HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Preliminary outcomes of EJP SOIL WP6

19 October 2021 EUSO Stakeholders forum
14:00 Core EUSO Objective: Integrated soil monitoring

Antonio Bispo, Maria Fantappiè, Fenny van Egmond, Bozena Smreczak, Zsófi Bakacsi, Rudi Hessel, Johanna Wetterlind, Grzegorz Siebelec

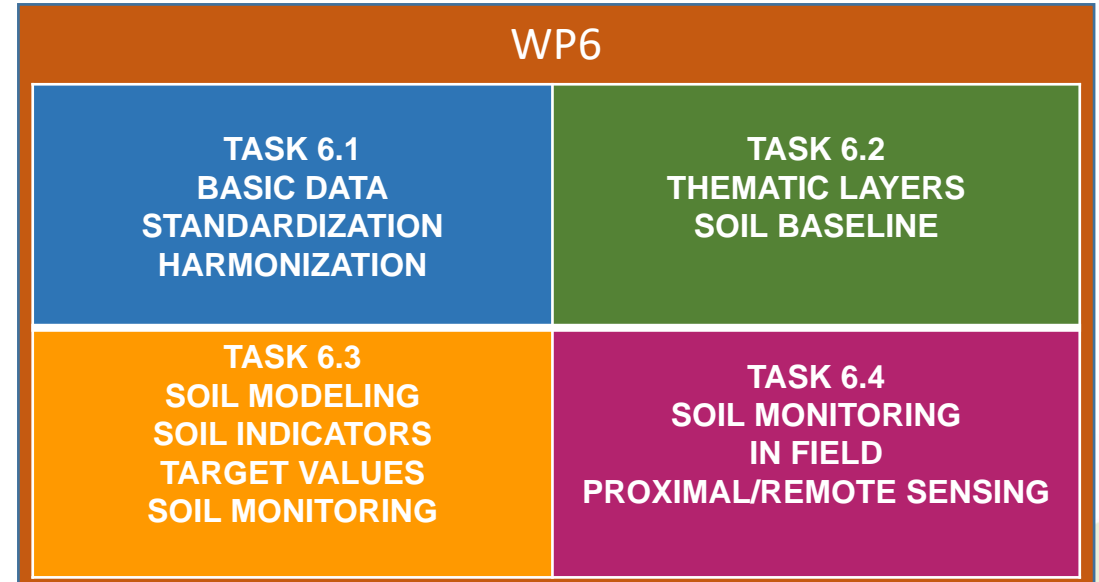

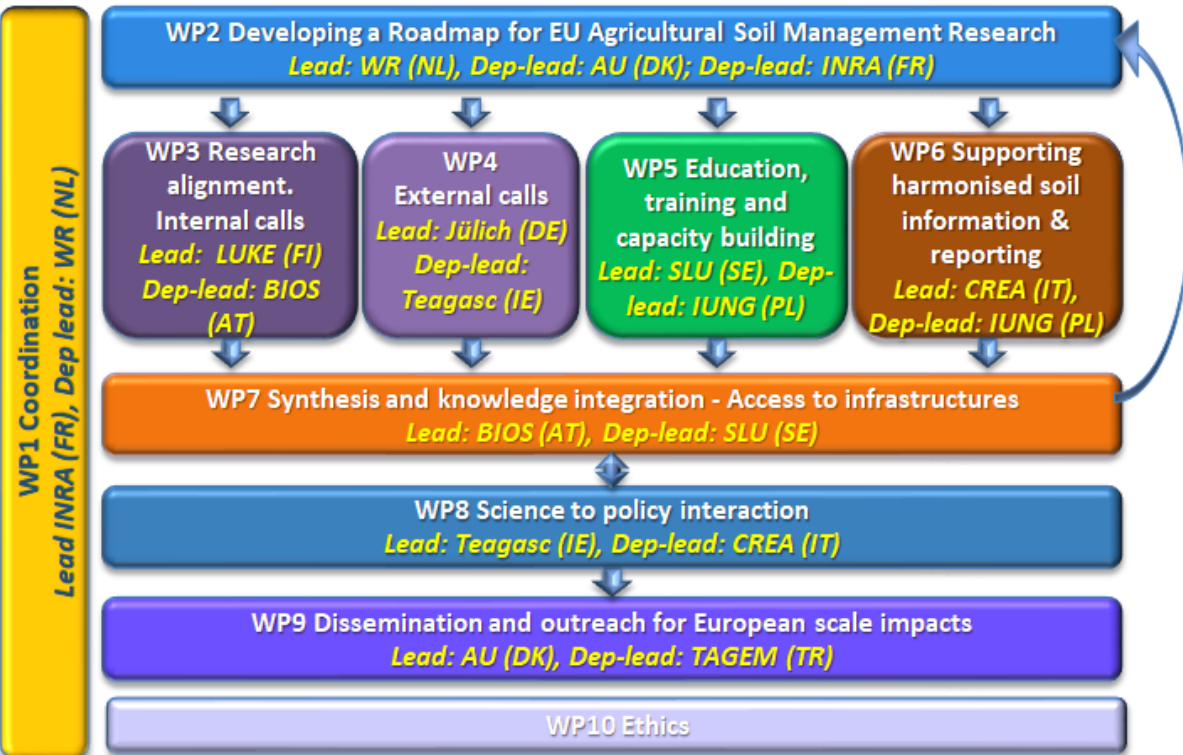

EJP SOIL
European Joint Programme

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 652615.

EJP SOIL PROJECT AND THE WP6

The **overall goal of the EJP SOIL** is to build a sustainable European integrated research system on agricultural soils and develop and deploy a reference framework on climate-smart sustainable agricultural soil management.

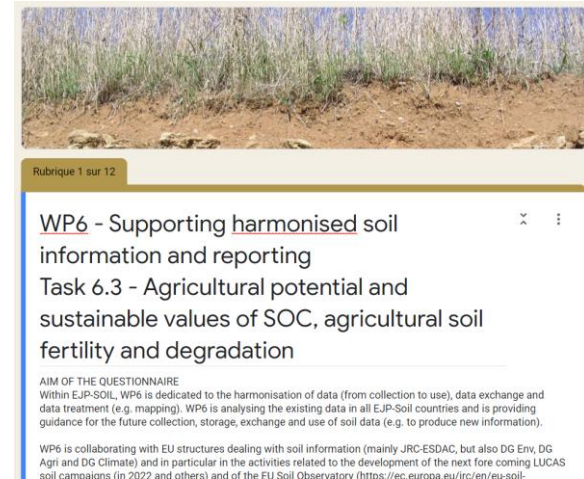

TASK 6.3 topics and aims

- Define, calculate and map indicators for soil health, threats and soil-related ecosystem services in close collaboration with JRC, EEA and EJP-SOIL internal projects
- Identify soil monitoring issues across EJP SOIL partners and JRC (to update national/EU monitoring campaigns as LUCAS)
- Contribute to a common ground for the future EU soil monitoring system (EU and national collaborations) in link with EUSO

T6.3 Activities

- Collaborate with LUCAS 2022 campaign to define/identify additional sampling points
- Stocktake the description of monitoring networks across EJP SOIL partners through the use of a questionnaire (20 answers, 41 contributors)
- Publish a deliverable (24 writers from 15 countries), under revision
 - State of the art
 - Review of existing soil monitoring systems based on the questionnaire (country by country)
 - Transversal analysis of the answers
 - Main deviations identified and possible ways of harmonization
 - Recommendations for the next steps
 - Conclusions

