HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Real-time unsteady air flow prediction to reduce mechanical load variations and wind turbine maintenance costs

ABSTRACT

For actively controlling aerodynamic systems – like Wind Turbine (WT) blades -- it can be necessary to estimate in real-time and predict the air flow around those systems. We propose here a new method which combines machine learning, physical models and measurements for this purpose. Very good numerical results have been obtained on wake flows.

APPLICATIONS

METHODOLOGY

1. Ultra-fast CFD simulations with intrusive reduced order models (ROM)

- Principal Component Analysis (PCA) on a dataset to reduce the degrees of freedom (dof) :

- Approximation (at small dof n):

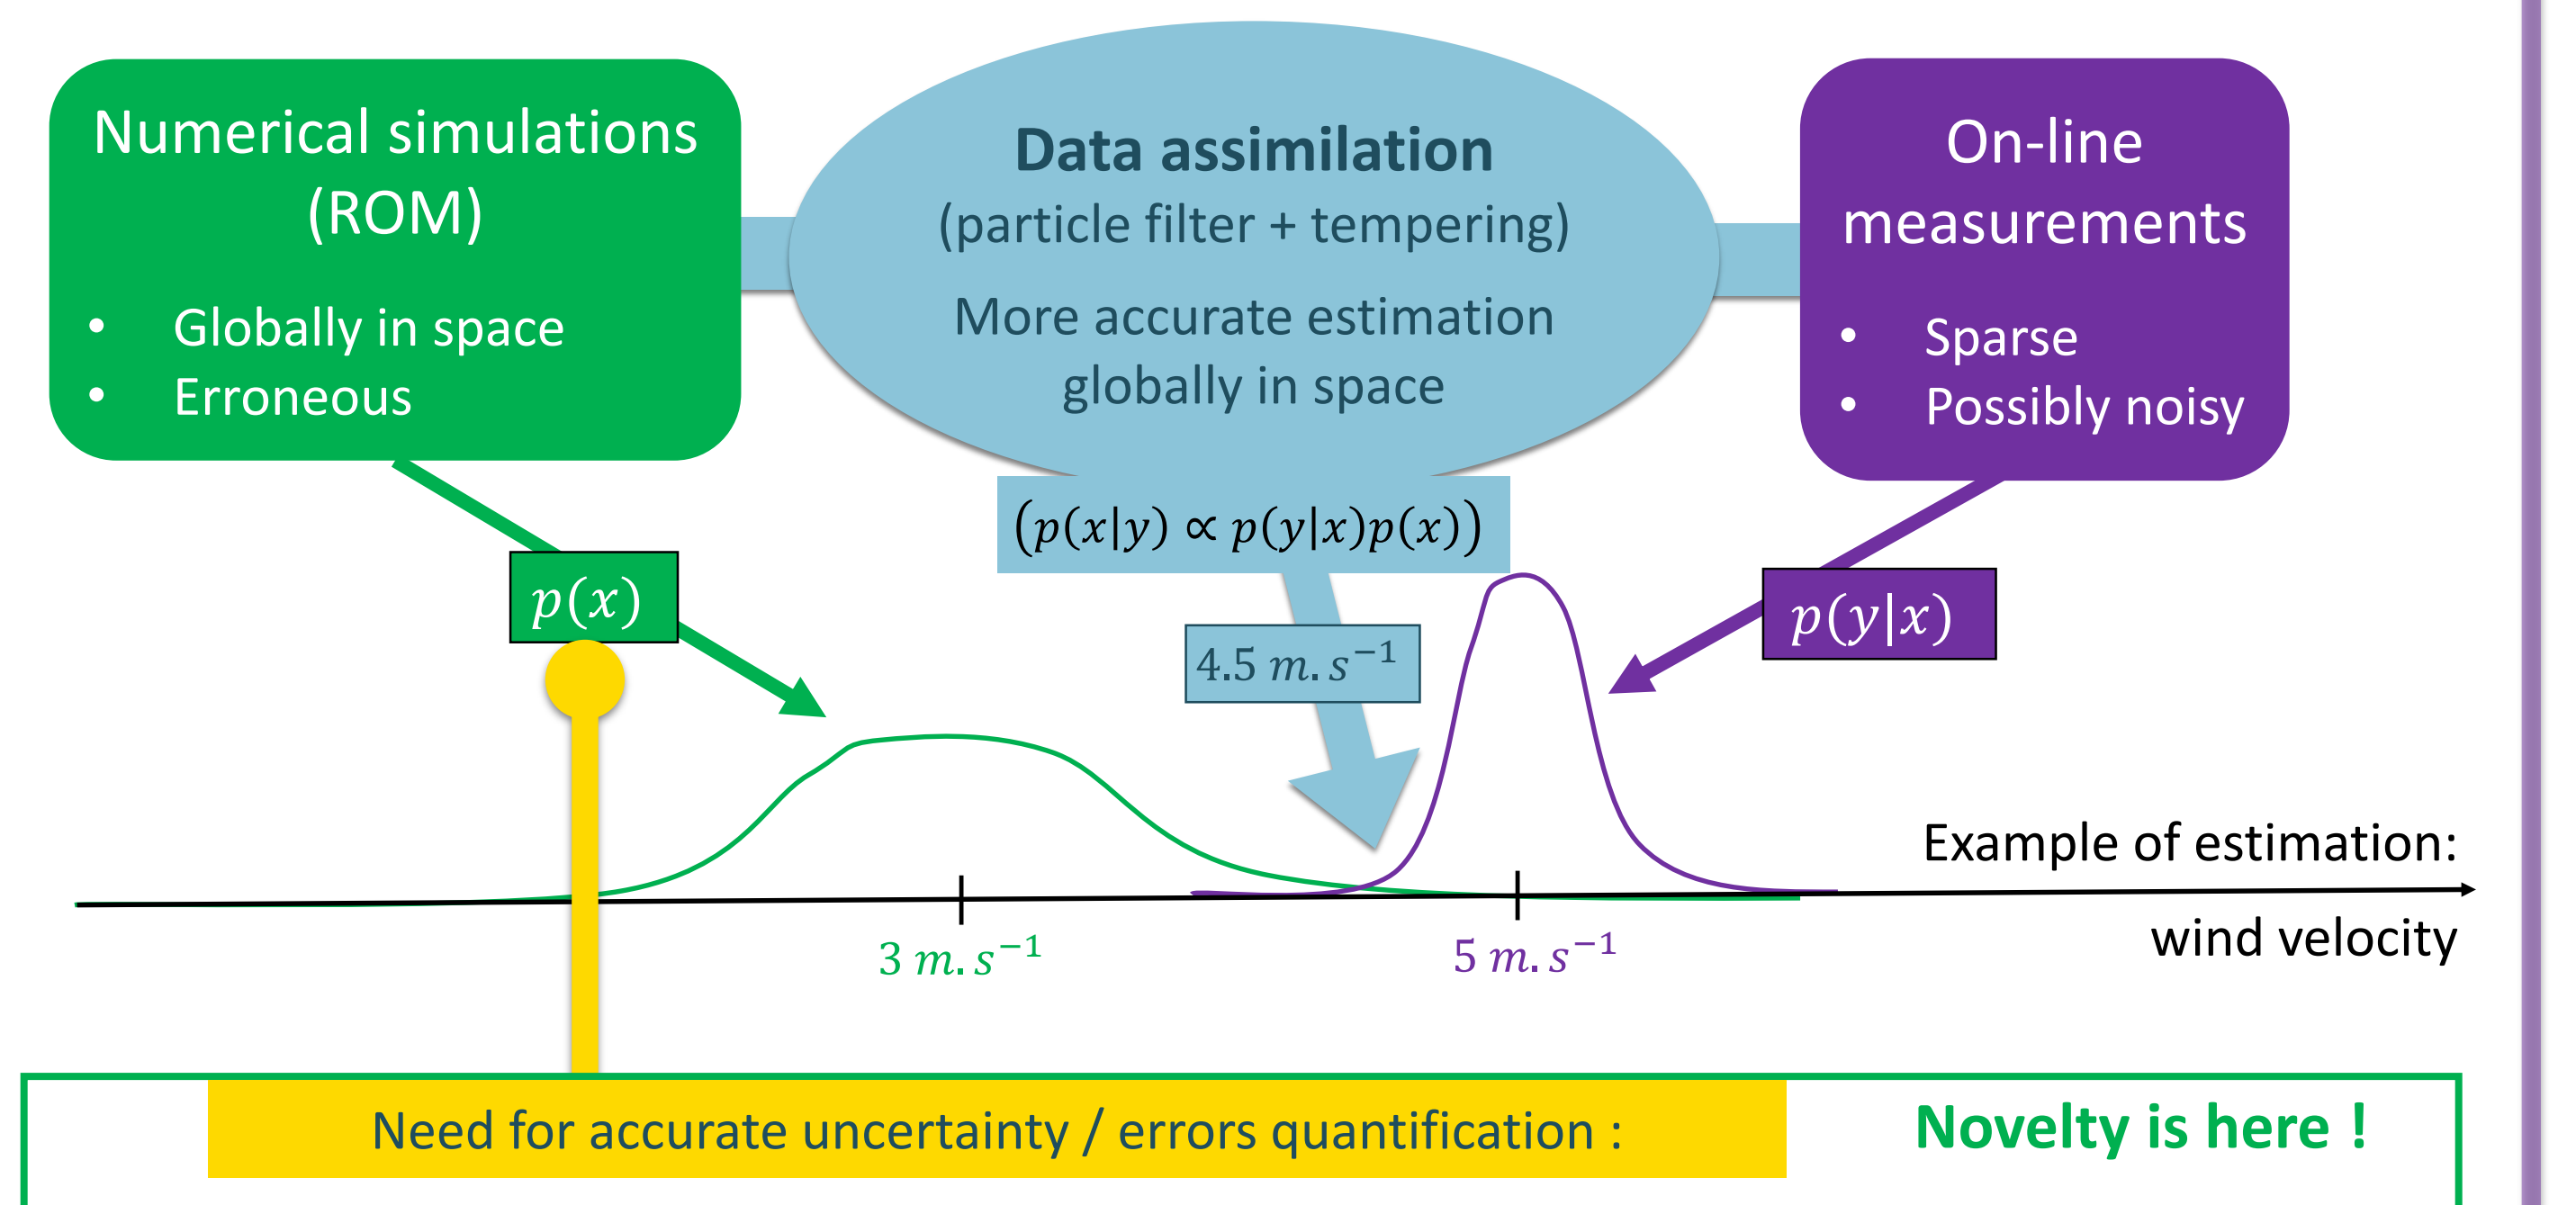

$$v(x, t) \approx \sum_{i=0}^n b_i(t) \phi_i(x)$$

- Projection of the "physics" onto the spatial modes : (POD-Galerkin)

$$\int_{\Omega} dx \phi_i(x) \cdot (\text{Physical equation (e.g. Navier-Stokes)})$$

We get a n coupled ordinary differential equations for very fast simulation of temporal modes $b_i(t)$

