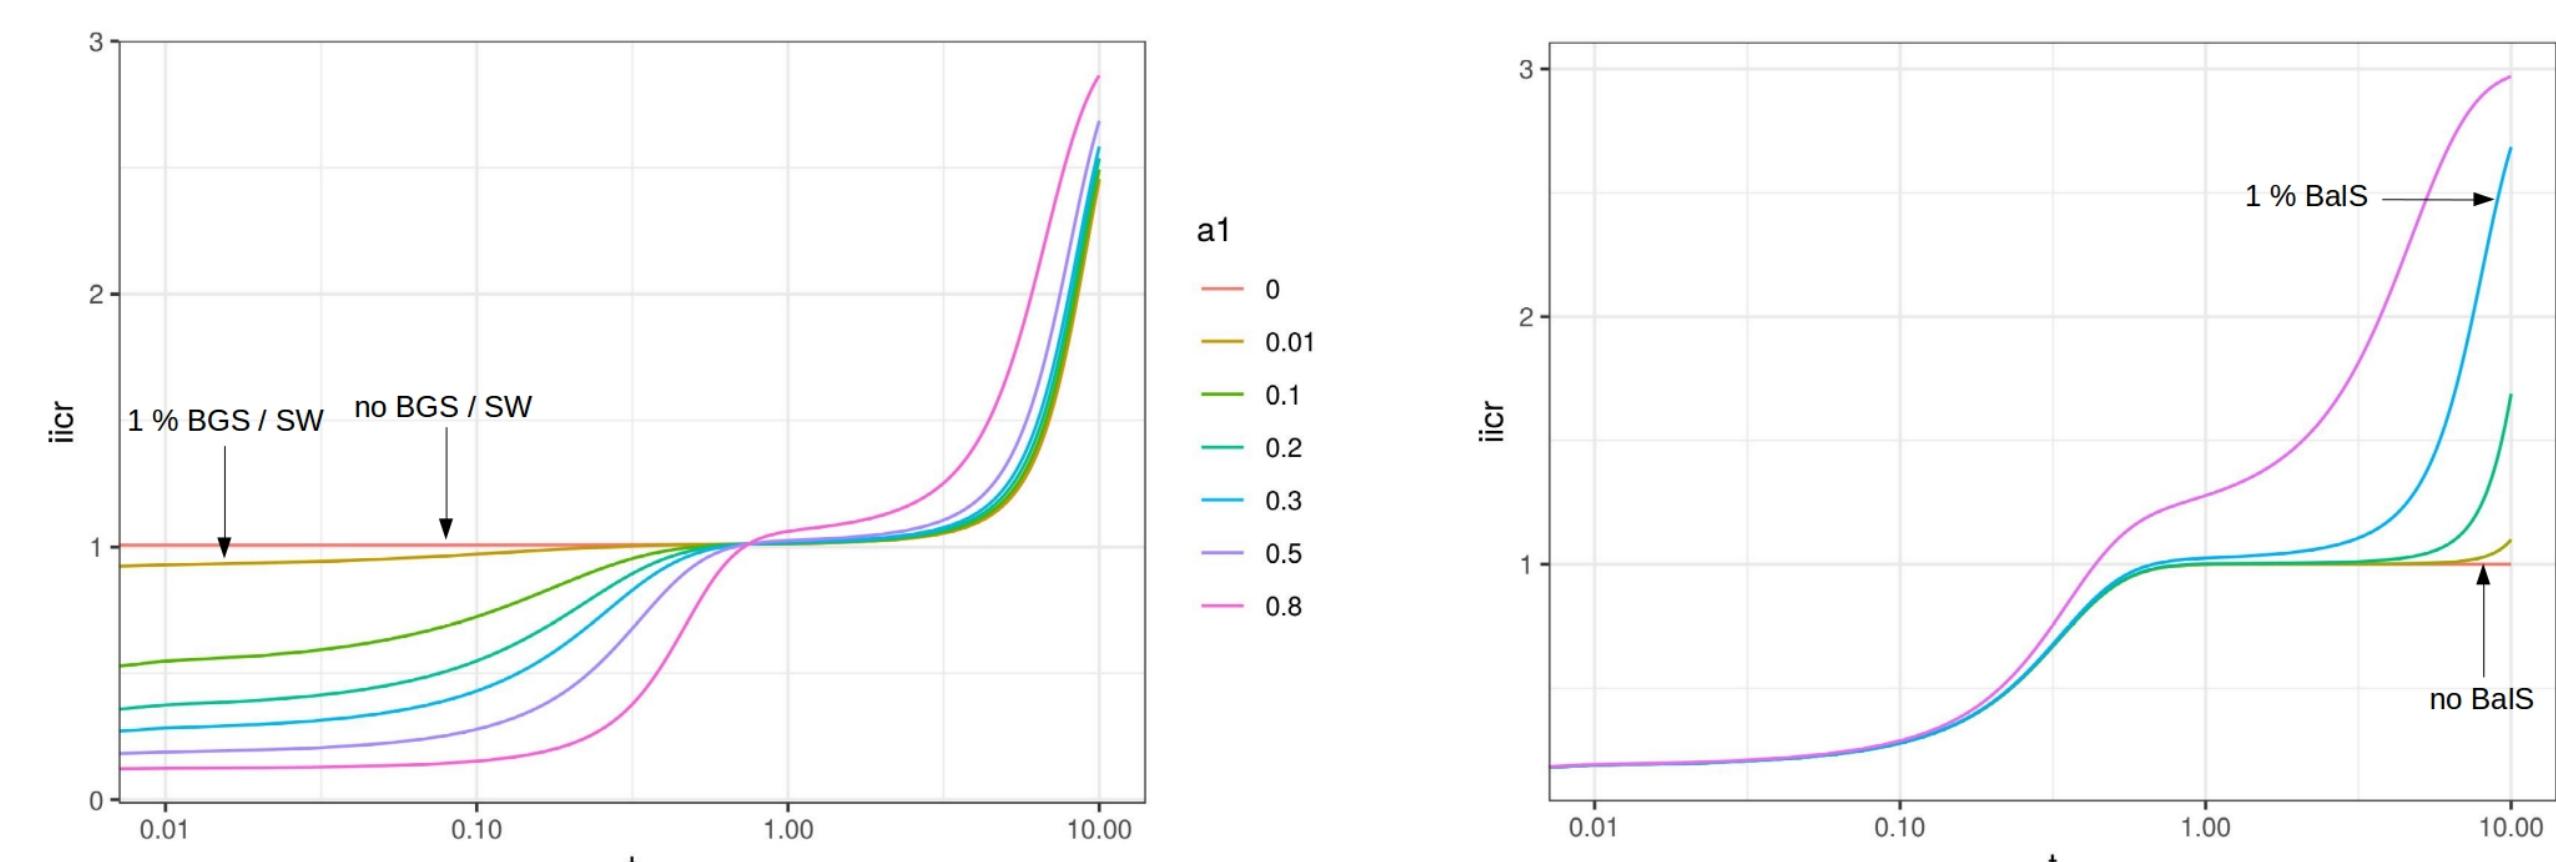

- The IICR $\lambda()$ is the quantity estimated by PSMC.
- It corresponds to the temporal trajectory of N_e if and only if the population considered has always evolved under panmixia.

COMBINING VARIOUS FORMS OF SELECTION

$K = 3: \lambda_1 = 0.1$ (BGS & sweeps), $\lambda_2 = 1$ (neutral), $\lambda_3 = 3$ (balancing).

