HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Heat transfer measurement and modeling in a jacketed batch stirred reactor applied to CO₂ hydrate formation kinetic study

CO₂ hydrate slurry is a promising phase change material for secondary refrigeration cold distribution issues, due to its high latent heat (about 500 kJ.kg⁻¹ of water, higher than that of ice - 333 kJ.kg⁻¹) and wide melting temperature range suitable for air conditioning application. While the thermodynamic properties of CO₂ hydrates are now well established, knowledge of crystallization kinetics phenomena is still a challenge in various applications, such as flow assurance in pipelines. The goal here is to promote the rate of CO₂ hydrate formation to increase the energy density of CO₂-hydrate-based system.

The present work investigates the kinetics of CO₂ hydrate crystallization for different types of stirrers and stirring speed conditions in a jacketed stirred batch reactor by heat transfer measurement. After a validation on water using heating and cooling steps, the mass fraction of crystallized hydrate was determined directly from the heat balance on the cooling jacket, with a specific differential thermal analysis protocol. Those results were compared to a classical mass balance approach based on pressure and temperature measurements, and suitable assumptions on CO₂ concentration and hydrate composition. Finally, a thermal model was developed to determine hydrate formation kinetics by estimating heat flows inside the reactor and with the environment.
