## 1. Context & objectives

- Sustainable crop production requires high efficiency of field operations and natural resources protection (soil).
- Soil compaction is a major threat for soils, inducing yield losses on spring and summer crops.
- Size and weights of agricultural machinery have significantly increased during the last decades.
- An evaluation tool is needed to evaluated **Soil Readiness**, considering soil compaction risk.

### Workability

Soil suitability for cultural operations (defined by soil properties & climate).

### Trafficability

Soil capacity to support machinery during traffic without soil physical degradation (to avoid soil compaction).

### Soil Readiness or Workable days

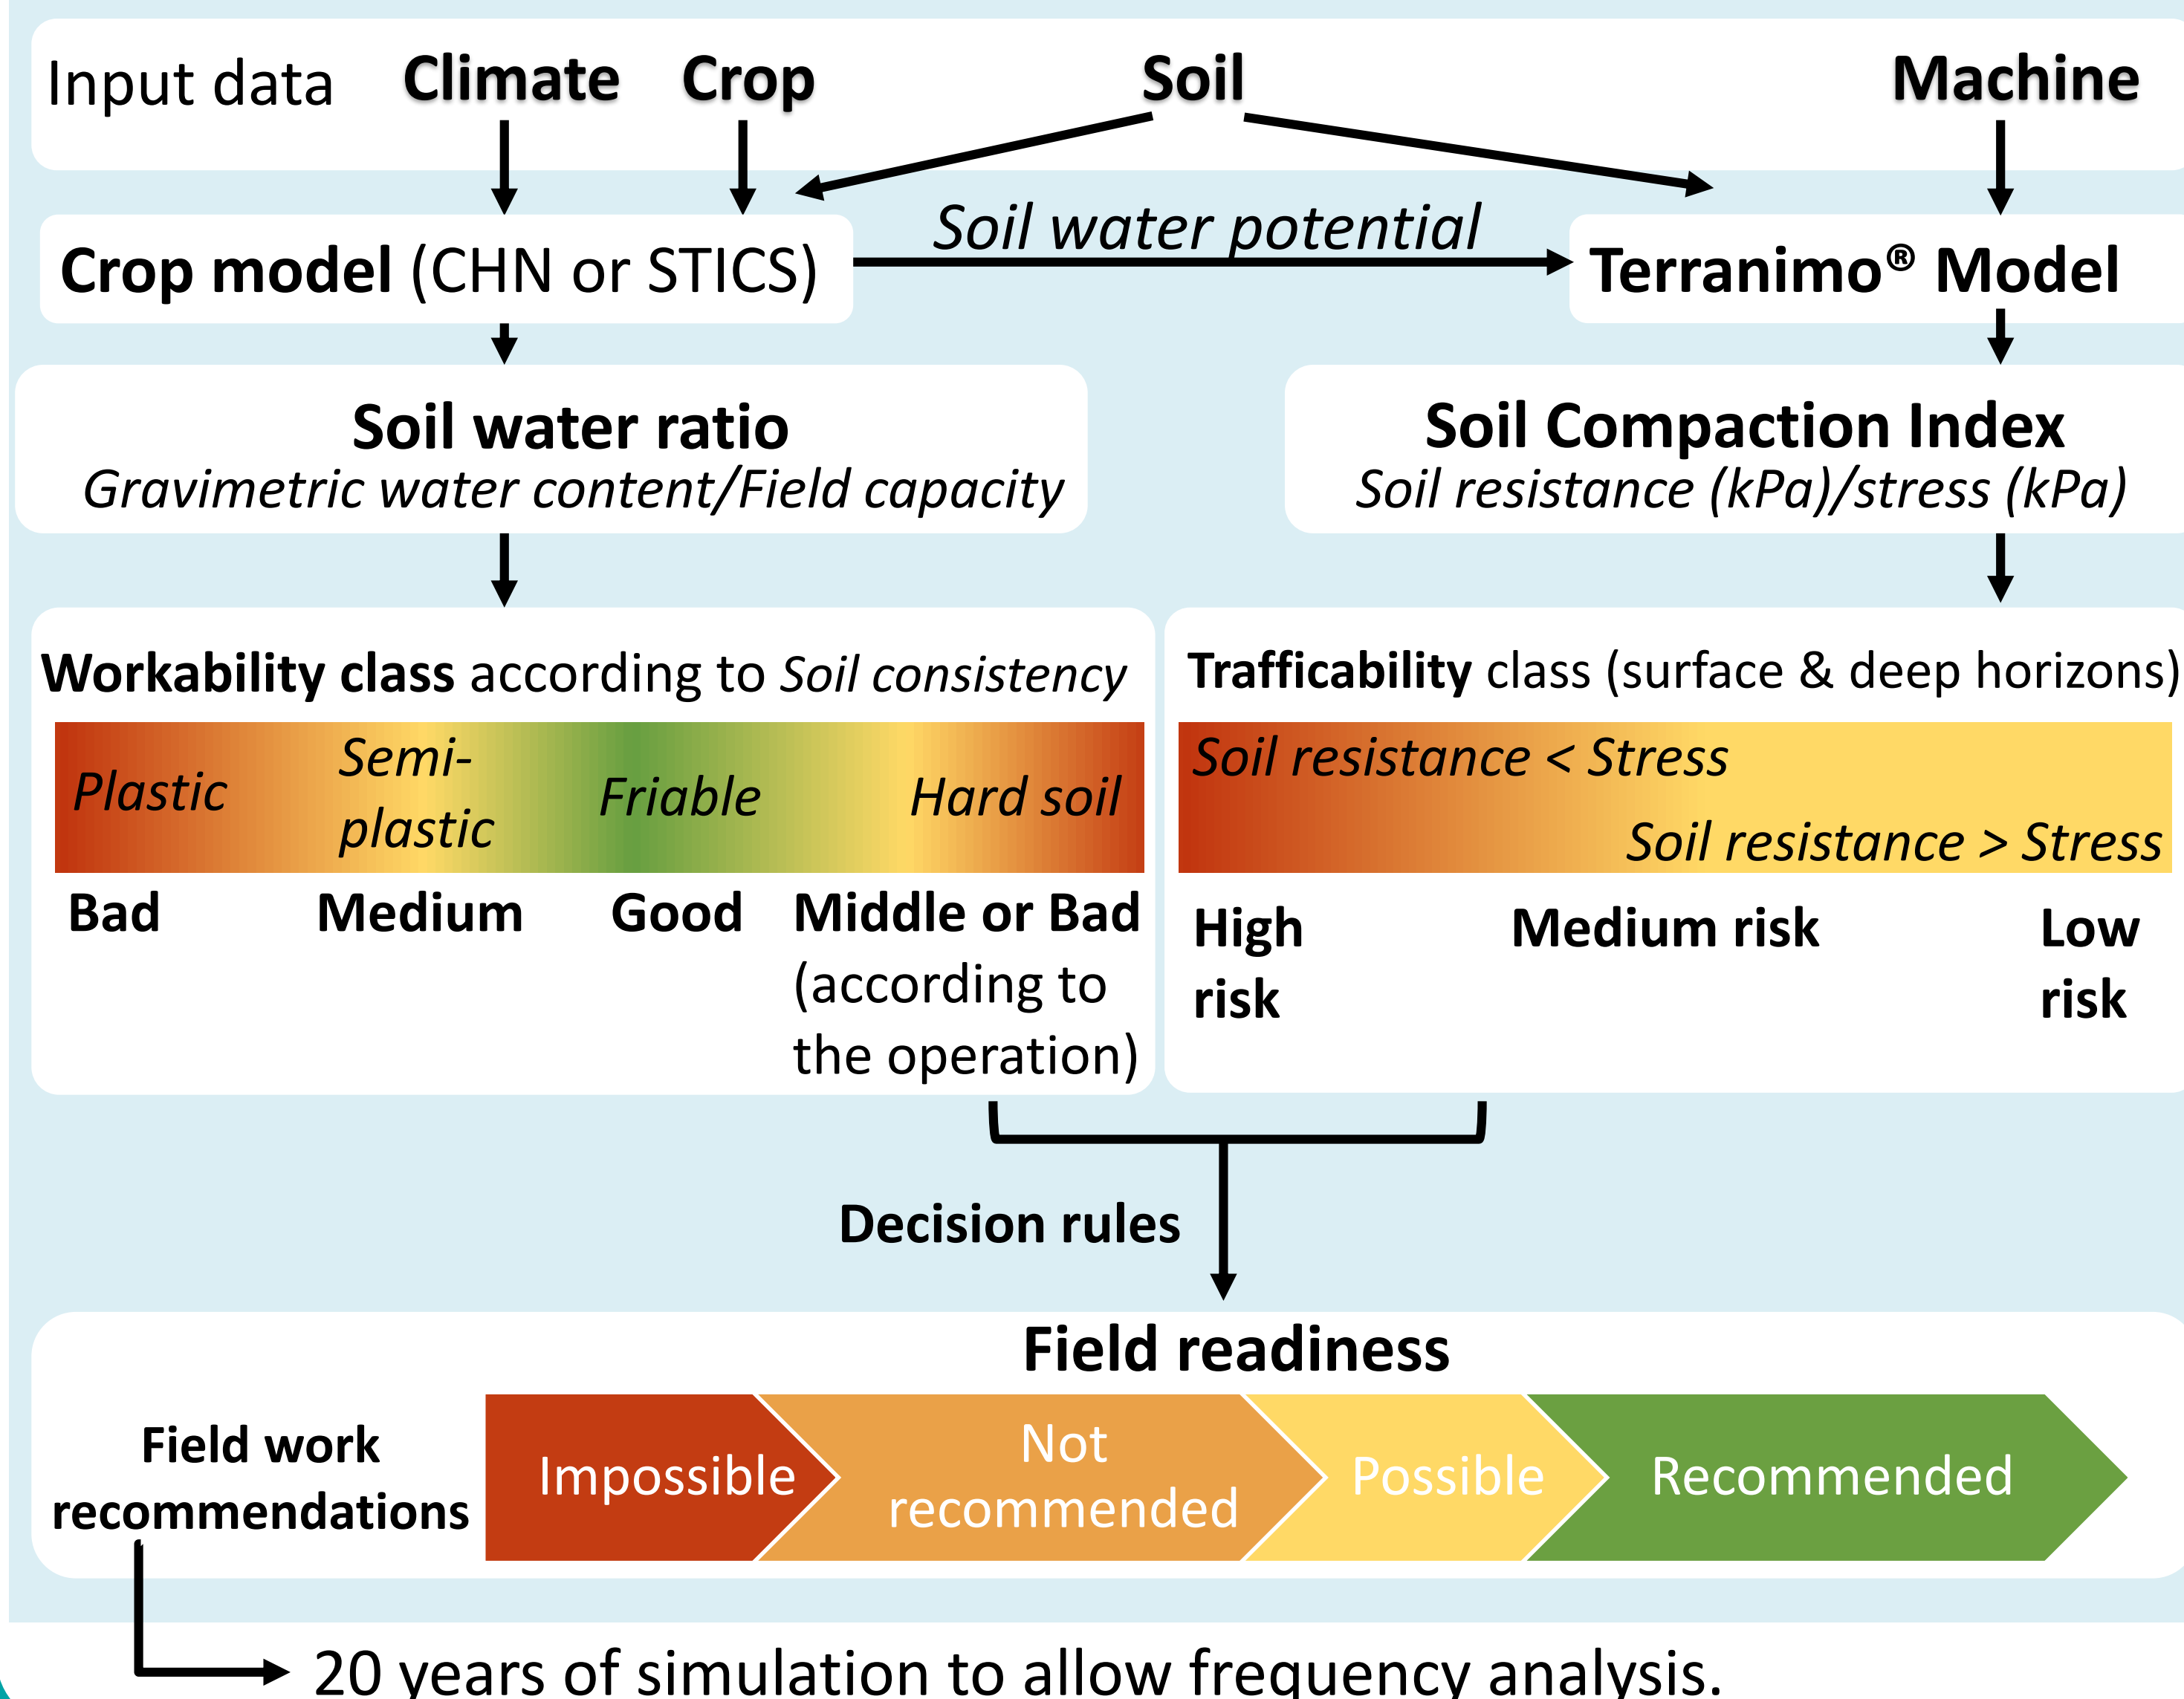

#### Decision support tool for strategic application:

- Conception of cropping systems (global change context).
- Optimization of mechanical (machinery) and labour force costs.
- Soil physical quality protection.

#### Possible uses and users:

- Modelling tool: technical institutes, research, specialist advisers.
- References for agricultural system design: cooperatives for the use of agricultural equipment, farmers, farm advisers, agricultural machinery sellers.

