I- Micropollutants problematic

- Definition
- Factors influencing the fate of micropollutants

II- Examples of research work on ISDND and anaerobic digester

- Identification of micropollutants to be taken into account in ISD impact studies
- Diffusion of micropollutants through the sealing barriers of storage facilities
- Biogeochemical cycles of metals in ISD bioreactors
- Biodegradation of organic micropollutants during methanization

How to define micro-pollutants?

The term "**micropollutants**" means organic or mineral substances whose toxic, persistent and bioaccumulative properties may have a negative effect on the environment and/or organisms even at low concentration.

They are present in many products that we consume daily (drugs, cosmetics, phytosanitary products, insecticides, etc.), at home or in industry.

Progress in laboratory analysis is increasingly highlighting their **presence in the aquatic environment** at extremely low concentrations, in the order of one nanogram per litre or microgram per litre (hence the term micropollutants).

Some of these substances are liable to have potentially chronic **direct or indirect effects on ecosystems** (e.g. the feminisation of fish due to endocrine-effect substances in the aquatic environment), and even on human health.

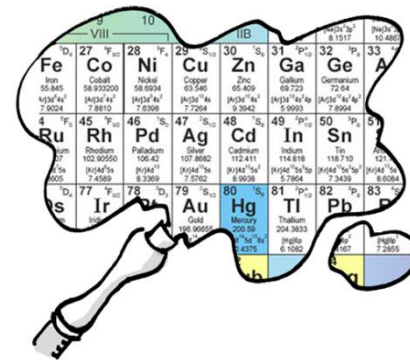

What are the micro-pollutants families?

➤ Metals and metalloids, radioactive elements

Lead, cadmium, mercury, arsenic, antimony, radon, uranium

➤ Organic micropollutants

Pesticides

Hydrocarbons

Plastics

Detergents

Cosmetics

Pharmaceutical products

Exemples of micro-pollutants

Volatile Organic Compounds (VOCs)

Benzene

Dichloromethane

Polycyclic Aromatic Hydrocarbons (PAHs)

Naphtalene

Benzo(a)pyrene

Polycyclic Aromatic Hydrocarbons (PAHs)

6

Polycyclic aromatic hydrocarbons are organic compounds containing only carbon and hydrogen—that are composed of multiple aromatic rings

PAHs are uncharged, non-polar molecules found in **coal and in oil** deposits. They are also produced by the **incomplete combustion of organic matter** (for example, in engines and incinerators or when biomass burns in forest fires).

Some **carcinogenic PAHs** are genotoxic and induce mutations that initiate cancer; others are not genotoxic and instead affect cancer promotion or progression

An adduct formed between a DNA strand and an epoxide derived from a benzo[a]pyrene molecule (center); such adducts may interfere with normal DNA replication.

Exemples of micro-pollutants

Volatile Organic Compounds (VOCs)

Benzene

Dichloromethane

Polycyclic Aromatic Hydrocarbons (PAHs)

Naphtalene

Benzo(a)pyrene

PolyChlorinated Biphenyls (PCBs)

PCB

(3,3',4,4',5,5'-hexachlorobiphenyl)

PolyBrominated Diphenyl Ethers

PBDE

(decabromodiphenyl ether)

PolyChlorinated Biphenyls PCBs

A mixture of compounds containing the biphenyl structure with different numbers (one to ten) and arrangements of chlorine atom attached

PCBs were widely used as dielectric and coolant fluid, in transformers, capacitors

PCBs are persistents in environment (non biodegradable hydrophobic...)

PCBs are carcinogenic

Dredging of PCBs contaminated sediments

PolyBrominated Diphenyl Ethers (PBDE)

Polybrominated diphenyl ethers or PBDEs, are organobromine compounds that are used as flame retardant.

The family of PBDEs consists of 209 possible substances, which are called congeners.

PBDEs have been used in a wide array of products, including:

- building materials,
- electronics,
- furnishings,
- motor vehicles,
- airplanes,
- plastics,
- polyurethane foams,
- and textiles.