Towards climate-smart sustainable management of agricultural soils

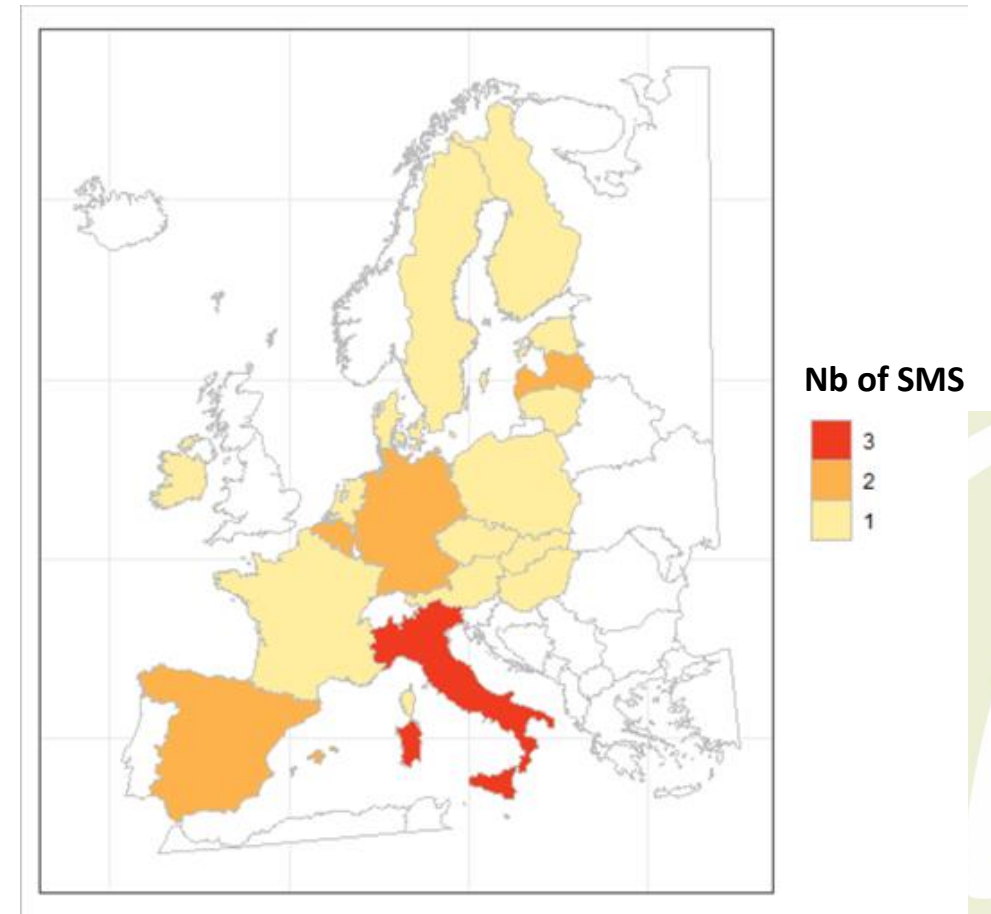

Deliverable 6.3

Proposal of methodological development for the LUCAS programme in accordance with national monitoring programmes

