***Staphylococcus aureus* is responsible for a wide range of infections in human and animals**

Gram-positive bacterium that is carried by up to 50% of healthy people

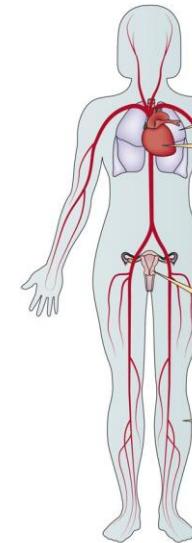

Mild skin infections

Human:

Life-threatening infections

Dairy cattle:

Chronic mastitis

Nature Reviews | Microbiology

***S. aureus* infections induce serious clinical problems. Despite antimicrobial therapy, there is a high percentage of relapse, leading to the chronicity**

INFLAMMATION

as a defense mechanism against infection and injury

Cause of inflammation

- Microbial infection
- Noxious substances
- Tissue stress
- Tissue injury

Physiological purpose

- Defense from microbial infection
- Expulsion of noxious substances
- Tissue repair
- Adaptation to stress

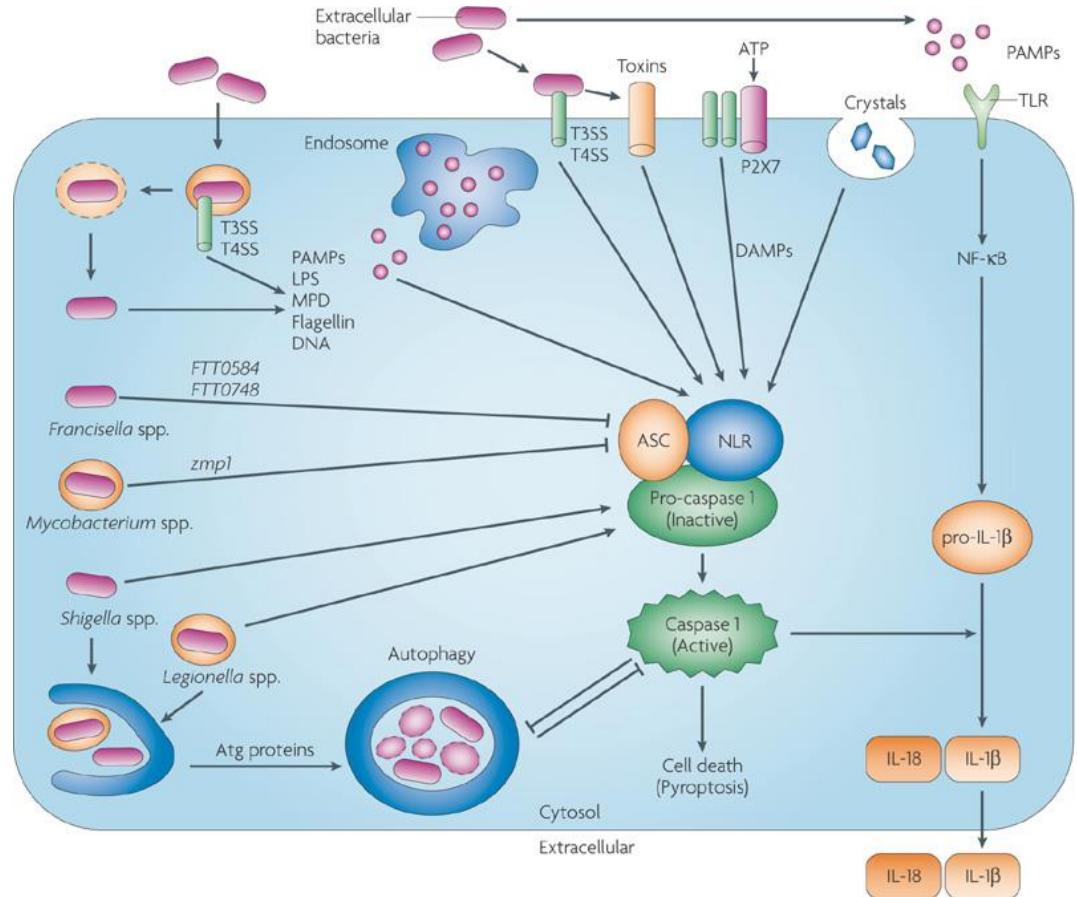

Outcomes

- DNA damage
- Tissue damage
- Autoimmune diseases
- Disease of homeostasis
- Fibrosis, metaplasie, cancer

Innate immune system instructs adaptive immune responses

Persistent inflammation induces the activation of inflammasomes that are central players of innate immunity to pathogens

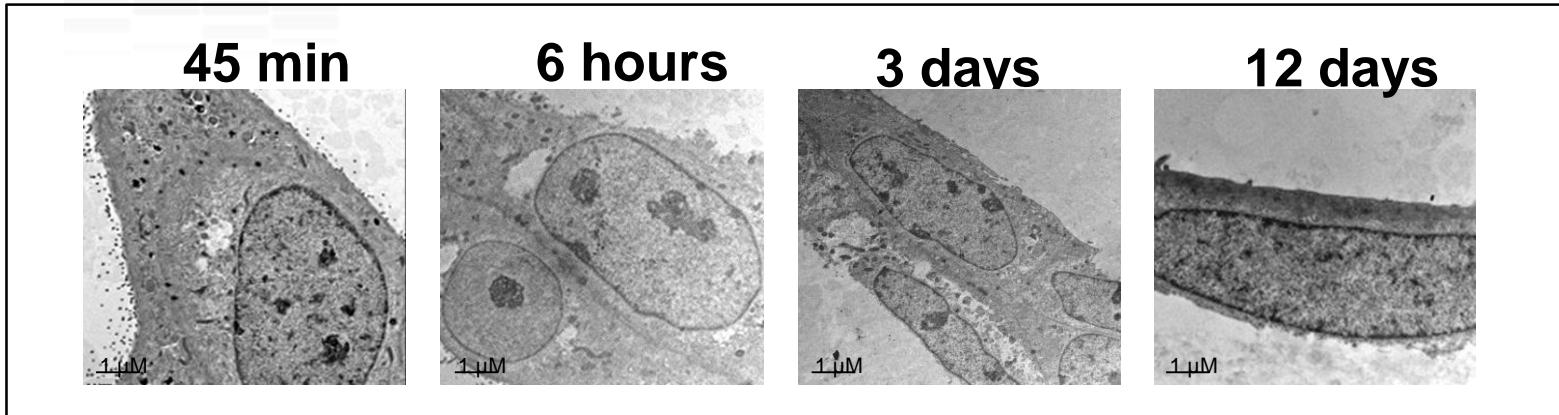

Inflammasomes are multi-protein signaling complexes that are composed of a sensor (NLR), an adaptor (ASC), and a zymogen procaspase-1