PBDEs share the environmental long life and bioaccumulation properties with PCBs

PBDEs can cause cancer in people

Exemples of micro-pollutants

Volatile Organic Compounds (VOCs)

Benzene

Dichloromethane

Polycyclic Aromatic Hydrocarbons (PAHs)

Naphtalene

Benzo(a)pyrene

PolyChlorinated Biphenyls (PCBs)

PCB

(3,3',4,4',5,5'-hexachlorobiphenyl)

PolyBrominated Diphenyl Ethers

PBDE

(decabromodiphenyl ether)

Plastic additives

Plasticizers

Phtalate

Anti oxydant

Bisphenol A

Pesticides

Glyphosate

Exemples of micro-pollutants

Volatile Organic Compounds (VOCs)

Benzene

Dichloromethane

Polycyclic Aromatic Hydrocarbons (PAHs)

Naphtalene

Benzo(a)pyrene

PolyChlorinated Biphenyls (PCBs)

PCB

(3,3',4,4',5,5'-hexachlorobiphenyl)

PolyBrominated Diphenyl Ethers

PBDE

(decabromodiphenyl ether)

Plastic additives

Plasticizers

Phtalate

Anti oxydant

Bisphenol A

Pesticides

Glyphosate

Surfactants

Nonylphenol

Pharmaceutical products

Ibuprofen

Aspirin

Diazepam

Bronchodilators

Stimulating agents

Anxiolytics/antidepressants

Analgesic/ anti inflammatory

Hormones / beta blockers

The fate of a micro-pollutant will depend on certain properties :

- Volatility/solubility : Henry's Law Constants
- Polarity: Octanol/water partition coefficient (Log KOW)
- Biodegradability : Half life time

This law establishes a relation between the partial pressure P_i of a pure gaseous body and its molar fraction X^L in a solvent :

$$P_i = X^L \cdot K_i \quad K_i \text{ is the Henry's law constant}$$

This law allows to determine the solubility of a volatile substance in a liquid solvent with which this gas is in contact.

The more K_i is great the more the substance is volatile

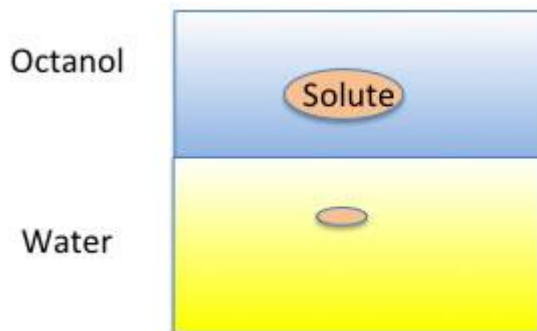

The Henry's law constant depends on the temperature:

Important property to know the mode of exposure to pollutants

Log Kow, is a measure of the differential solubility of chemical compounds in two solvents (octanol / water partition coefficient).

