**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# Combining categories of crossbred females to improve the overall performance of the dairy cattle herd

***How to benefit from genetic diversity induced  
by the use of three-breed crossbreeding into purebred Holstein herd ?***

**J. Quénon,<sup>1\*</sup> S. Ingrand,<sup>2</sup> and M.-A. Magne<sup>3</sup>**

# Introduction

- Low fertility (*Lucy, 2001*) and health (*Oltenu et al., 2010*) in purebred Holstein dairy cattle herds
- Resilience of dairy cattle systems require enhancing robustness of cows (*Friggens et al., 2017*) and functional diversity within the herd (*Tichit et al., 2011*)

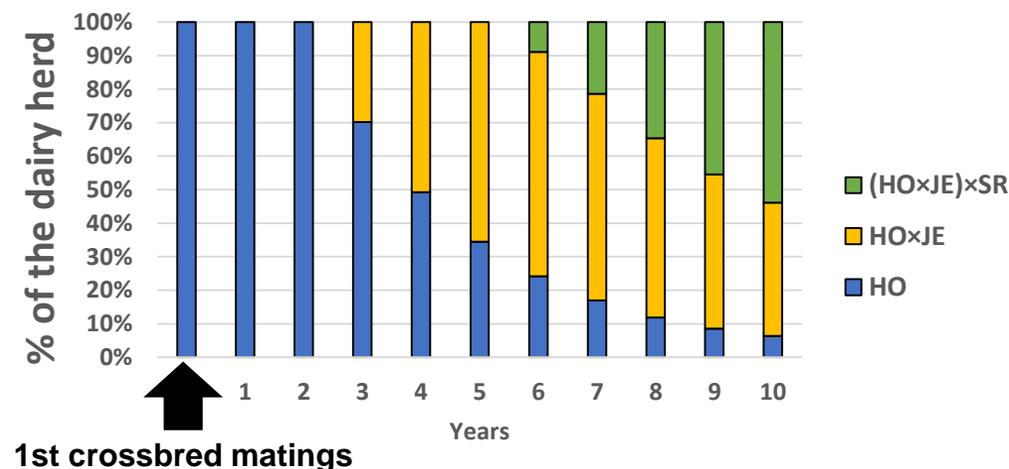

## ➔ Renewed interest in rotational crossbreeding

- Crossbreeding to benefit from **heterosis effect** (*Penasa, 2010*) and the complementarity of dairy cattle breeds (*Magne et al., 2016*)
- Three-breed rotational crossbreeding (**3BC**) : compromise to ensure high heterosis (83% in 3<sup>rd</sup> generation) while keeping management of crossbreeding simple
- Uncommon in Western countries
- **Induce genetic diversity within the herd over time**

### Three-breed rotational crossbreeding

### Genetic diversity induced by using a Holstein, Jersey, Scandinavian Red 3BC program

# Introduction

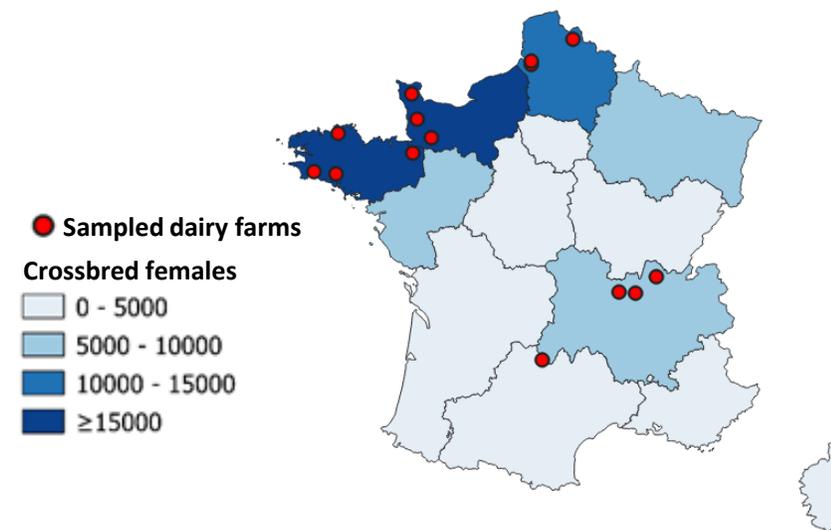

- Studies on crossbreeding :
  - Mostly assessing performances at animal level : comparison between purebreds and  $F_1$  (Hazel et al., 2014; Clasen et al. 2019; McClearn et al., 2019) and more rarely  $G_2$  crosses (Shonka-Martin et al. 2018)
  - To a lesser extent at herd level with simulation modelling (Dezetter et al., 2017; Clasen et al., 2020)
- ➔ In both cases: a crossbreeding program-based approach
- Diversity in technical transition paths towards rotational crossbreeding (Quénon et al., 2020) : several crossbreeding programs simultaneously, trial-and-error of breed combinations
  - ➔ Diversity in genotypes challenge categorisation method using 3BC program and crossbreeding generation

***How to categorise such genetical diversity?***

***Does it support functional diversity at herd level?***

# Materials and methods

- **14 French dairy herds enrolled in milk record**
  - 100% Holstein before using crossbreeding
  - In 2018 : **all crosses > 1/3 herd size**
  - In 2018 (at least): **lactating G<sub>2</sub> cows in herd**
- Data extraction for the 2009-2018 period
  - Lactations data : **performances**
  - Genealogical and breed data : **crossbred genotypes identification**
- 2 datasets
  - Dataset #1 (n = 4476 lactations, 2010 females) for reproduction performances
  - Dataset #2 (n = 4487 lactations, 2051 females) for yield and udder health performances