$$a_3 = 0.01$$

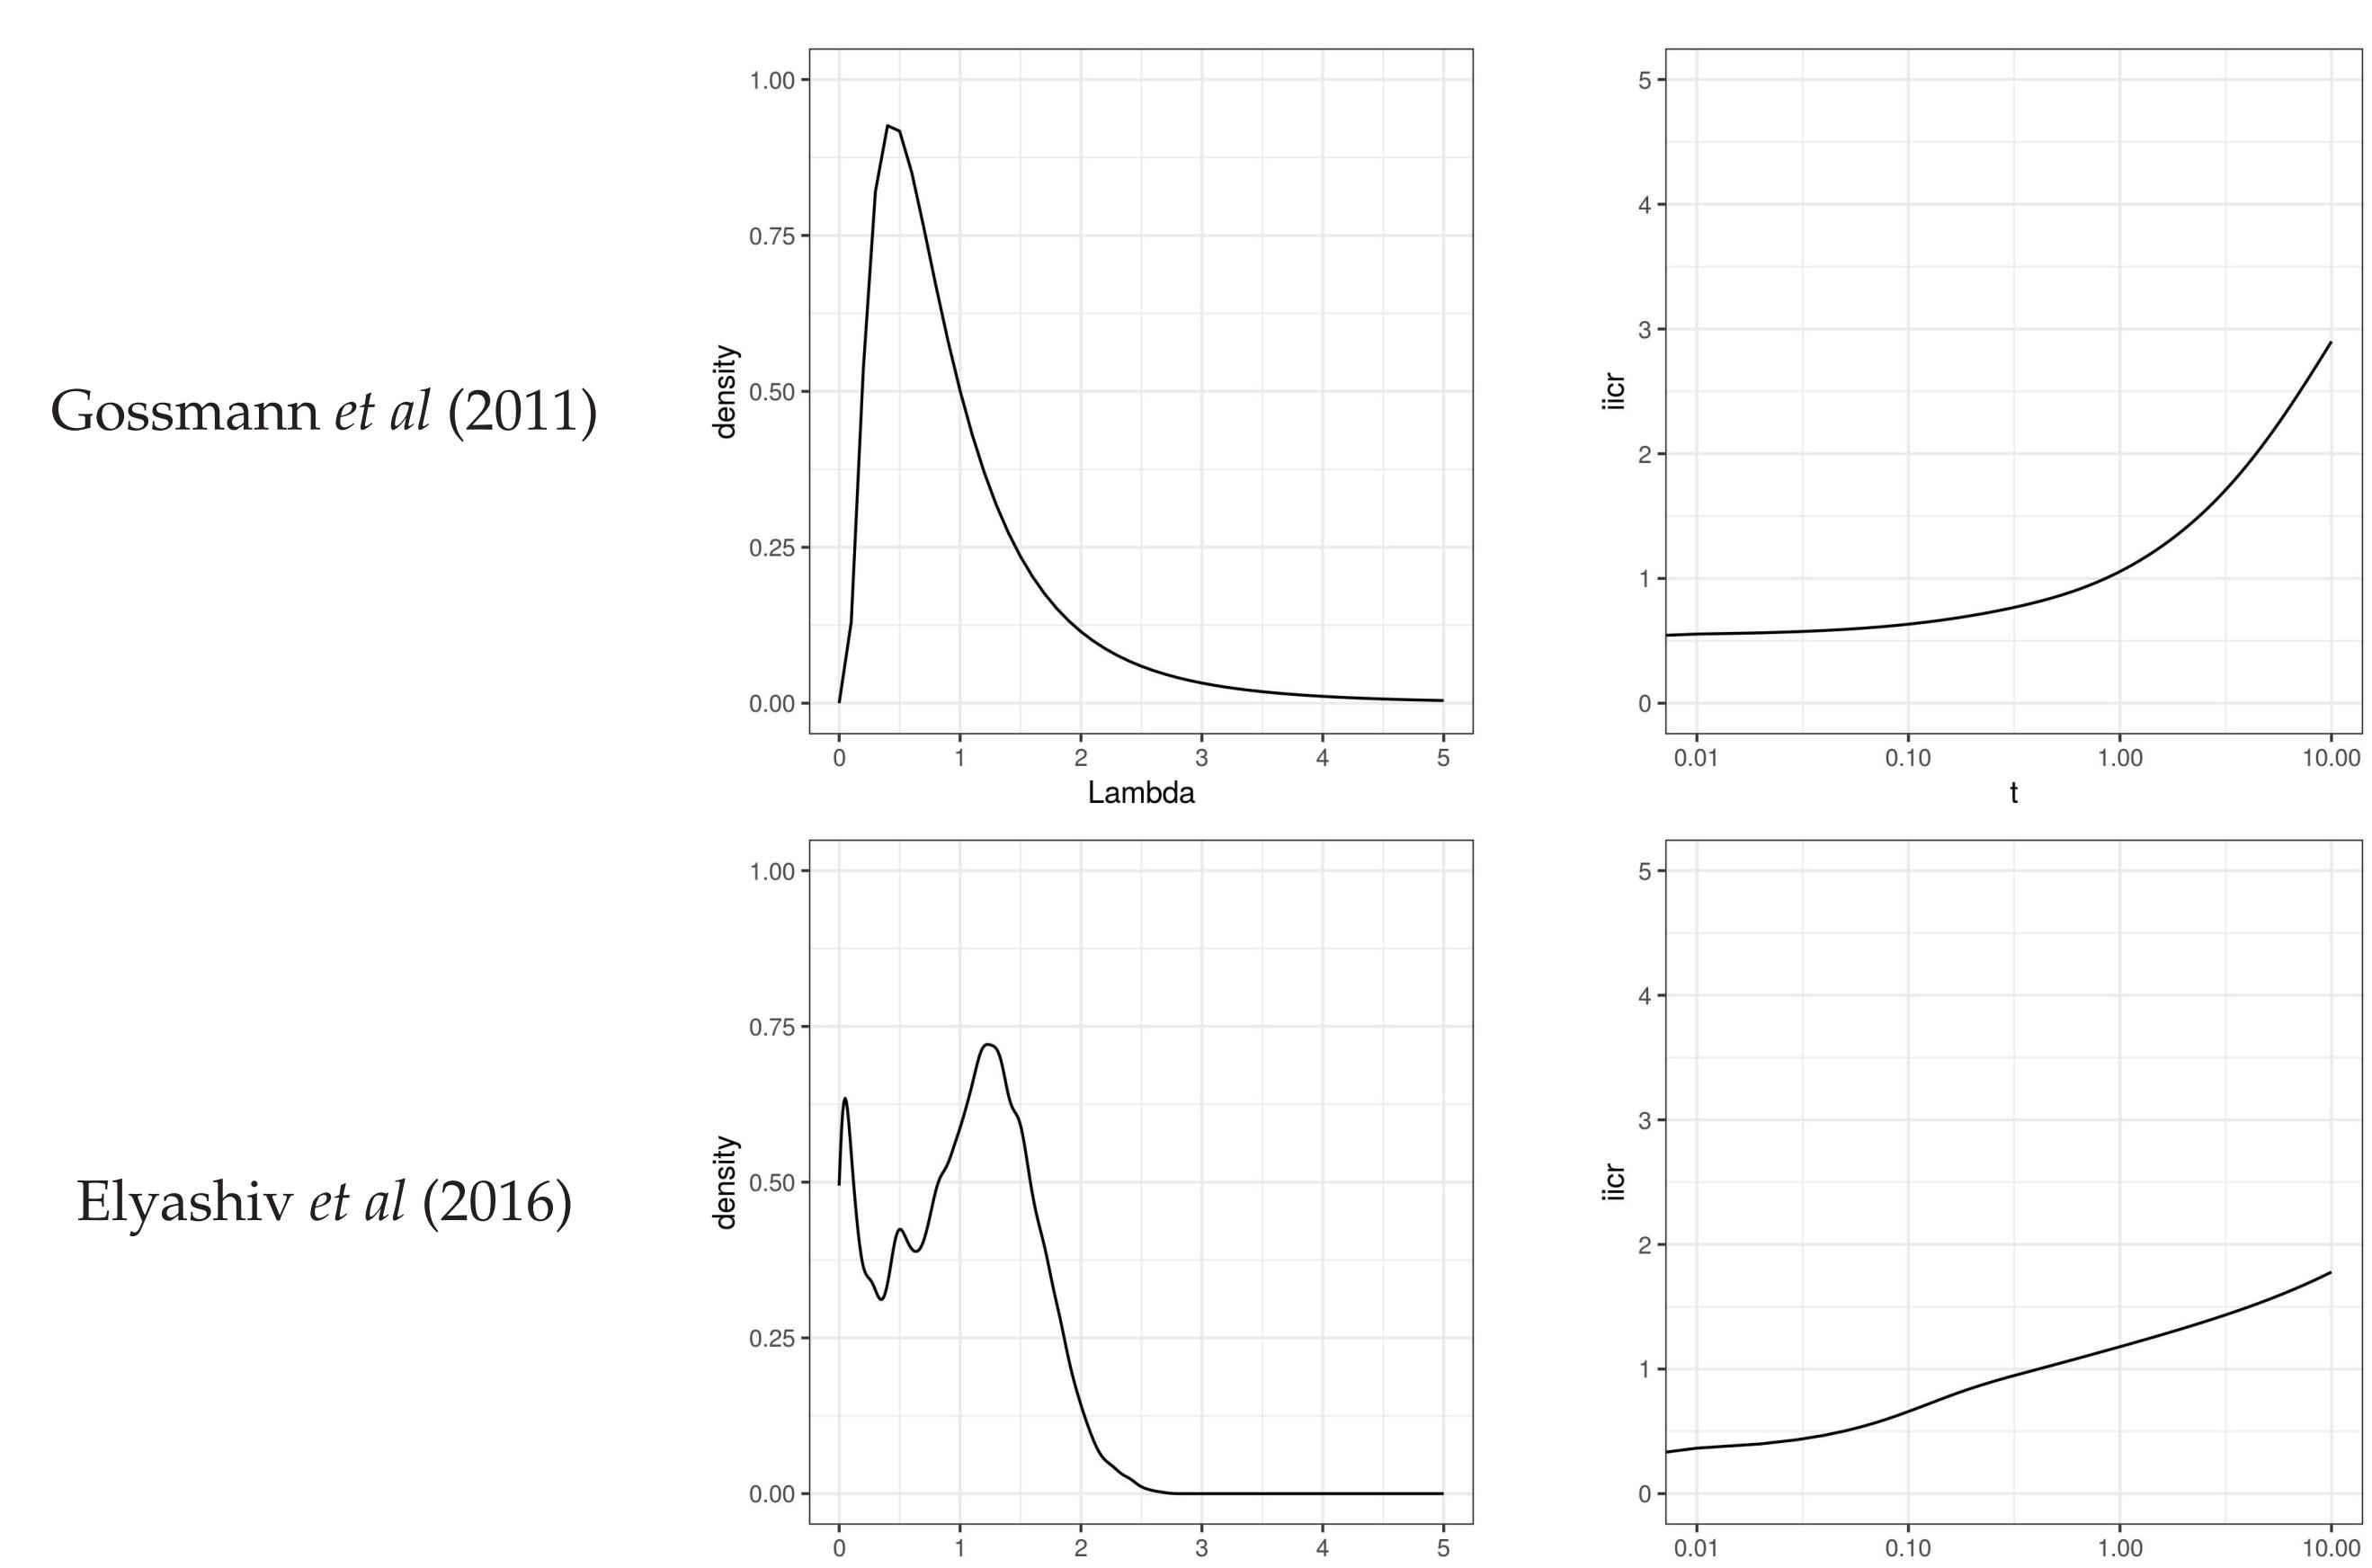

$$a_1 = 0.5$$

→ BGS & sweeps (resp. balancing sel.) affect recent (resp. ancient) IICR
→ Stronger effect of balancing selection for the same proportion.

REALISTIC N_e DISTRIBUTIONS

Estimated for *Drosophila melanogaster* from polymorphism and divergence data, discretized into $K = 25$ classes.

LINKED SELECTION, HUMAN STRUCTURE & IICR

- Demographic model (black): Island model with no population size change but 4 changes of M over time mimicking the human PSMC (Mazet *et al* 2016).
- With selection (red): $\lambda()$ distribution from Gossmann *et al* (2011).

→ Limited effect of selection except in ancient past.