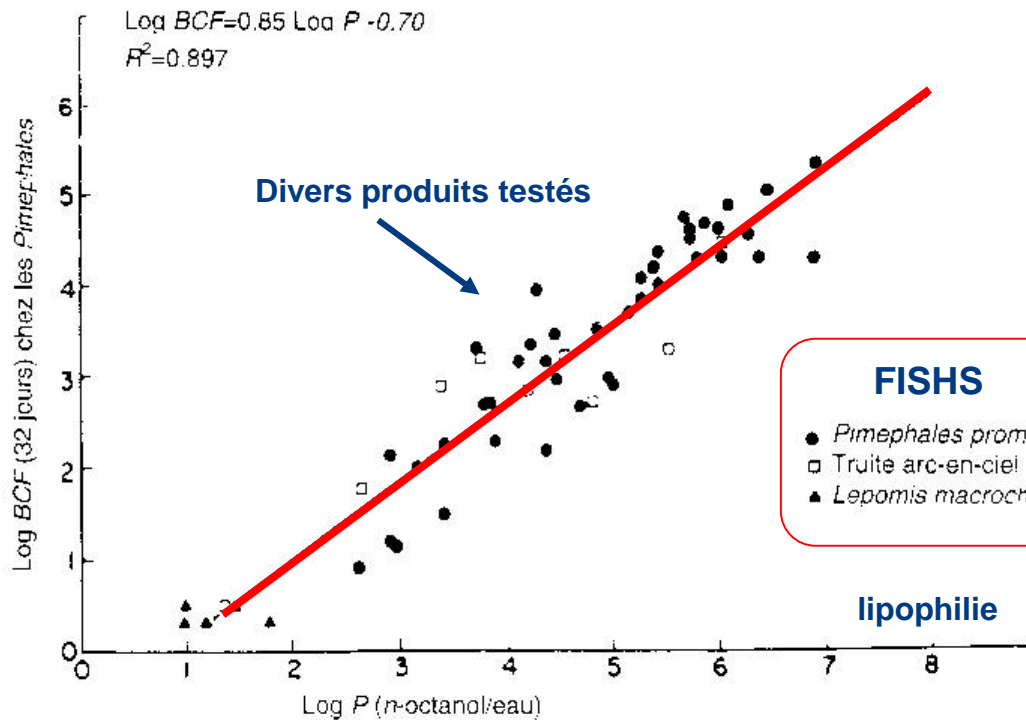

$$\text{Log Kow} = \text{Log}(C_{\text{oct}}/C_{\text{eau}}).$$

This value makes it possible to apprehend the hydrophilic or hydrophobic nature of a molecule

Indeed, if the Log Kow is positive and very high, it expresses the fact that the molecule considered is much more soluble in octanol than in water, which reflects its lipophilic or hydrophobic character, and vice versa.

$$\text{Log } P = \text{Log } K_{ow} = \text{Log } (C_{oct}/C_{eau})$$

$$\text{Log BCF} = a \log K_{ow} + b$$

BCF = bioconcentration factor
= $C_{organism} / C_{water}$

Notion of Bioavailability

Apolar organic pollutants

Semipermeable Membrane Device, SPMD

Polar organic pollutants

Polar Organic Chemical Integrative Sampler

Metals

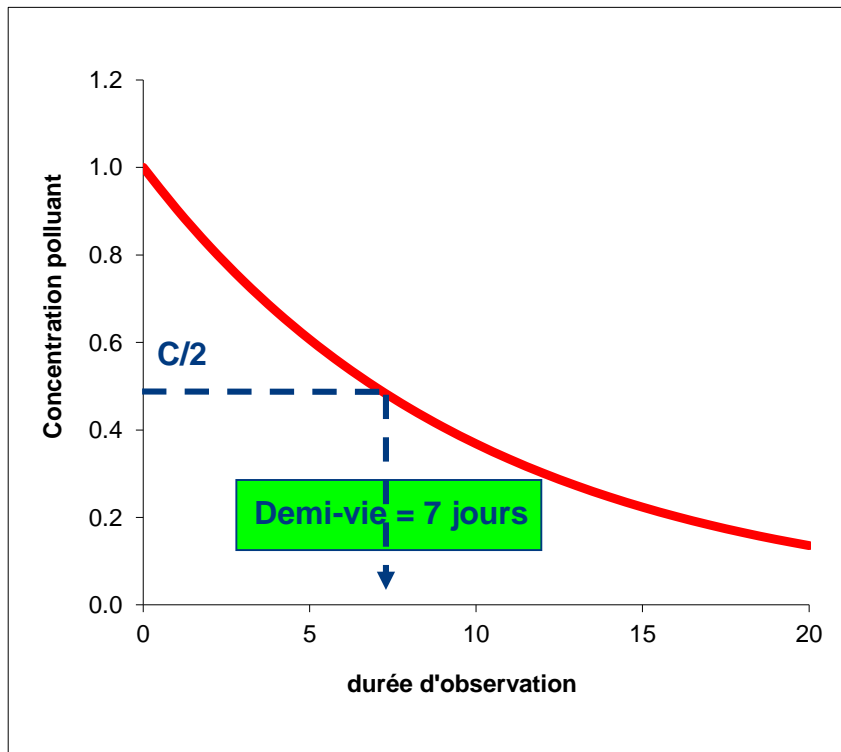

Diffusive Gradient in Thin film, DGT

Time required for half of a quantity or concentration of a pollutant to disappear from the biotope or a contaminated organism

Pollutant	Half life time
DDT	15 years
Lindane	2 years
Parathion	130 days
Malathion	11 days

Evaluation of pollutants persistence

Degradation

Physicochemical action (photooxidation, thermooxidation ...) leading to the more or less complete disappearance of a molecule.