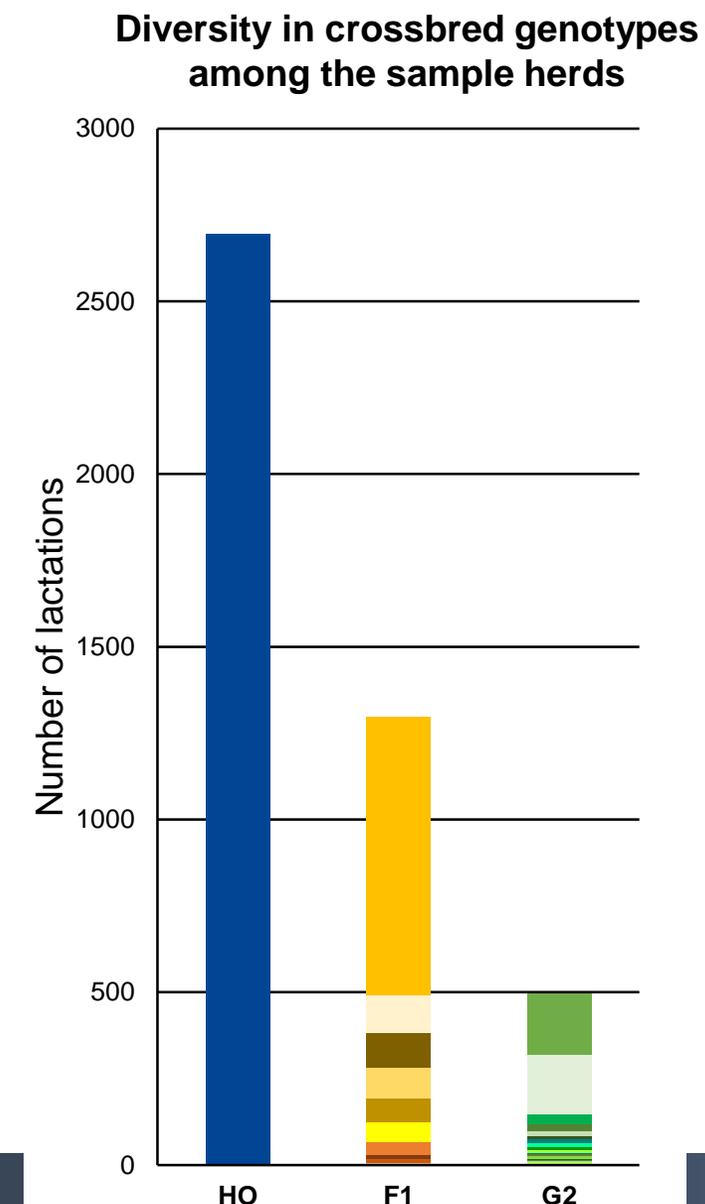

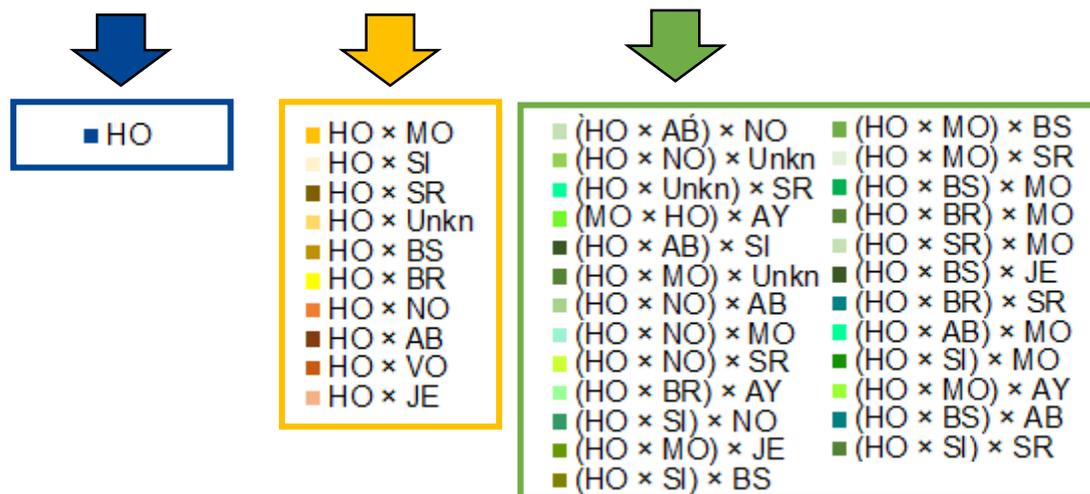

**7/14 organic farming**  
**7/14 conventional farming**

2018 characteristics in sampled farms	Med	Min	Max
<b>UAA (ha)</b>	98	43	225
<b>Grassland (% LFA)</b>	91	16	100
<b>Herd size</b>	70	25	139
<b>Milk yield (kg/cow)</b>	6 192	5 000	11 352

# Materials and methods

## 1 Categorisation of diversity in crossbred genotypes induced by 3BC programs : genetic classes

Genotype	HO	HO×A	(HO×A)×B
Heterosis (%)	0	100	100
% of HO genes	100	50	25
Genetic class	HO	F <sub>1</sub>	G <sub>2</sub>

