HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Iron acquisition is essential for pathogenic bacteria in DNA synthesis, enzyme activities, and respiration. However, free iron is toxic for organisms: it is bound to other molecules like hemoproteins, transferrin or stored in ferritin. To overcome this lack of free iron, bacteria possess several systems to acquire bound iron, by surface proteins or secreted iron chelating siderophores. In the gut iron homeostasis is complex since host cells, commensal microbiota and food-iron are interacting to maintain this balance and little is known about genes involved during gut infection. Our work addresses this purpose in *Bacillus cereus*, (closely related to the insect pathogen *Bacillus thuringiensis*). The presentation focus on genes related to iron homeostasis expressed during gut infection in the larvae of the insect model, *Galleria mellonella* (Greater wax moth). To perform these analyses, we adapted Laser Capture Microdissection to collect *B. cereus* cells in cryo-sections of previously force fed germ-free larvae and assessed targeted gene expression by RT-qPCR from the recovered mRNA. The results showed modulation of several iron homeostasis related genes at 16h (bacteria colonising the intestine surface) compared to 3h (bacteria in the lumen) post infection. Further analyzes are ongoing to characterize physiological and chemical markers in the gut environment.