Biodegradation

Biological degradation carried out by bacteria, fungi and obtaining metabolites of lower molecular weight.

Primary biodegradation = partial attack of molecules; may result in more persistent, more bioavailable, and sometimes more toxic metabolites than the initial molecule

Ultimate biodegradation: complete degradation of the molecule; leads to CO₂, CH₄, water, mineral elements.

Metallic micropollutants

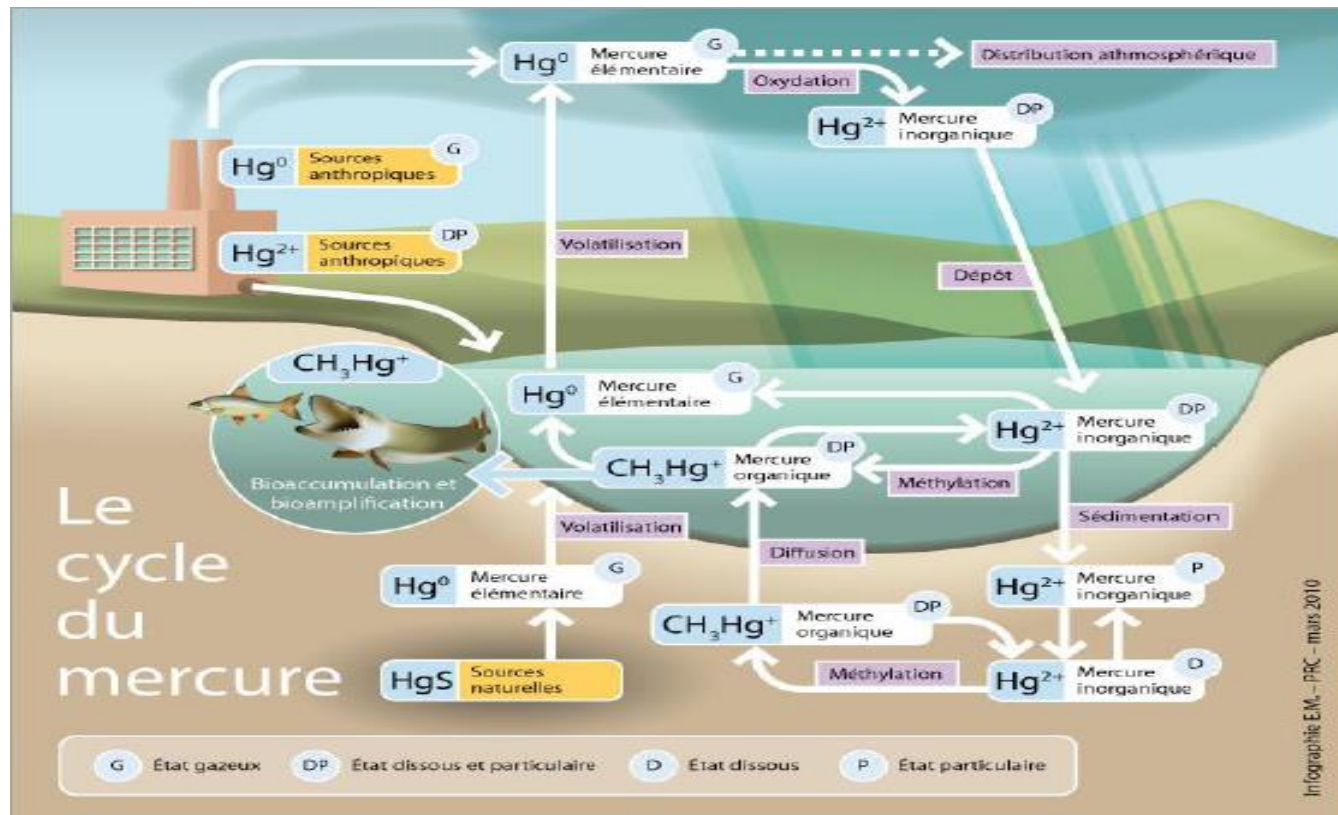

Source of mercury contamination

Biogeochemical cycle of mercury

Speciation consists, beyond the measurement of the total concentration of an element in a sample, to separate, identify and measure individually all the chemical forms of this element