# Materials and methods

- 2 Estimation and paired comparison of the zootechnical performances between genetic classes
  - Investigated traits :
    - 305-d milk yield (MY) in kg/cow
    - 305-s fat (FC) and protein contents (PC) in g/kg/cow
    - Days open (DO) in days
    - SCS
  - For each :
    - **Linear regression** ( $y = \mu + \Sigma \text{fixed effects}$ ) adjusted of the French genetic evaluation models (UMT eBis and Geneval, 2019)
    - **Least square means (LSM)** for genetic classes
  - **Test for differences in performance between genetic classes** (Tukey's tests,  $p < 0.05$ )

# Results : performances profiles of the genetic classes

Classe génétique	Milk yield (kg/cow)	Fat content (g/kg/cow)	Protein content (g/kg/cow)	SCS	DO (days)
HO	7513 <sup>a</sup> +	38.2 <sup>a</sup> -	31.3 <sup>a</sup> -	2.77 <sup>ab</sup>	143 <sup>a</sup> 😞
F <sub>1</sub>	7 289 <sup>b</sup> -	40.4 <sup>b</sup> +	32.4 <sup>b</sup> +	2.72 <sup>a</sup>	127 <sup>b</sup> 😊
G <sub>2</sub>	6 697 <sup>c</sup> - -	41.4 <sup>c</sup> ++	33.0 <sup>c</sup> ++	2.91 <sup>b</sup>	129 <sup>b</sup> 😊

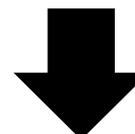

- Contrasted performances' profiles between genetic classes
- Trends in performances consistent with "crossbreeding program-based approach" studies
  - ➡ Although less precise and genetically accurate, our *a priori* categorisation of genetical diversity support phenotypical diversity

***How to combine these genetic classes in the herd to optimise its performances?***

# Materials and methods

## 3 Simulation of herd compositions and their mean performances

Herd compositions	Composition in genetic classes		
	% HO	% F <sub>1</sub>	% G <sub>2</sub>
#1	100	0	0
#2	99	1	0
...	...	...	...
#5150	0	1	99
#5151	0	0	100

Classe génétique	Milk yield (kg/cow)	Fat content (g/kg/cow)	Protein content (g/kg/cow)	SCS	DO (days)
HO	7513 <sup>a</sup> +	38.2 <sup>a</sup> -	31.3 <sup>a</sup> -	2.77 <sup>ab</sup>	143 <sup>a</sup> ☹️
F <sub>1</sub>	7 289 <sup>b</sup> -	40.4 <sup>b</sup> +	32.4 <sup>b</sup> +	2.72 <sup>a</sup>	127 <sup>b</sup> 😊
G <sub>2</sub>	6 697 <sup>c</sup> --	41.4 <sup>c</sup> ++	33.0 <sup>c</sup> ++	2.91 <sup>b</sup>	129 <sup>b</sup> 😊

N= 5151 herds

N° troupeau	Composition du troupeau			MY	FC	PC	DO	SCS
	% HO	% F <sub>1</sub>	% G <sub>2</sub>					
#1	100	0	0					
#2	99	1	0					
...	...	...	...					

