HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Image analysis for time-resolved study of micro-particle resuspension kinetics on a ventilated duct surface

Context and objectives

Analyse the temporal evolution of particle number and deposit properties

- **Monolayer deposit** of isolated bronze micro-particle
- **Glass surface** with nanometric roughness
- **Accelerated airflow** followed by a steady-state

Methods

Channel flow acquisition

- Open-loop ventilated duct
- **Optical method**: 2320 x 1728 pxl² window, 30 Hz acquisition frequency, 0.86 mm/pxl resolution
- **Airflow properties** acquisition: hot wire and glue-on hot film probes

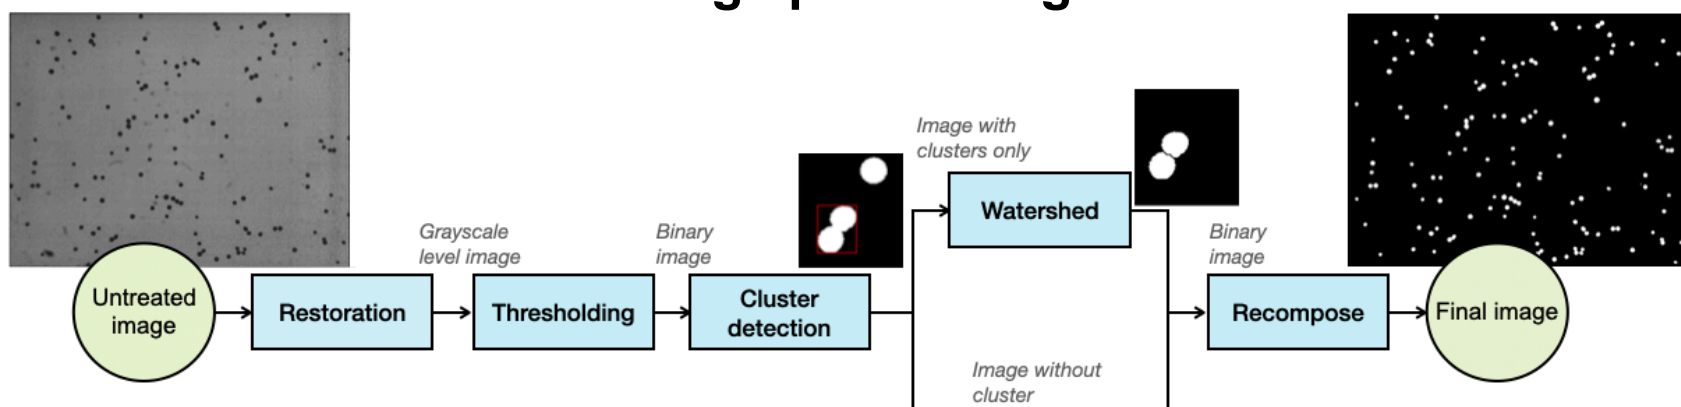

Image processing

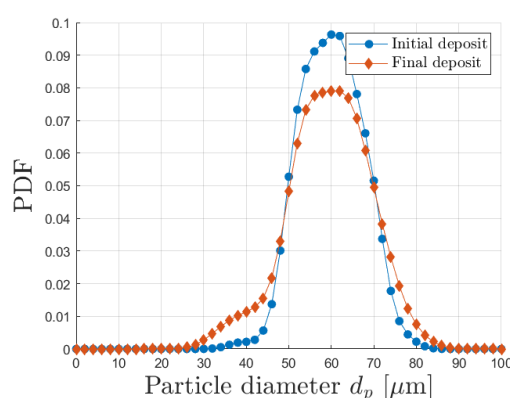

Algorithm validation and results

- Creation of **synthetic images** and **numerical comparison** between particle number and size distribution

Sample n°	Particle number	Size distribution
	Relative difference [%]	Bhattacharyya distance [%]
1	2.6	0.36
2	2.9	0.39
3	3.1	0.27
4	4.0	0.33

- Comparison between **manual counting** and algorithm result on real images: **relative difference < 4%**

- Identification of particle sizes preferentially resuspended

- Remaining particle fraction evolution with airflow properties

- Study of cluster behaviour

- Influence of the particle size