Microorganism can amplify pollution : Minamata case

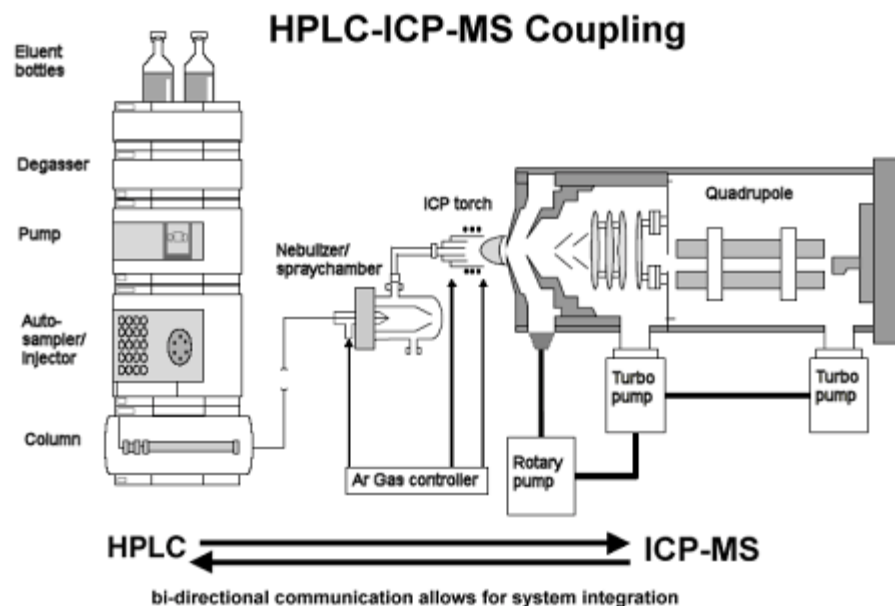

Why use ICP-MS for metal speciation analysis ?

27

- It can measure almost the whole periodic table in just about everything

- Analysis of:
 - Elemental concentrations
 - High precision isotope ratio determinations
 - **Species information** when coupled to separation devices

I- Micropollutants problematic

- Definition
- Factors influencing the fate of micropollutants

II- Examples of research work on ISDND and anaerobic digester

- Identification of micropollutants to be taken into account in ISD impact studies

- Biogeochemical cycles of metals in ISD bioreactors
- Biodegradation of organic micropollutants during methanization