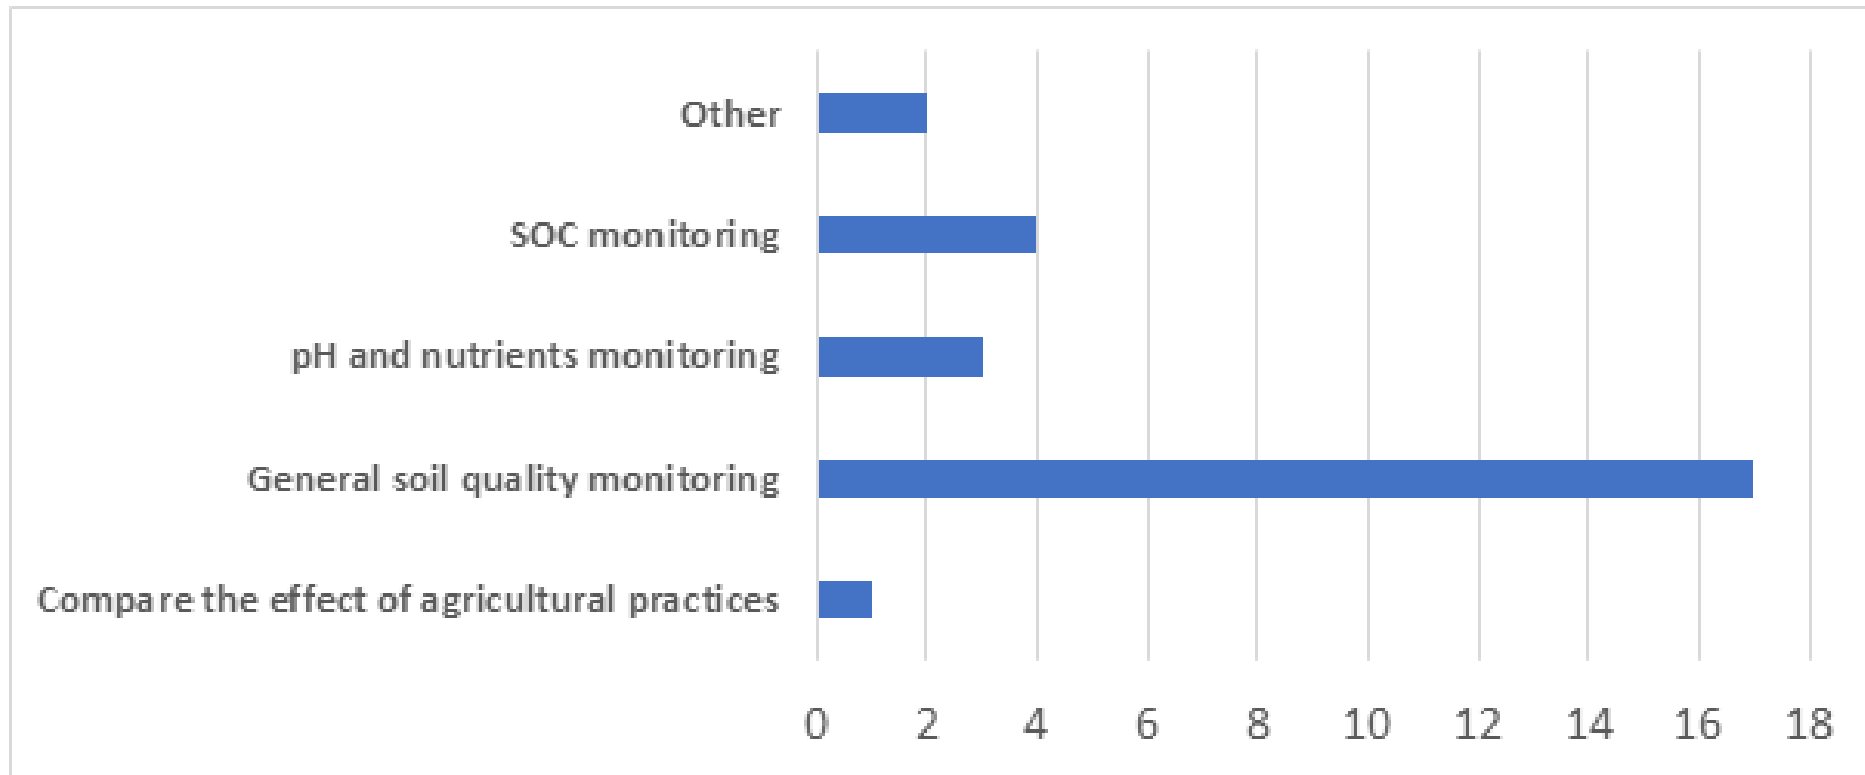

Due date of deliverable: M18
Actual submission date: 31.07.2021

Transversal analysis – SMS in EJP SOIL countries

- 20 countries answered out of 24 (ending with 27 declared SMS)
- Turkey and Portugal do not have SMS
- Five countries have 2 or 3 monitoring systems
 - SMS managed at regional scale
 - SMS with different purposes (e.g. agricultural vs forest, monitoring trace element vs agricultural parameters, monitoring a network of highly instrumented sites vs network agricultural soils)
- Caution: Not all countries declared their forest SMS

Transversal analysis – Main objective of SMS

Transversal analysis – Starting dates

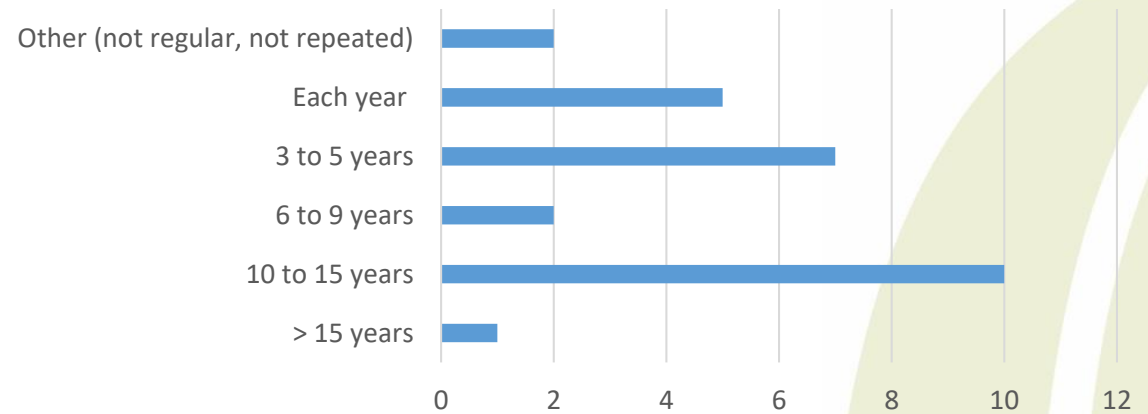

Starting dates

Transversal analysis – Number of campaigns completed and interval between each campaign