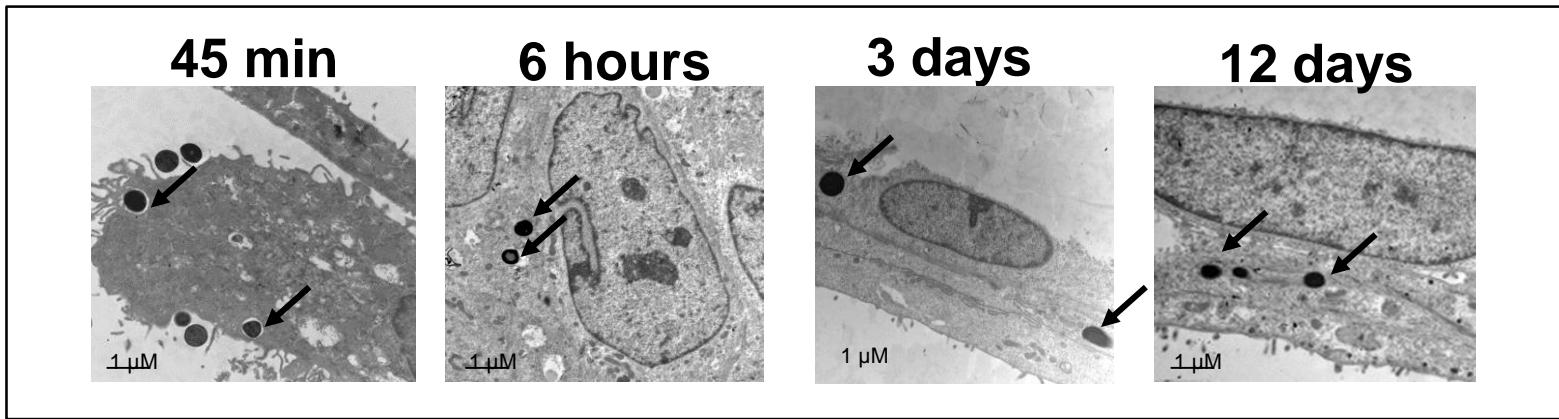

Nature Reviews | Microbiology

Staphylococcus aureus, a facultative intracellular pathogen

Control MG-63 cells

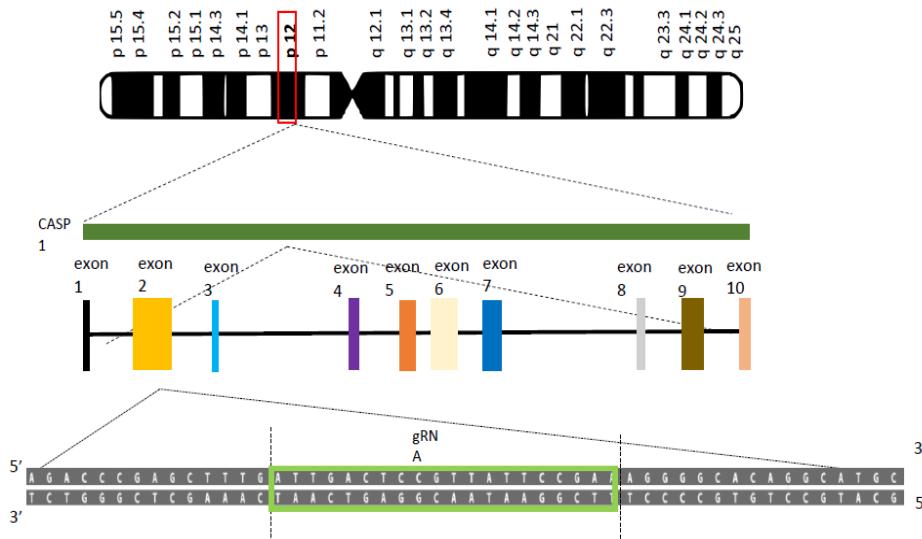

MG-63 cells +

CONCLUSIONS

Non-professional phagocytes induce an immune response against *S. aureus* through inflammasomes activation and processing of IL-1 β

The outcome of the infection depends on the balance between the host immune response and the action of main *S. aureus* virulence factors, such as PSMs, whose production differ among the *S. aureus* strains

The active caspase-1 prevents exacerbated intracellular replication of *S. aureus* in non-professional phagocyte

Our findings suggest that pathogens, which inhibit caspase-1 activation, do so not only to govern the generation of inflammatory cytokines but also to permit bacterial replication

Our results provide an atlas of deregulated host genes and biological pathways and identify novel markers and potential candidates for prophylactic and therapeutic approaches

Involvement of caspase-1 in inflammasomes activation and bacterial clearance in *S. aureus*-infected osteoblast-like MG-63 cells