1

Transfers of micropollutants through the sealing barriers

Contamination of subsoils and groundwater

2

Recalcitrant micropollutants to leachate treatments

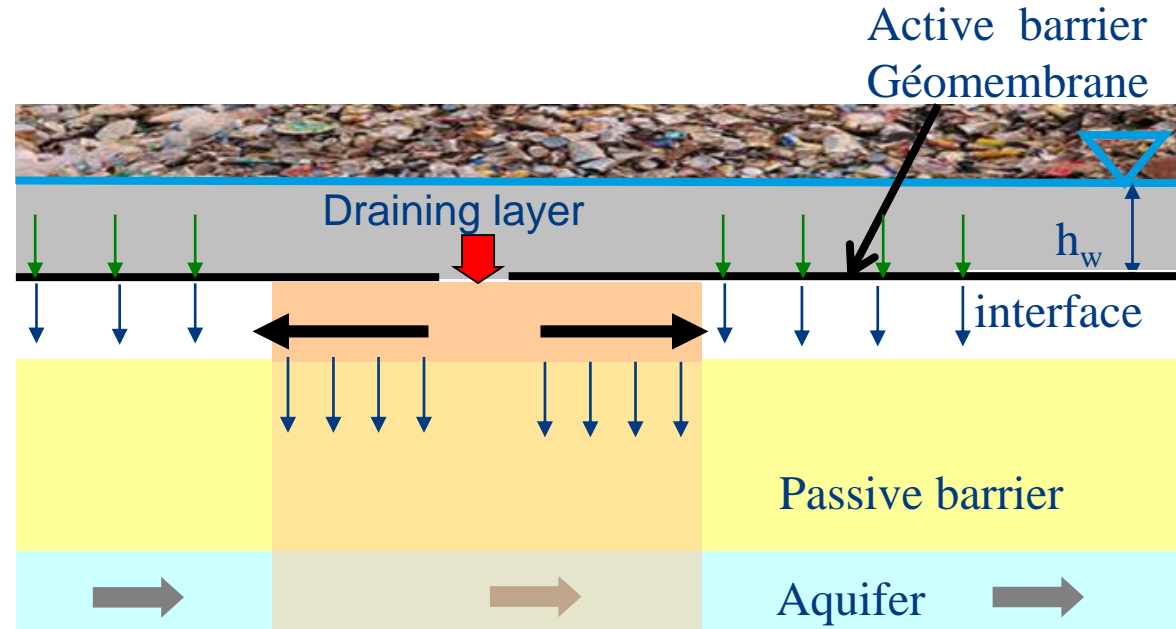

Contamination of surface water

Two basic modes of transfer in the sealing barriers :

- **advective transfers (defects in the geomembrane)**
- **diffusive transfers**

↓ : Diffusive transfer through the intact geomembrane

Database under access grouping:

- 33 publications and study reports
 - 100 different ISD
 - 311 leachate samples
 - 402 organic compounds
- The physical-chemical properties (solubility, Koc ...)
- The toxicological properties of pollutants (TRV, CMR classification ...)

no public data in France

Selection of compounds for impact analysis

- 1: Dichloromethane
- 2: 1,4_Dioxane
- 8: Benzene
- 9: Toluene
- 14: Z- 1,2_Dichloroethylene
- 16: E-1,2_Dichloroethylene
- 19: Aniline
- 22: p_Cresol
- 27: 1,1,2_Trichloroethane
- 32: Ethylbenzene
- 40: Bisphenol_A
- 44: 1,2,4_Trichlorobenzene
- 53: Bis2_ethylhexylphthalate
- 65: Aldrin
- 66: dieldrin

The choice of leachate collection sites: 8 sites

Compounds analyzed:

- **Volatile Organic Compounds (VOCs)**
- **Polycyclic Aromatic Hydrocarbons (PAHs)**
- **PolyChlorinated Biphenyls (PCBs)**
- **PolyBrominated Diphenyl Ethers (PBDEs)**
- **Phenols and bisphenol A**
- **Phtalates**
- **Pesticides**
- **Pharmaceutical products**
- **Organometallic compounds**

The organic compounds were analyzed both in the dissolved and particulate phases

- ❖ Presence in large quantity of bisphenol A (antioxidant) and phthalates (plasticizer) which are plastic additives with reprotoxic properties
- ❖ Presence also of some VOC (mono-aromatic, chlorinated solvent ...) with carcinogenic properties
- ❖ Presence of PAHs, PCBs and PBDEs mainly on the particulate phase because these compounds are not very soluble
- ❖ Pharmaceuticals and hormones have not been found