## 2. Global approach to predict field readiness for agronomical strategy

## 4. Example of application

**Question:** there is a need to renew a Corn planter. Should we take advantage of it to go from 6 to 8-rows?

### Data:

- Area to be sown: 200 ha
  - Sowing period: from April 1<sup>st</sup> to 30<sup>th</sup>
  - Traction time: 8 h/day
  - Working speed: 6 km/h
- 21.6 ha/day with a 6-rows seeder  
28.8 ha/day with a 8-rows seeder

### Results:

#### Field readiness (Number of workable days)

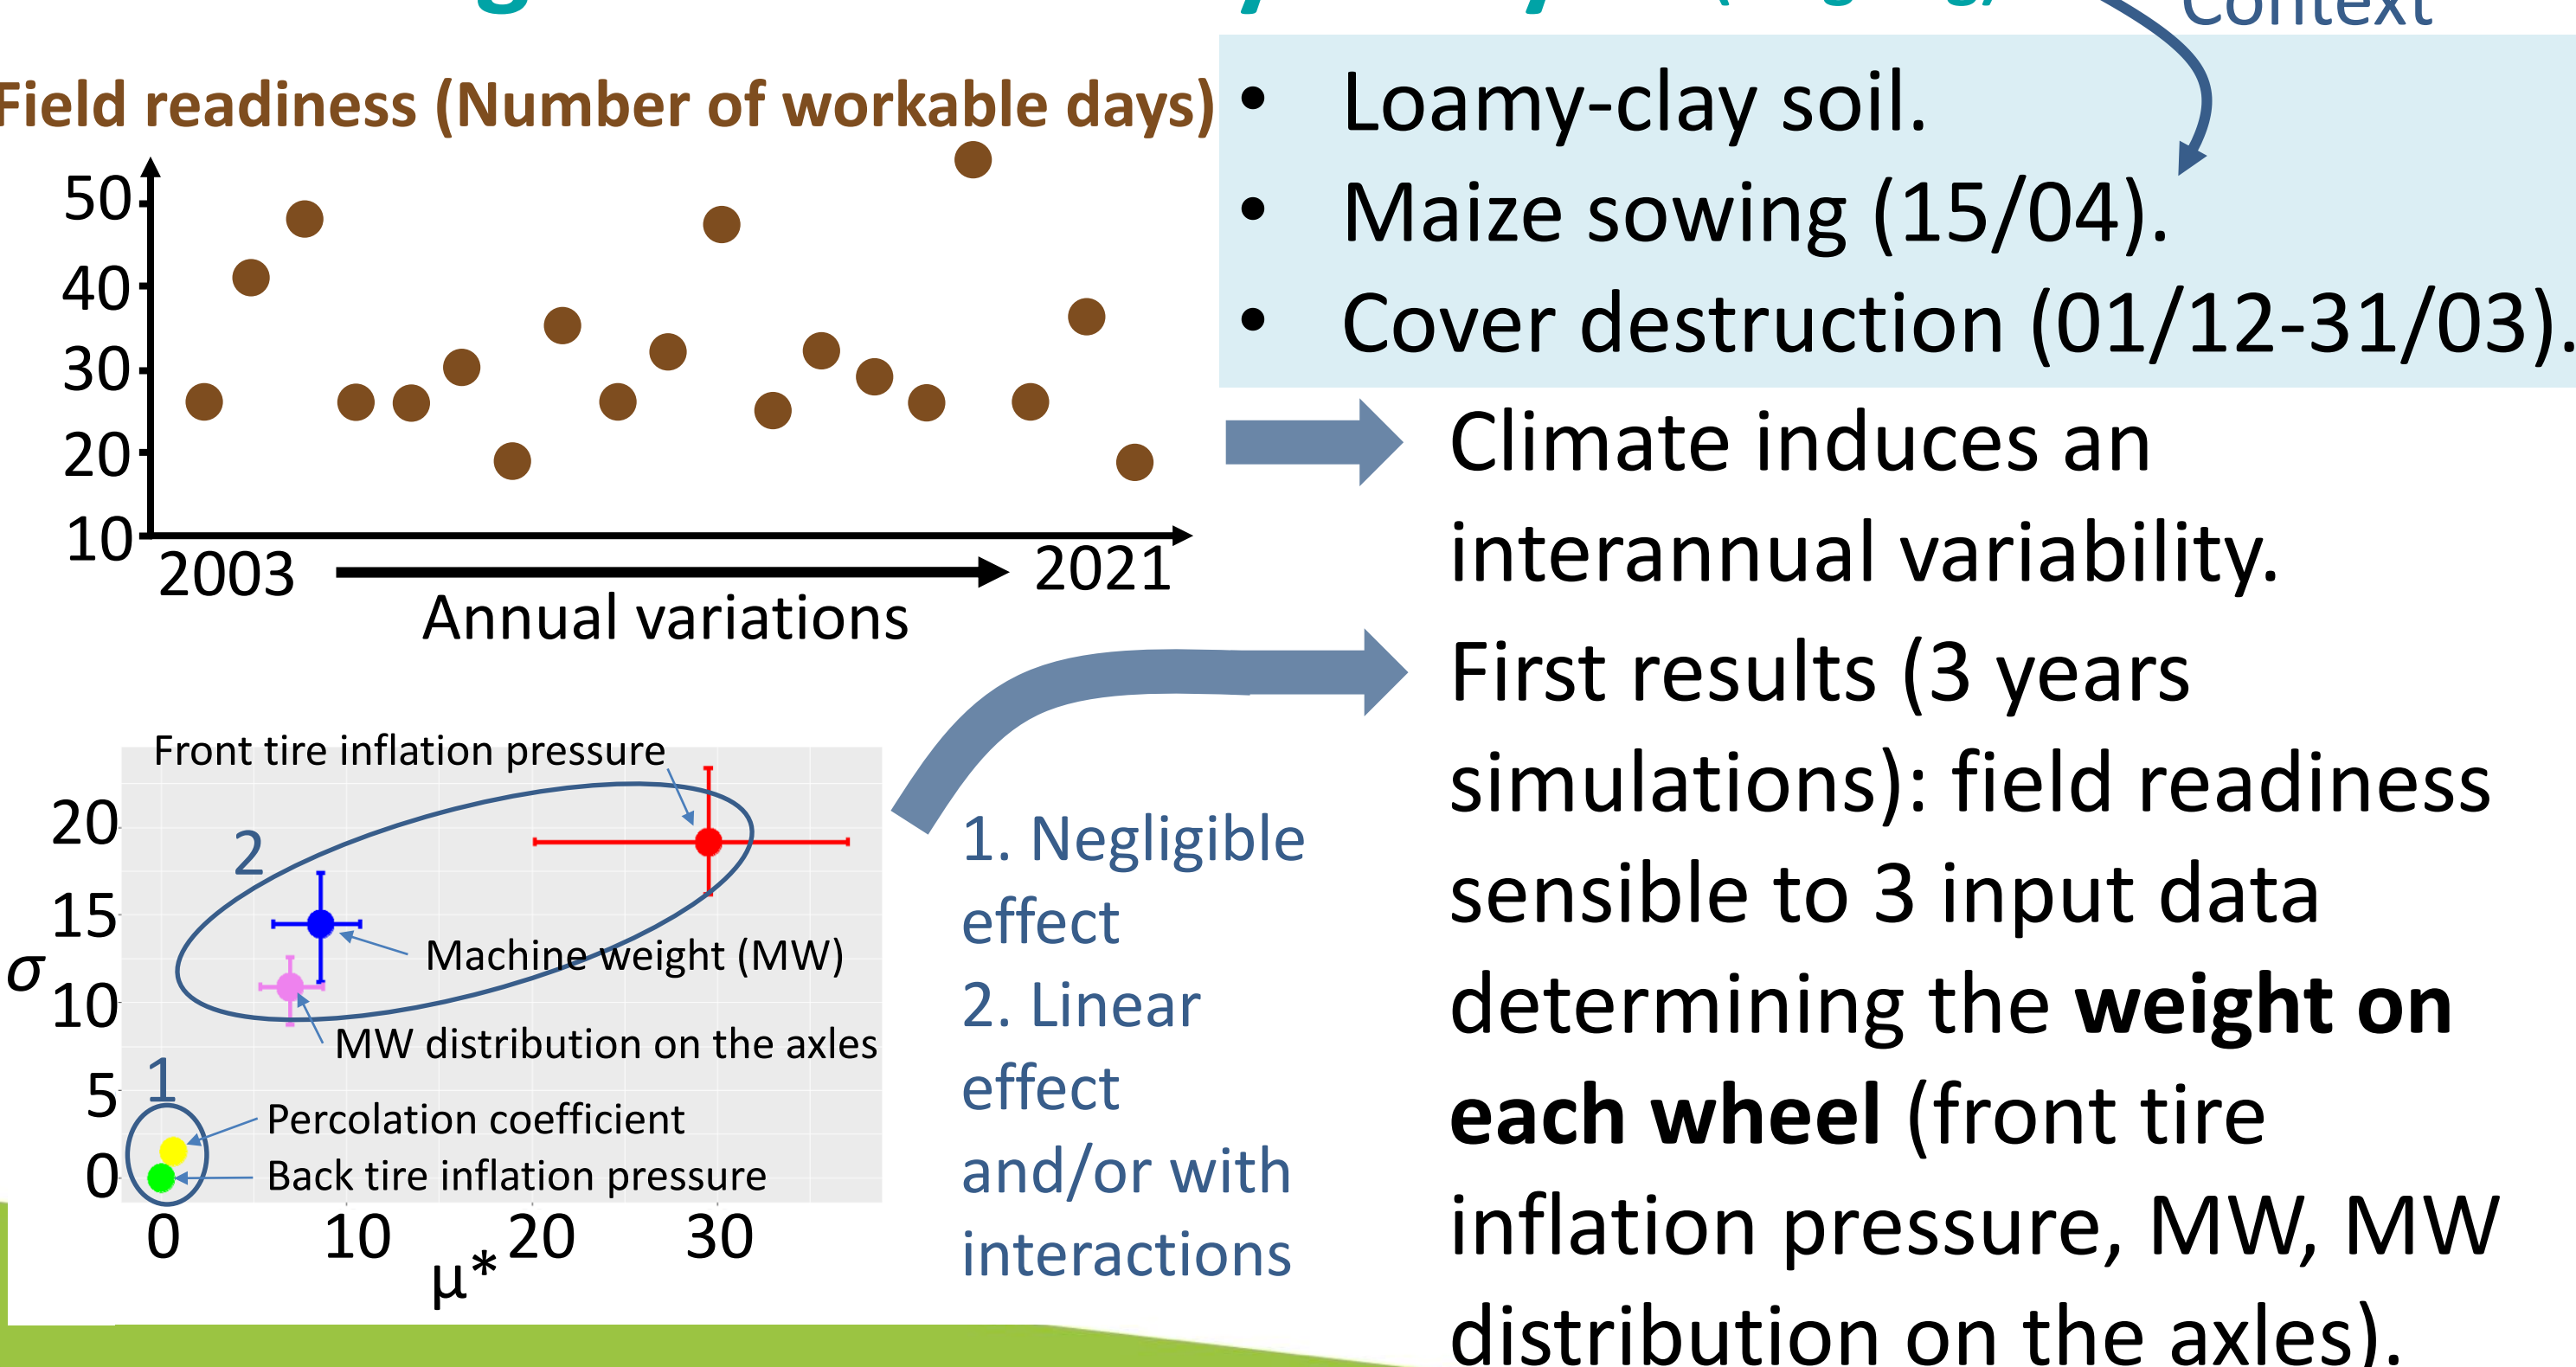

#### Area that can be sown on workable days

	6-rows	8-rows
Min.	86 ha	115 ha
2 <sup>nd</sup> decile	229 ha	305 ha

### Conclusions:

- The type of seeder had no impact on the number of workable days.
- The 6-rows seeder is sufficient for 8/10 years. There is no need to invest in larger/heavier equipment if the risk is accepted.

## 3. Morris global sensitivity analysis (on going)

- Loamy-clay soil.
- Maize sowing (15/04).
- Cover destruction (01/12-31/03).

Climate induces an interannual variability.

First results (3 years simulations): field readiness sensible to 3 input data determining the **weight on each wheel** (front tire inflation pressure, MW, MW distribution on the axes).

## 5. Where we are and were we go

- J-DISTAS is an **interoperable tool** combining several models (crop and soil compaction models) and databases (describing soil, machine and climate).
- J-DISTAS offers major improvements compared to previous tools used to estimate field readiness, considering soil **compaction risk**, and including a range of cultural operations suitable for the **evaluation of innovative crop systems**.
- Currently, a stable but not friendly version exists. An application programming interface (API) will be developed to make the use of the J-DISTAS tool easier (expected in 2023).
- Interest in using the J-DISTAS tool: economic, technical, scientific, social and environmental.