Number of campaigns

Interval between 2 campaigns

Transversal analysis – Density of sites

Density of sites

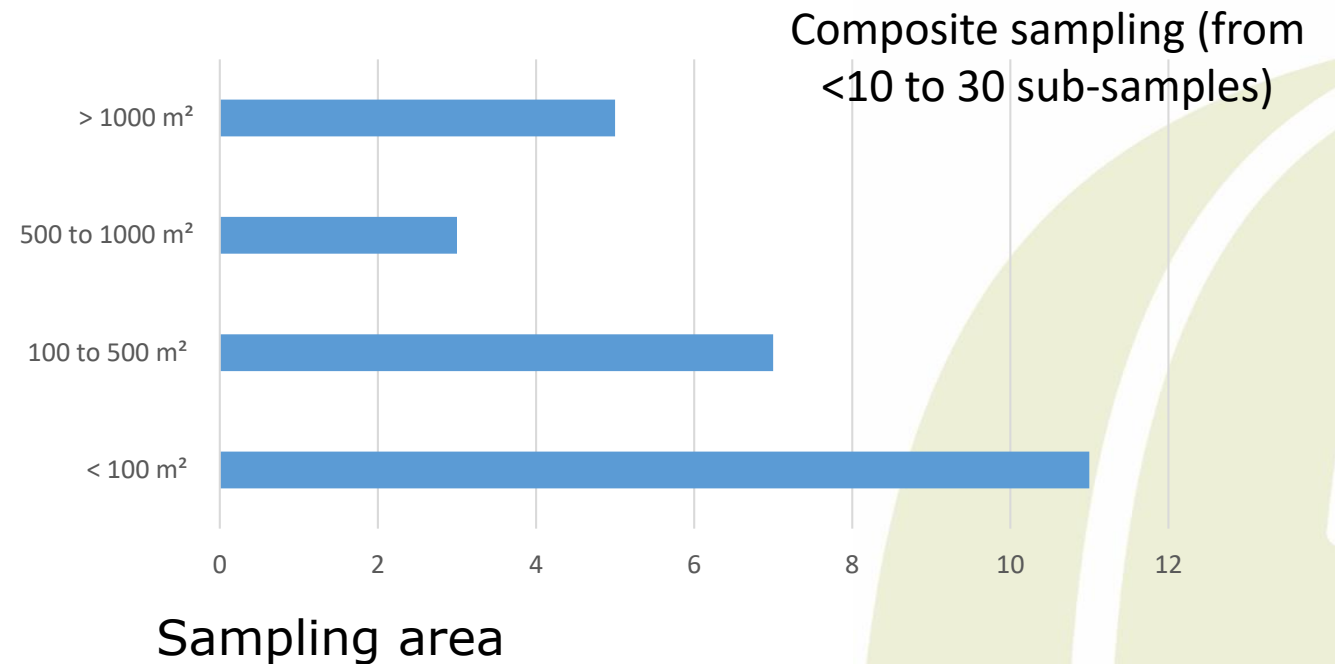

Transversal analysis – Sampling strategy and sampling area

- Grid
- Mixed (grid + representative sites)
- Stratified representative sites

Sampling design

Transversal analysis – Sampling depth

4 according to horizons

11 one fixed depth

16 MS sample for bulk density

14 different fixed depths

13 MS are sampling deeper than 30 cm

to 1 m

Analytical methods (to be completed)