Mean performances of  
 each simulated herd compositions

# Materials and methods

## 4 Selection of "optimal herds":

1. Herds with mean DO < 130 days

~~N= 5151 herds~~  
N= 1286 herds

2. **Outranking herds with unweighted optimisation  
methode**

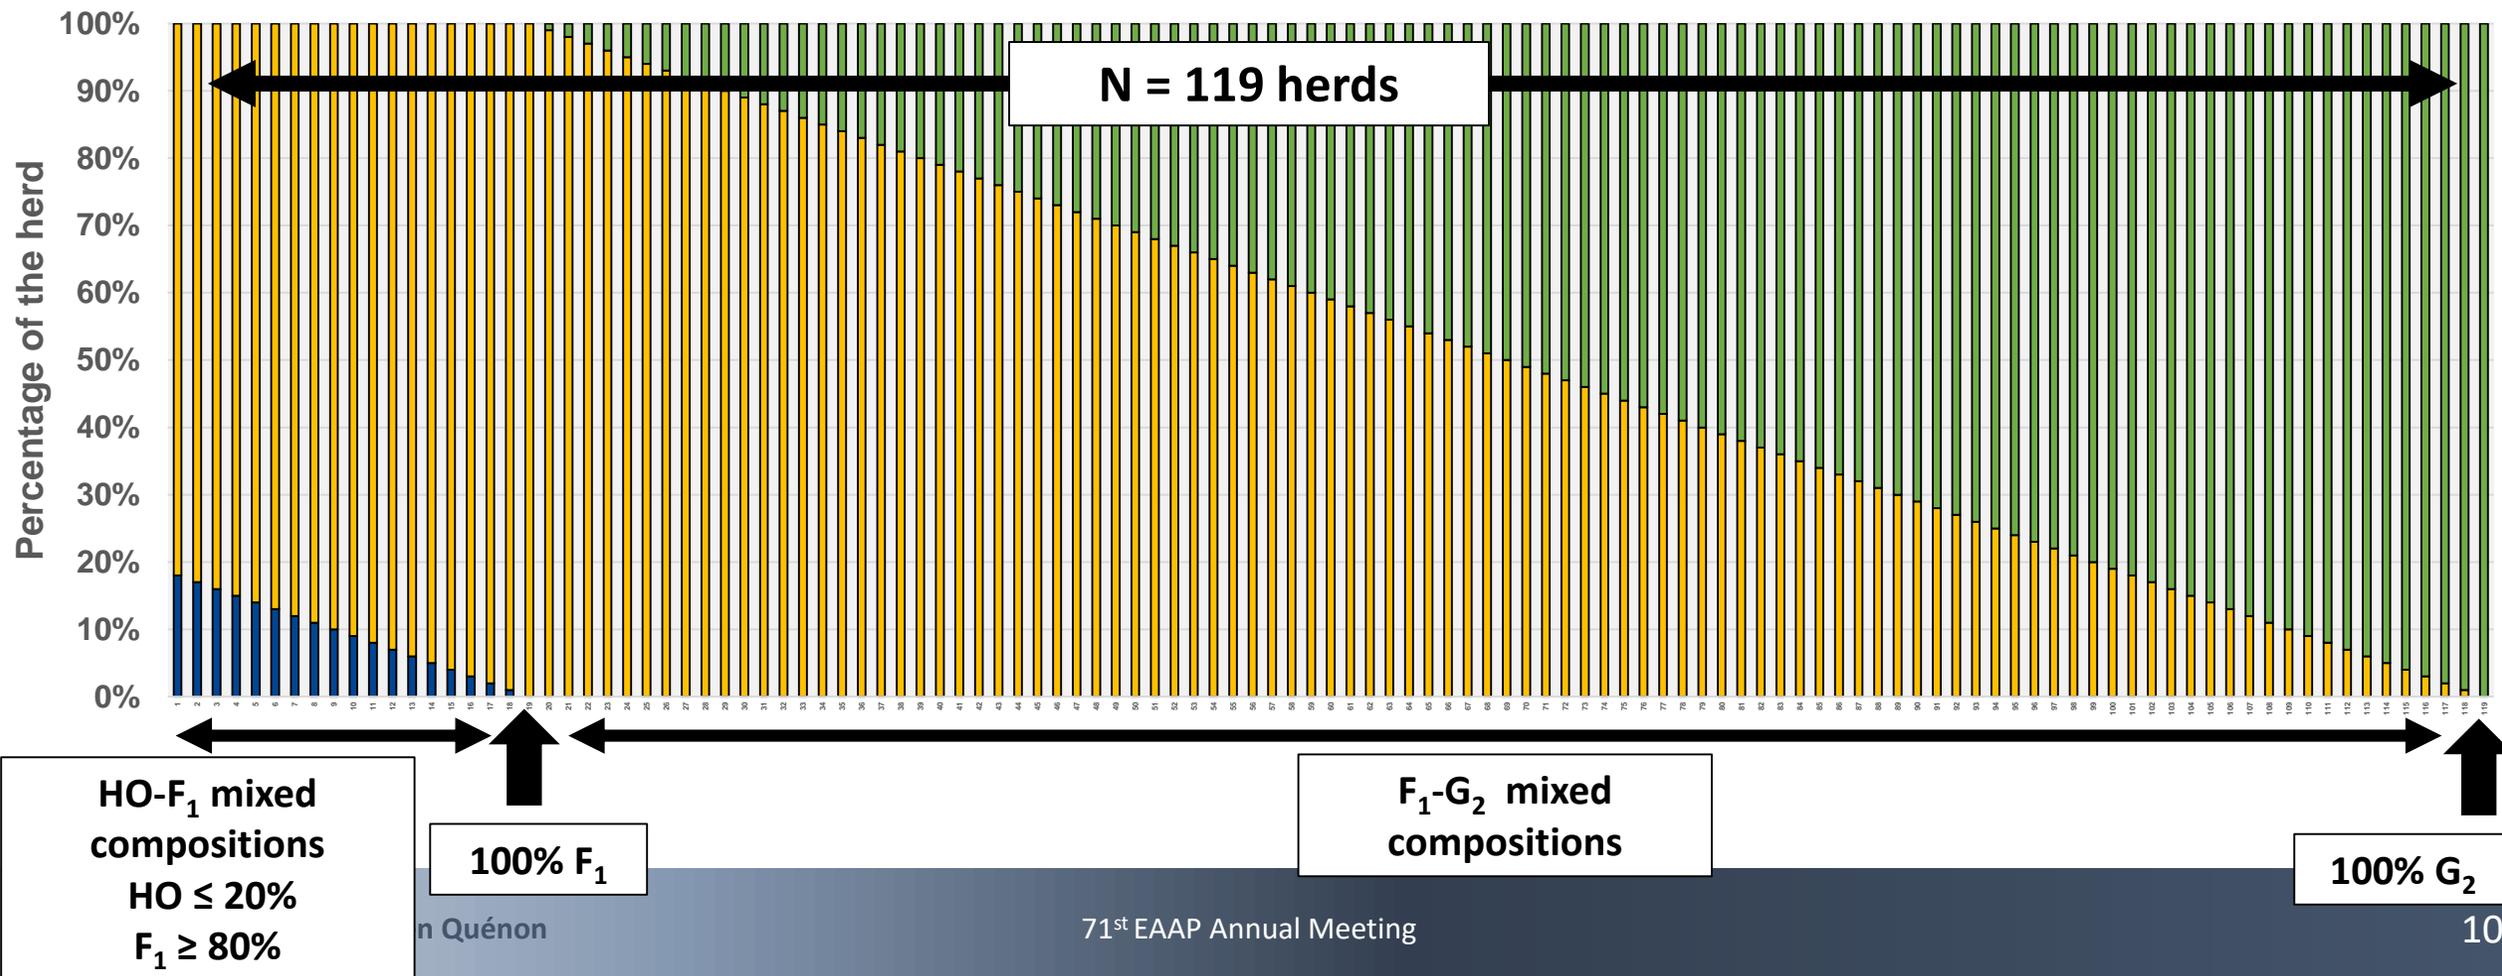

- Pareto optimal solutions (*Williams et Kendall, 2017*)
- On 5 objectives functions = 5 performances :
  - Milk yield
  - Fat content
  - Protein content
  - Days open
  - SCS

