HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Development of innovative food-base fortification solutions to sustain health in older people using co-creation approach

Small eaters in old age

Several epidemiological studies highlighted a *small eater* pattern ranging from 23% to 55% in community-dwelling older population¹.

Two recent studies have shown that about two thirds of dependent older people do not meet their protein requirements².

Insufficient protein intake leads to loss of muscle mass and impaired immune function, with negative effects on the autonomy and health of older people. In fact, poor appetite is a strong and major determinant of protein-energy undernutrition³.

➔ After 65 years old:
1 to 1.2 g of protein
per kg of body weight per day

Food-based fortification

Food-based fortification consists of incorporating ingredients of nutritional interest (*fortificants*) into everyday foods without increasing the volume to be ingested.

Fortificants can be:

- ✓ Regular food products (semolina, oils, butter, cream, pureed nuts, egg...)
- ✓ Macronutrients extracts (whey protein isolate, milk protein concentrate, caseinate, maltodextrin...)

Fortification is a flexible solution that allows better adaptation to older people's food preferences and better guarantees the maintenance of a varied diet.

➔ Systematic literature review:
significant increase in protein
intake and body weight⁴

Bridging the gap between nutrition and sensory

Systematic review reveals the acceptability of fortified recipes is seldom done:

- ✓ Identification of 44 original studies on fortification in older people⁴
- ✓ Only 10 reported both nutritional and acceptably outcomes
- ✓ The quality of acceptability testing is often poor: low sample size & convenient sample, qualitative tests, incomplete reporting

Acceptability is more than liking: we need to design fortified foods that people will choose to buy, cook, eat and enjoy, in order to ensure nutritional efficacy.

➔ Fortiphy

Database of protein extracts

A database including all protein extracts available on the EU market was built. Each product was assessed on the following domains:

- ✓ Technology
- ✓ Regulatory
- ✓ Sustainability
- ✓ Sensory
- ✓ Nutrition

➔ 135 products were identified
38% from animal and 50% from plant
Protein rate varies from 9 to 98%

Usage constraints

Focus groups were conducted in each country (FR, N, UK) with older people and caregivers to gather insights on attitudes to usage of high-protein ingredients

- ✓ Nutrition awareness
- ✓ Fortification
- ✓ Proteins extracts

➔ Posters on session 2
ECR2.1 ECR2.3

Technological constraints

Eleven protein extracts were selected and assessed for their technological constraints

- ✓ Tested in water, milk and tomato juice
- ✓ Cooking stirring viscometer
- ✓ Gas Chromatography/Mass Spectrometry

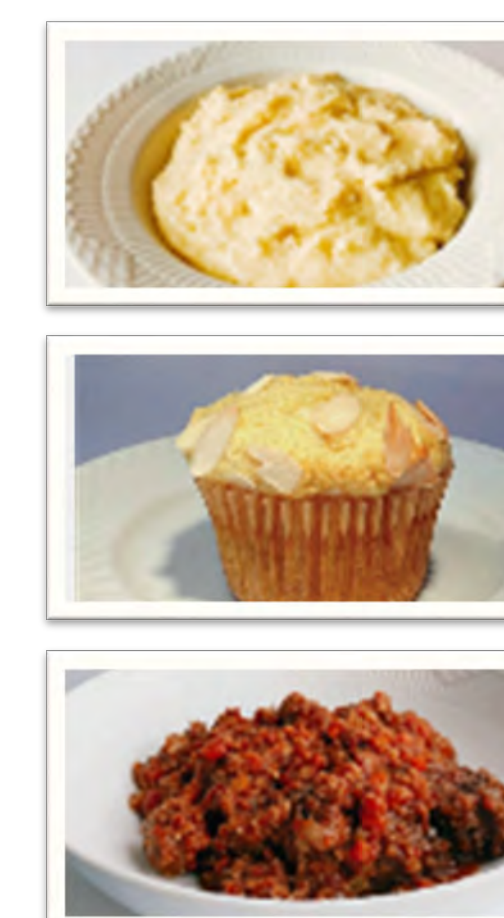

➔ Major challenges:
formation of aggregates when heated,
increased viscosity and lipid oxidation

Development of fortified recipes

Several recipes were developed by a chef in collaboration with a food technologist and a nutritionist

- ✓ Culinary ingredients (dairy, almonds, eggs...)
- ✓ 2 protein extracts (milk protein & extruded soya)
- ✓ Cooking from scratch and from ready-to-heat

➔ Each recipe provides an additional load
of 10-12g of protein and 250-300 kCal

Home-usage tests

Home-usage tests were conducted in three countries (FR, N, UK) with people aged over 70 (n=50 per country)

- ✓ Ease of preparation and palatability

Additional central location tests were conducted in France to compare standard *versus* fortified food (n=56; 37 ♀; 70-84 yo)

➔ Fortified foods (M=4.6/7; SE=1.7)
are less liked than standard foods
(M=5.2/7; SE=1.4; p<0.001)
