#### Abstract

The chemical pollution crisis severely threatens human and environmental health globally. To tackle this challenge the establishment of an overarching international science-policy body has recently been suggested. We strongly support this initiative based on the awareness that humanity has already likely left the safe operating space within planetary boundaries for novel entities including chemical pollution. Immediate action is essential and needs to be informed by sound scientific knowledge and data compiled and critically evaluated by an overarching science-policy interface body. Major challenges for such a body are (i) to foster global knowledge production on exposure, impacts and governance going beyond data-rich regions (e.g., Europe and North America), (ii) to cover the entirety of hazardous chemicals, mixtures and wastes, (iii) to follow a one-health perspective considering the risks posed by chemicals and waste on ecosystem and human health, and (iv) to strive for solution-oriented assessments based on systems thinking. Based on multiple evidence on urgent action on a global scale, we call scientists and practitioners to mobilize their scientific networks and to intensify science-policy interaction with national governments to support the negotiations on the establishment of an intergovernmental body based on scientific knowledge explaining the anticipated benefits for human and environmental health.

**Keywords:** Chemical pollution, Science-policy body on chemicals, Planetary boundaries, One-health perspective, Systems thinking

#### A call to action

Climate change and biodiversity loss are well known to pose a threat to humankind and the global environment and are rightly in the focus of global policies and the public. However, a third major challenge on a global level of the same significance is the chemical pollution crisis that severely threatens human and environmental health

# Conclusions

- **Soil, plant, animal and human microbiomes are affected by chemical pollution, at the least in terms of community structure and abundance**
- **Functional consequences (performance, ecosystem functions, metabolic disorders and pathologies...) need to be precised**
- **In the context of pollutions, microbiomes interactions are poorly considered**
- **Additional research is needed to better understand the impact of microbiome on chemical pollutions and vice versa, and consequences on the 'One Health'**
- **What is the impact of climate change on microbiomes interactions?**
