**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# Hyperspectral imaging data combined with climate data to predict stomatal conductance and transpiration of grapevine plants

## Using Sequentially-Orthogonalized Partial-Least-Square Regression (SO-PLS)

Maxime Ryckewaert, Daphné Héran, Thierry Simonneau, Nicolas Saurin, Florent Abdelghafour, Romain Boulord, Daniel Moura, Silvia Mas-Garcia, Ryad Bendoula

### INTRODUCTION

Digital agriculture driven by new intelligent sensors is one of the main ways to improve farm management.

Accessing physiological variables such as transpiration (E) and stomatal conductance (gs) in real time with optical instruments is challenging. These are the privileged variables to detect water stress.

### OBJECTIVE

The objective is to evaluate predictions of transpiration (E) and stomatal conductance (gs) of grapevine (*Vitis vinifera* L.) by combining visible-near infrared spectral images with climate data, using Sequentially-Orthogonalized Partial-Least-Square Regression (SO-PLS).

### EXPERIMENT

Pots of three grape varieties (Syrah, Merlot, Riesling) tested under two water conditions were studied to obtain water stress gradient. Hyperspectral images were acquired and a weather station provided radiation (Rg), relative humidity (RH), temperature (Ta) and wind speed (Ws). Precise monitoring of physiological variables was performed to obtain reference values.

#### Experimental design (Repeated twice)

Period: Summer 2020 / Location: Montpellier, la Gaillarde

Treatment	Varieties	Pots
Irrigated	Syrah	3 pots
None	Merlot	3 pots
	Riesling	3 pots

#### Hyperspectral and climate data acquisitions

- Block 1 (X):** Hyperspectral imaging Specim IQ 204 bands between 397 and 1003 nm
- Block 2 (Z):** Temperature, Humidity, Global radiation, Wind Speed

#### Physiological variables

- y1:** Stomatal conductance (Porometer Delta-T)
- y2:** Transpiration (Load cell)