Compounds	CMR Classification	Tracking frequency (%)
Dibutyl phthalate	REPRO 2 / REPRO 3	100
Bisphenol A	REPRO 3	100
Toluène	REPRO 3	100
Benzène	CARC1/MUTA2	100
Dichlorométhane	CARC 3	100
p-dichlorobenzène	CARC3	75
Benz[a]anthracène	CARC 2	62,5
Butyl benzyl phtalate	REPRO 2 / REPRO 3	37,5
Trichloroéthylène	CARC 2/ MUTA 3	37,5
Tetrachloroéthylène	CARC 3	37,5
Benzo[e]pyrène	CARC 2	25
Benzo[a]pyrène	CARC 2/ MUTA 2/ REPRO 2	25
Heptachlor epoxide	CARC3	12,5
Heptachlor	CARC 3	12,5

1: Toluène (DIB)
44: Toluène (OM + DIB)
22: Toluène (OM)
50: Bisphenol_A (OM + DIB)
42: Heptachlor_epoxide (OM)

Determination of diffusion coefficients

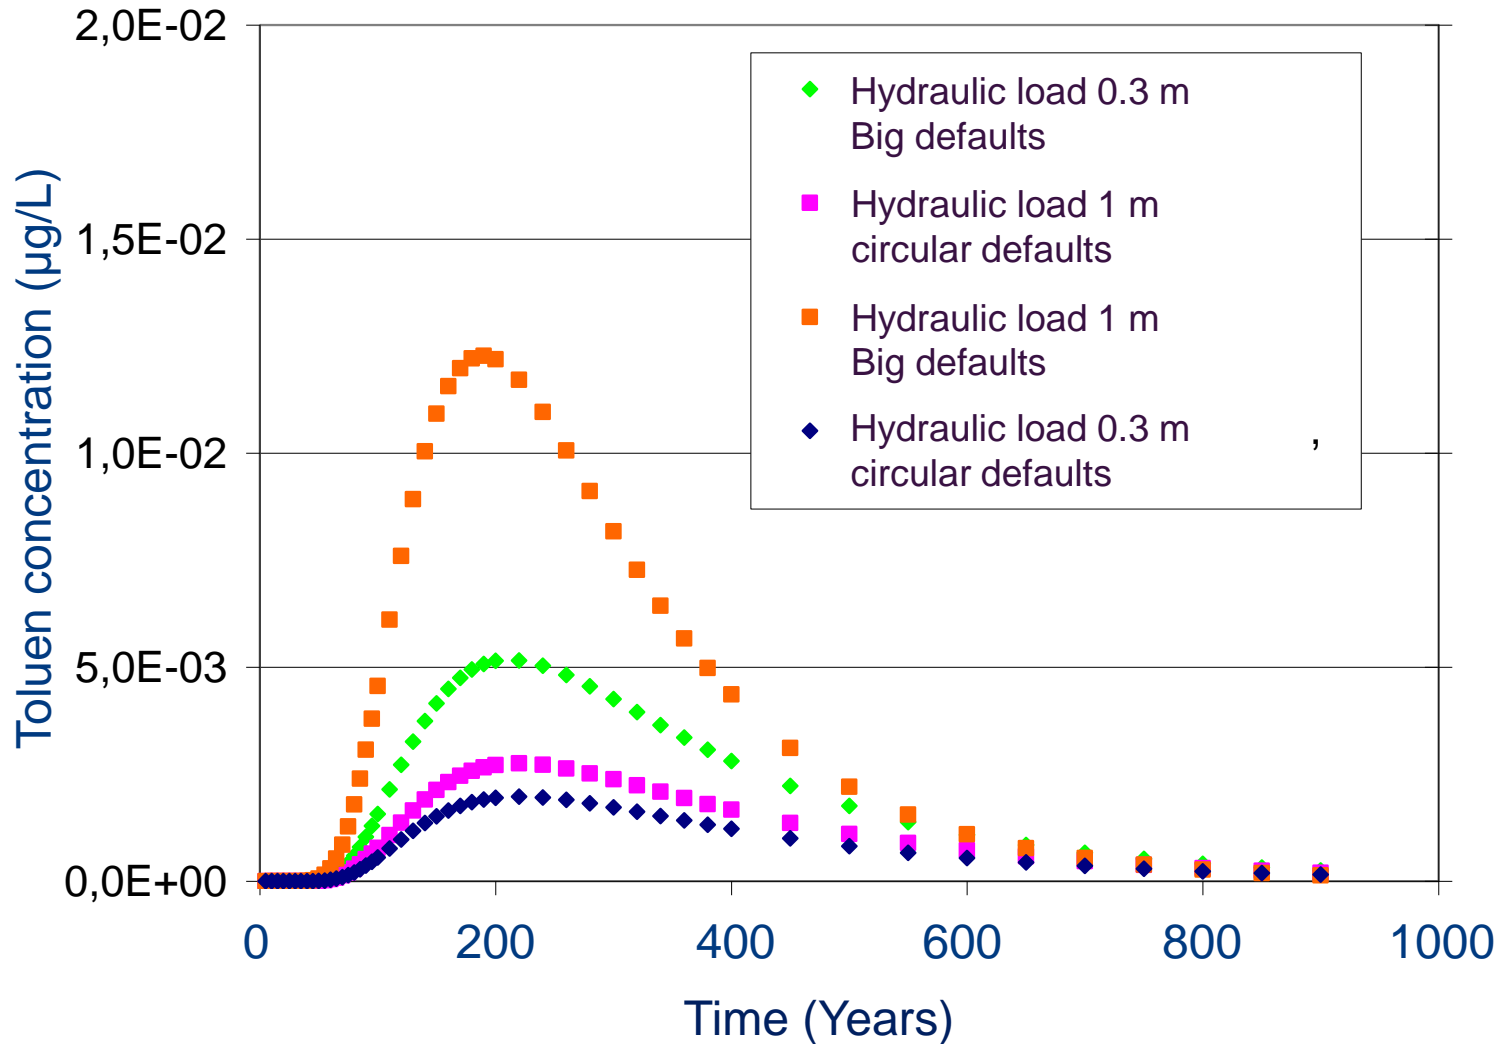

Toluen

Calculation of the concentration in the aquifer

Assessment of the toxicity of non-hazardous waste storage facility leachates and identification of the chemical agents responsible

Raw leachate

Aerated leachate

Treated leachate

Samples	Site	Characteristics
Site1-LB	Site 1	Lixiviât brut provenant de plusieurs casiers d'âges différents.
Site1-LA	Site 1	Lixiviât prélevé dans le bassin d'aération recevant le lixiviât site1-LB.
Site1-LT	Site 1	Perméât prélevé en sortie de traitement (évapo-concentration suivie d'une osmose inverse) du site1.
Site2-LB	Site 2	Lixiviât brut prélevé au niveau de la station de relevage du site 2.