Harmonization options

Questions	Yes		No	
	#	Representative comments	#	Representative comments
May the sampling design of your SMS be adapted or changed?	15	<ul style="list-style-type: none"> - New sites are possible (#12) - We are planning a new SMS, changes can occur (#3) 	13	<ul style="list-style-type: none"> - Changing design would make it impossible to compare the data with the old samples - Changes in the design would affect the time series in the core sampling area.
Can you consider collecting new information on the monitoring sites?	23	<ul style="list-style-type: none"> - Depends on means - Soil management information will improve the use of data 	4	<ul style="list-style-type: none"> - It takes too much time - Financial support needed
Can the soil description be improved?	16	<ul style="list-style-type: none"> - Translation of national classification into WRB can be made - If there is new funds soil description/classification can be made 	11	<ul style="list-style-type: none"> - Not planned - Needs skilled people - Too much time/work on the site
Can you modify the sampling area?	7	<ul style="list-style-type: none"> - We are planning a new SMS, changes can occur (#3) 	19	<ul style="list-style-type: none"> - Rather no, all the previous data rely on this protocol. - Changing the area would make it impossible to compare the data with the old samples
Can you change the sampling depths?	8	<ul style="list-style-type: none"> - We may sample deeper (#4) - We are planning a new SMS, changes can occur(#3) 	17	<ul style="list-style-type: none"> - All previous data rely on this protocol
Can you change the soil sample preparation, before analysis?	5	<ul style="list-style-type: none"> - We are planning a new SMS, changes can occur (#3) 	20	<ul style="list-style-type: none"> - All previous data rely on this protocol
Can you change measurement methods?	9	(without comment)	15	<ul style="list-style-type: none"> - Since the purpose is to monitor changes, changes in the measurement methods is problematic - Would probably need some double analysis, which means increased costs.
Can you add extra parameters to be analysed?	20	<ul style="list-style-type: none"> - Depending on funds (struggling to maintain basic analysis) 	4	<ul style="list-style-type: none"> - Costs

D6.3. Recommendations

- Compare national and LUCAS sampling strategies/schemes (develop the same approach)
- Compare national data with LUCAS data, country/country (develop the same approach)
- Develop transfer functions (from sampling to analytical methods), taking the opportunity of LUCAS 2022
- Identify / test methods to merge national and LUCAS datasets or existing maps
- Develop interpretation values/scoring approaches

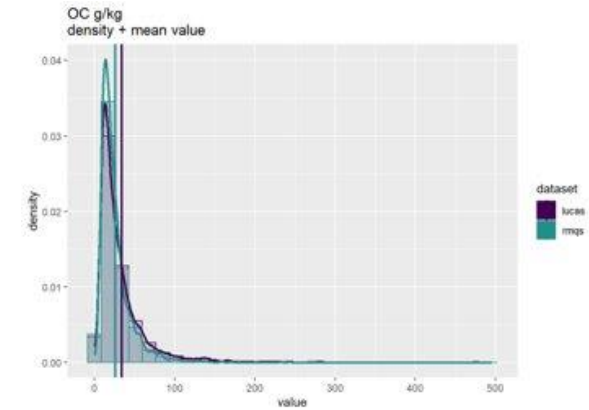

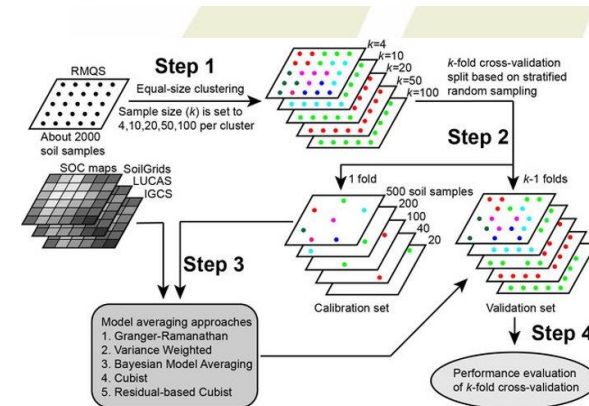

Table 3. Equations of PTFs built by partial least square regression (PLSR) for estimating Olsen P₂O₅ with their mean R² and RMSE values based on cross-validation.