### METHOD

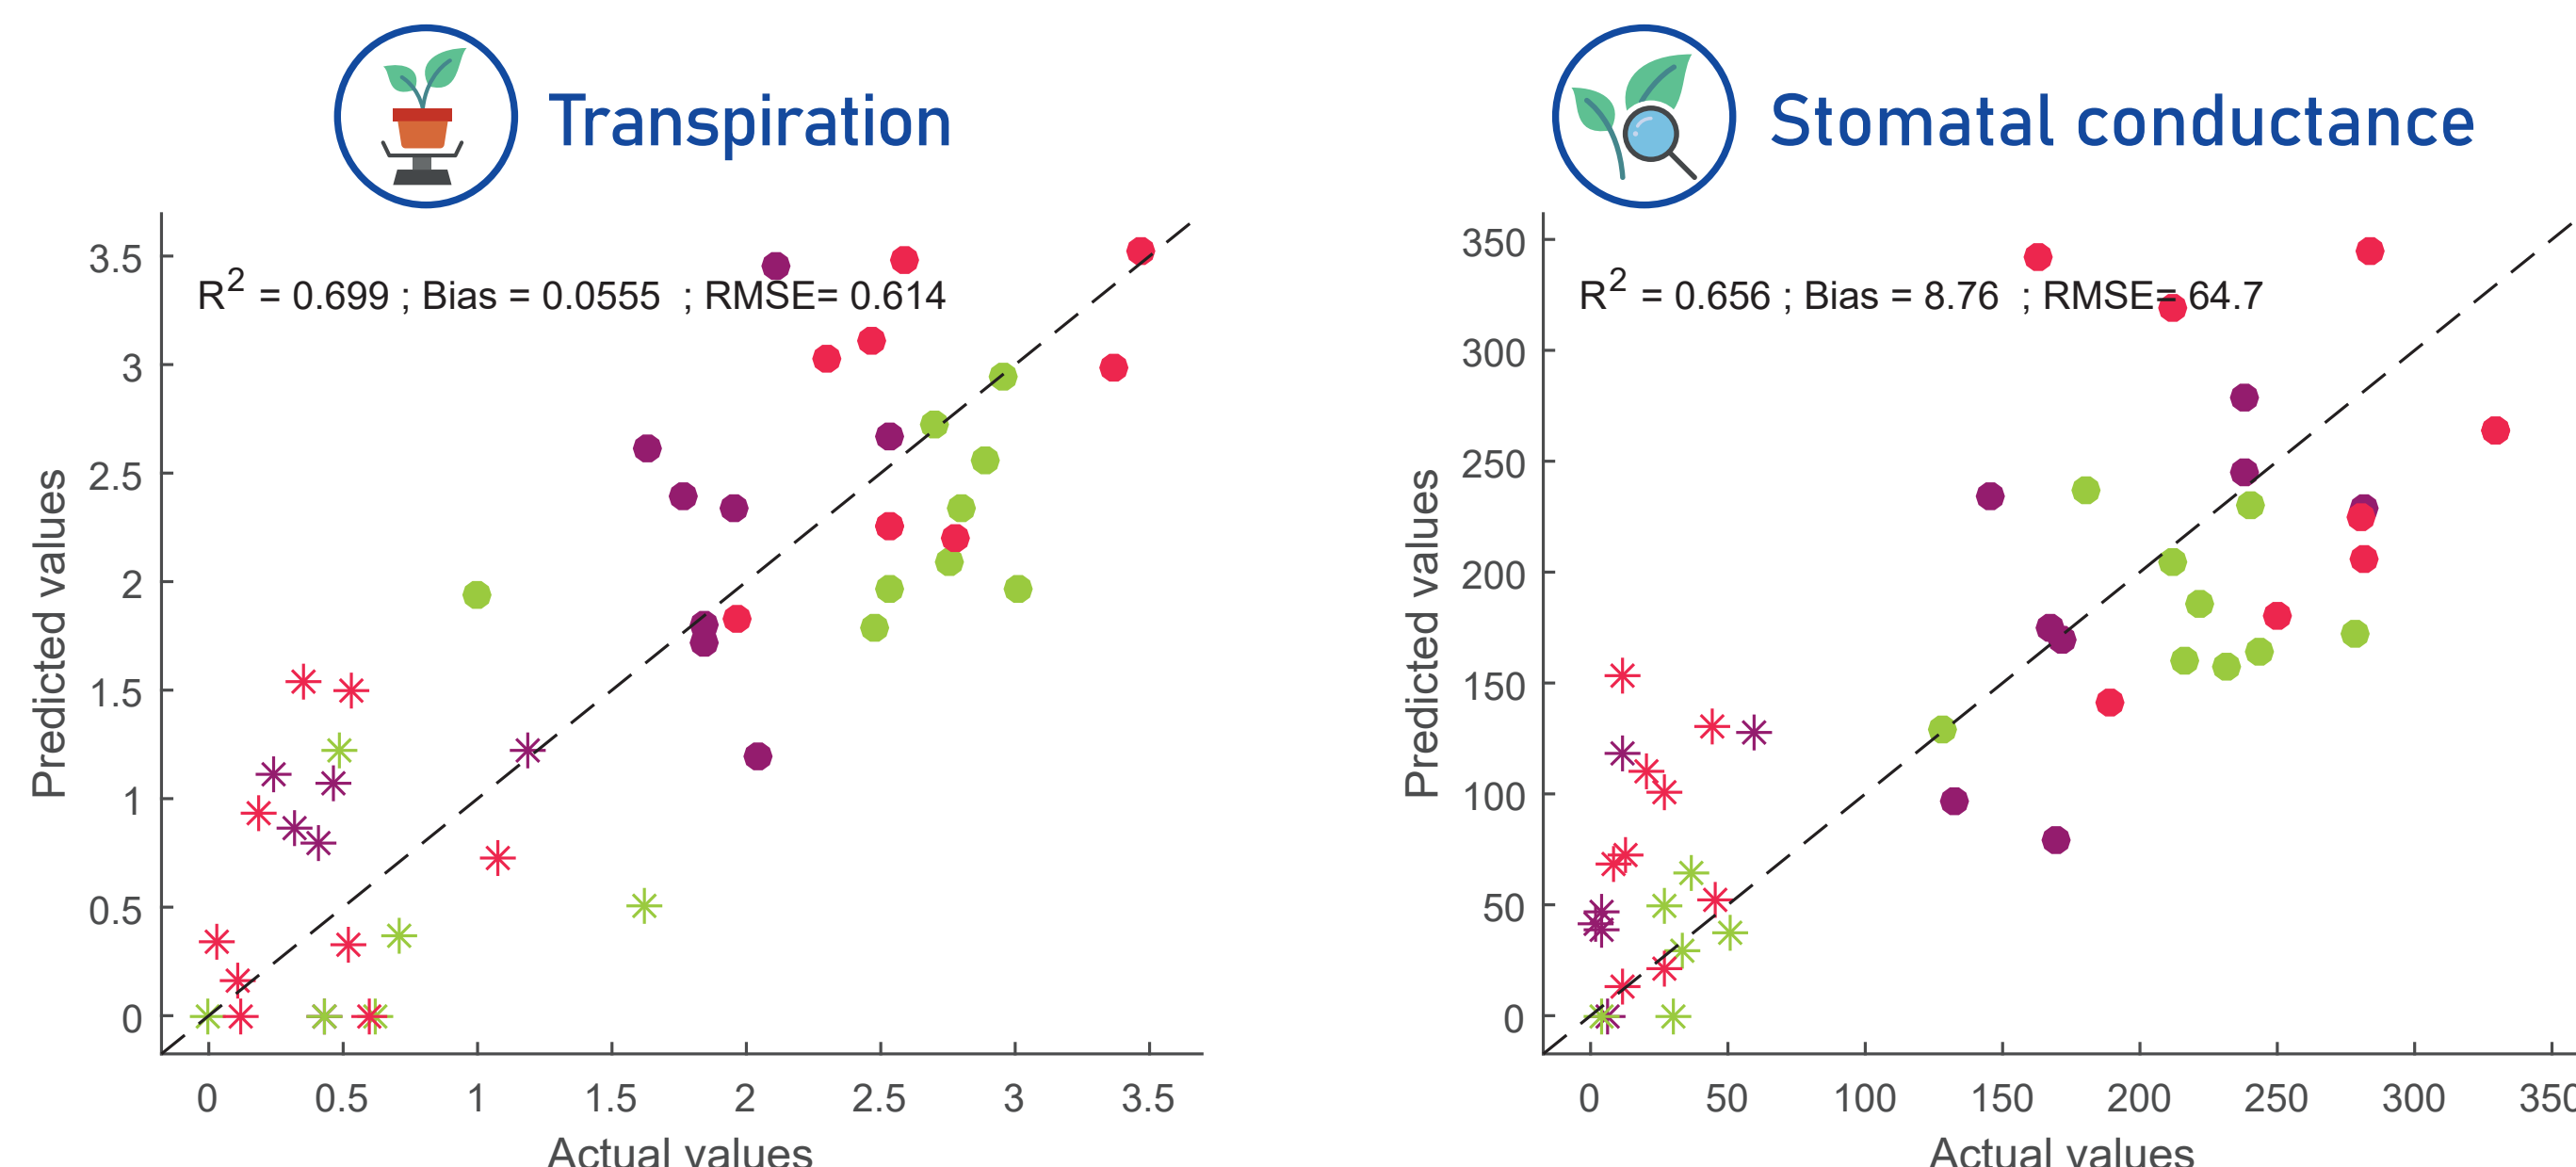

Sequentially-Orthogonalized Partial-Least-Square Regression (SO-PLS) was used to build a prediction model.

$$y = Xb + Zc + r_{X,Z}$$

#### Steps of the SO-PLS

- 1 - fit y to X.....  $y = Xb + r_X$
- 2 - orthogonalize Z to X-scores.....  $Z_{\perp} = Z - T_X (T_X^T T_X)^{-1} T_X^T Z$
- 3 - fit rx to  $Z_{\perp}$ .....  $r_X = Z_{\perp} c' + r_{X,Z}$