2. Measurement-simulation coupling (data assimilation)

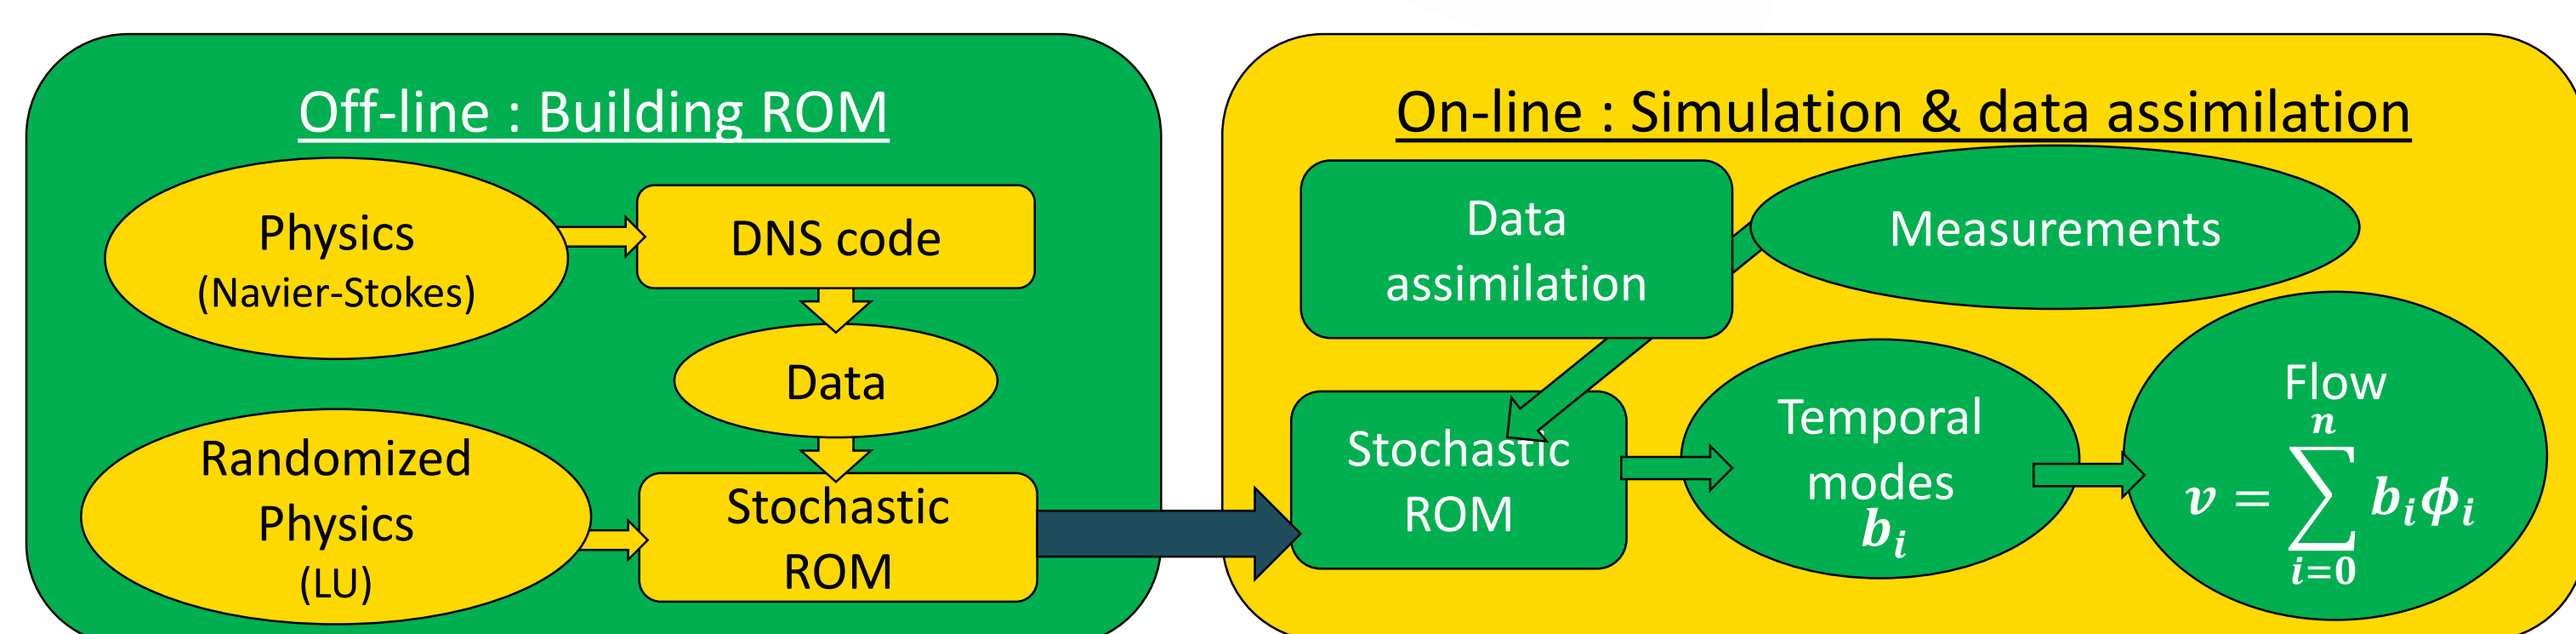

3. Randomized physics $p(x_{t+1}|x_t)$ → Location uncertainty models (LUM)

Rigorous CFD stochastic closure, with physically-based multiplicative noise

RESULTS FOR 8-DEGREE-OF-FREEDOM (DOF) SIMULATIONS COUPLED WITH A SINGLE MEASUREMENT POINT

	Reference : PCA-projection of the DNS (Optimal from 8-dof linear decomposition)	Our method : POD-Galerkin with Navier-Stokes under location uncertainty (LUM)	State-of-the-art : POD-Galerkin with Navier-Stokes + optimally tuned eddy viscosity & additive noise
Re 100, 2D 10 vortex shedding cycles after the learning period (DNS has 10^4 dof)			
Re 300, 3D 14 vortex shedding cycles after the learning period (DNS has 10^7 dof)			

METHODOLOGY SUMMARY

CONCLUSION

- Reduced order model (ROM) : for very fast and robust CFD
- Combine data & physics (built off-line)
- Data assimilation : to correct the fast simulation on-line by incomplete/noisy measurements
- Robust flow prediction far outside the learning period
- Optimal unsteady flow estimation/prediction in the whole spatial domain

NEXT STEPS

- Real measurements
- Increasing complexity
- Control loop