R ²	RMSE (mg kg ⁻¹)	Equations
PTFs built with Joret-Hébert P ₂ O ₅ and other variables		
0.398 a	33.719aa	Olsen P ₂ O ₅ = 27.215 + 0.244*Joret-Hébert P ₂ O ₅
0.535b	29.627bb	Olsen P ₂ O ₅ = -19.619 + 0.254*Joret-Hébert P ₂ O ₅ + 0.096*Silt
0.535b	29.630bb	Olsen P ₂ O ₅ = 299.664 + 0.270*Joret-Hébert P ₂ O ₅ - 35.208*pH _{water}
0.666c	27.198 cc	Olsen P ₂ O ₅ = -218.385 + 0.263*Joret-Hébert P ₂ O ₅ - 29.419*pH _{water} + 0.079*Silt
PTFs built with Dyer P ₂ O ₅ and other variables		
0.638d	27.860dd	Olsen P ₂ O ₅ = 28.315 + 0.19*Dyer P ₂ O ₅
0.681d	26.167dd	Olsen P ₂ O ₅ = 21.5 + 0.193*Dyer P ₂ O ₅ + 35.49*exchangeable Al
0.699d	27.062dd	Olsen P ₂ O ₅ = 63.246 + 0.195*Dyer P ₂ O ₅ - 6.063*pH _{water}
0.685d	25.985dd	Olsen P ₂ O ₅ = 57.522 + 0.193*Dyer P ₂ O ₅ - 5.987*pH _{water} + 35.447*exchangeable Al

Note: R² means coefficient of determination, RMSE means root mean-square error; "a", "b", "c", "d", "aa", "bb", "cc" and "dd": letters indicating significant differences from mean comparison (α ≤ 5%) of R² and RMSE among PTFs.

Compare LUCAS/national sampling schemes and datasets

- Sampling schemes (D6.1)
 - Not one best sampling design: depends on the objective (e.g. produce mean, identify variations, map a parameter, develop classes...)
 - When adding or combining two campaigns, the design and inclusion probabilities need to be known
 - Comparison of sampling designs is needed country by country, based on the same approach
- Datasets
 - Identify a set of relevant parameters,
 - Compare the results, country by country, at country level and at land use level...
 - Identify/explain possible variations (e.g. sampling designs/methods, analytical procedures...)

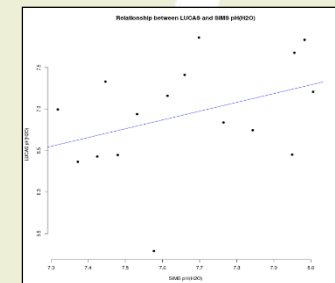

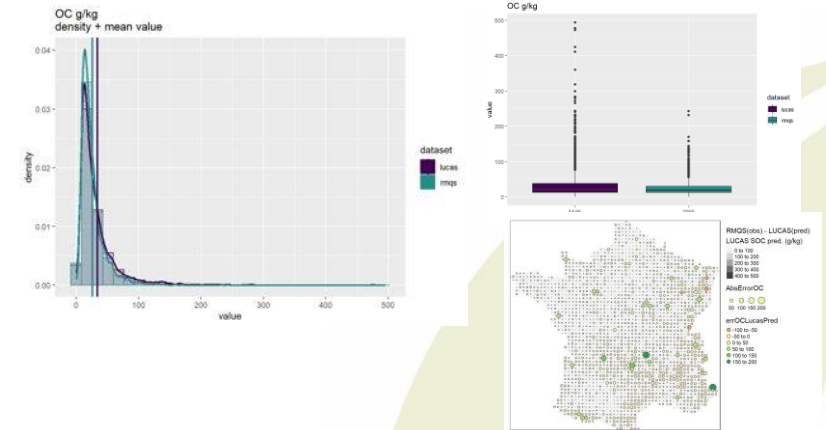

Figure 4.1 National examples of sampling patterns based on simple random sampling (left), stratified random sampling (middle), systematic random sampling (right). Adapted From De Gruijter et al. (2006).

Develop transfer functions (from sampling to analytical methods)

- Compare analytical methods
 - E.g. pH KCl/water, OC methods... across countries
 - Develop transfer functions to use soil data (LUCAS method being the “reference”)
- Compare the entire procedure (from sampling to analyze)
 - Double sampling needed (done in Austria)
 - Take the opportunity of LUCAS 2022
 - Develop transfer functions (LUCAS method being the “reference”)

Table 1. Comparison between the sampling devices and soil analyses of Biosoil and RMQS.