Site2-LA	Site 2	Lixiviât prélevé dans le bassin d'aération recevant le lixiviât site2-LB.
Site2-LT	Site 2	Effluent de sortie de traitement (réacteur membranaire suivi d'une filtration sur charbon actif) du site 2.

❖ Toxicity test

Targeted mechanisms	Methods	Detected molecules	References
Génotoxicité	SOS Chromotest	Genotoxics et pro genotoxics: HAP, nitrosamin , pesticides...	Quillardet et Hofnung, 1985

0.07	0.065	< 0.17	1.3
0.08	0.28	< 0.05	0.1

Levels of metals in leachates are low.

 Metal trapping in waste as a precipitate (sulphide, carbonate...) or complexes with organic matter

However, in the long term, there may be significant release of metals when returning to aerobic conditions.

sulfo-oxydation

Consumption of sulphides in the presence of oxygen or nitrates
(DMA) :

Consequences :

- Significant drop in pH
- Resolubilization of sulphides, hydroxides and carbonates

Arsenic speciation

	AsIII	AsV	MMA	AsB	TMAO
					
LD 50	8	22	916	4260	5500
TOXICITY					

Normal landfill

Bioreactor landfill

Demonstration of the disappearance of the pollutant

Lowering toxicity

Because the pollutant can :

1- Simply be adsorbed on the waste

2- Transformed into a metabolite which may be more toxic than the initial pollutant