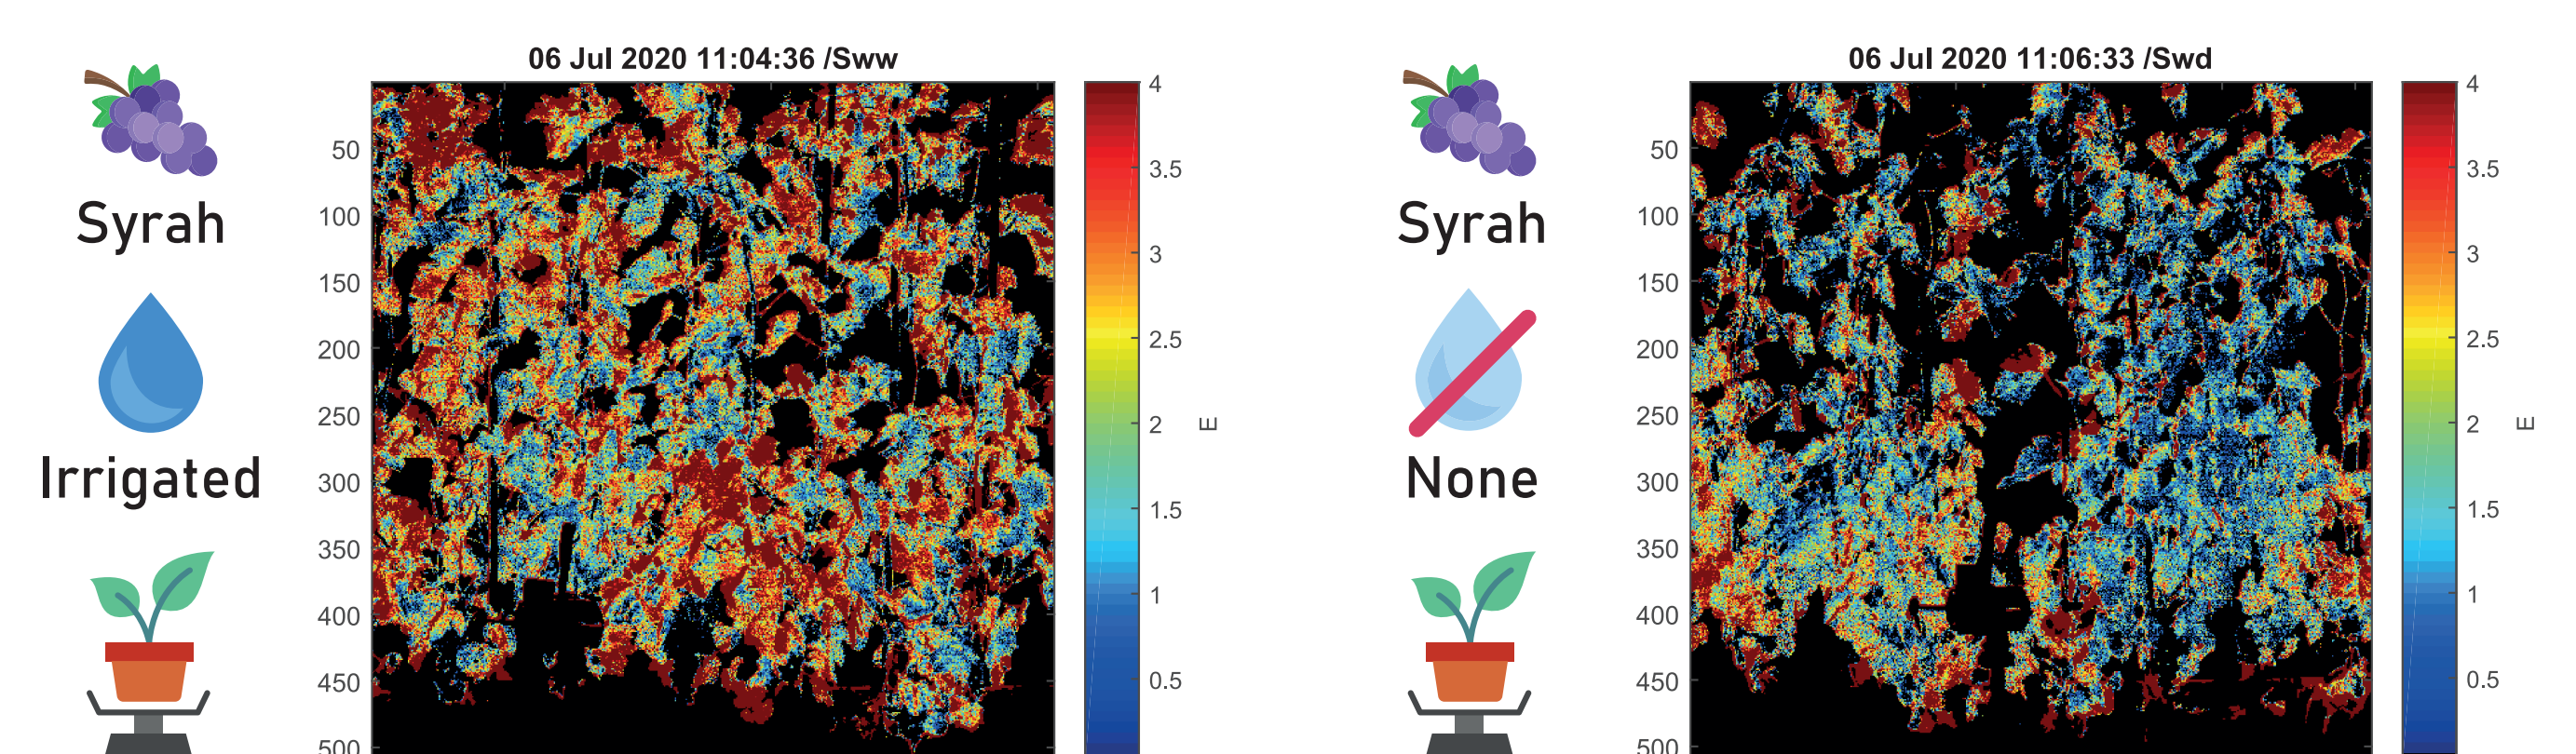

### RESULTS

### MODEL EVALUATION

### MODEL APPLICATION

- Opportunity to study spatial distribution of stresses over the leaf stages
- Within-variability as a new phenotyping trait for breeding varieties

### CONCLUSION AND PERSPECTIVES

The combination of climate data and hyperspectral images provides models with good performance to predict physiological variables. Quality of these prediction models could be improved by defining varietal models on a larger data set. These encouraging results offer prospects for the use of spectral imaging to study water stress of grapevine plants.
