HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destin ee au d ep ot et  a la diffusion de documents scientifiques de niveau recherche, publi es ou non,  emanant des  tablissements d'enseignement et de recherche fran ais ou  trangers, des laboratoires publics ou priv es.

The Road to Healthy Eating:

a new method based on graph theory

Elie Perraud, Juhui Wang, Alison Dussiot, H el ene Fouillet, Fran ois Mariotti

Background:

- healthy diets are defined, which could lower the burden of disease and provide targets for populations.
- these target diets are far removed from current diets, so at best, the population is expected to move slowly along a trajectory.

Objective: characterize the different possible trajectories toward a target diet and identify the most efficient one for health.

Methods:

- A new method developed using graph theory
- A graph with all stepwise change trajectories toward a target healthy diet
- Trajectories all avoiding the risk of nutrient deficiency
- Identified and characterized the trajectory with the highest value for long-term health
- The best trajectories were found using the Dijkstra algorithm with the Health risk criteria based on epidemiological data.

Results:

- Trajectories that were rather similar for males and females regarding the most efficient changes in the first phase of the pathways
- We found that a one-step increase in the consumption of whole/semi-refined bread (60 g) was the first step in all healthiest trajectories.
- For males, the subsequent decrease in red meat was immediately preceded by increases in legumes.

Conclusions:

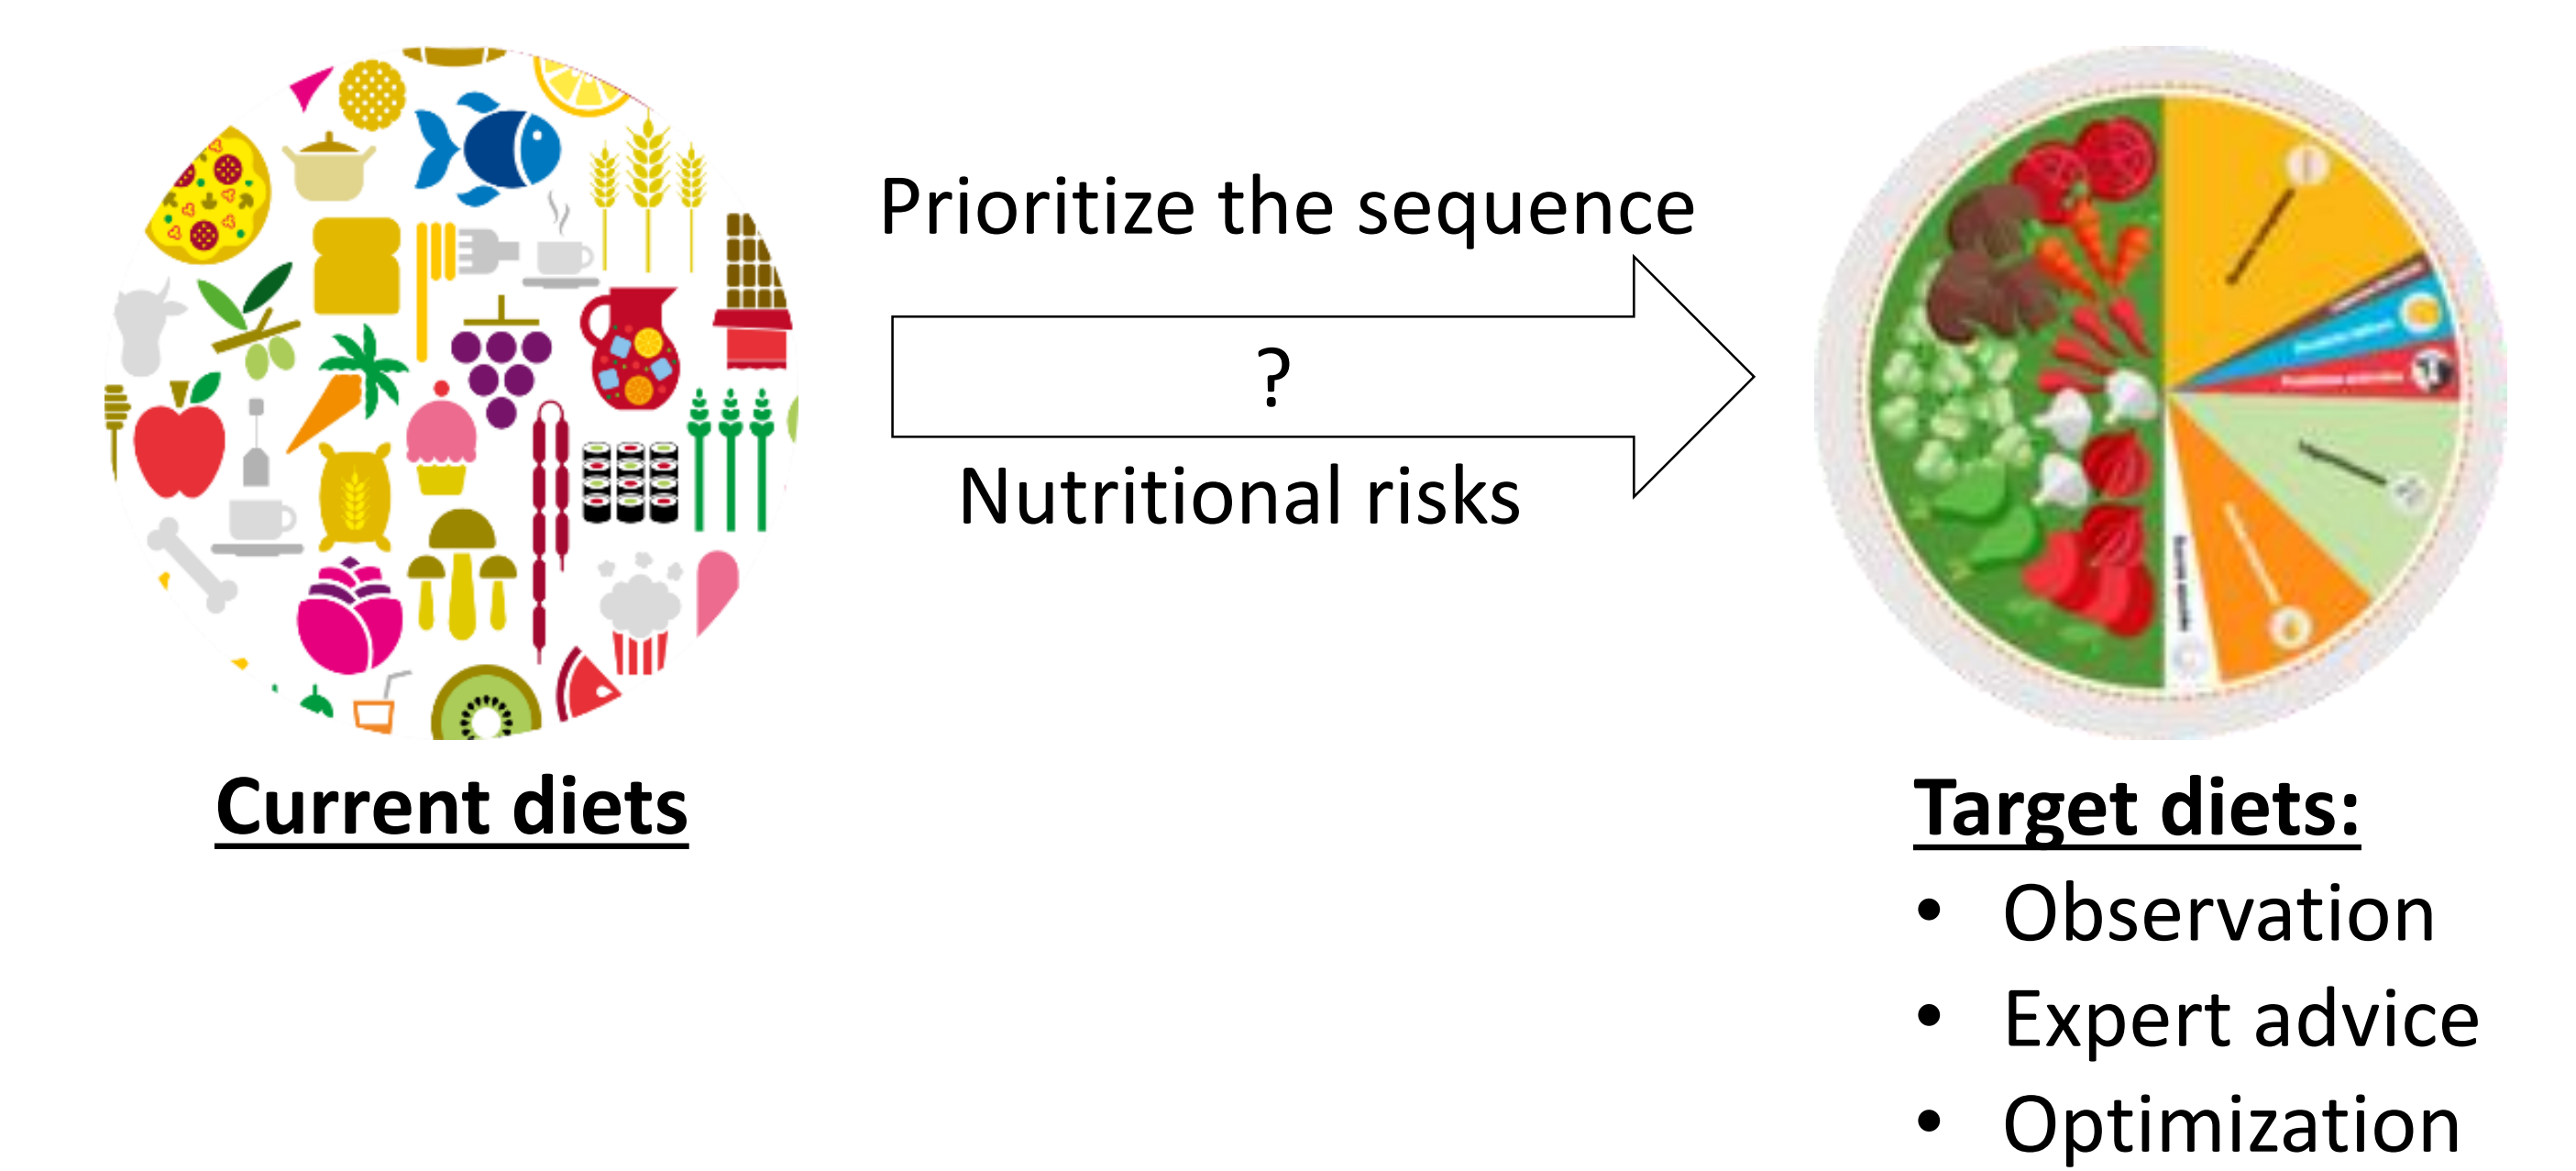

- We show simple practical dietary changes that can be prioritized along an integral pathway that is the most efficient overall for health when transiting toward a distant healthy diet.
- We put forward a new method to analyze dietary strategy for public health transition and highlight the first critical steps to prioritize.

Nutrition 2023 – July 22-25 – Boston – P14-073-23

Introduction

- ➔ Diets have a strong impact on health and the environment
- ➔ Target diets have been identified.

Methods

Mean diet of the French population (M/F)

Optimization criteria:
Health score: TMREL, DALYs

Graph theory
 ○ Diet: vector of 33 food groups
 → Dietary change: 1 portion step

➔ Optimal trajectory
 ✗ Constraint application

Results

Best trajectory identified based on the Health Risk Criterion, which uses estimates from the Global Burden of Disease.

Conclusion

- ➔ Trajectories are similar for males and females
- ➔ Importance of the consumption of whole/semi-refined bread
- ➔ Simple practical dietary changes that can be prioritized
- ➔ A new method to analyze dietary transitions
