HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Introduction and aims:

Salmonella are among the top-ranked foodborne pathogens, inducing a wide variety of diseases ranging from gastroenteritis to typhoid fever, depending on the infecting serovar, the host and its genetic background. As a facultative intracellular pathogen, it can induce its own internalization in non-phagocytic cells through at least 3 different bacterial factors: the SPI-1-encoded T3SS-1, and two outer membrane proteins, Rck and PagN. The *pagN* gene is part of the PhoP-PhoQ regulon, and was identified, through the use of *in vivo* expression technology, as a gene required for *Salmonella* Typhimurium survival in BALB/c mice [1]. It encodes for a widely conserved, 27 kDa protein displaying both structure and function homology with the proteins Hek and Tia of *E. coli*. This invasin allows *Salmonella* to invade cells through a Zipper-like mechanism, following interaction with heparan sulfate proteoglycans [2, 3]. However, its precise role *in vivo* remains to be determined including the cells targeted by this invasin. In this study, we aimed to precisely determine the kinetics of expression of this entry factor in mice.

Material and methods:

Bioluminescent *S. Typhimurium* reporter strains carrying transcriptional fusions were used to track the transcription of *pagN* in three murine models reproducing the different pathologies induced by *Salmonella*: typhoid fever, gastroenteritis and asymptomatic carriage.

Results, discussion and conclusion:

We observed a transcription of *pagN* in the intestine independently of the genetic background of the host and the inflammatory state of the animals. Moreover, *pagN* transcription was detected at later time points in lymphoid organs following the systemic spread of the pathogen in the typhoid fever reproducing model. This result demonstrates for the first time that *pagN* is expressed in the intestine and that its expression is different according to the pathology induced by *Salmonella*. Further analyses are in progress, focusing on the identification of the cells targeted by PagN.

Mots clés : *Salmonella* - PagN - Virulence - Expression - Bioluminescence.