~~N= 1286 herds~~  
**N= 119 herds**

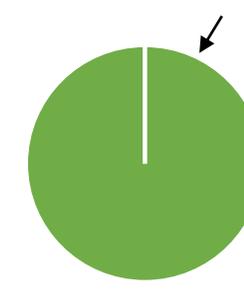

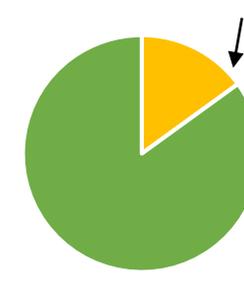

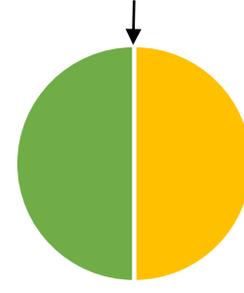

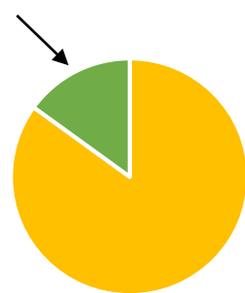

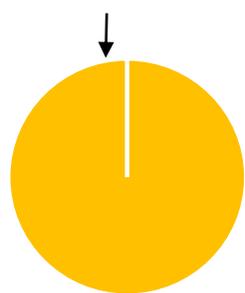

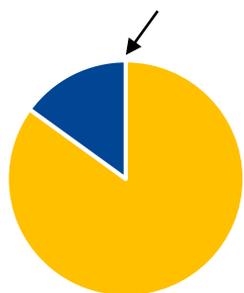

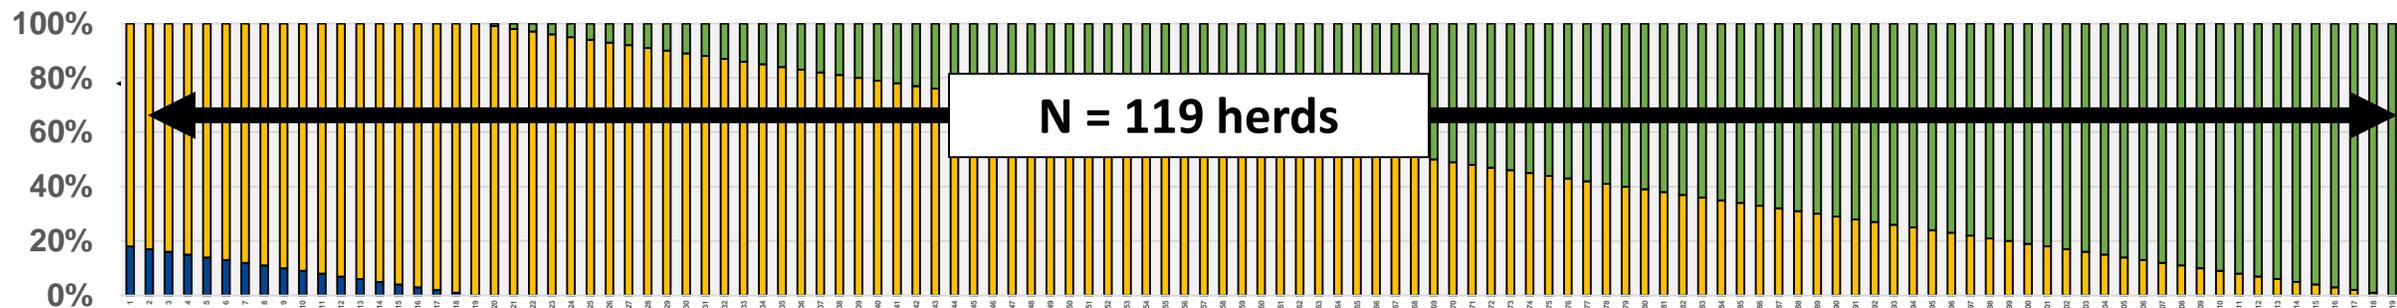

# Results : which combinations of genetic classes optimise herd mean performances?

■ % HO ■ % F1 ■ % G2

# Results : which combinations of genetic classes optimise herd mean performances?

■ % HO ■ % F1 ■ % G2