	RMQS	Biosoil	Comparison
Network	16 km × 16 km grid	16 km × 16 km grid	=
Sampled layers	0–30 cm	0–10 cm, 10–20 cm and 20–40 cm	≠
Organic carbon	Dry combustion NF ISO 10694	Dry combustion ISO 10694:1995	=
Potassium	HF & HClO ₄ (total) NF X31-147 ICP-MS	HF & HClO ₄ (total) ISO 14869-1:2001	=
Lead	HF & HClO ₄ (total) NF X31-147 ICP-MS	Aqua regia (incomplete) ISO 11466:1995 mod.	≠
pH	Suspension in 1/5 of water NF ISO 10390	Suspension in 1/5 of water ISO 10390:1994	=

A data fusion approach for spatial analysis of speciated PM_{2.5} across time

Colin W. Rundel^{a*}, Erin M. Schliep^b, Alan E. Gelfand^a and David M. Holland^c

PM_{2.5} exposure is linked to a number of adverse health effects such as lung cancer and cardiovascular disease. However, PM_{2.5} is a complex mixture of different species whose composition varies substantially in both space and time. An open question is how these constituent species contribute to the overall negative health outcomes seen from PM_{2.5} exposure. To this end, the Environmental Protection Agency as well as other federal, state, and local organizations monitor total PM_{2.5} along with its primary species on a national scale. From an epidemiological perspective, there is a need to develop effective methods that will allow for the spatial and temporal exposure observations to be used to predict exposures for locations

Identify and test methods to merge datasets/maps and score results

- Identify / test methods to merge national and LUCAS datasets or existing maps
- Develop interpretation values/scoring approaches to use data produced with different protocols

Soil & Water Management & Conservation

Statistics, Scoring Functions, and Regional Analysis of a Comprehensive Soil Health Database

Aubrey K. Fine
Harold M. van Es*
Robert R. Schindelbeck
School of Integrated Plant Science
Cornell University
Ithaca, NY 14853

Soil health (SH) refers to the ability of a soil to function and provide ecosystem services. The Comprehensive Assessment of Soil Health (CASH) is an approach that measures 15 physical, biol which are interpreted through scoring fun status of 5767 samples from the Mid-Atlar of the USA as evaluated using CASH. D subdatasets by region and soil textural gr correlation coefficients, principal compor regression (BSR) were performed. From functions were developed. Separate scor medium, coarse) were necessary for Wet Water Capacity (AWS), Organic Matter Protein. Differences existed among region and Respiration (Resp), where the Midwe compared to the Mid-Atlantic and North showed moderately strong correlations (r for the first two PCs. BSR results using response variable indicated that AC acco additional predictability from Penetration These four indicators are suggested for si the CASH approach can be successfully ap soils with differing pedogenetic histories.

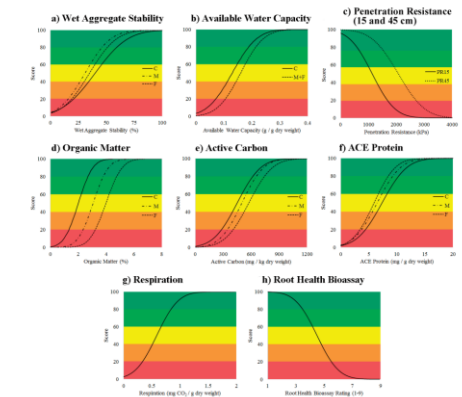

Fig. 3. Comprehensive Assessment of Soil Health (CASH) scoring functions for physical (a-c) and biological (d-h) soil health indicators. Functions are shown overlaying the expanded 2016 CASH five color scheme (red, orange, yellow, light green, dark green), used to classify scores as very low (0–20), low (20–40), medium (40–60), high (60–80), and very high (80–100), respectively.

Next steps

- Revise/update the Deliverable D6.3 and publish the document
- Harmonization will be difficult (nor impossible) as several SMS are currently running for more than 20 years and changing protocols will impact the use of previous data from existing campaigns (it may be an option for countries defining their SMS ...)
- Proposals were made to take benefit of existing systems and will be tested within EJP SOIL
 - Quite all EJP SOIL partners will compare according to the same approach,
 - National and LUCAS sampling strategies/schemes
 - National and LUCAS datasets/results
 - Several partners will also
 - Develop transfer functions (from sampling to analytical methods), taking the opportunity of LUCAS 2022
 - Identify / test methods to merge national and LUCAS datasets or existing maps
 - Develop interpretation values/scoring approaches (in link with other EJP SOIL projects)