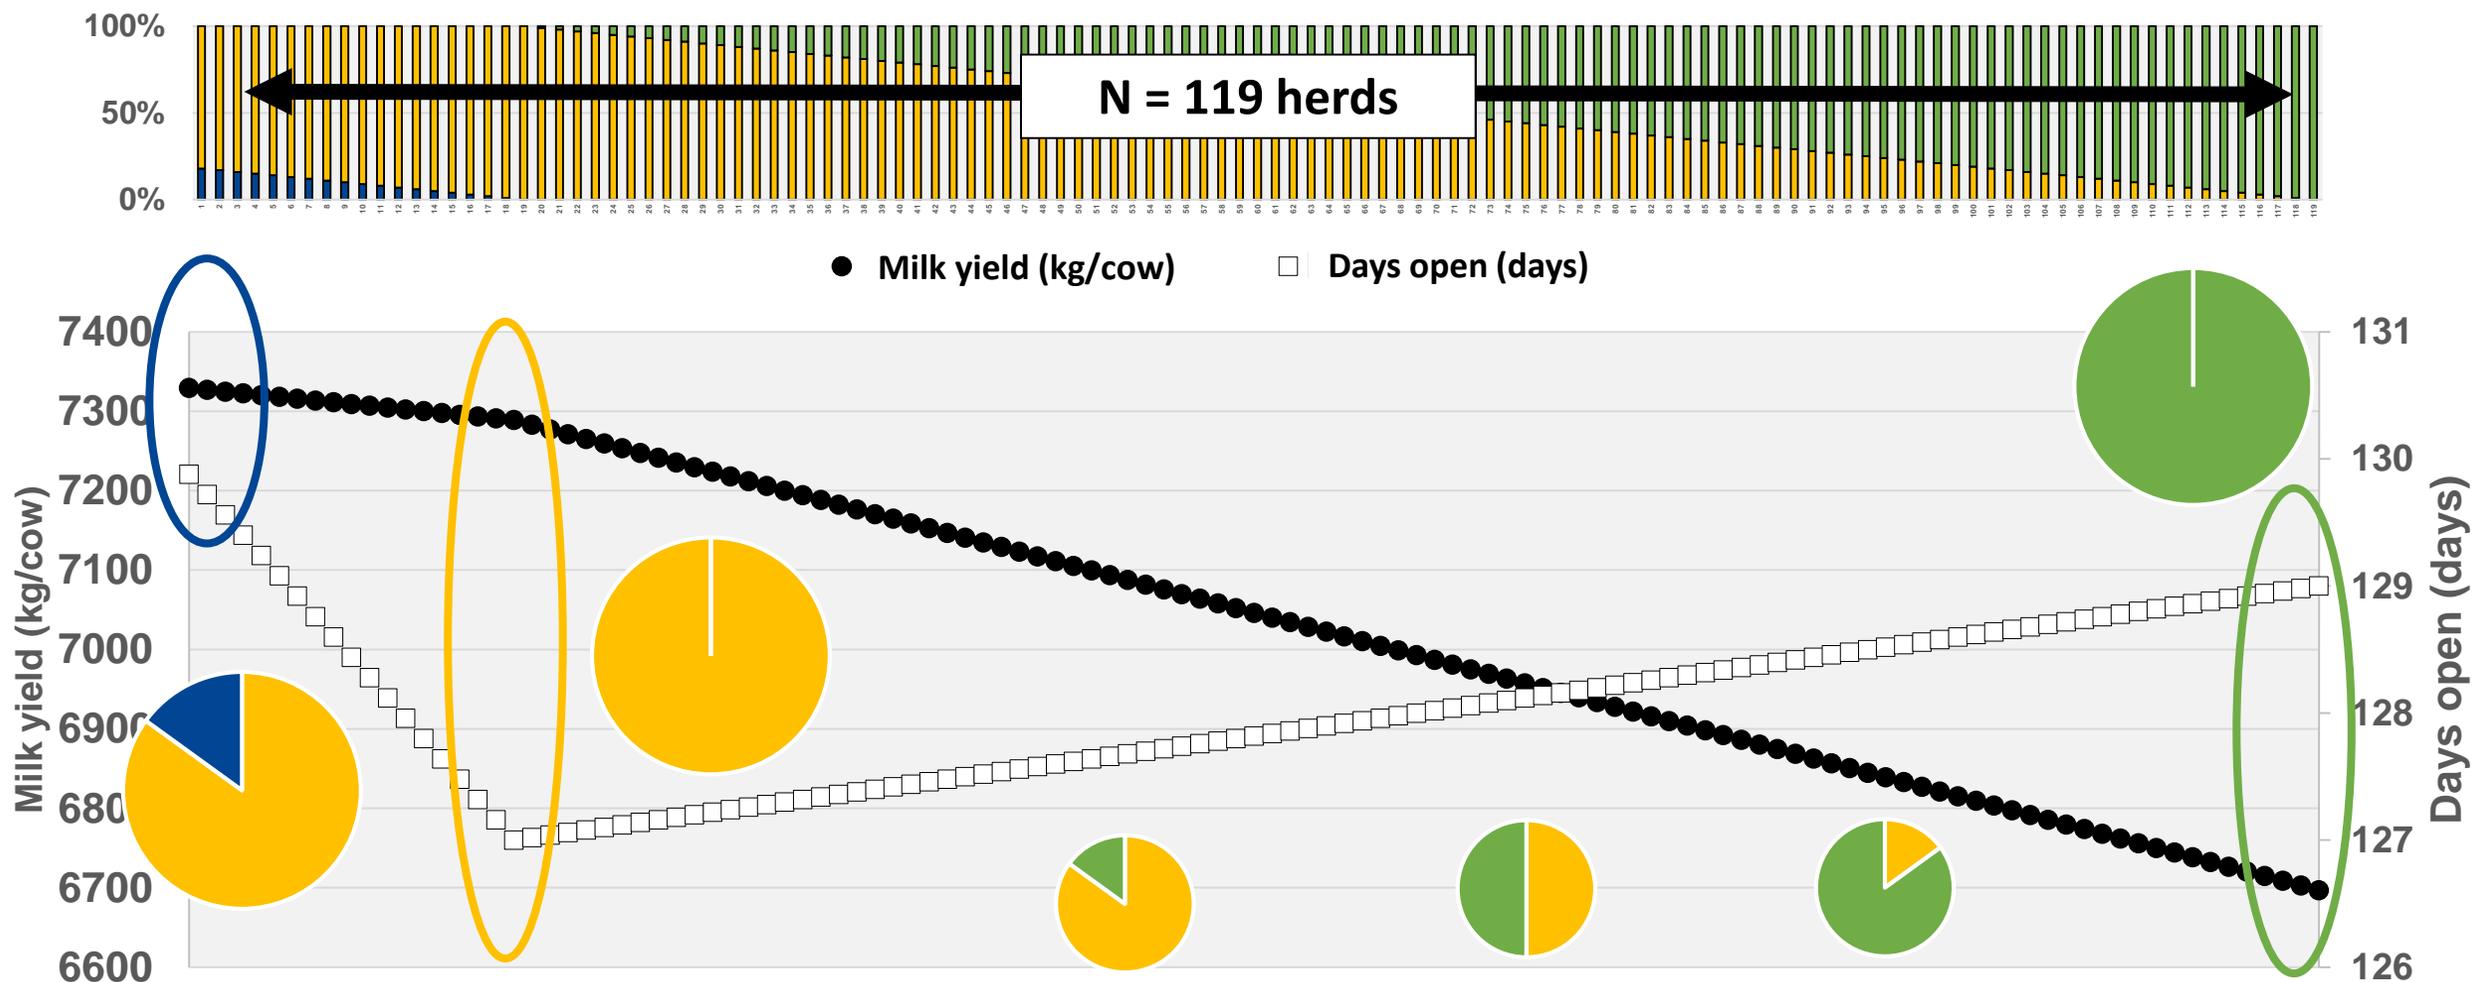

HO-F<sub>1</sub> mixed  
compositions  
HO ≤ 20%  
F<sub>1</sub> ≥ 80%

100% F<sub>1</sub>

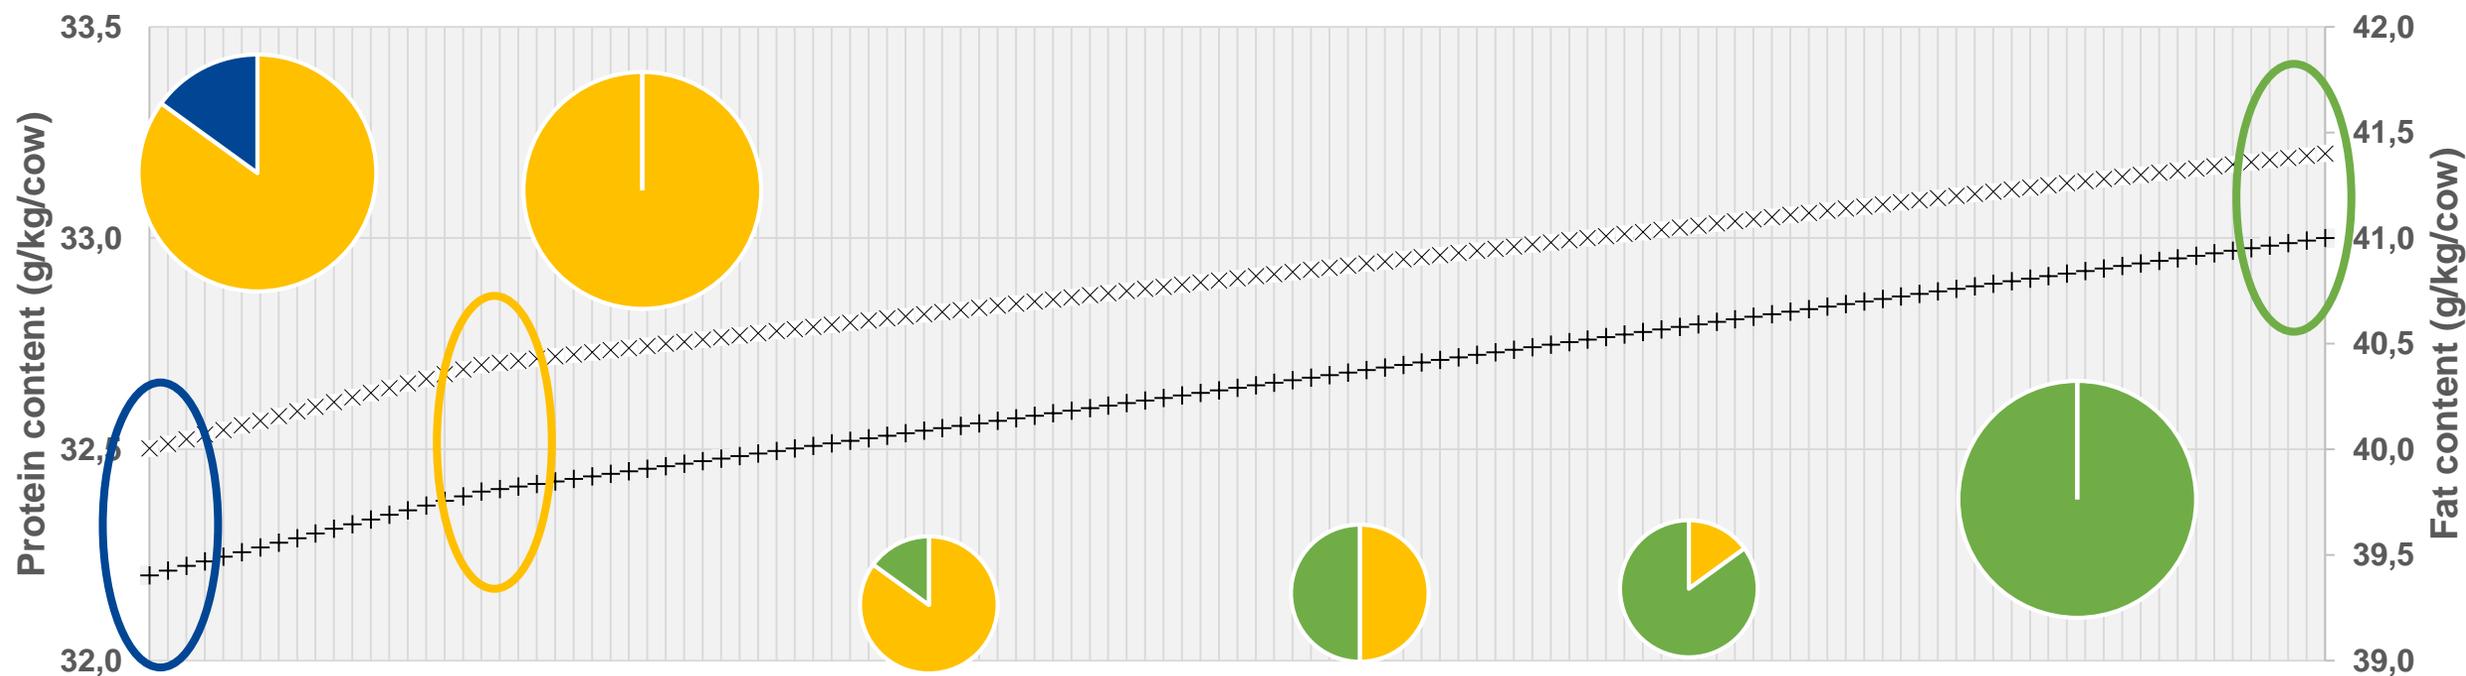

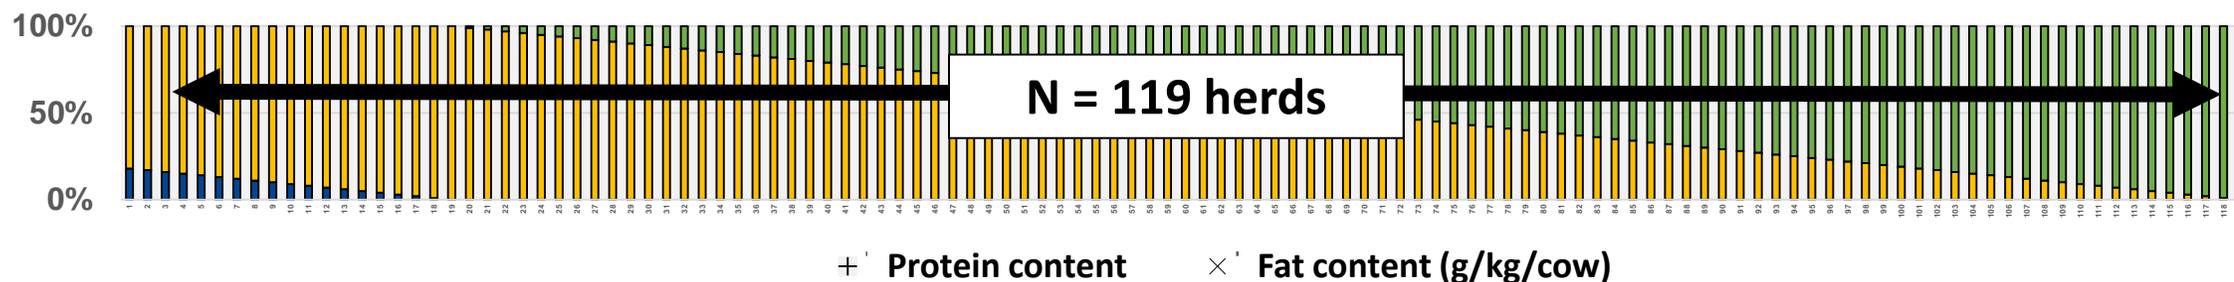

F<sub>1</sub>-G<sub>2</sub> mixed  
compositions

100% G<sub>2</sub>

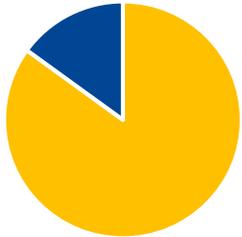

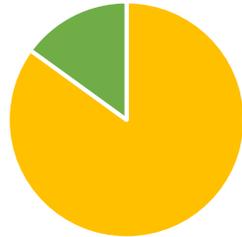

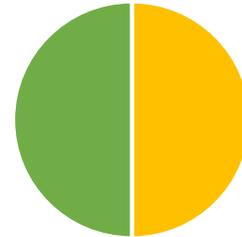

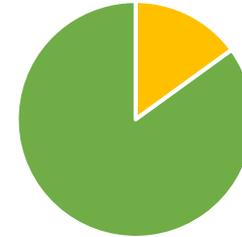

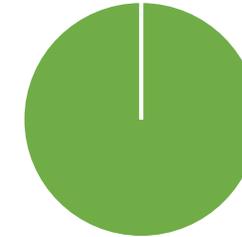

# Results : trade-offs between performances

# Results : trade-offs between performances

# Results : trade-offs between performances

Herd compositions in HO, F <sub>1</sub> and G <sub>2</sub>						
Milk yield	+++	+	-	-	--	---
Milk contents	-	+	++	++	+++	+++
Fertility	--	+++	++	++	++	++

# Thank you for your attention

This study was funded by the Sciences for Action, Transitions and Territories (ACT) division of INRAE, the French Occitanie Region, the ENSFEA scientific committee and the PSDR4 ATA-RI project. Data were provided by the French Chambers of Agriculture, Milk Record Organizations and Selection Organisms enrolled in National Systems of Genetic Information (SNIG). The authors thank dairy farmers for authorizing access to their data. They are grateful to Gabrielle Galipaud, Isabelle Palhière, Hélène Larroque, Célia Cholez and Jacques-Eric Bergez for their help with data processing and statistical analyses
